From 1898 to 1904 craft unions in the United States grew in importance, and made substantial gains by aggressive action. In 1905 with a slackening of business prosperity came a loss of faith in trade unionism as the one sure solution of the problems of the working class. The American Federation of Labor had organized the skilled trades but the unskilled had been practically neglected. The crafts seemed unable to cope with the trusts and with an open-shop campaign which drew employers together. Attempts were made to capture the American labour movement for a more radical class struggle. In 1905 the Industrial Workers of the World were organized. A movement to organize the building trades into an industrial union was resisted by the American Federation of Labor, but resulted in the establishment in 1908 of the Building Trades Department of the Federation. In 1909 the United Mine Workers announced their championship of the principle of collective ownership of the means of production. In 1911 the machinists followed. From 1903 we find increasing tendency toward concerted movements of the railway crafts. In 1908 the Railway Employees' Department was formed in the American Federation of Labor to include all the railway unions affiliated with the Federation. In 1916 the four railway brotherhoods, not affiliated with the Federation, acted together to demand the eight-hour day. In 1912 the national convention of the Federation voted down the minority report of the Committee on Education in favour of the principle of industrial unionism, 72 for and 264 against; voting strength, 5,029 for and 10,983 against. The two miners' unions voted solidly in favour of the change. Others in favour were the bakers and confectioners, iron, steel and tin workers, printing pressmen, railway carmen and journeymen tailors. In 1912 labour was weak economically but strong politically, due to its support of the Democratic party, then coming into power. Public hearings before the United States Commission on Industrial Relations in 1914 brought industrial conditions into the light of public opinion, for the first time a commission representing the Government not only pronounced the trade union movement harmless to the best interests of the country, but gave its unqualified approval to labour organization as an institution indispensable in a democracy. The return of business prosperity in 1916, coincident with the sudden decrease of immigration, gave labour a new economic advantage. In 1917 the Government asked and won co-operation of organized labour in producing military supplies. Organized labour was given recognition on Government committees, and the policy of boards which represented the Government in its relations with its employees was to recognize trade union standards of working conditions. The leadership of the American Federation of Labor was strengthened by the attitude of the Government, possibly it was weakened by the fact that the War Labor Board dealt with groups of disaffected workers in the local unions rather than with the national officers, and so made for decentralized control in the unions. After the Armistice labour was again on the defensive, and the increasing number of the unemployed were more ready than they had been to listen to the philosophy of the radical, who can always promise a steady job and a pay envelope every week in the Utopian state. The membership in the relatively conservative American Federation of Labor increased nearly threefold between 1910 and 1920. In 1910 there was a paid-up membership of 1,562,112; in 1915 1,946,347; and 1920 4,078,740. If we include also the membership of organizations suspended from the Federation, the total for 1920 was 4,509,213. Outside the Federation are the four brotherhoods of railway employees with a membership of over 400,000, the Amalgamated Clothing Workers, 200,000, the Amalgamated Textile Workers, 40,000;

and other smaller independent organizations. There are five industrial departments in the American Federation of Labor—building trades, metal trades, railway employees, union label trades, and mining. The six largest of the affiliated unions are the United Mine Workers', the Carpenters' and Joiners', the Machinists', Electrical Workers', Railway Carmen, and the Ladies' Garment Workers.

The National Women's Trade Union League of America was founded in 1903 for the purpose of investigating and giving publicity to conditions of women in industry, and to undertake educational work for wage-earning women, to promote labour legislation and improved labour standards, and to aid trade unions in organizing women. The League stands also for the eight-hour day and the 44-hour week, for a living wage, and for equal pay for equal work regardless of sex. The League is indorsed by the American Federation of Labor and the Canadian Trades and Labour Congress and is represented at their conventions by fraternal delegates. It claims 600,000 trade union women, and has also a large membership of men. It publishes *Life and Labor*, and maintains a training school for organizers. Its headquarters are in Chicago.

The decade 1910-20 saw a movement develop to unionize the teachers as a trade group. The first teachers' union was organized in Chicago in 1902, following the failure of the Teachers' Federation to gain consideration from the school board. As the board insisted that it had no money to pay a "living wage," the teachers investigated city finances, and found that many wealthy corporations had been evading taxes due to the city. In the struggle to force the payment of taxes the teachers received aid from organized labour. Then, at the invitation of the Chicago Federation of Labor, the teachers affiliated with that body. In 1916 the Board of Education dismissed those teachers who had been prominent in trade union activity. In order that these teachers might be reappointed, the union withdrew from the city Federation of Labor. In 1914 the teachers of Cleveland voted to affiliate with the American Federation of Labor, but were prevented by the Board of Education. In 1916 teachers' unions in a number of cities united to form the American Federation of Teachers and affiliated with the American Federation of Labor, but forbade recourse to strikes. The official publication is the *American Teacher*. The first trade union of librarians in the United States was formed in New York City, in 1917, to demand salary increases and a regular system of promotions. In 1918 the Boston Library Employees' Union was organized and affiliated with the American Federation of Labor. Union organizers were active without success at the 1919 and 1920 conventions of the American Librarians' Association.

Trade Agreements.—The economic strength of trade unions is crystallized in trade agreements. Such expression of a joint partnership of Capital and Labour to stabilize industry on the basis of an accepted law is typical of the American labour movement. The earliest national agreement in the United States was that of the iron puddlers in 1866. A national agreement of the stove moulders established in 1891, providing for peaceful adjustment of disputes which might arise, continues in force. In 1897 a general strike in the central competitive district of the bituminous coal-mining industry led to an agreement between the operators and the United Mine Workers' Union. In 1902 the president of the union refused to join in a sympathetic strike on behalf of the anthracite strikers because such action would be disloyal to the agreement. For more than 20 years the International Typographical Union had been arbitrating disputes with the publishers of newspapers. At the convention of the National Publishers' Association in 1900, three publishers were chosen as a committee to deal with labour, to represent, however, not the whole convention, but only those employers who had favoured the measure. Contracts between individual employers and the union had been made prior to this time. This committee effected an agreement with the Typographical Union, to be in force from May 1901 to May 1902, which provided for local boards of three persons, one to represent the publisher, one the union, and the third to be chosen by these two. The board was to decide all disputes in its territory, the *status quo* to prevail until an award should be made. If either party should be dissatisfied with the decision, appeal might be taken to a national board, composed of the publishers' labour committee and the president of the Typographical Union. If they failed to agree, an impartial person was called in. A majority decision was then binding on both parties. In 1902 the agreement was renewed for a five-year period, and again in 1907, revised to

succeeded in functioning effectively it would undoubtedly have wielded immense power; but owing principally to lack of coördination between its three constituents, it never took effective action upon an important question, and its last failure to act in the miners' strike of 1921 destroyed much of its prestige among the trade unions. Locally the branches of trade unions were united in Trade Councils, which in some cases were separate from and in other cases united with the local Labour party. These Trade Councils, of which there were several hundreds in the United Kingdom, varied greatly in size and importance. In large towns—where the Trade Council could often trace its history as far back as the eighteenth century—it sometimes wielded important industrial and political influence, while in remote places it was little more than a rallying ground for a few trade union branches to discuss matters of common interest. The Trade Councils for the most part, being composed of trade union branches with little money to spare, suffered from a lack of funds, though in times of crisis these could be partly increased by means of local levies. Their functions were not generally defined. This meant in practice that they were limited by opportunity, and might include many types of activity, from the providing of a hall for local meetings or a local Labour weekly paper, to the temporary control of the whole life of a town during a general strike.

Ireland—Irish trade unionism, in its later stages, needs separate treatment. Originally trade unionism in Ireland was a weak copy of the British model, but in the first decade of the twentieth century, it became imbued with ideas derived from the American Industrial Workers of the World. Under the leadership of James Larkin and of Connolly (executed after the Easter Rebellion of 1916) militant industrial unionism attained to great power. Its strongest exponent was the Irish Transport and General Workers' Union, which was the leader in the Dublin strikes of 1913, and subsequently went through a period of severe repression. It survived, however, and in 1921 was by far the largest constituent element in the Irish Trade Union Congress and Labour Party. The latter body, which adopted political as well as industrial functions in 1912, acts far more as a central executive for its affiliated societies than does the British Trade Union Congress. Affiliated to it are all the important Irish trade unions, with the exception of some located in Ulster, which are kept apart from it by political and religious differences. There are also affiliated a large number of Trade Councils (including the Trade Council of Belfast), which in weakly-organized districts serve as organizing centres, workers being invited to join the Trade Council until a branch of the appropriate trade union can be founded. This is an important respect in which the Irish Trade Councils differ from those of Great Britain. The Irish movement was strongly republican in its political policy, and had close relations with Dail Eireann on the one hand, and with the Irish agricultural cooperative movement on the other. Most of the Irish industries are organized in the Irish Transport and General Workers' Union, though in certain cases British trade unions have a large Irish membership. The most important of these are the railway and postal employees (organized respectively by the National Union of Railwaymen, the Railway Clerks' Association, and the Union of Post Office Workers, though a purely Irish Postal Trade Union also exists), the engineering, shipbuilding and woodworking employees in Belfast and Dublin and some other large towns, and some women workers, mainly in the east and north, who are organized in the National Union of General Workers. There are also separate Ulster unions, principally in the textile industries, but trade unionism in Ulster, especially in Belfast, is liable to be rent asunder from time to time by political and religious upheavals.

Legal Status.—There were few changes during 1911–21 in the laws relating to trade unionism. The most important of these was the Trades Disputes Act of 1913, which partially undid the effect of the Osborne Judgment. It provided that any trade union might take a ballot of its membership on the question of establishing a fund for political purposes. If a majority of the members is in favour of its establishment, contributions for political purposes may be levied, but no member can be forced to contribute to the political fund who does not wish to do so. In cases where there is a composite subscription, covering all purposes of the trade union, any member can reclaim that part of his subscription which would be devoted to political purposes. The political fund must in all cases be separately administered from the general funds. The Trade Union Amalgamation Act, passed in 1917, removed some of the previous legal restrictions on the amalgamation of trade unions by providing that, where a ballot is taken upon the question of amalgamation, it will be sufficient if fifty per cent of the membership votes, and if of those voting a majority of twenty per cent is in favour of it. Despite this Act, a number of amalgamations have failed owing to an insufficient total of votes having been recorded, and various devices have been adopted for getting round the difficulty.

Finance.—The finance of trade unions showed little change during the decade. Most trade unions slightly raised their subscriptions during the war, in about the same proportions, so that the unions of skilled workers have still a far higher subscription and provide on the average a larger number of benefits to their members than the unions of the unskilled. Again, most trade unions built up fairly large reserve funds during the war—which were considerably depleted during 1920–1,—but here again the increase was greater in the case of the skilled unions. All trade unions made large use of the levy, which is one of the most important elements of trade union finance. It is obvious that strike and unemployment funds, particularly strike funds, cannot be put upon an actually sound basis, so that in most trade unions the method is adopted, when a particular fund seems to be in low water, or some special object demands that an immediate sum of money be available, of imposing, generally after a ballot vote, a levy upon the whole membership. Thus, a trade union may levy itself to provide assistance to a particular branch or strike, or to another trade union, or to finance the *Daily Herald*, or for any other of a variety of purposes, and the practice of imposing levies frequently renders the obligation of a member to his trade union very much greater than would appear from the subscription rates laid down in the rule book.

Authorities.—The volume of publications on British trade unionism has increased very rapidly. Official statistics are to be found in the *Labour Gazette*, published by the Ministry of Labour, in the reports of trade unionism issued by the Board of Trade (not since the war), and in the reports of the Chief Registrar of Friendly Societies. Most of the available information will be found collected in the *Labour Year Book*. For the history, organization and theories of trade unions the standard works are *The History of Trade Unionism* (new edition, 1920) and *Industrial Democracy* (new edition, 1920) by Sidney and Beatrice Webb; *Trade Unionism* by C. M. Lloyd (revised edition, 1921), and *An Introduction to Trade Unionism* (1918) by G. D. H. Cole. All these contain full bibliographies. There are also special studies of trade unionism in particular industries. Of these may be mentioned *Trade Unionism on the Railways* (1917) by G. D. H. Cole and R. P. Arnot, *Village Trade Unions* (1920) by Ernest Selley; and *Women in Trade Unions* by Barbara Drake (1920). The standard work on trade union law is *The Legal Position of Trade Unions*, by H. H. Slessor and W. Smith Clark, and a smaller work by H. H. Slessor, *The Law Relat-*

The Progress of British Trade Unionism, 1910–9.

By far the most important up-to-date source of information, statistical and historical, for other countries is the *Labour International Handbook*. See also G. D. H. Cole, *The World of Labour*. For Germany see *Trade Unionism in Germany* by W. Stephen Sanders (1916). For Russia see A. Losovsky, etc., *Trade Unions in Soviet Russia* (1920). (M I C)

UNITED STATES

From 1898 to 1904 craft unions in the United States grew in importance, and made substantial gains by aggressive action. In 1905 with a slackening of business prosperity came a loss of faith in trade unionism as the one sure solution of the problems of the working class. The American Federation of Labor had organized the skilled trades but the unskilled had been practically neglected. The crafts seemed unable to cope with the trusts and with an open-shop campaign which drew employers together. Attempts were made to capture the American labour movement for a more radical class struggle. In 1905 the Industrial Workers of the World were organized. A movement to organize the building trades into an industrial union was resisted by the American Federation of Labor, but resulted in the establishment in 1908 of the Building Trades Department of the Federation. In 1909 the United Mine Workers announced their championship of the principle of collective ownership of the means of production. In 1911 the machinists followed. From 1903 we find increasing tendency toward concerted movements of the railway crafts. In 1908 the Railway Employees' Department was formed in the American Federation of Labor, but included all the railway unions affiliated with the Federation. In 1916 the four railway brotherhoods, not affiliated with the Federation, acted together to demand the eight hour day. In 1912 the national convention of the Federation voted down the minority report of the Committee on Education in favour of the principle of industrial unionism, 72 for and 264 against, voting strength, 5,029 for and 10,983 against. The two miners' unions voted solidly in favour of the change. Others in favour were the bakers and confectioners, iron, steel and tin workers, printing pressmen, railway carmen and journeymen tailors. In 1912 labour was weak economically but strong politically, due to its support of the Democratic party, then coming into power. Public hearings before the United States Commission on Industrial Relations in 1914 brought industrial conditions into the light of public opinion, for the first time a commission representing the Government not only pronounced the trade union movement harmless to the best interests of the country, but gave its unqualified approval to labour organization as an institution indispensable in a democracy. The return of business prosperity in 1916, coincident with the sudden decrease of immigration, gave labour a new economic advantage. In 1917 the Government asked and won cooperation of organized labour in producing military supplies. Organized labour was given recognition on Government committees, and the policy of boards which represented the Government in its relations with its employees was to recognize trade union standards of working conditions. The leadership of the American Federation of Labor was strengthened by the attitude of the Government; possibly it was weakened by the fact that the War Labor Board dealt with groups of disaffected workers in the local unions rather than with the national officers, and so made for decentralized control in the unions. After the Armistice labour was again on the defensive, and the increasing number of the unemployed were more ready than they had been to listen to the philosophy of the radical, who can always promise a steady job and a pay envelope every week in the Utopian state. The membership in the relatively conservative American Federation of Labor increased nearly threefold between 1910 and 1920. In 1910 there was a paid-up membership of 1,562,112; in 1915 1,046,347; and 1920 4,078,740. If we include also the membership of organizations suspended from the Federation, the total for 1920 was 4,500,273. Outside the Federation are the four brotherhoods of railway employees with a membership of over 400,000, the Amalgamated Clothing Workers, 200,000, the Amalgamated Textile Workers, 40,000;

and other smaller independent organizations. There are five industrial departments in the American Federation of Labor—building trades, metal trades, railway employees, union label trades, and mining. The six largest of the affiliated unions are the United Mine Workers', the Carpenters' and Joiners', the Machinists', Electrical Workers', Railway Carmen, and the Ladies' Garment Workers.

The National Women's Trade Union League of America was founded in 1903 for the purpose of investigating and giving publicity to conditions of women in industry, and to undertake educational work for wage-earning women, to promote labour legislation and improved labour standards, and to aid trade unions in organizing women. The League stands also for the eight-hour day and the 44-hour week, for a living wage, and for equal pay for equal work regardless of sex. The League is indorsed by the American Federation of Labor and the Canadian Trades and Labour Congress and is represented at their conventions by fraternal delegates. It claims 600,000 trade union women, and has also a large membership of men. It publishes *Life and Labor*, and maintains a training school for organizers. Its headquarters are in Chicago.

The decade 1910-20 saw a movement develop to unionize the teachers as a trade group. The first teachers' union was organized in Chicago in 1902, following the failure of the Teachers' Federation to gain consideration from the school board. As the board insisted that it had no money to pay a "living wage," the teachers investigated city finances, and found that many wealthy corporations had been evading taxes due to the city. In the struggle to force the payment of taxes the teachers received aid from organized labour. Then, at the invitation of the Chicago Federation of Labor, the teachers affiliated with that body. In 1916 the Board of Education dismissed those teachers who had been prominent in trade union activity. In order that these teachers might be reappointed, the union withdrew from the city Federation of Labor. In 1914 the teachers of Cleveland voted to affiliate with the American Federation of Labor, but were prevented by the Board of Education. In 1916 teachers' unions in a number of cities united to form the American Federation of Teachers and affiliated with the American Federation of Labor, but forbade recourse to strikes. The official publication is the *American Teacher*. The first trade union of librarians in the United States was formed in New York City, in 1917, to demand salary increases and a regular system of promotions. In 1918 the Boston Library Employees' Union was organized and affiliated with the American Federation of Labor. Union organizers were active without success at the 1919 and 1920 conventions of the American Librarians' Association.

Trade Agreements.—The economic strength of trade unions is crystallized in trade agreements. Such expression of a joint partnership of Capital and Labour to stabilize industry on the basis of an accepted law is typical of the American labour movement. The earliest national agreement in the United States was that of the iron puddlers in 1866. A national agreement of the stove moulders established in 1891, providing for peaceful adjustment of disputes which might arise, continues in force. In 1897 a general strike in the central competitive district of the bituminous coal-mining industry led to an agreement between the operators and the United Mine Workers' Union. In 1902 the president of the union refused to join in a sympathetic strike on behalf of the anthracite strikers because such action would be disloyal to the agreement. For more than 20 years the International Typographical Union had been arbitrating disputes with the publishers of newspapers. At the convention of the National Publishers' Association in 1900, three publishers were chosen as a committee to deal with labour, to represent, however, not the whole convention, but only those employers who had favoured the measure. Contracts between individual employers and the union had been made prior to this time. This committee effected an agreement with the Typographical Union, to be in force from May 1901 to May 1902, which provided for local boards of three persons, one to represent the publisher, one the union, and the third to be chosen by these two. The board was to decide all disputes in its territory, the *status quo* to prevail until an award should be made. If either party should be dissatisfied with the decision, appeal might be taken to a national board, composed of the publishers' labour committee and the president of the Typographical Union. If they failed to agree, an impartial person was called in. A majority decision was then binding on both parties. In 1902 the agreement was renewed for a five-year period, and again in 1907, revised to

eliminate the impartial person from the adjustment boards, and to reorganize the final arbitration board to consist of three members of the employers' committee and three from the executive council of the union. By the end of 1912 the American Newspaper Publishers' Association had in operation a total of 416 individual arbitration contracts: 217 with the Typographical Union, 108 with stenographers' unions, 47 with mailers' unions and 44 with photo-engravers' unions. A fourth national agreement, 1912-7, made local settlements compulsory, since the business of the national board had been impeded by the number of the cases. In 1917 the agreement was renewed until 1922.

In the book and job printing industry the development of central government in 1919 added new features. Cooperating to preserve industrial peace there are four groups of closed-shop employers, united in a national association, and five trade unions, centralized for concerted action in the International Albed Printing Trades Association. In Feb. 1919 representatives of both sides met to discuss cooperation. In April they agreed upon a draft of an International Joint Conference Council, international since Canadian publishing companies were included. The Council was composed of four trade unionists and eight employers; each union representative had two votes. There was no impartial member, two joint chairmen sitting together—a trade-union president and an employer. Meetings were to be held usually every other month, in different places. Resolutions were to be passed unanimously by the Council and accepted by all the organizations represented, after which they were to become law for all member shops in the United States and Canada. Enforcement was left to the executives of the individual organizations. The Council drafted an arbitration code to be used by the members. The Council itself did not settle disputes. Its work has been to give its approval to a general labour policy, expressed as "five cardinal points." It adopted for its slogan "Stabilization and Standardization." The agreement provided that wages should be reviewed semi-annually, should be based on the cost of living and the economic conditions of the industry, to provide at least a living wage, also that employers should introduce a uniform system of cost-keeping, and that voluntary agreements should take the place of strikes and lock-outs. Economic conditions in the industry and cost of living having been determined by scientific investigation, the actual fixing of wages was left to bargaining between the two parties. The unions agreed not to work for employers who did not operate their business under the standard cost-keeping clause, and the employers agreed to employ only union labour. In March 1921 employing printers not members of the Joint Conference Council formed the 48-Hour League of America and called for the abolition of the Council.

Perhaps the most remarkable change brought into any industry by trade union efforts is in the clothing industry, where "sweated" workers have been able to build up a system of industrial government respected by their employers. In Nov. 1909 discrimination against union members by employers led to a general strike of the shirt-waist makers of New York. More than 25,000 girls walked out. Other grievances were: the long overtime worked in the rush seasons, followed by long periods of unemployment; low wages, fines, and subcontracting. The employers formed themselves into a Mutual Protective Association. The police prevented picketing. This aroused public interest in favour of the strikers. The employers individually came to settlement with the girls. The workers gained better conditions, and the principle was inaugurated of adjustment of grievances between employer and representatives of the workers. During the same month, Feb. 1910, which marked the conclusion of this strike, 7,000 shirt-waist makers in Philadelphia struck for concessions similar to those secured in New York. The strike was short; the chief result was a plan for settlement of difficulties by adjustment in the shop, or by appeal to a permanent arbitration board of representatives of the union, the employer and the general public, and a promise not to discriminate against union members. The wage scale was to be fixed for each shop by a committee of that shop.

In July 1910 the cloak and suit makers struck in New York City, 45,000 strong. Their grievances were low wages, the system of subcontracting by which a few of the employees received wages from the employer directly, and engaged their own helpers, whom they "sweated" for a pittance. The strikers also demanded a 49-hour week with double pay for overtime, the installation of power sewing machines, and the closed shop. This last point was the most strongly contested by the employers. Finally a conference was held, with Louis D. Brandeis as chairman. He urged that the strikers modify their demand for the closed shop to one for the "preferential union shop." After some further dispute an agreement on this basis was signed in Sept., which also pronounced in favour of the abolition of home work and subcontracting. But the most notable feature of the agreement was the provision known as the "protocol," which established three joint boards to administer labour conditions in the future. The Board of Grievances, of two representatives from each side, was to take up differences of opinion between employers and employees, and to settle any disputes which might arise. Disputes which could not be settled in this way were to be carried to the Arbitration Board, made up of one representative from each side and an impartial member. The Board of Sanitary

Control consisted of two representatives of the employers, two of the union and one for the public, this impartial member to be appointed by counsel for the two sides. This board determined a standard of sanitation for the shops. "Health strikes" to enforce the findings of the Board were permitted in shops remaining in any condition condemned. These three boards were financed jointly by the employers and the union.

In Oct. of the same year (1910) the men's clothing workers struck in Chicago, to demand shorter hours and higher wages and some method of adjusting grievances. After 19 weeks the strikers, beaten, went back to work but the important firm of clothing manufacturers, Hart, Schaffner & Marx, made an agreement with their employees which established a permanent arbitration board of one representative from each side. There was no impartial member until one year later, when a Trade Board of 11 members was instituted to settle the minor matters which were impeding the work of the Arbitration Board. The impartial chairman of the new board also presided at the old. A third part of the machinery was composed of the individual shop committees which met with the labour managers (employers' representatives) to try to smooth out grievances before bringing them to the Trade Board. In 1913, when the agreement was renewed, provision for the preferential union shop was added.

In Jan. 1913 several trades of the ladies' garment workers struck and secured an extension of the protocol plan to cover a larger number of the trades. A strike in Boston led to its introduction there. The Joint Board of Sanitary Control was extended to cover other ladies' garment workers and also the fur workers of New York. Medical supervision features were added, with individual examinations and preventive work. Early in Jan. the men's garment workers of New York also struck. The president of the United Garment Workers' Union submitted the dispute to arbitration. Many of the members were dissatisfied, and a plan was made to put a new union leader in office at the next national election. When the convention met in 1914, many of the more aggressive delegates found themselves debarred by the committee on credentials. The insurgents retired to another building, held a rival convention and elected officers. The union membership throughout the country was divided in its allegiance to the two groups of national officers, the overall and union label shops clinging to the old leadership, but the mass of the men's and boys' clothing workers acknowledging the new, although for this they were branded as "secessionists" by the American Federation of Labor. During a strike at this time in Baltimore the cutters remained subordinate to the old leaders, the tailors were led by the new, who managed to continue the strike to victory, although without strike funds. The new leaders then organized their forces throughout the country under the new name Amalgamated Clothing Workers of America. This organization, while retaining the craft divisions, adopted industrial unionism as its working principle. The preamble stressed the aggressive character of the new union and the part it hoped to play in the "class struggle"; also the importance of education of the members.

In 1915 the new organization carried on and won two general strikes: a short one in New York, and one of four months' duration in Chicago, which cost the union over \$40,000, and was finally lost through exhaustion. But the spirit of the workers was not broken. The year 1916 was marked by disputes in the clothing trades throughout the country. In New York the Manufacturers' Association abrogated the protocol in the cloak and suit trade. After a two months' lock-out and a general strike of 60,000 workers an agreement was made according to which grievances were to be adjusted by direct negotiation between union and employer. The Joint Board of Sanitary Control continued through the period of the strike. Protocols were established in the garment trades in Boston and Philadelphia. The Board of Standards of the dress and waist trade opened a test shop to time and standardize the operations.

In 1917 the Amalgamated Clothing Workers of America led other unions in establishing the 48-hour week by strikes in the different clothing centres. In 1918 they led with the 44-hour week. At the same time the industry in New York adopted an agreement for industrial government similar to that which had been introduced by Hart, Schaffner & Marx in 1910. In Feb. an impartial chairman took up his post. Studies were undertaken by both the union and the employers' association to ascertain the changes in the cost of living relative to wage increases, and an award was made of wage increases varying from 10% to 12.5%. Introduction of the 44-hour week followed in the other clothing centres. The financing of the New York strike by the union, except for contributions of \$11,000, was viewed as a notable achievement for workers who until recently had been "sweated" and ill paid. Other firms in Chicago followed the example of Hart, Schaffner & Marx, and similar arbitration agreements were introduced also in the clothing centres of Baltimore, Boston, Rochester, Montreal and Toronto. An attempt of the A C W A to organize Cincinnati was as bitterly opposed by the old union as by the employers. In Rochester and Chicago, where the work is done in factories, the agreements still held in May 1921. But in New York and Boston, where most of the work is let out to contractors, the impartial machinery broke down in the autumn of 1920, it could not weather the period of industrial depression. The union in New York then went on strike to force the reinstatement of arbitration machinery. By the end of March 1921 the locals of

the A.C.W.A. had raised \$930,244.54 toward the strike fund. The contribution plan was renewed July 1921.

In the spring of 1919 during a strike in Lawrence, Mass., the amalgamated Textile Workers of America were organized. A solution of the executive board in April 1920 to affiliate with the amalgamated Clothing Workers was favourably received by the latter in their convention in May. The constitutions of the two organizations are similar. The membership of the A.T.W. in Jan. 1921 was 40,000; that of the A.C.W.A. 200,000. In 1920 the Amalgamated Clothing Workers and the Ladies' Garment Workers were drawing together and affiliation was discussed.

Shop Unions.—In recent years some employers have offered substitutes for trade agreements with organized labour. The Colorado Fuel & Iron Co. recognized committees of its employees as a part of the welfare plan of 1915. In 1918 the Standard Oil Co. introduced a system of conferences with representatives elected by its employees. Committees on health, safety, sanitation and housing were formed, and individuals might present grievances through their representatives. By the summer of 1919, 160 companies in the United States had shop committees in their plants. In some plants elaborate industrial governments have been developed, the best known are those in the Filene store in Boston and the watch plant named after its originator, John Leitch of Philadelphia, and modelled on the checks and balances of the U.S. Government. Some employers associate the workers with themselves by profit-sharing and bonus plans. Others offer a "forum" in which workers may meet with the managers to discuss the problems of the business. One firm expressed the hope that the purchase of stock by employees would save it from the dictatorship of absentee financial control.

In 1918 the attention of managers was called to the high cost of the labour turnover. Employment departments were instituted in the course of placing and training the worker and securing his honest effort in production, and in organizing the working force or the safety movement, the science of personal management has been evolving. Persuasion takes the place of coercion or bargaining. The old "scientific management" introduced in 1911 by Frederick W. Taylor, an engineer connected with the Midvale and later with the Bethlehem Steel Co., looked upon the individual worker as a producing machine, effort to increase earning power was the only human reaction expected from him. The new scientific management obtains production through group action, by a general consensus of opinion in the shop. The labour problem is no longer left solely to the production engineer, who has been trained to deal with the forces of nature, but is given to a new official, a psychologist, the labour manager. The labour department is not responsible for getting out the product, but for building up a permanent and dependable labour force.

Criminal Unionsists.—On Oct. 1 1910 the office of the Los Angeles Times was blown up and 21 people were killed. On the same night bombs were found in the homes of the publisher of the Times and of the secretary of the Merchants' and Manufacturers' Association. On Dec. 25 the Llewellyn Iron-Works, also at Los Angeles, were dynamited. In May 1911 William J. Burns, a detective, secured the arrest, in Indianapolis, of John McNamara, secretary of the International Association of Bridge and Structural Iron Workers, his brother James, and Orrie McManigal. The men were taken to Los Angeles, where they were found to be responsible for these and other dynamite outrages in various parts of the country. McManigal confessed to dynamite plots involving also the McNamaras and others, and the brothers pleaded guilty to blowing up the Times building and the iron-works. The criminals were formally repudiated by the American Federation of Labor. An investigation by a Federal grand jury of the dynamite plots led to the indictment of 54 men, many of them officers of the Bridge and Structural Iron Workers. They were tried and 38 were found guilty. Burns was arrested for kidnapping, but acquitted. In June 1916 14 business agents of the Painters' and Electrical Workers' unions of Chicago were found guilty of extortion. The evidence showed that contractors and merchants had been compelled to pay sums ranging from \$50 to \$200 under the threat of damage to their property. In Nov. 1920 an investigation into the high cost of building in New York City brought to light a conspiracy among dealers in material, building contractors, bankers and labour bosses to keep up the bids for construction work. The labour leader implicated and convicted was President Brindell of the Building Trades Council.

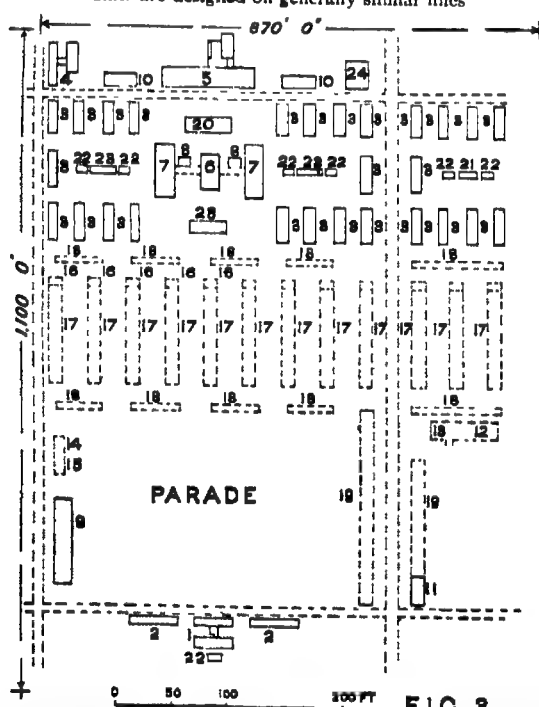

The Industrial Workers of the World, commonly spoken of as the I.W.W., were organized in June 1905 at a convention in Chicago of 203 persons, representing over 40 groups in the working classes. Among the sponsors were the leaders of the Western Federation of Miners, the remnants of the American Labor Union (made up of workers from different industries, but chiefly railwaymen), and the Socialist Trade and Labor Alliance, known to be the economic arm of the Socialist Labor party. The originators of the new association felt that a labour union based on craft autonomy, such as the American Federation of Labor, could not succeed in the struggle of the workers against capital. For success, "one big union," the industrial workers massed in a single army, was felt to be necessary. Moreover, it was thought advisable to get the working class organized beforehand and accustomed to working together in "the same groups and departments and industries that the workers would

assume in the working-class administration of the Coöperative Commonwealth." The aim of the new organization, as intended by the founders, was first to provide a new central body in which the existing trade unions, consolidated into industrial unions, could be associated; and second, to organize and add to this nucleus the great mass of the unorganized, unskilled and migratory labourers. The philosophy of the movement, as expressed in the constitution adopted, was that "the working class and the employing class have nothing in common, there can be no peace so long as hunger and want are found among millions of working people and the few who make up the employing class have all the good things of life"; the wages system must be abolished, and the capitalist form of society must become extinct. This was to be accomplished by direct action; the final solution of the class struggle would be by the "social general strike," when the toilers would "take and hold" that which they produce by their labour. "There is but one bargain that the I.W.W. will make with the employing class—complete surrender of all control of industry to the organized workers." Some of the leaders insisted that political action should be discouraged as useless. This led to the split, in 1908, between the western, or direct-action faction, known as the Chicago branch, and the parliamentary or doctrinaire group, represented by the Socialist Trade and Labor Alliance, led by Daniel De Leon of New York, which became known as the "Detroit Branch," until in 1915 it took the name of Workers' International Industrial Union. Its official publications are *The Weekly People*, *Industrial Union News*, and *The Socialist*. The Chicago direct-action branch, exclusively claiming the name Industrial Workers of the World, was led by W. D. Haywood. After being sentenced to prison (see below) Haywood fled to Russia in April 1921, leaving the office in Chicago in charge of Roy Brown. Their organs are *One Big Union Monthly*, *New Solidarity*, both published in Chicago, and *The Industrial Worker*, Seattle. Before 1917 they published seven papers in foreign languages. After the war the organization issued 19 publications in 13 languages. The I.W.W. have amended their original constitution to omit the clause calling for political action. At its origin the I.W.W. spoke hopefully of sweeping the working class into its ranks, at the end of its first year it had a paid-up membership of 14,000, in 1907, before the split, of less than half that number, in 1912 the Chicago branch reported 18,387; in 1913 14,851; in Jan. 1917 60,000, on Oct. 1 1919 100,000. The general office had issued 500,000 membership cards to that date. One department, the Agricultural Workers' Union, reported 18,000 members enrolled between April 1915 and Nov. 1916. The turnover between 1905 and 1915 was very high, both as regards members and local unions. In 1915 7.5% of the enrolment had remained in active membership. By 1918 only one-fifth of the number of locals which had been chartered were in existence. The greatest loss was in 1907 when the Western Federation of Miners left the I.W.W. In 1911 it affiliated with the American Federation of Labor, and in 1916 became the Mine, Mill and Smelter Workers' International Union.

The I.W.W. claimed leadership in the McKees Rocks, Pa., strike in 1909, and in the "free speech fights" at Spokane, Wash., and Fresno, Cal., in 1909, San Diego, Cal., in 1910, and Everett, Wash., in 1916. In 1907 the leaders Haywood, Moyer and Pettibone were accused of the murder of the ex-governor of Idaho, they were arrested in Colorado without warrant, carried to Idaho, imprisoned and finally tried. They were acquitted. In 1912 the I.W.W. leaders helped carry on strikes at Lawrence, Mass., and at Paterson, N.J. (see STRIKES AND LOCK-OUTS). They were active among the lumbermen in Louisiana. In 1914 they organized the migratory labourers in the harvest-fields, lumber workers, miners and construction workers. In the spring of 1917 the lumbermen of the extreme north-west struck; soldiers rounded up the pickets and threw them into a stockade. By July 50,000 lumbermen were on strike, demanding an eight-hour day and better housing. The I.W.W. were considered responsible for trouble among the miners in Arizona in the summer of 1917 (see STRIKES AND LOCK-OUTS). On Sept. 5 1917 I.W.W. offices throughout the country were raided by the Department of Justice, and their property seized. A few days later most of the officials were arrested. The grand jury in Chicago indicted 166 members for conspiracy to interfere with the nation's war programme. Over 1,000 members were arrested; aliens among them were held for deportation. At the trial in Chicago in Aug. 1918 97 of the accused were industrial workers, four were journalists and organizers. Ninety-eight were pronounced guilty, and 93 were sentenced to imprisonment of from 10 days to 20 years. Haywood received 20 years' imprisonment and a fine of \$10,000. He appealed, and was released on bail. The sentence was confirmed by the U.S. Supreme Court in April 1921, but, as stated, Haywood had escaped to Russia. At about the same time 46 reputed members of the I.W.W. were arrested in California under the Espionage Act. Others were added to their number. The indictment was added to six times. The defendants believed that the trial was a mere formality, and sat silent throughout the proceedings without offering a defence. They were found guilty and severe sentences were passed. Five of the defendants died in jail. In 1917 the lumber workers substituted "sabotage" for strikes. They would work for eight hours and then quit in a body. If anyone was discharged the whole crew quit. In Nov. 1917 the Construction Workers, an international union of the I.W.W., attempted to hold a convention in Omaha; all attending

comfort and shelter during the waking hours, while for sleeping purposes it was thought that, even in winter, tents would be sufficient, leaving the sleeping huts to be built at leisure. Had this scheme been carried out (and afterwards it was found that tents, in winter, for sleeping would not have been impracticable) it might have been quite possible to have housed with a fair amount of comfort the large armies then being raised, taking into account the limited time and materials and labour available. Unfortunately, as it turned out, this compromise was not sanctioned. The rapidity with which the first large hutted camp was erected may have raised a hope that the same rate of progress would have been maintained; but that first camp had, of course, very special advantages in that large supplies of material, especially corrugated steel sheets, were available, and labour difficulties were negligible, factors which later were not to be relied upon. Accordingly, orders were issued to construct living huts as well as the others, and the attempt to do this in the short season available was a failure. Nevertheless, in some of the first camps it was accomplished. At Belton Park at Grantham, a camp for 12,000 infantry, begun on Aug 24 1914, was occupied on Nov 3, less than three months from the start, a result which may be compared with the case of the Curragh in 1855-7 where three years were required for a less number of troops.

Reverting again to the typical plan, it will be seen that the officers' quarters and mess are divided from the men's huts by a small parade ground, flanked on either side by administrative buildings. Also that among the central accessory buildings are dining-rooms, baths, and drying-rooms, with a large "regimental institute." These are features which were unknown in the early hutted camps, and are the result of greater civilization and attention to the soldier's improved position. Baths are, moreover, a hygienic necessity and the value of these was insisted upon from the outset. In some of the later hutted camps the dining-rooms were omitted, but the saving effected was hardly commensurate with the disadvantages. Drying-rooms were very useful, for frequently the men's clothing got soaked by rain, but there were difficulties in the practical use of them, and they were not always repeated. Fig 2 shows an alternative arrangement for an infantry battalion camp. Fig 3 shows the grouping of typical huts in the case of a field artillery unit. Other units are designed on generally similar lines.

 24. Coal Yard, Dung Pits, Water Troughs

(C) *Grouping of Unit Hutmments*—The grouping of such unit hutmments as have just been described, into a divisional camp or

cantonment, can but be considered in taking an actual case, viz. that of Hipswell camp, the northerly half of the large cantonment of Catterick, near Richmond in Yorkshire. The site was not selected until Dec 1914; some experience had, therefore, been gained in the matter of grouping. In examining this plan (fig. 4) it must be borne in mind that immediately to the S.E. of it lies another divisional camp. Thus the hospital, post-office, power station, army ordnance store sheds, banks, etc., which in the plan appear to be at one corner, are really in the centre between the two divisions. There are 12 infantry battalion hutmments, marked A to L. In the actual lay-out there is some irregularity owing to the ground, no attempt being made to preserve a rigid formality of plan which would only be symmetrical on paper, but would necessitate great extra expense in foundations, etc. Yet in each case the broad principles enunciated above as to general grouping have been maintained. It will be observed that branch lines of railway approach each hutmment, and each has access to a main road. The engineers and pioneers are near the outer flank of the cantonment, close to ground used for field entrenchments. Between them and the first infantry brigade (A to C) are the field artillery brigades, while the administrative troops are on the extreme N.W. flank. It may be added that the main training ground, rifle ranges, etc., lie on the W side of the camp. The general slope of the land is from N to S. towards the brook passing the power station and hospital.

(D) *Accessory Services*—The accessory services are (i.) Hospital, (ii.) Roads and Railways, (iii.) Water Supply, (iv.) Lighting, (v.) Refuse Disposal and Sewage.

(i.) *Hospital*—For a large cantonment, a hospital of 600 beds, with an isolation hospital for infectious complaints, is needed. In the theatre of war, this number was of course largely exceeded, and there the unit of each general hospital was 1,000 beds, base hospitals being frequently groups of 10 or more such units. The principles of design, however, are the same, and although in matters of construction detail there may be differences, the following general description is of universal application. Fig. 5 shows the

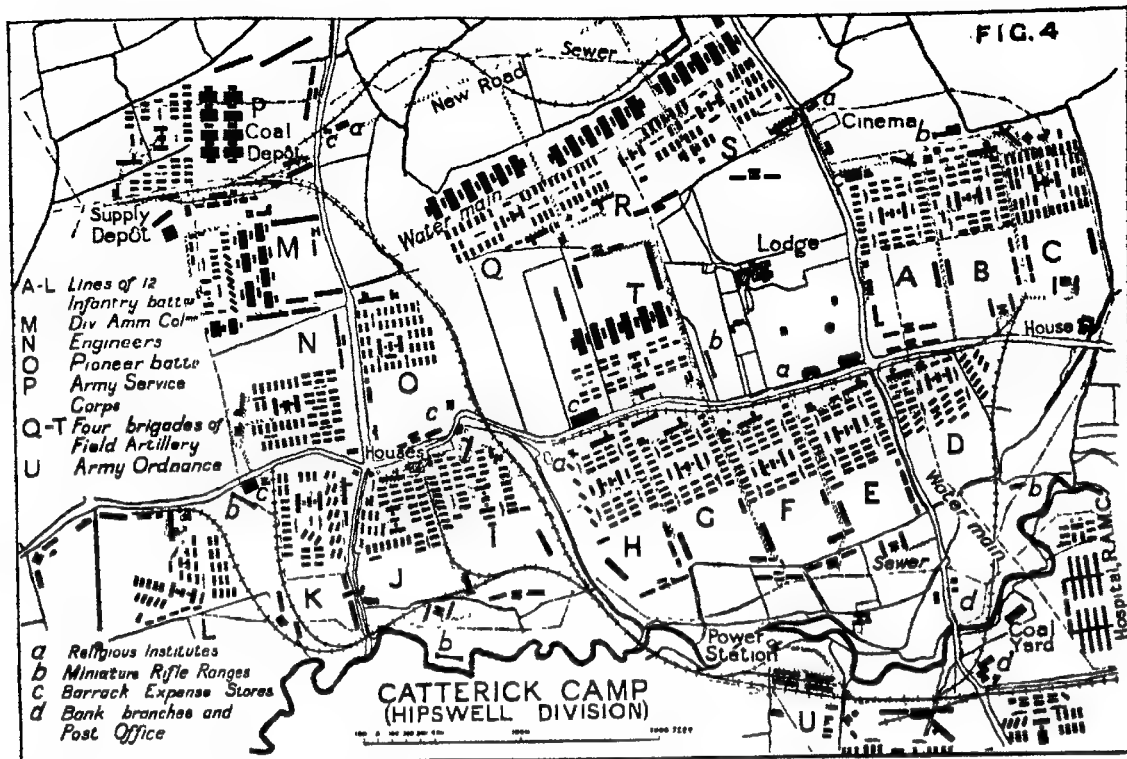

- 1 Mortuary, etc. 2 Pack Store 3. Disinfecting Block 4 Hospital Supply Department. 5. Dining-room. 6. Kitchen Block 7. Operation Block. 8 Administration Block.

lay-out of a camp hospital, considered as a type. In front on one side are the mess and officers' quarters, on the other side the accommodation for the nursing sisters. Both these are arranged so as to be separate from the hospital itself, though sufficiently near for all practical purposes. It was subsequently found desirable to surround the nurses' quarters with a high fence on the hospital side so as to ensure greater privacy. In front of the main hospital enclosure is the administration block and behind it the operation room. In some of the field hospitals this building was the centre of a series of wards radiating out from it. Groups of wards, in the type figure, are on either side, and in most hutted camps, in England, these were connected with the operating rooms and administration block by covered passages. The kitchen and dining-rooms and supply stores occupy a central position behind the operating room, and the quarters of the hospital orderlies are beyond. The isolation wards are in any convenient position not too far away from the main buildings.

At the later stages of the war, when the number of sick and wounded increased, it was found that 24 or 25 beds were too few, and much larger wards were designed, but the same general arrangement was continued.

(ii) *Roads and Railways*.—The ordinary roads of the country where a large hutted camp is situated, will soon be found inadequate for the constant heavy traffic entailed by the occupation, and additional roads will be necessitated. This will be evident from the plan of Hipswell Camp. Consequently early steps must be taken to provide roads of the best construction, preferably concrete 20 ft.

to 30 ft wide with asphalt surface. Many small bridges will have to be reconstructed. Maintenance of such roads will have to be kept in view. In each unit camp plank paths ("duck boards") will be necessary from the very first, from every hut, otherwise the whole place will become a quagmire.

Railway lines should be laid into every group of hutments (see plan of Hipswell Camp, fig 4) and there should be a branch leading to a main line. The gradients should not exceed 1 in 50 and the curves 600' radius at a minimum. The construction of these camp lines was, in some cases where the sites had been hurriedly chosen, a matter of very serious difficulty.

(iii.) *Water Supply*.—At Catterick Camp the water was obtained from the river Swale in a valley with steep banks about a mile above Richmond. It was conducted by gravity from a deep pool in the river to a pumping station where, after settling in suitable tanks, it was pumped up to two tanks holding in all one million gallons, where the water was chlorinated. From this position, which is sufficiently elevated from the general level of the cantonment to command all parts by gravity, a 10 in. main leads along the main line of railway, and branches are taken off to each unit camp. A subsidiary storage tank of 100,000 gals. at the S.E. end of the cantonment, about two and a half miles from the main tanks, provides against any inconvenience caused by a temporary breakdown.

(iv.) *Lighting*.—This subject was very carefully considered in the early days of the war and it was decided that electric light would be the safest and best, and by using aerial transmission lines supported on simple poles, it would be as inexpensive as any other form. A scale of lighting for various buildings was then carefully drawn up, upon which the whole system for any grouping of units was easily calculated. In almost every case of a large hutted camp the installation had to be provided *de novo*, for municipal supply was insufficient to enable the current to be brought from the local installation of some adjacent town. A power station was then designed at some central spot and preferably near a stream where water for boilers and for construction tanks could be easily obtained. From this central station transmission lines radiated to various hutments. Occasionally, and especially in camps (those for 1,000 men or less), gas from an adjacent town supply was used.

(v.) *Refuse Disposal and Sewage*.—This subject presented difficulty owing to faulty selection of sites in some cases. For comparatively small camps the removal of solid matter was possible by cartage and incineration; there being several patterns of destructor in the market, it was only a question of erecting one or more in suitable places, and arranging for a regular system of conservancy. But with large bodies of men, 20,000 and upwards, this became very difficult, and in the larger cantonments a regular system of water-borne sewage was adopted. Here, again, cooperation with local bodies was tried as far as possible, but generally the task was too

great for town sewers (e.g. at Ripon, a town of 9,000 pop., the addition of 42,000 men and 10,000 horses was far too great for the efficient use of the town sewers, and a separate purification plant had to be devised for the camp with an elaborate network of sewers). The sewerage system for the Hipswell Camp is indicated on the plan (fig 4), as far as the hospital, beyond which point the main sewer is joined by the sewer from the other division (Scotton) and together the main sewer, now 18" in diameter, proceeds some two miles to the disposal works.

In any case some disposal works are necessary in every camp for the treatment of liquid sullage from lavatories, kitchens, etc. This sullage water is often very foul and had to be carefully filtered—either in primary and secondary contact filter beds, or according to some other recognized method of sanitary engineering.

Other refuse from the camps can be dealt with by some simple form of refuse destructor.

Organization of Constructing Hutted Camps.—The system of organization in America is that each department of engineering has a separate and independent charge, one department doing all the surveys, another the building, another the water supply, and so on. In England the system was that, while the War Office technical staff supplied the type plans, the authorized rules for quantities of water, electric light, etc., the general approval of the order of urgency and of lay-out, and the selection of the contractor who executed the work, the whole of the local work was entrusted to an experienced senior Engineer officer. He had sub-departments under him for roads, railways, water, electricity, sewage, but he was entirely responsible for coordinating their work and for the local application of materials. The actual execution was almost invariably in the hands of a large firm of contractors who worked on a system of cost plus percentage (which has certain defects but which can be worked well on a competitive system). The superintending officer had authority to give instructions to the contractor, and was responsible for the supervision of his work and for regular and periodical payment. The system worked well and expeditiously.

As regards materials, although some of the earlier camps had their walls built of corrugated steel on wooden framing, this material was rapidly exhausted, and the subsequent substitution of timber boarding caused such a famine of all sorts of scantlings and planks that every effort was made to use some other method. Light steel framing filled in with concrete vertical slabs was used with success, and framework with expanded metal plastered over was also used. Both these methods had the advantage of giving employment to such trades as bricklayers and plasterers, and thus not being so entirely dependent on carpenters.

Roofs were for the most part covered with one or another of the many waterproof felts in the market. In some cases corrugated steel sheets were used and a few hutted hospitals were roofed with

slates. Floors were in most cases of planking, tongued and grooved, or otherwise rendered impervious to air from below, though in some camps this precaution was omitted, to the great discomfort of the men. In some camps concrete and asphalt floors were used with good result. The interior fittings of the huts, such as pegs and shelves, were very few. Fire buckets and screens to surround and isolate a burning hut were provided, but as a matter of fact, fires were remarkably few, notwithstanding the fact that the huts were heated by stoves. Ventilation was given by large louvred openings in each gable of the hut, and strict orders were issued that two of the windows also should be kept open at all times when the hut was in full occupation.

The cost of the camps amounted to between £20 and £30 per man, all building and engineering services whatsoever being included. The average may be taken at £23. After the war most of the materials were disposed of, in some cases at a profit. Many of the huts were easily adapted at small expense into comfortable cottages of four or five rooms.

Miscellaneous Huts other than for Troops—In addition to the hatted camps for brigades, divisions, etc., as above described, there were similar cantonments for (i.) Remount depots, (ii.) Ordnance stores, (iii.) Munition workers, and (iv.) Aerodromes, which deserve some brief description. The broad principles of lay-out and details of construction are of course similar.

(i) *Remount depots* to accommodate from 5,000 to 10,000 horses were constructed in England at or near important seaports. The personnel amounted to 1,500 to 2,000 of all ranks whose accommodation was, of course, on the same lines as that already described. The other buildings were stables, offices, forage barns, granaries, veterinary hospitals, as well as power-house, water supply, etc. The stables were open shelters with a longitudinal central wall fitted with mangers on either side and with hanging bails 5 ft. apart, supported on the outer side on pillars which carried the roof. It was most desirable to have mangers, bails, posts, etc., all of iron, as the animals were continually gnawing anything of wood. The best floors were of concrete, with a slight slope to the rear—but in France, where there were many remount depots, rough planking, sleepers or half logs made very satisfactory flooring. A very essential matter was the prevention of cold draughts, and for this purpose either the stables were built close together to shelter each other (fig. 6) or a wind screen was erected outside (fig. 7). In the early days of the

FIG. 6

war the S. African plan of having about an acre of land fenced in round each group of stables for 50 horses, was tried, but it was found that in the moist climate of the British Isles the ground soon became a quagmire, and the area required was enormous. Later, therefore, the stables were built in parallel lines near one another, a better arrangement for administration and good enough for exercising the animals. The veterinary stables were on much the same principle as the ordinary ones, but there were some loose boxes provided with slings for special cases. A horse bath, i.e. a narrow concrete tank with a sudden drop under water at the entering side and a ramp out on the far side, was a most useful adjunct in the veterinary lines, and indispensable in the case of skin complaints.

(ii.) *Ordnance Store Depots* were numerous on lines of communication in France, and in connexion with munition collecting centres in England. The largest of these was at Didcot, close to a railway junction. The depot was divided into two main sections, one for ammunition, the other for ordinary stores. The former had to be at some distance from other buildings, was fenced in and guarded by sentries, and the interior space was divided up so that certain buildings were allotted to different classes of ammunition (shells, small arms, cartridges, etc.) under magazine regulations. The buildings were of a fairly substantial character, well ventilated and

lighted, and where necessary, furnished with transporting gear and lifting tackle. The ordinary store buildings consisted of a double line of large steel framed and walled sheds, 400 ft. by 40 ft. in each case, spaced sufficiently far apart to admit between them laterally a double line of rails, so that wagons could be unloaded at one shed, while the other line was open, and on the side of the sheds farthest from the rails there was a metalled road for heavy motor lorries. The floor of each shed should be on a level with the floor of railway trucks, and there should be an outside verandah to the shed, so that

FIG. 7

trucks can be unloaded under shelter. The distance between sheds longitudinally should be sufficient to allow for cross-over lines from one railway line to the other. As protection from fire is of urgent importance there should be a girdle of fire mains all round the sheds, and an ample supply of water. There are a few other groups of buildings, e.g. offices, workshops and open vehicle sheds, but these require no special description.

(iii) *Hutments for Munition Workers*.—For male workmen and employees the general lines of provision are the same as for soldiers, but with the coming of women into the field of labour, special provision was needed. One of the best arranged works had its women's colony situated on attractive and healthy ground about two miles from the works, the workers being sent to and fro by a light railway, and the special provision at the actual works being limited to dining-rooms and lavatories. At the colony headquarters the huts, which were made as attractive as possible with furniture well chosen, with flower beds and grass lawns surrounding them, consisted of two main groups, viz. the dormitories and the recreation huts. The former were double-storied wooden huts, about 25 ft. span, with a central passage, from which opened on either side little cubicles, about 8 ft. square, the partitions being about 7 ft. high. At the end of the central corridor were the lavatories and baths. Outside were water-closets. The number of women in each block was about 60. The recreation blocks consisted of dining rooms and kitchens in one block and a recreation and games room in the other, where also were the rooms of the lady superintendent.

(iv.) *Aerodromes*.—The accommodation for officers and men corresponded to that of infantry. The aerodrome sheds were sited at the end of the landing ground, a certain portion near the sheds being paved with concrete, asphalt or, in some cases in France, with rough planking. At first, the doors of the aeroplane sheds opened at the sides of the shed, a structural defect which became more accentuated as the demand for wider opening became greater. A fresh design of aeroplane shed, therefore, which gave doors at each end of a large shed, the span in some cases being as much as 100 ft., and the height of the shed 30 ft. to 35 ft., was made out, and all the later aeroplane sheds were built accordingly. Behind the aeroplane sheds were small workshops for minor repairs, and a cellar for the boilers required to heat the piping for maintaining a temperature in winter suitable for the various aeroplanes. Adjacent to the great sheds, but on the other side of a metalled road (for motor lorries) were workshops, lorry sheds, stores for spare parts, ordinary store houses, and power plant. Of these the only special one was for doping aeroplane wings, the poisonous fumes from which necessitated very special ventilation by means of fans. All the above were required in ordinary cases, but special designs had to be made in certain aerodromes used for experimental or other purposes; these however need not be detailed here.

Generally speaking it may be said that the requirements of aviation gave rise to a number of new constructive problems in connexion with hutting, but none of these proved to be insurmountable.

Although the arrangements in the theatre of war followed the above in general design, there were obvious local modifications. In the case of ammunition dumps, for instance, the buildings contained limited quantities of different classes of ammunition, and

were constructed with very strong roofs, covered with sand bags or earth, and concealed as much as possible from aerial observation.

The following brief statistics of the Catterick Camp (Hipswell and Scotton divisions) may give an idea of the magnitude of such a task:—The total number of buildings for the two divisions was 2,700, and 240,000 tons of concrete were used. About three-quarters of the huts were of concrete slabs with steel framing, the remainder of frame work and expanded metal plastered. The central power station was of 1,000 kw. Overhead mains transmitted 3-phase current at 3,000 volts to transformers at each battalion hutment, hospital, etc. The lighting of each battalion was arranged in three separate circuits at 200 volts; there were about 12,500 lights and 300 H.P. of motors installed. The total length of high-tension main was about 15 m. and of low-tension circuit 50 miles. The water supply from the Swale was pumped 400 ft. from the river to the chlorinating tanks by electrically driven 120 H.P. centrifugal pumps, one of which could supply water for the whole camp for one day in six hours. The main pipes were 10 in. diminishing to 6 in. and were eight m. in length. There were 40 m. of branch pipes. The sewage outfall drains from 18 in. to 24 in. diameter were taken six miles to the treatment works. There was a complete system of surface drainage independent of the sewage system. The main camp roads totalled 22 m. and there were 70 m. of pathways. The average cost of each hut was £200 and of this 40% was for labour and 60% material. The total cost, including railways, electric installations, etc., was £1,250,000. (G. K. S. M.)

II. UNITED STATES

The presidents of the United States since Washington, almost without exception, had pointed out the need of a certain degree of preparedness in the way of a trained citizenry, arms and equipment, not only as an instrumentality for carrying out national policy at home but as a means of ensuring peace with other nations. Most of them recognized that lack of preparedness for national defence was in itself a temptation to aggressive and predatory nations. They also recognized that unorganized, unequipped, untrained, the United States could not hope to exercise that weight in the world's councils or in maintaining peace and international fair dealing, to which its position and importance entitled it. American politicians had often deliberately misled the people as to what could be done. The result was that, at the time when a world crisis was approaching which was in the end certain to involve the people of the United States, they were, in everything which related to preparedness for defence or to playing their part in the struggle for civilization, asleep. Lord Roberts had already sounded the clear note of warning to England, Kitchener had planned organized defences for the British colonies, but America, warlike yet un-military, was doing nothing to prepare for the storm. Impelled by an appreciation of the utter unpreparedness of the United States to meet promptly any military emergency arising from conflict with a first-class Power and by the general lack, not only of knowledge but of interest in the question of national preparedness on the part of the general public, and realizing that such interest could best be built up through the youth of the country, Maj.-Gen. Leonard Wood took up in 1913, as chief of staff of the army, with the Secretary of War, Lindley M. Garrison, the project of establishing certain training camps for duly qualified youth, and obtained his approval. This was the beginning of the Plattsburg idea. It was pushed forward by Gen. Wood in the following three years.

The 1913 camps were held at Gettysburg, Pa., and Monterey, Cal., and were made up principally of college students. The total number in camps was 244. They were known as Students' Military Instruction Camps. The young men who came were an unusually intelligent and earnest lot. Those at Gettysburg formed a permanent organization, which became known as the National Reserve Corps and had for its purpose the building up of a corps of reserve officers. The shield of the corps bore the words "Ready-Organized-Prepared" and its motto was "Striving for Peace but Ready for War." The results at Gettysburg and Monterey were such that these first camps attracted immediate and favourable recognition, and were the seeds from which sprang the Plattsburg camps. The question then presented itself, "Why should not the college and high-school students receive a training for national defence and learn that equality of privilege implies equality of obligation?" President Drinker of Lehigh University and Gen. Wood sent

out circular letters to the presidents of many American universities, inviting them to membership in an advisory committee. Those who at first joined the committee were President Drinker, and President Hibben of Princeton, who were respectively president and secretary of the committee; President Lowell of Harvard; Hadley of Yale; Hutchins of Michigan; Benjamin Ide Wheeler of California; Schurman of Cornell; James of the university of Illinois, as well as John J. Finley, commissioner of education, state of New York; and to these were added later the president of Williams College, the president of the university of Alabama, the rector of the Catholic University, Washington, D.C., and a number of others.

The following year, 1914, camps were established at Fort Ethan Allen, Burlington, Vt.; Asheville, N.C.; Ludington, Mich.; and Monterey, Cal. The total number in the different camps was 667. These aroused a gradually growing interest and the Department of War determined that four such camps should be established during the summer of 1915, at Chickamauga Park, Ga.; Plattsburg, N.Y.; Ludington, Mich.; and at the Presidio, San Francisco, Cal. These camps were even more successful than those which preceded them, and the number in attendance was very much larger. Three successful camps in three consecutive months were held at Plattsburg, and camps of a month each at the other designated training points. The total number of men who passed through the camps during this year was 3,406. The camps were no longer limited to students from colleges and high schools but were open to business men and to men from all walks of life who had the necessary physical qualifications. The educational qualifications were moderate, and lack of education was compensated for by initiative, as shown by success in life, the position the applicant held in his community, etc.; in other words, anything which showed sound qualities of leadership. Interest grew apace. There were recruiting committees at the various universities. The World War had broken out, and to all who looked ahead it was evident that America would sooner or later be drawn into the struggle. In 1916 over 16,000 men were passed through the camps. The Advisory Committee and the Students' Recruiting Committees of the various universities were influencing the general public, and the Military Training Association of the United States was formed for the purpose of increasing the attendance. As Plattsburg was the largest training centre, the camps, wherever held, began to be called "Plattsburg Camps," the idea of this intensive training being spoken of as the "Plattsburg Idea."

In 1917, applicants for the camps numbered about 130,000, and had the United States not gone into the war in the spring, well over 100,000 men would have been trained in these volunteer training camps. The men who came to these camps were from every walk of life: bishops, priests, clergymen, rabbis, men from the labour unions, farmers, policemen from neighbouring cities, business and professional men, youths from the colleges.

The outbreak of the World War in 1914 stimulated interest in the training. It must be remembered that the second series of camps, those of 1914, were coming to a close just before the war began. During the winters of 1915-6 and 1916-7 courses were opened in Boston, New York, Providence, Detroit, Pittsburgh, Philadelphia and other cities for the instruction and examination of applicants for reserve commissions, and through them were developed a large number of officers who played an important, indeed a vital, part in the training of the great war levies. Speaking of these camps, the chief of staff of the army, in his Annual Report for 1915, said:—

"The military camps of instruction for students of educational institutions which were held in 1913 and 1914 have been continued this year. As there were no funds available to meet any expenses incident to the establishment of these camps, it was necessary to have them at military posts where the ordinary utilities of the post could be used, or, if at a place other than a military post, the citizens had to incur the necessary expenses in constructing the camps. . . . The reports show that the results have fully justified the establishment of these camps. In addition to camps for students, camps have been authorized at Plattsburg, N.Y., Fort Sheridan, Ill., and San Francisco, Cal., for business men whose interest in the prepared-

fire, early man made a primitive boat by hollowing out the trunk of a tree, which, being shaped as experience has taught, formed the first point in the evolution of the ship. To harness the wind was a further stage, and the gaining of the art of navigation furthered the development of the sailing vessel.

On land, the animals natural to a country—the horse, the camel, the ass—have been employed as beasts of burden from early days. Chariots were in existence thousands of years before the Christian era, but the absence of good roads resulted in a very slow development of land transport.

Coming to Britain in the Middle Ages, we find water transport as the most important means of conveying goods; what little transport was effected on land was by means of pack-horses. Travellers and traders combined in armed companies for protection against marauding bands, and we see long lines of laden horses slowly progressing over tracks so narrow that the animals could seldom pass two abreast. The rolling of a log is supposed to have inspired the idea of the early wagon for transporting materials, and in the 16th century a heavy wagon with broad wheels on a rotating axle, and fixed front wheels, came into use. Its sphere of action was limited to local markets. Such organization as there was lay in the hands of the lord of the manor, who could call upon his tenants for the services of a specified number of wagons and wagoners. Better roads were required. Although the Romans, with their knowledge gained from the Etruscans, did construct many and great roads, organized road-making was practically non-existent from their time until the 16th century, when counties were made responsible for the upkeep of bridges, and parishes were ordered to appoint two road surveyors, who were assisted by compulsory labour. Passenger carriages came into vogue in 1550, but, being springless, had little pretension to comfort.

In 1634 the Sedan chair came into use, and in the same year the first hackney carriages were licensed. In 1650 waggons completed the journey from London to Dover in three or four days. About the same time, springless stagecoaches carrying passengers inside at a charge of five m. for 1s. and luggage at the back, were introduced. By reason of the condition of the roads their rate of travel was only four to five m. an hour; they seldom travelled in winter. In 1658 a coach made the journey from London to Edinburgh at a cost of 4s. per passenger, and was more than a fortnight on the way. The post-chaise system was now established. Wealthy people were able to hire horses for their carriages in relays at the various inns, or both the chaise and the horses. A journey from London to Scotland in this manner cost at least £30.

At the beginning of the 18th century, waggons were journeying with goods from London to Bristol, and we read that in 1776 waggons travelled from London to Edinburgh and back in six weeks with a load of four tons, whereas a sailing vessel made a similar journey in the same time, carrying some 200 tons and requiring only four times as many men as a wagon. In 1763 a monthly coach service between the same two towns was instituted, completing the journey in 14 days, and about the same time services to Bath, York, Glasgow, Exeter, and other towns were inaugurated. Coaches with springs appear to have been in use by 1760. Particular attention was now being paid to roads. The famous road engineers, Telford, Macadam and Metcalfe, were at work, and in the 14 years following 1760 some 450 Acts of Parliament authorizing road construction and tolls were passed. The experimental mail coaches of 1784 gave an impetus to road transport. Their speed of six m. per hour was soon increased to 12. Outside passengers were charged about 5d. a m., and those inside, 3d.

Canals had long existed in Holland, and were introduced into France in the 17th century, but although two canals were constructed in Britain by the Romans, one of which, the Fosse Dyke, is still in use, it was not until the 18th century that canal development began in this country. The first important canal was constructed from Worsley to Manchester, at the instance of the Duke of Bridgewater, and was opened for traffic in 1761. It was found that the cost of transport by canal was about one-quarter of that for carriage by pack-horse or wagon for the same distance, and the price of coal in Manchester was immediately reduced by 50 per cent. In 1772 passenger boats, charging 1s. for 20 m., were established on the canal. In 1777 the Grand Trunk Canal, between the Mersey and the Trent, 96 m. in length, was completed, and in 70 years 3,000 m. of canals were constructed in the British Isles by the Companies of Proprietors. Since 1830, with the exception of the Manchester Ship Canal, there has been but little expansion of Britain's canal system. So far as England and Wales are concerned, practically all the canals were constructed by private enterprise without any State financial assistance, but this does not apply to Ireland or Scotland.

Towards the end of the 18th century, experiments with steam-driven vessels were in progress, and in 1788 a small steam-boat was tried in Scotland. Trains hauled by horses over parallel logs of wood had been in use for colliery purposes in the 17th century. Later, the wood was covered with metal plates, and in 1767, cast-iron rails were brought into use.

The coming of the 19th century was heralded by the authorization by Parliament in 1801 of the first public railway—from Croydon to the Thames. Traders paid tolls to the company for the privilege of horse-hauling their own waggon over the line. In 1804 Trevithick's

locomotive hauled 70 passengers and 10 tons of goods near Merthyr Tydvil, but the first use of locomotives on public railways was on the Stockton and Darlington line (now part of the North Eastern railway), which was opened in 1825. The first train carried 500 passengers and made the journey of 8½ m. in 65 minutes. For some years, steam traction was employed for the haulage of goods and mineral traffic only, passengers being conveyed in horse-drawn coaches. The company soon learned that it was impracticable to allow individuals to run their own waggon at will over the line, and as a solution the system of company-owned traction and waggon developed. In 1829 George Stephenson made certain the future of railways by producing his famous "Rocket" type of engine, which attained a speed of 29 m. an hour at its trials. By 1840 there was a regular service between London and Birmingham, the journey occupying from 5 to 6 hours, and Glasgow was brought within a 24-hours' journey. There was also a quarter-hourly service between London and Greenwich. In 1845 over 1,200 railway bills were presented to Parliament, but only a tenth of them received sanction.

Similar progress was made with steamships. In 1807 the "Clermont," constructed by Robert Fulton, began to ply on the Hudson river between New York and Albany. In 1818 the "Rob Roy," a wooden paddle-steamer, travelled from Dover to Calais, and in 1819 the "Savannah," a sailing vessel with auxiliary steam and removable paddles, crossed the Atlantic from Savannah to Liverpool in 25 days. In 1838 two vessels crossed the Atlantic under steam-power only, and the screw propeller, which was invented in 1836, was used on ocean-going craft in 1850.

In 1820 was started the Paris cabriolet, which word was later contracted to "cab," and the "Dandy-horse," the forerunner of the bicycle, and in 1829 the first omnibus made its appearance on the streets of London.

The advent of the "Industrial Revolution" saw in Britain a number of self-contained communities, each more or less dependent on its own resources for necessary commodities, and a transport system which has been described as probably the worst in Europe. The means of transport were limited to river transport, supplemented by teams of pack-horses and waggon, and, in mining districts, by horse tramways. The comparatively bad condition of the roads, and the small amount that could be carried, made conveyance by horse and wagon slow and costly, while transportation by river had only a limited sphere, and even then it was unreliable.

The application of steam as the motive power of machinery cheapened and speeded up production, but labour, iron for the machinery itself, and coal as fuel, were needed. There followed a rapid development of the British coal industry, not only where there were river and sea facilities, but far inland. The iron industry moved its base northward, and there was a speedy growth of large factory areas, with increasing numbers of workers. The workers required food and domestic supplies, the factories required raw materials and coal, and these must needs be obtained from other areas. Improvements in the iron industry gave better and cheaper agricultural implements, and a development in agriculture gave greater supplies of produce ready for moving to the industrial areas. Industry had now reached a stage where production had outstripped its necessary adjunct, transport, and there was a crying need for more efficient and economical methods of transport. For this, capital was necessary, and the increasing wealth which accompanied the industrial development provided it. At first, canals, and, later, railways, played their part in providing the factory districts with raw materials, fuel, and food, and, in addition, along with steam-boats, made possible the distribution of the manufactured articles to an ever-widening range of markets.

Modern Development.—The modern development of transport may be said to date from the "Industrial Revolution," and from that time it has been generally recognized that, where advantages have been granted by the State to various forms of carriers, the rates of charges and the provisions for the safety of the public should be controlled to a certain extent by the State. This has been chiefly in evidence in the case of the railways, which were given compulsory powers by legislation for the acquisition of land and other advantages. In other words, it has been recognized that, as the carriers existed to a large extent for the benefit of the public, it was necessary that individuals should be compelled to sacrifice their private interests for the good of the public generally. On the other hand, it has also been recognized that, the carriers having been given these advantages, the State should protect the public in certain respects.

In Great Britain practically the whole of the transport undertakings have been initiated and carried on by private enterprise, the primary object of the companies from their point of view being the earning of money. For this reason the various companies have of necessity vied with each other in making as much money as possible, and one of the most obvious ways of doing this was by increasing the amount of traffic carried. Induce-

were constructed with very strong roofs, covered with sand bags or earth, and concealed as much as possible from aerial observation.

The following brief statistics of the Catterick Camp (Hipswell and Scotton divisions) may give an idea of the magnitude of such a task:—The total number of buildings for the two divisions was 2,700, and 240,000 tons of concrete were used. About three-quarters of the huts were of concrete slabs with steel framing, the remainder of frame work and expanded metal plastered. The central power station was of 1,000 kw. Overhead mains transmitted 3-phase current at 3,000 volts to transformers at each battalion hutment, hospital, etc. The lighting of each battalion was arranged in three separate circuits at 200 volts; there were about 12,500 lights and 300 H.P. of motors installed. The total length of high-tension main was about 15 m. and of low-tension circuit 50 miles. The water supply from the Swale was pumped 400 ft. from the river to the chlorinating tanks by electrically driven 120 H.P. centrifugal pumps, one of which could supply water for the whole camp for one day in six hours. The main pipes were 10 in. diminishing to 6 in. and were eight m. in length. There were 40 m. of branch pipes. The sewage outfall drains from 18 in. to 24 in. diameter were taken six miles to the treatment works. There was a complete system of surface drainage independent of the sewage system. The main camp roads totalled 22 m. and there were 70 m. of pathways. The average cost of each hut was £200 and of this 40% was for labour and 60% material. The total cost, including railways, electric installations, etc., was £1,250,000. (G. K. S. M.)

II. UNITED STATES

The presidents of the United States since Washington, almost without exception, had pointed out the need of a certain degree of preparedness in the way of a trained citizenry, arms and equipment, not only as an instrumentality for carrying out national policy at home but as a means of ensuring peace with other nations. Most of them recognized that lack of preparedness for national defence was in itself a temptation to aggressive and predatory nations. They also recognized that unorganized, unequipped, untrained, the United States could not hope to exercise that weight in the world's councils or in maintaining peace and international fair dealing, to which its position and importance entitled it. American politicians had often deliberately misled the people as to what could be done. The result was that, at the time when a world crisis was approaching which was in the end certain to involve the people of the United States, they were, in everything which related to preparedness for defence or to playing their part in the struggle for civilization, asleep. Lord Roberts had already sounded the clear note of warning to England, Kitchener had planned organized defences for the British colonies, but America, warlike yet un-military, was doing nothing to prepare for the storm. Impelled by an appreciation of the utter unpreparedness of the United States to meet promptly any military emergency arising from conflict with a first-class Power and by the general lack, not only of knowledge but of interest in the question of national preparedness on the part of the general public, and realizing that such interest could best be built up through the youth of the country, Maj.-Gen. Leonard Wood took up in 1913, as chief of staff of the army, with the Secretary of War, Lindley M. Garrison, the project of establishing certain training camps for duly qualified youth, and obtained his approval. This was the beginning of the Plattsburg idea. It was pushed forward by Gen. Wood in the following three years.

The 1913 camps were held at Gettysburg, Pa., and Monterey, Cal., and were made up principally of college students. The total number in camps was 244. They were known as Students' Military Instruction Camps. The young men who came were an unusually intelligent and earnest lot. Those at Gettysburg formed a permanent organization, which became known as the National Reserve Corps and had for its purpose the building up of a corps of reserve officers. The shield of the corps bore the words "Ready-Organized-Prepared" and its motto was "Striving for Peace but Ready for War." The results at Gettysburg and Monterey were such that these first camps attracted immediate and favourable recognition, and were the seeds from which sprang the Plattsburg camps. The question then presented itself, "Why should not the college and high-school students receive a training for national defence and learn that equality of privilege implies equality of obligation?" President Drinker of Lehigh University and Gen. Wood sent

out circular letters to the presidents of many American universities, inviting them to membership in an advisory committee. Those who at first joined the committee were President Drinker, and President Hibben of Princeton, who were respectively president and secretary of the committee; President Lowell of Harvard; Hadley of Yale; Hutchins of Michigan; Benjamin Ide Wheeler of California; Schurman of Cornell; James of the university of Illinois, as well as John J. Finley, commissioner of education, state of New York; and to these were added later the president of Williams College, the president of the university of Alabama, the rector of the Catholic University, Washington, D.C., and a number of others.

The following year, 1914, camps were established at Fort Ethan Allen, Burlington, Vt.; Asheville, N.C.; Ludington, Mich.; and Monterey, Cal. The total number in the different camps was 667. These aroused a gradually growing interest and the Department of War determined that four such camps should be established during the summer of 1915, at Chickamauga Park, Ga.; Plattsburg, N.Y.; Ludington, Mich.; and at the Presidio, San Francisco, Cal. These camps were even more successful than those which preceded them, and the number in attendance was very much larger. Three successful camps in three consecutive months were held at Plattsburg, and camps of a month each at the other designated training points. The total number of men who passed through the camps during this year was 3,406. The camps were no longer limited to students from colleges and high schools but were open to business men and to men from all walks of life who had the necessary physical qualifications. The educational qualifications were moderate, and lack of education was compensated for by initiative, as shown by success in life, the position the applicant held in his community, etc.; in other words, anything which showed sound qualities of leadership. Interest grew apace. There were recruiting committees at the various universities. The World War had broken out, and to all who looked ahead it was evident that America would sooner or later be drawn into the struggle. In 1916 over 16,000 men were passed through the camps. The Advisory Committee and the Students' Recruiting Committees of the various universities were influencing the general public, and the Military Training Association of the United States was formed for the purpose of increasing the attendance. As Plattsburg was the largest training centre, the camps, wherever held, began to be called "Plattsburg Camps," the idea of this intensive training being spoken of as the "Plattsburg Idea."

In 1917, applicants for the camps numbered about 130,000, and had the United States not gone into the war in the spring, well over 100,000 men would have been trained in these volunteer training camps. The men who came to these camps were from every walk of life: bishops, priests, clergymen, rabbis, men from the labour unions, farmers, policemen from neighbouring cities, business and professional men, youths from the colleges.

The outbreak of the World War in 1914 stimulated interest in the training. It must be remembered that the second series of camps, those of 1914, were coming to a close just before the war began. During the winters of 1915-6 and 1916-7 courses were opened in Boston, New York, Providence, Detroit, Pittsburgh, Philadelphia and other cities for the instruction and examination of applicants for reserve commissions, and through them were developed a large number of officers who played an important, indeed a vital, part in the training of the great war levies. Speaking of these camps, the chief of staff of the army, in his Annual Report for 1915, said:—

"The military camps of instruction for students of educational institutions which were held in 1913 and 1914 have been continued this year. As there were no funds available to meet any expenses incident to the establishment of these camps, it was necessary to have them at military posts where the ordinary utilities of the post could be used, or, if at a place other than a military post, the citizens had to incur the necessary expenses in constructing the camps. . . . The reports show that the results have fully justified the establishment of these camps. In addition to camps for students, camps have been authorized at Plattsburg, N.Y., Fort Sheridan, Ill., and San Francisco, Cal., for business men whose interest in the prepared-

after the Franco-Prussian War of 1870-1 adopted the policy of acquiring all the German lines. This was entirely for military reasons, and was accomplished in two decades. There was also Government coöperation in the United States. Various states assisted the railways by land grants and other subsidies, while the Union Pacific—the first American transcontinental railway—was made possible by financial aid from the Federal Government.

The World War of 1914-8 was destined to have far-reaching influences on transport. Until then, except for the fixing of rates and for the ensuring of public safety, the British Government did not interfere with the working of the railways. At the outbreak of the war, however, it became apparent that it would be necessary for the Government to take control of the whole of the British railways, and, as a direct result of former amalgamations, this was done with admirable results. Rolling-stock was pooled, engines being loaned where necessary. The success which followed justified the action taken, and valuable lessons were learned which have proved of great assistance in the consideration of the direction of future development. Similar action was taken in the United States.

The early part of the 20th century was marked by a tendency towards large combinations of capital and labour, one acting and reacting upon the other. This movement, perhaps first developed in the United States as to capital and in Great Britain as to labour, has been gradually increasing, and the state of affairs is now such as to render difficult the existence of any small concern, either of capital or labour, which is not protected by some form of combination with other similar bodies. With other concerns, transport has been largely affected by the Trust movement, and to this cause the Railways Bill of 1921 which amalgamated the railways of Great Britain into four groups was largely due. This arrangement in reality has been a development of the Trust movement.

If modern transport is to develop on economic lines and properly fulfil its functions, the tendency of the future will be toward the standardization of the various forms of transport all over the world. The lessons of the war have emphasized this very strongly, and though the progress may be slow, the future prosperity of the world largely depends upon its being brought into effect.

Operation Principles.—Transport operation deals with the actual movement of passengers and goods, and the methods of operation are dictated by the requirements of both classes of traffic. Any passenger service must be so designed as to satisfy public requirements in respect of safety, convenient times of departure and arrival, connexions for through services, speed, and comfort. Attention must be given in the first instance to what are the main channels of traffic, and these are dictated by the requirements of both commerce and pleasure—in other words, “necessary” and “luxury” travelling.

With goods traffic the conditions are different. One essential difference between passenger and goods traffic is that whilst passenger traffic must conform in some measure to the requirements of the public, goods traffic can, generally speaking, be run more or less at the transport company's convenience, attention being paid at the same time to the needs of the commercial community. The question of safety is not so important here, as evidenced by the more lax regulations governing goods traffic, as compared with passenger traffic, both on land and sea. In the United States, however, safety laws apply to freight trains and passenger trains alike. (See RAILWAYS *United States*)

Recent developments in block and automatic signalling have made railway operation—where automatic train-stops are in use—as safe as is humanly possible, while shipping is now controlled by adequate safety regulations. If safety in the air were assured, such means of transport would compete more severely with rail and sea services; already the safety and comfort of road transport have opposed to the railways a keen rival.

Another factor in transport operation is speed. In all forms of transport, other things being equal, the demand is for the quickest route.

As to goods traffic in particular, it is probable that the tramp steamer will continue to carry commodities which do not require quick delivery, and the “slow” as distinct from the “fast” goods train will always have its particular use, while a future generation will doubtless use aircraft for the conveyance of goods where the quickest delivery is the main consideration. The speed and convenience of road transport is attracting a considerable volume of traffic formerly borne by rail.

High speed is one of the primary considerations in all forms of transport. The aeroplane attains a speed of 100 m. per hour, the express train 60 m. per hour, the liner 24 knots, and while road motor vehicles can attain the speed of railway trains, other considerations limit their speed on public highways. One of the reasons why canals have fallen almost into disuse in England is that barge traffic is exceedingly slow. In France, the serious competition of the railways was recognized a generation ago, and although the canals were then equipped to furnish efficient service, and steam and motor traffic has to a large extent superseded the slow horse-drawn barge system which in England is still very general, the average speed seldom exceeds four or five m. an hour.

The methods of loading of ordinary goods traffic vary. A well-equipped goods depot has various mechanical appliances for lifting and loading goods on to waggons, but a considerable amount of waggon-loading is still performed by hand. Small parcels require a large amount of manual labour. Oil-loading in bulk is on the other hand a mechanical process. Then again different classes of goods require different vehicles, such as refrigerator vans for meat, fruit and other perishable commodities, vans for explosives, and mineral waggons. Ships, too, are adapted for carrying special classes of goods; grain ships, meat ships, oil tankers, as their names imply, are constructed for conveying particular commodities.

In the United Kingdom goods waggons have a limited loading capacity of ten to twenty tons, with mineral waggons up to forty tons, although two or three railways of the United States use a 120-ton coal waggon. It is obvious that the work involved in loading a goods train is far greater owing to break of bulk than that involved in placing the same load in the hold of a ship.

A very large tanker, for example, can load or discharge about 11,000 tons of oil in 12 hours. Loading the same quantity for conveyance by rail is a much longer process, as at present each oil tank waggon has a limited capacity of about 10 tons. The question of transport in bulk by ships applies not only to oil but to every class of commodity. Docks and harbours are generally well-equipped with cranes and warehouses, and with special appliances such as grain elevators and oil pumps.

Much time and labour are expended at tranship points. Goods are brought to ports by rail for shipment, and the accumulation of cargo for any particular vessel usually commences long before the vessel's arrival. This predicates the necessity for goods warehouses and sheds, so that commodities are properly protected against pilferage, wind and weather, while awaiting shipment. When the vessel arrives, there must be adequate facilities for removing and dispatching her inward cargo before the outward freight is dealt with. Rail facilities on the quayside, as at Manchester, Southampton, and all modern ports, obviously make the process of transshipment much simpler than as at some of the older docks, where, when goods are taken from the ship's hold, they must first be loaded on road vehicles, and thus dispatched to the rail terminus.

The transshipment difficulty is also to be met where through-running facilities for trains do not exist, due to break of gauge, for example. This difficulty has been very acutely felt on the mainland of Australia, where the states have varying gauges, so that inter-state traffic involves transfer or change at several of the boundaries. The importance of the subject has resulted in the appointment in 1920 by the Australian Government of a commission to report on the possible unification of the railway gauge throughout Australia.

The most usual method of local collection and distribution of goods from a dock, station, or goods depot is by means of motor

lorries. These have largely superseded horse traffic. In Great Britain, the railway companies perform a certain amount of carting, but many private traders have their own collection and delivery vans, and special carrier companies also assist in this very essential service. The use of motor vehicles for the local conveyance of goods has been so far extended that regular goods and passenger services now operate over long distances throughout the country. For the transport of perishable goods the motor lorry is particularly well suited. It has the advantage of offering door-to-door facilities with one handling at each end. The publication of the first "road Bradshaw" in Great Britain is an indication of the extent to which road traffic now operates.

The haulage of empty stock from one point to another is clearly necessary whenever a centre receives more or fewer waggons with loads than it requires for its own outward traffic. Very few centres receive the same number of loaded waggons as they require for forwarding goods. There must therefore always be a considerable movement of empty waggons. Statistics published by the Ministry of Transport in England show that in that country, at the commencement of 1921, about 30% of waggon mileage was "empty" running. Similar conditions prevailed in the United States. A large proportion of "empty" running is in connexion with mineral traffic. A mining area offers a considerable volume of outward traffic, with very little inward. Occasionally, however, loads can be obtained in both directions. A good example is seen in the case of iron-ore carried from Tyne dock to Consett for use at the iron-works there. The waggons are then used to convey coal from the collieries in the neighbourhood of the iron-works to Tyne dock for shipment. But this case is exceptional. The number of mineral waggons which run empty, or the ineffective dead load, can be reduced by the introduction of higher capacity waggons with a larger proportion of live to dead load.

This question of "empty" running is of equal importance in connexion with shipping. A well-organized shipping company will have its agencies so well distributed to secure return cargoes that loss through running ships in ballast is reduced to a minimum.

One great difference exists between the operation of railways and that of all other forms of transport. Railways operate on their own tracks, property which they must maintain and which has to be adequately staffed and attended. Ships have the advantage of the trackless ocean; aeroplanes and airships, infinite space; road vehicles, the public highway. Canals in Great Britain are different again; the waterways themselves are as a rule owned by various authorities, but the barges and other canal craft are usually owned by separate transport companies and private traders.

It is thus apparent that a railway undertaking must have proportionately a much larger operating staff than any other transport service. This introduces the question of management. The combination of the several factors of transport efficiency is the key to efficiency in operation. For the efficient handling and use of these factors an executive management is required, a management that should not only have full knowledge of the agencies, means and methods required for the particular type of transport operation with which it is concerned, but should also possess ability for the correlation and control of the many resources at its command. Indeed, the whole system of operation depends upon the body of management.

As to what is the best organization for management of a railway there are such wide differences of opinion that it is not possible to suggest that any given or particular plan is the correct one. In England at the head of a railway organization are the directors, presided over by their chairman, who are responsible to the shareholders for the efficient conduct of the undertaking. All questions of policy are settled by the Board of Directors, and the administrative staff, which is controlled by the general manager, who is directly responsible to the Board of Directors, is responsible for the actual carrying out of the work. The general manager cannot actually attend to all the details of operation of a railway: he can however see that the policy of the directors is carried out by the various heads of the departments. The

chief executive officers are the chief engineer, mechanical engineer, traffic and goods managers, secretary, legal adviser, and accountant. In America, where one company is responsible for perhaps 5,000 m. of permanent way, the "divisional organization," which decentralizes the management, is more extensively resorted to than in other countries, having less track mileage.

A comprehensive view of the whole system is necessary to any manager or body of managers. The American railways recognized at an early stage that they could obtain a proper survey of the working of the whole system only by the collection and collation of statistics relating to every branch and section of the industry, and the Interstate Commerce Commission in a recent report stated that the successful operation of American railways is highly dependent upon statistics. The value of statistics is now better appreciated in England than formerly, and statistics relating to railway operation, on the general lines of those in use on the North Eastern railway for many years past, are now officially collected and issued. These have the effect of reflecting the operating efficiency of the various lines. They enable a number of units of efficiency to be arrived at, as, for example, the ton mileage, the train mileage, the waggon mileage, the average waggon load, the net ton miles of freight moved per hour, the percentage of time a locomotive spends in effective work, the proportion of standing and running time, and the proportion of time a waggon is moving. The ultimate object of statistics is to enable railways by comparison to find out the weak points and thus to be operated in the most economical and efficient manner.

As regards shipping, the Board of Directors is again responsible to the shareholders, but the managing staff is much smaller in proportion than in the case of railways. Each department has, however, its executive head, viz. marine superintendent, superintending engineer, freight superintendent, victualling superintendent, etc. The operating staff is also much smaller than is the case with railways, and the larger part of a ship's crew is engaged temporarily for a voyage, and when a vessel returns to a home port and the crew is discharged, only a nucleus staff remains. Then again, most shipping companies send their vessels for overhaul to shipbuilders and only carry out minor repairs themselves, unlike the railways, who do most of the repairs to their stock in their own shops.

Economics of Transportation.—The business of transport, whether by land or water or air, is subject, like any other industry, to those economic laws which govern the production, distribution and consumption of the commodities and services required for the satisfaction of the needs of humanity. From the economic standpoint, therefore, it is essential that the cost of the "production and distribution" of transport services and the price at which these services are placed at the disposal of the consumer shall be so related as to yield a reasonable margin of profit to the undertakings concerned. Where transport services are provided and operated by private enterprise, the applicability of this principle is naturally more obvious than in those instances where the enterprise is undertaken by a municipality or State: but even in this latter case the assumption should be that the benefits derived directly or indirectly by the community concerned are sufficiently great to warrant the expenditure which the provision of the service involves.

Railways.—In their efforts to attract traffic, railways have to compete not only with other railways but also with transport services carried on by road, river and canal. In certain circumstances an additional element of competition is to be found in coastwise shipping, and the competitive influence of air transport agencies still remains to be measured. Railway undertakings differ from road service undertakings in that the former ordinarily bear the whole cost of constructing and maintaining the "way" upon which the traffic is carried, whilst the cost of roadways is usually borne, wholly or in part, out of public funds. In the case of inland waterway services also, the expenditure on "way and works" is frequently defrayed out of State resources in countries other than Great Britain; but against this advantage must be set the slowness of inland water transport and the much greater vehicular capacity which railways can offer. The competition of coastwise shipping on the other hand is frequently severe, the cost of carriage by sea being relatively low, whilst in the conveyance of non-perishable goods, rapidity of service may be a matter of little moment.

In the promotion of any new railway the selection of the route to be followed is of the first importance. Upon this depends the expenditure involved in overcoming the physical difficulties to be encountered in the course of construction, and the location of the line should be such as to secure the maximum amount of traffic available. The cost of future operation also depends, in great measure, upon the route adopted.

By the exercise of engineering skill and experience, the total mileage of track may be reduced, and difficult gradients and curves may be avoided, and by these means the subsequent cost of haulage is obviously affected. At the same time savings may be effected in capital expenditure on earthworks, tunnels, bridges and other special works of a costly character.

The location of the line and of the stations, goods depots and sidings in relation to the centres of population, trade and industry, determines to a great extent the amount of traffic and consequently the earnings which will be secured; and the number and position of these stations, etc., will in turn affect both the capital cost of the undertaking and the annual expenditure involved for staff and maintenance. Moreover, as distance is one of the prime factors to be considered in the fixing of rates and fares, it is manifestly desirable that, *ceteris paribus*, the route selected to connect the various traffic points to be reached should be as short as possible. This principle is obviously of particular importance in competitive areas.

In determining the location of the line the question of curvature and gradients calls for special attention. Curves are introduced with a view to avoiding undue expenditure on special works, such as tunnels, bridges, embankments and cuttings, but as a set-off against this, if the curves are anything but flat ones (i.e. curves of large radius), there is the resultant increase of wear and tear upon the rails and rolling-stock and increase in the mileage of track, whilst reductions of speed and a greater consumption of fuel may also be involved.

The influence of gradients upon working costs is still more marked. Where they are numerous and severe it may be necessary to employ engines of a heavier and less economical type, with the result that when running on the level sections or on the down-grades there is an appreciable waste of power, whilst the use of brakes is accompanied by an increase of the wear and tear of the rolling-stock of permanent way. In extreme cases it is usually necessary to employ additional ("banking") engines on the up-grades. In some instances the length and weight of trains have to be reduced and the cost of working the line is thus inevitably increased.

In considering the "earnings" of railway companies, or the "price" at which they place their services at the disposal of the consumer, it must be remembered that the undertakings themselves, being quasi-monopolistic in character, are usually subject to regulations imposed by the State. Consequently, in railway working, the economic tendencies which usually determine the price of commodities or services do not operate with entire freedom. At the same time even railway rates and charges, as a whole, must bear some relation to the cost of production.

Railway expenditure, apart from taxes, falls under two main heads: (a) working expenses, which include salaries and wages, maintenance and renewal of way and works and of rolling-stock, and also fuel and stores; and (b) fixed charges, including interest on capital and also rentals and other similar charges.

The aggregate earnings or gross receipts of a railway undertaking which is run on a purely commercial basis must be sufficient to cover both the working expenses and the fixed charges. The success of the undertaking depends ultimately upon the amount of the gross receipts and upon the proportion of this amount which is absorbed in the payment of working expenses. The volume of the traffic is therefore a matter of fundamental moment. If it be small and incapable of further development, and if the working expenses are already at the minimum compatible with efficiency of service, it may be necessary to charge high rates in order to cover both working expenses and the fixed charges. An increase of rates, to be effective, must, however, be such as to produce an amount which will more than compensate for the loss of traffic which such an increase tends to produce. Successful railway transportation therefore rests upon the following factors: (a) economy in the cost of construction and other items by which the magnitude of the fixed charges is determined, requiring engineering skill; (b) the maximum development of the traffic available, requiring business capacity; and (c) economy in working expenses, which is a matter for a railway expert.

In the fixing of freight charges, account is taken not only of the weight and bulk of the goods conveyed and of the distance for which they are carried, but also of terminal services, such as the loading and unloading of waggons. This charge varies in accordance with the services rendered and the class of goods dealt with. It is also irrespective of the distance the goods are carried. The maximum rates chargeable for goods traffic are fixed by Statute, but on British railways these rates are not necessarily the same in every case. This is not due to any ascertainment of the cost of "production" per unit of service in each case, but to a consideration of the general circumstances of each line concerned. The amount of the fixed charges being known, the density and regularity of the traffic is taken into account. Where the traffic is dense and regular and where fuel is obtainable at a comparatively low cost, there is obviously some ground for establishing lower maxima than would be appropriate

for lines in agricultural areas having a light or intermittent traffic. Nevertheless, such differentiation is less common abroad than it is in the United Kingdom.

Service charges and mileage rates differ also according to the varying values of the commodities carried, the differences being determined by an elaborate system of classification. It is extremely difficult to say what proportion of the fixed charges or working expenses of a railway is attributable to the handling of a particular quantity of any particular kind of traffic, because a large part of such expenditures is "joint costs." Consequently railway charges are based very largely upon the consideration of the value of the commodities offered for conveyance. On general economic principles the amount which any commodity can pay for carriage to the market for which it is intended depends upon the amount by which its value in the market exceeds that which it possessed at the point of despatch. The difference between the value of a commodity at the point of despatch and its value in the market is naturally greater in the case of a costly article, and it therefore can bear a higher actual charge without sensibly diminishing the percentage available for profit. The apparently heavy charge payable for the transport of a valuable commodity may increase the cost of that commodity by only a small percentage, whilst in the case of merchandise of low value a similar charge would add a large percentage to the cost of the goods and possibly render them unmarketable. Thus the traffic is usually made to pay "what it will bear" and so long as the aggregate return to the undertaking is adequate, the railway manager is content to carry much traffic at rates which are below the average. This he can usually afford to do, not only because he obtains super-average rates for higher-grade traffic, but also because the additional expenditure incurred by the company in carrying a given quantity of additional traffic is rarely proportionate to the volume of such additional traffic. In the majority of cases the acceptance of additional traffic is accompanied by little addition to the fixed charges which have to be met, and can usually be handled without any proportionate increase in working expenses.

With regard to distance, the rates per mile quoted for freight traffic usually decrease as the distance to be covered increases, for although the cost per ton-mile (or per passenger-mile) for journeys of varying lengths can hardly be gauged with accuracy, it is recognized that long-distance freights are more profitable. Apart from the fact that a long-distance journey may be regarded as having a "wholesale" as distinct from a "retail" character, it enables the railway undertaking to make a fuller use of its plant, whilst the amount of terminal and other work involved is not affected by the greater distance for which the goods are conveyed.

In British practice, railway passenger fares are of three kinds, (a) ordinary fares at scheduled rates, (b) season-ticket rates, and (c) special fares.

Ordinary passenger fares were originally fixed in a somewhat empirical fashion, being arrived at by under-cutting the rates quoted by the other passenger transport agencies which were in operation prior to the advent of the railway era. Nevertheless, the rates which were thus fixed proved to be remunerative without being immoderately so, and it is no doubt because of this that they have usually been recognized as reasonable by the travelling public and the companies concerned.

Similarly, the differentiation which exists between the fares charged to first-class and third-class passengers rests upon an arbitrary basis and is not measured by the actual difference in the cost of the accommodation and haulage. Arbitrary, however, as the method of fixing passenger fares has been, it is the general experience of railway companies that passenger traffic is, on the whole, less remunerative than freight traffic.

Season-ticket traffic being chiefly confined to large urban areas involves heavy expenditure on the construction of lines and stations in districts where the value of land and property is naturally greatest, and where competitive influences are strongest. Another characteristic of season-ticket traffic is that the bulk of it has to be carried within the limits of the morning and evening rush-hour periods, and to meet the requirements of these "peak" hour periods (where trains can get full loads in one direction only), it is necessary to provide a large quantity of rolling-stock which must perforce remain idle during the slack hours of the business day. Against this must be set the fact that the traffic is regular and provides full train-loads with a minimum attention on the part of the station staffs. On the whole, however, the question whether season-ticket traffic is remunerative is debatable, whilst with regard to the low rates chargeable under the system of "workmen's fares" it may safely be said that political and not economic considerations have been the principal determining factor.

"Special" passenger fares are mainly confined to holiday and pleasure traffic. This traffic is naturally mobile and tends to pass readily from one line to another according as the advantages offered by each to the passenger vary in attractiveness. Consequently the traffic is usually secured by purely competitive methods, e.g. by advertisement and by the quotation of special fares. The cost of working pleasure traffic is high in proportion to the revenue earned, but good train-loadings are usually obtained, and as much of the traffic is genuinely "additional" it is doubtless a source of appreciable profit.

Apart from the charges for freight and passenger transport to which reference has been made above, railways commonly quote special rates "for goods traffic which has to be obtained by active competition with other transport agencies. These special rates prevent departures from the ordinary schedule, and in Great Britain and the United States a great part of the total weight of goods conveyed by rail is charged for on the special-rate system.

The institution of these rates may in certain cases be due to the presence of waterway or other railway competition. The cost of transport by waterway is normally low and the competition for the carriage of goods of low intrinsic value is therefore severe; and where competition arises from the presence of another railway, the competing line which possesses the shortest route naturally has an advantage over its competitor. In other cases the competitive influence may be exerted by a road motor service, but from whatever source it springs the question whether the quotation of special railway rates as a means of securing the traffic is justified is one which can only be determined by a consideration of the particular circumstances of each case.

Water Transport.—The expenses of transportation by water, like those of rail transport, fall under two main heads: (a) the fixed charges, which do not vary very much with fluctuations of traffic, and (b) the working expenses, including the costs involved in the actual movement of goods and passengers, the terminal charges which depend upon the volume of the traffic and not upon the distances for which it is conveyed, and lastly, the general expenses which vary very little with increase or diminution of business. As in railway management, the gross receipts must be sufficient to cover both the fixed charges and the working expenses, and provide a reasonable return upon the capital invested.

With regard to fixed and general charges, water transport services differ somewhat from railways. In the case of transport by sea, there are no considerable general charges for maintenance of way nor any fixed charges consequent upon the construction of such way. Construction is limited to wharves, docks and vessels with this equipment, and can be proportioned more or less directly to the amount of traffic to be carried. There is therefore less likelihood of excess investment in construction and less necessity to accept additional items of traffic at less than average rates merely in order to make a fuller use of the plant provided.

In the case of canals, or of other waterways on the adaptation of which considerable sums have been invested, the conditions with regard to fixed and general charges obviously present a closer resemblance to those which obtain on railways.

The ownership of wharves on inland waterways is ordinarily distinct from that of the vessels which use them; and wharf charges could be such as to yield in the aggregate a normal return on the capital invested in the purchase of land and in the work of construction, *i.e.* the equivalent of a fair rent for the land occupied, plus a reasonable rate of interest on construction cost.

In water transport competitive influences operate more freely than on railways, and, in the case of ocean services, the choice of route is determined mainly by physical and economic considerations *pari passu*, the choice is determined by the location of the centres to be served, and the route taken will follow the shortest lines between them.

In the case of inland navigation the course of a river will itself determine the route to be taken, whilst in the location of a canal the principles which operate are similar to those which determine the location of railroads.

Transport on natural waterways, and especially by sea, is less monopolistic in character than railway transport, the "sea road" being open to all competitors, and at terminal points also such water transport is more subject to competitive forces than is usually the case with railways.

With regard to rates for freight, the general principle is that, on a whole, these rates should bear some resemblance to the cost of carriage, whilst with regard to particular articles discrimination may be made according to their character and value. There is, however, one case in which rates for water transport may be far lower than cost, namely, in those cases where certain goods may be used as ballast. On a particular route, for example, the demand for cargo space for shipments in one direction may be considerable, whilst in the other direction the demand may be very much weaker. In such cases cargoes may be accepted for the return journey at very low rates, apart from the fact that they may prove useful as ballast.

Road Transport.—The principal factor in the modern development of road transport is the advent of the mechanically propelled vehicle, the use of which is rapidly extending. In road motor services, as in the case of other transport agencies, the question of return on capital expenditure is important. The amounts expended upon the purchase of vehicles and upon the purchase of land and the erection of garages (where these are not rented) must be taken into account. Where vehicles and garages are rented, the annual charges thus created must be covered by the gross receipts. Depreciation, repairs and renewals, fuel, and wages must also be provided for.

The responsibility of road motor undertakings for a proportion of the cost of maintaining the roadways which they use is now coming to be recognized, but they still escape the heavy capital expenditure which is the provision of railway way and works involves. In the

case of these road undertakings, therefore, the fixed charges are of less importance, and such capital charges as they do incur (*e.g.* in the purchase of vehicles or in the provision of garage accommodation) can be more easily proportioned to the amount of traffic.

The gross receipts, and therefore the rates for freight and passengers, must be such as to cover both the fixed charges and working expenses, and must therefore bear some relation to the costs involved; but in the stage through which road motor transport is now passing there can be no doubt that, in the fixing of rates, the necessity for competing with railway services (especially for short-distance traffic) and with other road motor services is a governing factor.

Air Transport.—The possibilities of transport by air remain to be revealed, but it is significant that, already, regular mail and passenger services have been instituted and that, to a limited extent, the aeroplane is being utilized for the carriage of goods in small parcels. The general economic principles governing this form of transport are similar to those which operate with regard to those other transport agencies which use a way provided by nature and escape the construction and maintenance charges which the provision of an artificial permanent way would involve.

Ownership and Control.—The question whether the ownership and/or control of transport undertakings should be vested in the State, in municipal bodies, or should be in private hands, was in 1921 still the subject of considerable controversy. In some countries State ownership and, with it, State control of railways are accomplished facts, and even the working of the lines is undertaken by the State. In other cases, State ownership is accompanied by a strict control whilst the actual working of the lines is leased to private companies. In yet other instances State control goes hand in hand with private ownership and management, whilst in some cases (as in the United Kingdom prior to the war, and in the United States) railways are privately owned and managed, and are subject only to State "regulation," particularly in respect of matters concerning public safety and the like.

Many tramways are municipally owned and worked, being subject to State regulation in respect of public safety, whilst in the case of water transport State interference is usually limited to the grant of subsidies, coupled with a relative measure of control and with regulations for safety. In most cases, however, transport by sea is subject to safety regulations alone.

The advocates of private enterprise contend that the economic development and operation of transport is best achieved when public interference is absent or is limited to such matters as concern the public safety. They urge that, as public ownership or control involves official management, the great incentive to make a profit—which is the mainspring of private enterprise and stimulates efficiency—is removed. They urge that in the absence of this spur to efficiency, management tends to become slack and wasteful, that the element of political pressure is present, and that the vigorous enterprise which is essential to development and progress is seldom forthcoming. Experience has shown that these contentions are very largely correct.

On the other hand, the advocates of State ownership and control contend that as transport services possess the character of public utilities, they are proper subjects for public ownership and control, that they should be operated in the public interest alone, and that any profits which may result from such operation should properly accrue to the State or to the municipality as the case may be. They argue also that by the centralization of management of which public ownership and control admit, large economies in administrative and overhead charges can be effected, and that the wasteful competition and duplication of services can be avoided.

In weighing up the contentions of these two factions, it should be borne in mind that, whereas private ownership must of necessity be worked on an economic basis in order to exist at all, in the case of State ownership it is impossible to say definitely whether a service is being worked efficiently or economically.

Government Regulation.—The extent and nature of the regulation of transport by Government has varied very considerably at various times and in different countries. Where, as in many countries, the railways and canals have been built or acquired, and similarly the roads, to a varying extent, built and maintained, by the State, the extent of Governmental regulation is naturally great. In other cases—notably in Great Britain and

the United States—transport has been traditionally regarded as a matter for private enterprise and initiative, and only such measure of control provided as might be necessary in the interests of public safety and general national policy. The present tendency has in all cases been towards a greater measure of control of transport services by the State, due to the increasing realization of the importance of transport in the economic life of a nation.

As regards roads and rivers—the latter having formed the principal channel of communication for many centuries, the State exercised but little control in Great Britain. Roads were regarded essentially as of local interest, the local authorities or private individuals being responsible for such construction and maintenance work as was undertaken. During the eighteenth century considerable improvement of the road system in many parts of England was made by the Turnpike Trusts set up by Private Acts of Parliament, and subsequently by the work of Macadam and Telford. In 1835 the Highways Act abolished the compulsory Statute labour on roads and empowered each parish to levy a rate for road maintenance, and in 1888 the care of the main roads outside urban areas was transferred to the County Councils. During the whole period the general policy adopted had been that of adapting traffic to road conditions rather than vice versa, with consequent restriction of weight of load, and stipulations as to breadth of wheels, and the fixing of conditions for the licensing of public vehicles, but a great step forward, mainly due to the extended use of mechanical road transport, has been the passing of the Roads Act of 1920, which initiated a Road Fund financed by the excise duties on mechanically propelled vehicles, from which grants can be made by the State for the construction, maintenance and improvement of roads, and which provided also for a greater measure of control over vehicular traffic.

As regards rivers, State action was mainly directed to the prevention of obstructions and abuses; and when authorizing the construction of canals—which during the latter part of the 18th and the beginning of the 19th century became the system of transport on which Industrial England mainly depended—these private undertakings, as later in the case of railways, were given compulsory powers to acquire land, and in return Parliament laid down the maximum charges which they might levy. In spite of the variety in the gauge and depth of the different canals, the canal system developed into a virtual private monopoly earning at one time very large profits, and the charges gave rise to much discontent among traders.

The railways suffered from this discontent, not only in the early stages of their development, but for many years afterwards, since the principal care of Parliament for a long time was to avoid the creating of another monopoly. It was at first thought that competition would be assured by the different carriers owning their locomotives and waggons, the railway companies owning only the lines. This was soon found to be impracticable, and reliance was then placed in competition between different undertakings; and it was many years before it was realized to be in the interest of the State that the various companies should work together.

Hitherto Government control in England has been mainly restricted to matters concerning the safety of the public and railway-workers, and to the charges made by the railway companies for the carriage of passengers and goods. The supervisory authority was placed by Parliament with the Board of Trade, a separate railway department being formed subsequently in the Board to deal with all railway matters. Officers of this department inspected all lines before they were opened for traffic, being given power to delay the opening where necessary, and were required to inquire into the causes of all accidents. They had no power to order work to be carried out in any special way, but if their requirements or recommendations were not given effect to, they had the power of refusing to sanction the use of the lines for passenger traffic for which fares were charged. In the case of goods lines and alterations to existing lines, the interests of the public were protected by the

fact that if an accident occurred and the Board of Trade regulations had not been complied with, juries would deal very severely with the offenders. In practice, wherever railways have been constructed or operated, the Board of Trade regulations have always been complied with.

The Board of Trade was empowered to act as conciliator to settle, amicably if possible, differences between individuals and the railway companies, and, with a view to giving traders a specially qualified tribunal for complaints against the companies, the Railway and Canal Commission was set up in 1888.

The outbreak of war in Aug. 1914 brought about a remarkable extension in the control of transport service by Government. In Great Britain the Government at once took possession of the railways under the Regulation of the Forces Act, 1871, and during the whole period of the war these were worked on behalf of the Government by the Railway Executive Committee, a standing body formed from among general managers of the principal railway companies. Certain canals were taken over by the Canal Control Committee, and during the period of the war the greater part of the shipping was worked under the direction of the Ministry of Shipping. In 1919 further progress in control was made by the Ministry of Transport Act. This Act brought into being the Ministry of Transport, and placed under the minister the existing powers (with certain exceptions) of other Government departments in relation to railways, light railways, tramways, canals, waterways and inland navigations, roads, bridges and ferries, and vehicles and traffic thereon, harbours, docks and piers. By this Act the minister was charged with the initiation and formulation of a policy for dealing with transportation, and in order to allow time for this and to permit of development in the meantime, he was authorized to retain for a period of two years control of those undertakings which were already in Government possession, and if necessary to take possession similarly of any other undertakings. Very wide powers were given to the minister in regard to these undertakings. He might give directions as to the rates and fares to be charged, and the salaries and wages of employees were under his control. He might order the working or discontinuance of working of an undertaking, or any part thereof, and take steps to see that alterations and improvements were carried out and cooperative working effected which would result in greater efficiency or more economical working. The minister was also empowered to establish and work, directly or indirectly, transport services by land or water. During the period of two years it was thought that the undertakings would be able to make considerable progress, as these powers would enable the minister to authorize the companies to carry out alterations and improvements and to acquire land without the delay and expense involved by the ordinary procedure.

In addition to the above temporary powers, the minister was authorized to make grants and loans for the construction, improvement or maintenance of the various classes of transport services and for the promotion of such services by existing companies, and he was also given powers in regard to the classification of roads, the through running of tramcars, omnibus routes, and the purchase of privately owned railway waggons.

The British Ministry of Transport was formed in Aug. 1919, Sir Eric Geddes being the first minister. It comprised departments dealing with civil engineering, mechanical engineering, development, traffic, finance and statistics, public safety, roads, secretarial and legal. A separate branch was formed to deal with Irish transport questions. In July 1920, the ministry issued a memorandum containing proposals for the future organization of transport undertakings in Great Britain. These provided for the grouping of existing railway companies into seven groups, each of these groups being under the control of a Board of Management composed of representatives of the shareholders and employees; for the fixing of rates to a certain standard revenue, a proportion of any surplus being allocated to a development fund to assist backward districts to develop light railways and other appropriate purposes; for the setting up of permanent machinery for settling railway wages and working

conditions. It was also stated in this memorandum that it was intended to confer powers upon the State in relation to the railways (a) for the protection of the public, (b) for the economical working of the railway systems of the country, and (c) to safeguard national interests.

These proposals led to considerable criticism, and as a result of discussion with the railway companies, trading interests, and trades unions concerned, various alterations were agreed upon and embodied in the Railways bill introduced by the Government in the House of Commons in May 1921. This bill was designed to sweep up masses of legislation which had accumulated in the years since railways were first sanctioned by Parliament, and to simplify the relations between the State, the railway companies and the users.

The bill provided for the grouping of railways in four groups, which grouping was to take effect on Jan. 1 1923, and also for a variation of the grouping, provided that the Minister of Transport was satisfied that the variation was not incompatible with the efficient and economic working of the railway system of the country. The machinery by which the amalgamation of the companies in each group was to be effected was laid down in detail, and the scheme when agreed upon by the companies had to be submitted to the Amalgamation Tribunal established by the bill. If the companies were unable to agree upon a scheme, one would be settled by the Tribunal. The Board of Management of each group would be elected by the shareholders, but the proposal that the employees should be represented was abandoned. Elaborate machinery was provided for the fixing and periodical review of rates and fares. It was proposed to set up for this purpose a new court, called the Railway Rates Tribunal and consisting of three members, one a lawyer, one a commercial expert, and one a railway expert. An entirely new system was to be adopted, and the fixed charges would be actual and not maximum charges, that is to say, that except in certain specified cases the railway companies would not be at liberty to charge for any traffic a rate other than that fixed. The proposal to set up a development fund was abandoned, and in order that the railway companies might have every incentive to efficient and economical management, the bill provided that in the event of a company earning a surplus above the standard revenue, 20% of such surplus should go to the company and 80% to the trading community in the shape of reduction of rates.

It was proposed that the Minister of Transport should have power to require any two or more railway companies to conform gradually to measures of general standardization of ways, plant and equipment (including methods of electrical operation, type, frequency and pressure of current), and to adopt schemes for cooperative working or common use of rolling-stock, workshops, manufactories, plant, and other facilities, also, the railway companies might be required, on a proper complaint being made, to afford reasonable services, facilities and conveniences, and the machinery for obtaining authority to construct a light railway was simplified.

In other countries the war has similarly brought about a greater measure of Governmental control. In the United States the railways were taken over by the Government in Jan. 1918, and worked by a director-general of railroads until March 1 1920, when they were handed back to their owners. In the meantime the Transportation Act had been passed, of which the two cardinal features were:—(a) the continuance of private ownership and operation as a national policy, and (b) the recognition of public interest and duty in respect to the adequacy and efficiency of transportation facilities. The powers and responsibilities of the Interstate Commerce Commissioners have been largely increased by this Act, particularly in relation to the settlement of rates, the economical provision of adequate facilities, the regulation of operation of the railways in times of emergency, and the certification of loans to transport undertakings to enable them to render effective service during the period of transition which followed immediately upon the termination of Federal control.

In Germany the pre-war individual State administrations have been replaced by a central commonwealth administra-

tion under a Ministry of Transport established in 1919; and in most other European countries there has been considerable strengthening of the departments dealing with transportation, due to the increasing appreciation of the importance of this factor in the economic life of the State.

International Aspect.—A further question needs consideration, i.e. the international aspect of an effective international transport council. Roads, waterways and railroads originally were built for communication between neighbouring towns or districts, and to serve the needs of traffic within each nation, and not as routes from one State to another. Apart from custom and policy, to which must be attributed in earlier times the relatively small amount of commerce between the various European countries, there were great difficulties arising from customs dues, physical obstacles, differences in gauge and plant, and in loading regulations. These difficulties had such serious results that as the need for the interchange of goods became appreciated, endeavours were made to overcome them at various international conventions. Of these, the best known is the Berne Convention, formulated in 1893 as a result of arrangements initiated at a conference of representatives of various Governments held at Berne in 1878. This convention, which has been embodied in the laws of the adhering States, settled many difficulties. It abolished customs dues in intermediate countries on through traffic, specified the rights, liabilities and responsibilities of shipper, carrier and railway company, and provided for the establishment of a permanent association to facilitate settlements between the railways governed by the Convention and for the diffusion among them of information relating to the matters covered by the Convention. Further agreements have been subsequently reached on other important matters, but the need of a fresh and thorough review of the subject from all points of view became increasingly apparent during the first decade of this century. Very little was, however, done until the peace negotiations at Paris in 1919. A strong commission of experts of the Allies was formed to advise on questions concerning transit which arose during the negotiations; and the Covenant of the League of Nations included a declaration that members of the League will make provision to secure and maintain freedom of communications and of transit for the commerce of all members of the League. The expert commission in question continued to work until March 1920, when it was taken over by the Council of the League of Nations and instructed to arrange the Conference on Communications and Transit, which was held at Barcelona in March and April 1921, under the presidency of M. Gabriel Hanotaux. One of the results of this conference, which may have very far-reaching importance, was the creation of a permanent international body, to be known as the Technical and Advisory Commission, to watch the international traffic situation. The Commission will consist of sixteen members and will function as part of the League of Nations organization at Geneva. It will meet at frequent intervals and will arrange for a full assembly of all the members of the Conference or for regional conferences as circumstances may require. It will have duties of advice, initiation and administration, and will also serve as a council of conciliation in the event of a dispute on a traffic question between signatories of the Barcelona Convention. The latter function may lead to the gradual creation of a recognized and authoritative body of international law on traffic questions, which will prove a considerable advance on existing conditions. The Commission will have, as a basis for its decisions, conventions and recommendations agreed upon at the Barcelona Conference, which, however, require to be ratified by the several Governments. The more important of these deal with freedom of transit, waterways of international interest, and international railways. The convention on freedom of transit lays it down that the parties shall facilitate the free transit of persons, goods, vessels, coaching and goods stock or other means of transport by the routes most convenient for international transit. No distinction whatever is to be made as to the nationality of persons, the flag flown by vessels, the origin, points of departure, entry, exit, destination, or the owner-

ship of the goods; no special transit dues are to be levied beyond what is necessary to defray the cost of actual services rendered, and they are to involve no discriminations as regards nationality or ownership. It is expected that many States will act on the recommendations, which declare that the Powers represented at the Barcelona Conference recognize that "any one of these States is entitled on the railways under the sovereignty or authority of any other State to all reasonable facilities for promoting and encouraging the flow of international traffic to and from its territory," and proceed to lay down detailed regulations for the application of these principles. (A. G.)

TRANSVAAL (see 27 186), since 1910 a province of the Union of South Africa. At the 1911 census the inhabitants numbered 1,686,212, compared with 1,269,051 in 1904, an increase of 32.78%. Whites numbered 420,562 (as against 297,277 in 1904), coloured 1,265,650. Women outnumbered men, the proportion being for all races 80.71 males to 100 females. Of the whites 92.55% and of the coloured 24.30% were returned as Christians. Asiatics numbered 11,072 (9,018 males), of these 10,048 were British Indians, 3,065 having been born in the Transvaal.

In 1918 the whites numbered 490,347, of whom 303,050 lived in urban areas. At the 1921 census the total white pop. was 543,481 (males 284,052, females 258,529). Thus between 1904 and 1921 the whites had almost doubled in number, the increase being principally due to the development of the gold and coal mines. The growth of the white population gave the Transvaal at the 1920 election 13 more seats in the Union Parliament than the province had in 1910.

The chief towns are Johannesburg (total pop. 1911, 237,104, whites only, 1918, 137,166) and Pretoria (total pop. 1911, 57,674, whites only, 1918, 41,690). Besides Johannesburg there were on the Witwatersrand the municipalities of Krugersdorp, Germiston, Boksburg, Benoni, Roodepoort and Brakpan (the last named the centre of the Far East Rand, being created a municipality in 1919), approximately half the inhabitants of the province being concentrated on the Rand.

The chief executive officer is styled administrator, and provincial government is in the hands of a provincial council, the system being the same for all the provinces of the Union (for particulars see CAPE PROVINCE). In the five years 1913-4 to 1917-8 the revenue collected for provincial purposes rose from £602,000 to £815,000, native pass fees providing half or more of the receipts. The Union subsidy in the same period rose from £620,000 to £695,000. The two main heads of expenditure were education and roads, bridges, works. The sum spent on education was £665,000 in 1913-4 and £1,143,000 in 1917-8. In 1920 there were 1,040 State schools with 109,700 scholars. There were also 389 State-aided native schools with 26,900 scholars. There was keen controversy over the language question in the schools for white children. By an ordinance of 1911, which came into operation on Jan. 1 1912, instruction up to standard IV. was to be in and through the "home language of the child"; a second medium might then be used if the parents so desired. This arrangement ended an attempt to enforce bi-lingualism and worked very fairly. In other respects the Transvaal was noted for its many educational experiments.

Gold mining retained its position as the chief industry, the Transvaal producing nearly half the world's output. There was a notable increase in the output of coal, and with the provision of railway communication to the Messina mines (situated in the extreme N. by the Limpopo) the production of copper ore rapidly increased. The output of tin from the Bushveld was also noteworthy. Manufacturing industries were developed on the Rand. The province retained its importance as a stock-raising country, and there was a marked increase in the cultivation of maize and tobacco (for statistics see SOUTH AFRICA).

Politics and parties in South Africa cut across provincial boundaries, and the history of the Transvaal since 1910 is part of that of the Union. The province presented in its social life many extremes, the conservatism of the back-veld Boer contrasting strongly with the progressive and democratic spirit of the dwellers on the Rand. But both these elements had their counterparts in other provinces. Party feeling was, however, more strongly expressed in the Transvaal than elsewhere, and this led to the introduction of politics into the provincial council, in which, at the election of 1914, the Labour party gained a majority of one. This election followed a great industrial upheaval on the Rand, leading to serious riots and bloodshed. The white workmen on the Rand formed the main strength of the Labour party, though it had also a considerable following in Durban and Cape Town.

A considerable number of Boers in the western Transvaal took part in the rebellion of 1914, but the influence of Generals Botha and Smuts kept many Boers loyal to the British connexion, as was shown at subsequent general elections. At the 1920 election the Nationalists, or Separatist party, gained 13, and at the 1921 election 15 out of the 49 Transvaal seats—how evenly the Dutch vote was divided was shown by the narrow majorities obtained in 1921 in the rural areas, while in two constituencies the voting resulted in a tie. The 1920 election had been notable for the success of Labour candidates on the Rand; the election of 1921 saw the Labour representation of the province reduced from 12 to 5 members. Labour organizations were not confined to the whites, but extended to the natives, who showed unexpected powers of combination and arranged strikes on customary European lines. But neither this industrial movement among the natives, nor their demands for political rights, was confined to the Transvaal.

The first administrator was Mr. Johann F. B. Rissik (Minister of Lands and of Native Affairs in the Transvaal as a self-governing colony). He was reappointed for a second term but resigned in 1917 to become a member of the Railways and Harbour Board of the Union, being succeeded as administrator by Mr. A. G. Robertson, who had represented Wakkerstroom in the provincial council (F. R. C.)

TREE, SIR HERBERT BEERBOHM (1853-1917), English actor and manager (see 27 234), died in London July 2 1917. The chief Shakespearean productions of his later years were *Macbeth* in 1911 and *Othello* in 1912. In 1912 he also produced Louis N. Parker's *Drake* and in 1913 his biblical play *Joseph and his Brethren*. In 1914 he produced Mr. Bernard Shaw's *Pygmalion*. During the World War he was active in propaganda work, organizing lectures at His Majesty's theatre and speaking himself frequently in America during his theatrical tours. He published a volume of *Thoughts and Afterthoughts* (1913) and other occasional papers. His sudden death, after a comparatively slight operation, at the age of 63, was felt as a great loss to the contemporary English stage.

See *Herbert Beerbohm Tree: some Memories of him*, collected by Max Beerbohm (1920).

TRENCH, FREDERICK HERBERT (1865-), British poet and playwright, was born at Avoncove, co. Cork, Nov. 12 1865. Educated at Haileybury and Keble College, Oxford, he was elected a fellow of All Souls' College, and in 1891, after some years spent in travelling, was appointed an examiner in the Board of Education. This appointment he gave up in 1908 in order to devote himself to literary work. In 1908 he also became director of the Haymarket theatre, London, and during a short tenure of this position he staged *King Lear* and Macterlinck's *Blue Bird*. During the World War he worked in Florence for the establishment of a better understanding between Great Britain and Italy. From his school days he had been a writer of verse, and his first volume of poems, *Deirdre Wedded*, appeared in 1901. It was followed by further poems, notably "Apollo and the Seaman," included in *New Poems* (1907), and *Lyrics and Narrative Poems* (1911). Among his later publications were an *Ode from Italy in Time of War* (1915); *Poems with Fables in Prose* (1917); and a poetic play *Napoleon* (1918), which was produced in London by the Stage Society in 1919.

TRENCHARD, SIR HUGH MONTAGUE, BART. (1873-), British air marshal, was born Feb. 3 1873 and joined the army in 1893. He served through the S. African War, was dangerously wounded, and was promoted brevet major. He was then for seven years with the W. African Frontier Force and during that time took part in three campaigns, receiving the D.S.O. in 1906. After returning home in 1910 he joined the Royal Flying Corps and he became assistant commandant at Upavon in 1912. On the outbreak of war in 1914 he was at first left in charge of the central depot at Farnborough, but before the end of the year he was summoned to the front and he shortly afterwards became head of the military wing of the air forces under Sir J. French; this appointment he filled with signal success for nearly three years. He was promoted brevet

lieutenant-colonel and brevet colonel in 1915, and advanced to the rank of major-general at the beginning of 1917. On the formation of the Air Ministry at the end of that year he was brought home to become chief of the staff, but he resigned the position in the following April, he was however a few weeks later given command of the "Independent Force," which carried out extensive raids into German territory during the closing months of the struggle. He had been made a K.C.B. in 1918, and on the final distribution of honours for the war he was given a baronetcy and received a grant of £10,000. He was gazetted air vice-marshal on the introduction of the new designations of rank in the air service, and in 1919 he was promoted air marshal and became chief of the air staff.

TRENCH FEVER.—Early during the World War, in 1915, it was noticed that a large number of soldiers in France and Flanders were falling victim to a disease the nature of which was not clearly understood. It was an infectious disease because men were affected who shared the same tents, huts or billets. It bore some resemblance to rheumatism in that pain in muscles and bones was a prominent symptom. It was also rather like influenza except for an absence of nasal catarrh.

The disease at first was given many names. Thus cases were called "P.U.O.," an army term meaning "pyrexia of uncertain origin." They were also called "rheumatism" and "influenza" and "myelitis" and "lumbago." If the cases were seen at a late date when palpitation and breathlessness had become prominent, they were often called "cardiac neurosthenia" or "disordered action of the heart" ("D.A.H.")

Soon, however, it was felt that these diagnoses were inaccurate and a serious attempt was made to study the disease. The earliest contributions to its literature were made by Dr. J. W. McNee, and others who worked with him. Afterwards several Trench Fever Committees were formed by the British medical authorities. One of these worked in connexion with the American Red Cross, another, known as the "War Office Trench Fever Committee," had a hospital in Hampstead. This Committee was presided over by Sir David Bruce, the director of its research work was Col. William Byam. Both Committees infected volunteers and the conclusions reached, though they differed on points of detail, were substantially the same.

Trench fever is a louse-borne disease. The lice do not become infectious at once after feeding on a trench fever patient; there is a latent period of some 8-12 days before they are dangerous to other people. Thereafter the excreta of the lice, rather than their bites, are infective. If these infective excreta be rubbed into a scratch or scarification trench fever develops in about eight days. The importance of this discovery about the excreta lies in the fact that persons may contract the condition who have never had lice upon them. The excreta is a dry powder, easily blown about, and so apt to reach the clothes. It remains infective for long periods and even when exposed to sunlight. Water on the other hand seems to diminish its infectivity quickly.

The blood of trench-fever patients is infective to other patients when injected into their veins. Thus the parasite circulates in the blood. The parasite is also in the louse excreta. It has not, however, so far been positively identified, though there is a certain amount of evidence, that it is one of the so-called Rickettsia bodies. In this connexion the names of Dr. G. A. Arkwright and Prof. A. W. Barot must be mentioned.

The disease is protean in its manifestations. A proportion of the cases begin suddenly with great muscular weakness and exhaustion, headache, furred tongue and blood-shot eyes. Other cases come on gradually, the above symptoms increasing daily in intensity. The patient feels very ill and usually develops a temperature-rise to 102°F or 103°F. Various types of temperature have been described. In some instances there is but one wave lasting two or three days; in other instances a "saddle-back" curve is shown, the temperature falling slightly and then rising again. Some patients relapse definitely on the fifth day, others about the eleventh day. Others again relapse at irregular intervals for long periods, each relapse giving a "spike" of temperature of short duration.

In a few cases there is no rise of temperature. Thus three volunteers were infected with the same batch of louse excreta. All of the three developed symptoms of trench fever but in one instance the

temperature remained normal. Yet lice, subsequently fed on this patient, were able to transmit the disease to other volunteers all of whom developed rises of temperature. (For similar disease-carrying by body-lice see *TYPHUS FEVER*.)

The skin pains of trench fever are characteristic. They do not as a rule appear until a few days after the onset. They are of a boring, gnawing character and may be so violent that the patient cannot even bear the weight of the bed clothes. Again they may be very slight or absent.

The diagnosis is easy in early cases but the disease tends to run a very chronic course. In one case a patient labelled as a "neurasthenic" was found to infect lice four years after his initial attack. A percentage of patients become chronic invalids, others develop symptoms of functional heart trouble, others have nervous symptoms. It is probable that all these patients remain infected. The most reliable signs on which a diagnosis can be founded in the chronic stage are: (1) the patient's history, especially the state of his health before and after the initial attack; (2) the nature of his relapses; (3) the tenderness commonly met with on gently pinching the skin of the front of the leg (over the tibiae); (4) the presence of heart or nervous complications, e.g. breathlessness on exertion, pain, palpitation, gross tremor, etc.

The treatment is very unsatisfactory. At present no drug is known which will end the condition as quinine will end malaria. Thus it is necessary to attempt to build up the patient's strength against his infection. He should if possible lead an open-air life, he should have exercise, good plain food and cheerful surroundings. Some authorities lay stress on the value of thyroid, gr. 2 daily, in these cases. Others believe in iron tonics. Recent observations have suggested that the muscular weakness which follows the disease prevents the proper opening of the chest in respiration and so interferes with the suction action of the opening chest on the great veins. On this account the wearing of an abdominal belt has been recommended. It causes the patient to breathe with his chest and so tends to the restoration of thoracic movement. The disease is very disabling and its marked tendency to relapse makes it very distressing to the victim, who can never count on his health. Change of weather and wet weather seem specially to conduce to relapses. (R. M. WIL.)

TRENCH ORDNANCE.—The need of some form of easily transportable weapon for bombarding an enemy's works or his men from trenches immediately facing them, instead of from a distant artillery position, has made itself felt throughout the history of siege warfare. The use, in the trenches, of small mortars (known as "cohorns," from the Dutch engineer Coehoorn who designed them) was habitual in the sieges of the 18th century, and the great Carnot early in the 19th century proposed their use on a very large scale for the purpose of attacking personnel protected from direct fire by breastworks. The introduction of rifled ordnance, and the consequent modifications in siege methods, led to the disappearance of these cohorns. Nevertheless the need of a trench-mortar was felt in both of the two great sieges of modern times—Vicksburg and Port Arthur—in which, before the World War, trench fighting was close and prolonged. In these cases mortars of wood and hoop-iron, strong enough to bear the strain of throwing small bombs a short distance, were improvised by the troops themselves. After the experience of Port Arthur, however, European designers took up the question, and several types were worked out, of which three, the Belgian Aasen, the German official "Military Engineering Committee's" design, and the Krupp, initiated progress along three different lines which were followed up in the World War. The first named, which was used in action even before the World War—at the siege of Adrianople, 1913—was the prototype of the light trench-mortars, the second, with few important modifications, remained in service throughout the World War, and represents the adaptation of standard artillery ideas and elements to the new problem, while the third introduced the principle of the "stick-bomb," fired from a small-bore high-pressure cannon. The Aasen, besides opening the series of light trench-mortars, introduced the principle, opposite to that of the Krupp, of low pressure.

The history of trench-mortars in the World War is a record, first of a continually increasing demand which the supply authorities in the various belligerent countries could not meet; then of a period, coinciding with the full development of position-warfare methods of tactics, in which well-designed weapons with ample ammunition supply played an increasingly important part; and lastly of a period in which, under pressure of new tactical needs, the "trench" mortar strives to become a gun of

TRENCH ORDNANCE

"accompaniment" The tactical employment of trench ordnance, whether in its designed rôle or as accompanying artillery, is dealt with under ARTILLERY. the present article is concerned with the weapons themselves.

The German trench-mortars—handled not by artillerymen but by engineers in their capacity as the technicians of the siege trenches—were used with great effect in the attack of certain of the Liège forts, and a little later at Maubeuge and Antwerp. In this they were carrying out the special duties for which they were designed, and at that stage of the war it was not foreseen that weapons of this class would be required for the equipment of a trench-front hundreds of miles in length. Consequently very few were available when the western front became stabilized, and the demand was made simultaneously from all quarters for some short-range trench weapon capable of curved fire, by which alone the covered enemy could be attacked from covered positions. For the time being, it was impossible for any belligerent to do more than provide stop-gaps in the form either of mechanical throwers (see BOMBTHROWERS) or small mortars mounted on wooden beds, which were in fact either artillery shell sawn off at the neck and bored with a vent or else cohorn and other mortars of the smooth-bore era, unearthed from arsenals or museums. But while the troops made shift with these, inventors and designers were producing experimental models which, when approved, were brought out in enormous numbers, with little difficulty from the point of view of manufacture since the designs were deliberately kept simple so as to be serviceable in the roughest conditions.

Setting aside, for the present, direct-fire trench-guns, of which various types came into use for combating machine-gun emplacements, and, later, tanks—trench ordnance for curved fire is classified either according to weight, as light, medium or heavy, or according to the principle of design, as high-pressure or low-pressure. The latter basis of classification is taken here; and it is desirable at once to indicate the specific differences which mark off trench ordnance from normal artillery weapons, applying equally to high-pressure and to low-pressure types.

The most important difference is in *range*. Although by the end of the World War some remarkable results had been obtained by progressive experiments in the direction of increased range, the trench-mortar remained essentially a weapon of less than 2,000 yd. effective range. In the earlier models—save a few—the limit was about 500 yd., while many were incapable of exceeding 250. Even this last range sufficed in some cases, owing to the short distances separating the opposed front lines, and during the period of position-warfare most of the work of light and medium trench-mortars was done at ranges of 400 to 600 yards. The main motive for increasing range was not the desire to reach a more distant target from the front line, but the desire to replace the trench-mortar at such a distance behind one's own front-line troops that premature explosions—specially liable to occur with improvised ordnance and ammunition—would not affect them. An almost equally cogent motive was the desire to avoid drawing the enemy's reprisal-fire, time after time, upon the same body of friendly infantry. Another motive was the desirability of withdrawing the trench-mortar itself from the effects of fire directed upon the front line, and preventing too close observation of its position by the enemy.

The next point is *weight*. For use in or near the front trenches the trench-mortar must be portable, either as a single unit (as in the case of light mortars) or in parts which severally do not exceed certain limits fixed by experience, either in point of weight or in point of dimensions. For the heavier trench-mortars, having greater range, the limits imposed on those which have to be taken close up to the front line are somewhat relaxed; indeed, the very heaviest, used only in very favourable conditions, is designed for a concrete bed and light-railway transport.

A third point is *simplicity*, or better, in the French phrase, "rusticity." The trench-mortar is by hypothesis subjected to the worst conditions of exposure and handling. From birth it lacks the mechanical finish of standard artillery; it is required in great numbers at a time when all engineering shops for high-

class ordnance works are fully occupied and take the pick of the available metal. Then, on service, it is handled in the main by a hastily trained personnel, not all of whom possess the gunner's respect for his gun or the mechanic's pride in his machine. Moreover, the medium and heavy models are in most cases taken down and assembled frequently, and the parts are transported by hand through winding, muddy trenches, or across broken country in the dark. Save perhaps a detachable sight (which is carried by a non-commissioned officer or gunlayer), none of the customary adjuncts of modern ordnance is admissible.

Lastly, the *ammunition*, even of rifled trench-mortars, differs considerably from that of standard artillery. In most cases its design is special to the particular design of mortar, and there is no interchangeability such as that of 6-in. gun and howitzer ammunition. But in all cases, not being exposed to the bore pressures which standard artillery ammunition must endure, it has much thinner walls and a far greater explosive content.

These specific differences will be best realized by comparing a standard heavy trench-mortar with a heavy howitzer of the ordinary kind. The trench-mortar here taken is the Batignolle 24-mm. used by the French, British and Italian armies, the howitzer the German 21-cm., 1910 model, with a somewhat thick-walled shell.

	Shell	Weight of gun exclusive of mounting	Propellant Charge	Burating Charge	% of Burst-er to weight of filled shell	Range in Metres
	kgm	kgm	grm	kgm	%	
Trench-mortar	80	220	720	45	56	1,040
Howitzer	83	2,625	3,200	8	9.7	9,100

Here the trench-mortar shows roughly one-fifth the propellant charge and one-ninth the range, but one-twelfth the weight of gun and six times the shell "efficiency" of the howitzer.

All trench-mortars fire at super-angles, that is, they use elevations of about 47° for their longest range and highest elevations up to 75° or more for the shorter ranges. This enables them to be used from deep and narrow trenches.

The design may now be considered under the three headings of high-pressure smooth-bore, low-pressure smooth-bore, and rifled.

I.—High-Pressure Smooth-Bore Trench-Mortars.

The prototype is the Krupp bomb-gun of 1912. This, and all the types presently to be described have "stick-bombs." The stick-bomb is a large-bodied explosive container sometimes spherical ("football" bomb), as in the case of the Krupp and the British 2-in. T.M., sometimes formed to overcome air resistance, as in the Dumézil types. In either case, attached to the base of the projectile is a rod which fits closely into the bore of the mortar—like the rod of a rifle-grenade—and may or may not be fitted with a gas-check disc at its end. The gun itself is either a solidly forged small cannon or a long stout tube, trunnioned at its breech end, and its mounting is supported on a wooden bed. It is fired either by friction tube or percussion lock like an ordinary piece of ordnance, or by the primitive device of lighting a length of match placed in a vent or touchhole. As the base or gas-check of the rod is in contact with the bag containing the propellant charge, the pressures developed in the bore are comparable to those in a regular howitzer, and it is necessary not only for the gun to be stout but for the seating of the rod in the bomb base to be solid and cup-shaped, lest (as sometimes happened) the shock of discharge should drive the rod into the bomb before the inertia of the latter has been overcome. All stick-bombs, owing to the air-drag of the stick, and in the Dumézils and some others to the steadying effect of external vanes, fly nose first, and can be used with ordinary percussion or instantaneous fuzes provided the arming resistance of these is adjusted. Of this class, the most widely used was the Dumézil, designed by General Dumézil, in substantially its final form, as early as June 1915, and subsequently used by the French, Italian, Russian (in a modified form) and American armies, though declined by the British. The "Dumézil No. 2," here described was the standard medium trench-mortar of the French army throughout the last three years of the war. It is simple and easily transported and assembled by unskilled personnel.

The mortar (fig. 1) is a stout cannon of forged steel (1) with simple vent-firing and rear trunnions. The maximum pressure with the heaviest bomb is 16 tons to the sq. in. The trunnions (2) are massive and bored through transversely to take a carrying bar or

axle. It rests, when assembled for firing, in trunnion seatings formed in the inner parts of two cheek-pieces (4), which are heavy castings with accurately fitting inner faces. The foreparts of these are moulded upward to form elevating arcs forming a collar (3) on

the gun slide, the gun being secured at the desired angle of elevation by screwing home the clamping screws. The cheeks (4) carrying the gun rest in a trough (5), attached to the back of which is a curved plate. This curved plate butts against a similar curved plate (10), which is jammed firmly against the back wall of the trench or emplacement. The mortar can thus be laid for direction by sliding the back-plate of the trough (5) along this back-plate (10).

The bed, in which the system rests without being attached, consists of three planks (8, 8, 9). The system may be moved without being taken down, by means of wooden truck wheels attached to the axle (6) which is passed through to the sides of the trough, the cheeks and the bored trunnion. These accessories were, however, not much used in practice, as only 4 to 5 minutes are required to bring up and re-assemble parts in a new position. Various methods of indirect laying for line were employed, as well as direct laying by periscope (excluding axle and wheels). The weights of the various parts are as follows—mortar, trunnions and elevating collar 165 lb.; two cheek pieces, 143½ lb. each, trough 132 lb.; wall back-plate 106 lb.; three planks 128 lb. Total weight in action 818 lb.

The stick-bombs vary in weight from 35 lb. (burst 134 lb.), to 99 lb. (burst 504 lb.). The earlier types, as in the 99-lb. bomb of fig. 2, had three vanes; later, as in the 40-lb. bomb of fig. 3, six were fitted. Some types had considerably more elongated bodies than those illustrated. With a charge of 4 oz., the 35-lb. bomb ranges to 715 yd. at an angle of elevation of 45°, the muzzle velocity being 263 f.s., and

with a charge of $4\frac{1}{2}$ oz. a 68-lb. bomb, m.v. 220 f.s., ranges at the same angle of elevation to 490 yards. (C. F. A.)

II.—Low-Pressure Smooth-Bore Trench-Mortars.

Trench-mortars of this class are characterized by the fact that the pressure of the propellant gas is reduced by being allowed to expand into an "expansion chamber" of one form or another before beginning to take effect on the projectile. This device enables a thin-walled gun-tube to be used (instead of a true cannon such as the Duménil above described) with considerable saving of weight. In some types, the firing of the charge was arranged to take place

in a separate chamber which communicated by a channel with the expansion chamber, i.e. the breech portion of the gun-tube in which the projectile is seated. Such were the Aasen, the Sutton-Armstrong, which was employed as a naval "hombthrower" (*see* ORDNANCE: section *Naval*), and the Temple. The last-named was distinguished by possessing a silencer attachment, which was considered by some authorities as a desirable addition in the period of short ranges and very advanced emplacements.

Of more importance in the history of the World War are those types in which the strong-walled "combustion chamber" does not form a separate component, but is included either in the base of the gun-tube (as in the Batignolles type) or the base of the shell (as in the Stokes). In both of these, the "expansion chamber" is formed automatically by the fact that only certain projections from the shell-base, and not the base itself, rest on the bottom of the bore or chamber-shoulders when in the loaded position.

FIG 3

Although it is believed that the first record of automatic ignition in trench-mortars, where the projectile carried its own propelling charge and igniter attached to the base of the bomb, existed in an early patent taken out in Germany by Messrs Krupp, no practical use seems to have been made of this, and the first application of the theory of dropping a bomb of this nature down the bore of a mortar, so as to fire the charge and eject the bomb upon impact with the base, was that put forward by Sir Wilfred Stokes. The bomb in its first service form (fig. 4) had a container screwed on to the base, and this took a 12-bore sporting cartridge, the percussion cap of which, after the bomb had slid rapidly down the bore, impinged upon a striker fixed in the base of the mortar. In the 6-in. medium mortar (Stokes-Newton), developed later in the war, the principle of the fixed striker was adhered to, but both the mounting and the projectile differed entirely in design.

The barrel of the 3-in Stokes mortar (fig 5) consists of a light seamless steel tube (A) drawn down at the base end, which is bumped into a semicircular form having a slight projection in the centre of the axis of the bore. This projection is drilled and threaded to take the striker (11), which, when screwed home, projects into the bore; the size of the combustion chamber is regulated by the extent to which the striker protrudes into the barrel or bore of the mortar. A cap (C) is screwed over the outside of the projection to take the wet-back of firing. This cap, which is made of steel, rests in a small depression in the base-plate (E), which is fixed in the ground approximately facing the objective, and at a convenient angle, and has several such depressions placed in an

are to provide for changes of direction. The thin tube or barrel of the mortar has a smooth bore; it is supported above the centre of gravity by a pair of folding legs (B), between the apex of which (when open) and the barrel are the elevating and traversing gears, the latter being attached to the barrel by means of a steel band (see fig. 6).

There is no attempt to take up or absorb mechanically the setback on firing, or the recoil, as the low combustion pressure renders this unnecessary at the ranges used.

As already noted, the 3-in. Stokes was in the British service set apart for the firing of high-explosive bombs (although smoke-pro-

ducing bombs were added later), while the 4-in. mortar was reserved for gas, smoke and incendiary projectiles. The weight of the 3-in. bomb was given at 10 lb., and of the 4-in. at 25 pounds. The design of the mortar, as between the two types, was only varied in so far as the difference in size rendered this necessary, and the same is substantially true of the design of the bomb. Steel is used in the 3-in. and both steel and cast iron bodies in the 4-inch.

The first service patterns of bomb, and all subsequent ones up to the introduction of the vaned bomb in the last days of the war, have a cylindrical body, which is provided with 2 bands or "guides" as far apart as the wall of the bomb permits, preferably one at each end of this (fig. 7). The object of these guides is to ensure that the percussion cap falls accurately upon the striker after the bomb has travelled down the inside of barrel. The guides also eliminate friction during the descent of the bomb; windage has to be allowed for (i.e. sufficient space to permit the air compressed by the bomb in

its descent to escape between the guides and the wall of the barrel). The windage provides an escape for the surplus air and ensures that the acceleration due to gravitation will drive the percussion cap with sufficient force on to the striker to cause ignition. In the 3-in. and 4-in. service designs the working chamber pressure is limited to 2 tons per square inch. At this pressure a range of 1,250 yd. is obtainable with the cylindrical bomb, when using the full propelling charge. This charge is obtained by placing rings of cordite round the exterior of the cartridge container, the container being per-

forated with a number of small holes, through which the gas from the cartridge escapes into the chamber, thus igniting the cordite rings in passing.

The steel bomb is made up of ordinary commercial lap-welded steel tubing, cut to the desired length, and of the forged steel head and base which carry the guides and the cartridge container.

As this mortar is not rifled, the bombs (except in the vaned patterns developed later) turn over and over in flight. If then, a burst or impact is desired, fuzes of the ordinary type which require nose-first impact will not serve. A type of fuze was, however, designed, known as the Allways fuze (see AMMUNITION section *Fuzes*), which operates whatever the direction of fall. When time fuzes are required, either for air burst or for delay-action after impact, or because no Allways fuze is available (as was the case for a considerable period in the war), the arrangement most commonly adopted is that seen in fig. 7, viz. a "pistol," which is practically identical with the ignition device of the Mills grenade (see GRENADE). The control of the bomber's hand over the lever is here replaced by that of a pin, which secures it till the moment of discharge, when the pin sets back and the lever is free to fly up.

Bombs with vanes have been designed to obtain greater range and accuracy. As these fly straight, head on, air resistance is diminished. These bombs are stream-lined as far as is possible, while allowing for the guides to be sufficiently far apart for accuracy in impinging upon the striker. An additional margin of inaccuracy in descent down the bore of the mortar is provided for by fitting a cap which holds the needle point over the end of the cartridge, so that, no matter where this hits the striker, the needle will ignite the percussion cap. Safety against accidental dropping is provided by designing the vanes to extend slightly beyond this cover. With vaned bombs, of course, normal types of fuze can be used.

Generally speaking, high-explosive, smoke and gas bombs are all designed to explode upon impact, while incendiary bombs are designed to function in the air as nearly over the objective as possible.

The Stokes-Newton 6-in. T.M. is similar, so far as the barrel is concerned, to the Stokes 3-in. and 4-in. A much stronger bedplate, however, is required owing to the increased weight of the projectile and the greater range, and the mounting is quite unlike that of the smaller weapons. Both direction and stability are obtained by means of lugs set radially round the outside of barrel, about midway, and attached to rings in the bedplate. These lugs can be lengthened or shortened by means of turnbuckles in the centre, thus obtaining elevation or depression and traverse at the same time. This method is slower than that used in the 3-in. and 4-in., but has the advantage of tying the mortar well down to the bedplate and ensuring stability. A somewhat similar device, providing for elevation only, is found in certain German and Russian trench-mortars. The projectile of the Stokes-Newton is similar to the cast-iron vaned bomb of the smaller weapons. It has steel vanes which are placed in the mould and become part of the casting. The propelling charge is gun-cotton, and this is ignited by a shortened service rifle cartridge, instead of the 12-bore cartridge which is used in the Stokes cylindrical bomb. This bomb is an adaptation of that of the French 240-mm. described below.

The *Baignolles 240-mm. (0.45-in.) Heavy T.M.* is perhaps the most elaborate of those trench-mortars which stood the test of war. It was brought out in 1915 by the Baignolles Company of Paris, and first used in a great battle in the Champagne offensive of Sept. 25 1915. The model described is the earlier trench type. Later, the piece was lengthened and provided with less primitive firing arrangements. The model finally adopted in 1916 by the British War Office as the standard heavy trench-mortar also had different firing arrangements and a periscopic dial-sight.

The *240 court de tranchée*, as this model is officially styled, consists of four main parts, the piece, the carriage, the baseplate, and the platform (fig. 8). The *piece* consists of two sections screwed together; the lower section, which has very thick walls, contains the chamber proper, in which the propellant charge is housed, and (in this model) an aerial vent to take the 12-secs. length of Bickford fuze which communicates the flame from the gunner's porthole to the powder primer of the charge. The upper or front end of the chamber is not "choked" but on the contrary opened out so as not to impede the rush of gas into the broader "expansion chamber," or lower part of the thin-walled tube. This thin-walled tube contains the vaned bomb (fig. 9), which unlike those previously described in connexion with the Duménil trench-mortar, has its four vanes exactly in prolongation of the body. This arrangement not only enables the whole of the projectile to enter the bore, but ensures

the maintenance of a free expansion chamber as the tips of the vanes, and not the base of the bomb, rest on the curved shoulders of the chamber proper. The bomb is of steel, thin-walled, and its body is built up from three pieces by autogenous welding, the cruciform vanes being secured to the body in the same way after being riveted

FIG. 8

to each other. A delay-action fuze only is used. With this, the powerful bomb, weighing 192 lb., of which 101 lb. are high explosives, will demolish thirty linear feet of trench work, break down all but heavily protected dugouts, and make a crater in compact clayey earth 10 ft. deep and 30 ft. across.

The piece is rear-trunnioned, the trunnions being firmly held in their seatings in the base of the carriage by a locking device. The carriage consists of a bottom-plate which contains the pivot-seating and the trunnion-seatings, and two side-brackets which are formed at their top edges as arcs for giving elevation. These arcs are toothed, and into them gear small pinions on a cross-shaft secured to a collar on the piece. Below this cross-shaft, and similarly secured to the collar, is another cross-shaft, the ends of which engage in slots in the side brackets of the carriage and carry the clamping arrangements by which the piece is secured rigidly to the carriage when the arc-and-pinion gear have brought it to the desired elevation. The elevation limits are 54° (with certain precautions 45°) for maximum range, 75° for minimum. On its underside the bottom-plate of the carriage has an ingenious arrangement of locking sectors which, when the carriage is placed over the pivot on the baseplate and given a partial turn, engage in a locking-ring on the face of the baseplate. (The ring originally admitted of all-round traverse, but this was later restricted to one of 18° each side of the mid-line, so as to avoid slantwise strain on the platform.) The baseplate is almost square and has on its upper side the locking-ring and pivot above mentioned. From its underside six vertical flanges project downwards. The platform is made up of five heavy square baulks, iron-shod and fitted with distance pieces so that, as they lie in position in the shallow, levelled pit, the four inner flanges of the baseplate can enter between them, while the two outer flanges sit over the outer baulks. Latches on both ends of each baulk engage with projecting tongues on the baseplate. Thus baseplate and baulks together form a steady unit in firing. The unit is further steadied against the horizontal component of the thrust by being wedged, back and front, against end-boards placed against the walls of the pit. The piece is laid for direction by an auxiliary aiming point, any suitable dial-sight being adaptable to the mounting-means of one or another form of dial-sight, a clamp on the bottom-plate of the carriage binding the latter in the desired position of traverse.

FIG. 9

All the parts are equipped with sockets for lighting-handspikes, except the piece itself which is carried by two staves passed through the two parts of carrying rings seen in the drawing. But movement in the trenches is as a rule by means of iron barrows pushed by hand. One barrow takes the mortar upright, another the carriage, a third the baseplate and accessories, while the baulks and end-boards are carried by hand.

The weights of the short 240-mm. are as follows: mortar 485 lb., carriage 425 lb., baseplate 510 lb., platform baulks 132 lb. each. Total weight in action (exclusive of wedges, steadying pickets, etc.) 2,080 lb. The loaded weight of the heaviest barrow (baseplate, etc.) is 943 lb. The maximum range of the 192-lb. bomb with a propellant charge of 1 lb. 9½ oz. is 1,125 yd. at 45° elevation and 1,045 at $55^\circ 30'$. The maximum pressure in the bore is slightly less than 1 ton per sq. in. (150 kgm. per sq. cm.). The lengthened 240-mm. (breach-loading and percussion-fired) ranged with a 179-lb. bomb to 2,265 yd. (m.v. 476 f.s., maximum pressure 3,700 lb. per sq. in.), using a charge of 2 lb. 13 oz., but it required a heavier and more elaborate platform. A still more powerful weapon of the same class was the 340-mm. (13.4-in.), which required a concrete bed and a light-railway track for supply. This carried a 430-lb. shell (high explosive bursting 205½ lb.) to a distance of 2,250 yards.

Pneumatic guns, as possessing a high-pressure reservoir and a low-pressure gun chamber, should also be included amongst the low-pressure class of trench ordnance. Owing to their silence and invisibility in action, they possessed marked advantages over the earlier forms of trench-mortar using explosive propellants. But their low power, their complication and liability to get out of order, and as regards some models, their entire dependence on a special form of supply (air or carbon-dioxide bottles) disappointed expectation; and of many ingenious designs put forward in the different belligerent countries, one only was consistently employed in the field. This was the French Brandt, classed as a light trench-mortar, which could obtain its pressure either from a bottle or from a motor-car pump. Its first model, which had a tripod mounting, weighed 484 lb. for the gun, 35½ lb. for the tripod, and 70½ lb. for the box of accessories and pumps. A later model, firing to a fixed angle only, was much lighter. It threw a 1½-lb. bomb, or rather grenade, very accurately to a distance of 250 yd. but, although much greater ranges were obtainable, the accuracy fell off rapidly beyond that figure. (C. F. A.)

III—Rifled Trench-Mortars.

The Germans were the first to produce an officially designed model of trench-mortar (*Minenwerfer*), and these weapons were used in the earliest sieges of the war. Although this gave German designers a long start in the competition, it did not save the German army from passing through the same phase of crude improvisations, which the French and British armies had to traverse. Bored-out shell mounted on blocks, old bronze siege mortars, experimental pneumatic mortars, and various smooth-bore types all figured in the armament of the German trenches for the first years of the war, and it is not till 1916 that the standard types are found in very large numbers. Thereafter, with the sole exception of a *minenwerfer* copied in principle from the Batignolles 240-mm., the standard types alone were used for general battle and trench service. The older types, so far as they survived, were practically reserved for throwing gas-bombs and other special projectiles. All the standard types of light, medium and heavy *minenwerfer* are rifled, and are derived from the pre-war service weapon. Modifications during the war were few, and did not affect the main elements of the design. They were principally two—the lengthening of the barrel in all three classes, and the adaptation of the light type to a direct-fire carriage, which enabled it to be used with conspicuous success as an "accompanying gun" in the semi-open warfare of 1918. The models selected for description here are the original model of "medium," the new or 1916 model of "heavy" and the light type with and without direct-fire carriage. Rifled trench-mortars were not used in any of the Entente armies.

The characteristic of the German rifled trench-mortar in all forms is that, unlike the stick-bomb weapons and the low-pressure weapons which are radical departures from ordinary artillery practice, they are designed essentially as siege howitzers of reduced weight and power. Recoil-gear is provided, but of a simpler kind than the intricate combinations of elements necessary in a howitzer of high velocity and recoil energy; similarly, to ease the strain of discharge, by reducing the power necessary to propel the projectile, the driving band of the shell is "engraved" in advance. But the arrangement of piece, cradle and buffer, and the form of the shell, is in accordance with the conventional artillery practice.

The "old" model medium trench-mortar (fig. 10) is a short, thin-walled howitzer of 17-cm. (6.69-in.) calibre, rifled with 6 shallow grooves of uniform twist, 1 turn in 26½ calibres. The length of the rifling is 3.3 calibres. It is muzzle-loading and has percussion-firing gear placed axially on the breech. It is mounted in a ring-cradle which carries, above and below, a combined buffer and spring recuperator of simple type. The piece slides back and forth in the cradle and has the pistons attached to horns above and below the breech. The cradle is centre-trunnioned and the trunnions rest in seatings in a top-carriage of the usual form. The left trunnion car-

ries an elevating arc actuated by a worm-shaft and handwheel on the carriage. This trunnion also carries a panoramic sight (not shown in the illustration), mounted so as to slide on an arc which renders its position independent of the gun elevation. The baseplate, which is of steel, has longitudinal and transverse spades or flanges to enable the mounting firmly to be bedded on the ground.

FIG. 10

In the forepart, the baseplate has a vertical pivot and in the rear part an arc, which enables the top carriage to be traversed 124° either way from the centre line by means of the handwheel seen in the illustration. As in all German rifled trench-mortars care is taken to house in gearing and mechanism so as to keep out mud and dirt. The weight of the whole system in action is 1,064 lb. and the maxi-

FIG. 11

mum range, with a 109-lb. shell (bursting 24½ lb.), is 980 yards. For transport, wooden wheels are fitted to axles on the bedplate and a handspike with a socket formed at the back of the same. The "new" model of medium *minenwerfer* is slightly longer (3.8 calibres rifled length), weighs 1,232 lb. in action, and ranges to 1,250 yd. with the same shell.

The heavy *minenwerfer*, new model, shown in fig. 11, is similar in all essentials of design to the above, but like other new models longer than the original model of its class. The details, such as the sight and the traversing gear seen in the illustration, and the elevating gear, etc., seen in fig. 10, are common to old and new models of medium and heavy. The new model heavy has a calibre of 245 mm (9.8 in.) and has a rifled length of 4.54 calibres. It weighs in action 1,693 lb. and with a 210-lb. shell (103-lb. burster) ranges to 990 yards. The old model has a rifled length of 3.1 calibres and weighs in action 1,362 lb.; with the above shell it ranges to 612 yd. only.

In the light *minenwerfer*, 7.6-cm. (2.9-in.) calibre, of which the "new" model is shown in fig. 12 and the direct-fire carriage in fig. 13, the piece, buffer and recuperator system and bedplate are similar in general to those of the medium and heavy types. But the top-carriage design is entirely different. The ring-cradle (which carries the buffer system as in the other types) is continued on each side

FIG. 12

to form arms which at their extremities are traversed by an axle, or through trunnion-bar, a few inches above the baseplate level. This bar rests in seatings in a very small intermediate carriage which traverses (through a circle) round a pivot in the bedplate. In the forepart of this intermediate carriage is another cross-axle which at its middle is formed as a socket, taking the foot of a stout elevating screw (which is cased in leather to protect it from dirt) is clearly seen in fig. 13. It supports the weight of the cradle and piece, to which it is jointed, and elevation is given by screwing up or down.

The weight in action of this model is 312 lb., the rifled length of bore 5.2 calibres, and the high-explosive shell weighs only 9 lb., and, comparing these proportions to those of the heavy and medium shell, it is not surprising to find that it ranges to 1,422 yards. The "old" model was somewhat shorter and lighter, and ranged to 1,150 yd. with the 9-lb. shell.

The light *minenwerfer*, which is also known as the "Ehrhardt," was a very successful weapon, and every German infantry battalion had by 1917 a "light *minenwerfer* section," consisting of 4 of these pieces and a number of the "*granatwerfer*" described under BOMB-THROWERS.

In 1918, in preparation for the expected resumption of "open" warfare, the Germans on the western front adapted the light *minenwerfer* for service as a direct-fire short-range gun of accompaniment for use against undisclosed machine-gun nests and other defences that might be met with in the course of a deep advance. For this purpose the bedplate, already provided with axles, was fitted with higher (29-in.) wheels, and a trail with trail spade was bolted to the small intermediate carriage described above. This trail is peculiarly arranged in the forepart. The cross-axle, or through trunnion-bar, which, in the trench-service mounting, connects the ends of the cradle arms to the intermediate carriage, is, in the direct-fire mounting, connected to a framework in the trail which can be raised or lowered, thus enabling the cradle and mortar, always supported in front by the elevating screw, to assume either the horizontal or slightly elevated position with trunnion-bar high, or the quasi-vertical loading position (shown by dotted lines) with the trunnion-bar low.

The motion of the framework in question is about a transverse axis contained in the trail and is controlled by a shifting level.

Traversing is still about the pivot in the bedplate, and is managed by moving the point of the trail (by means of a small lever) along the broad arc-shaped spade member. The limits of this traverse, viz. with spade bedded, are $11^{\circ}8'$ either way from the middle-line. The maximum range with the 9-lb. shell in the direct-fire position high-trunnioned (elevation 38°) is 995 yd., but all angles between 34° and 75° may be obtained by transferring the trunnion-bar to the

low position and proceeding as its high-angle platform fire. Both platform-fire and fire from wheels is possible in the high and low positions alike. In movement, the system is either man-drawn or limbered up to a two-wheeled cart drawn by one horse.

IV—Direct-Fire Trench Ordnance

In spite of the great defensive powers revealed by the machine-gun in trench warfare, certain local-defence needs made themselves felt in that type of warfare which the machine-gun of rifle calibre could not satisfy. In consequence, a variety of trench-guns were designed or adapted for emplacing as "forward" guns, or "infantry" guns. It cannot be said that this class of trench ordnance possesses any generic characters. A few were specially designed but the majority were field or small naval guns cut down and mounted on low carriages. Captured guns were frequently adapted for this service, when a large enough supply of ammunition and pieces was available, and also hooded quick-firing guns of the 57-mm. class taken from fortress armaments, in which formerly they had figured largely as a standard close-defence armament. Later on, these forward guns were sometimes made mobile again for use as guns of accompaniment. None of these converted types, however, need be dealt with here, and it will suffice to mention more particularly the 37-mm. gun (of French origin, but used also by other armies), not so much because it is representative of a class—which is too miscellaneous for any member of it to be regarded as such—as because it was used on a large scale in the war. It is a direct-fire quick-firing weapon, short in barrel length, mounted on a low-wheeled carriage and provided, as is a field gun, with a shield. It was laid over open sights and fired small, high-explosive shells with percussion fuzes similar to those of the "pom-pom," which were effective against machine-guns, etc., under light cover. The dimensions and weights of the Russian model of the 37-mm. (which is provided with the recoil-absorbing rubber discs commonly found in Russian designs) are as follows.—Calibre 37 mm.; weight of the system in action 396 lb.; of the gun, breech and lock alone 86½ lb.; and of the pointed shell with base-fuze and bursting 1.1 lb., m.v. 1,450 f.s.; max. range on the sights 3,500 yards.

In their later evolution, many of these miscellaneous trench-guns became anti-tank guns. (C. F. A.)

TREVELYAN, SIR GEORGE OTTO, 2ND BART. (1838–), English author and statesman (see 27.255), who received the O.M. in 1911, published in 1912 the first volume of his work *George III. and Charles Fox*, and the second in 1914.

His eldest son, **CHARLES PHILIPS TREVELYAN** (b. 1870), resigned his post at the Board of Education in 1914 as a protest against the policy which involved Great Britain in the war. He lost his seat in Parliament at the general election of 1918.

His third son, **GEORGE MACAULAY TREVELYAN** (b. 1876), was during the World War commandant of the first British ambulance unit on the Italian front, and received in 1915 the Italian silver medal for valour. He published *Garibaldi and the Making of Italy* (1911); *Life of John Bright* (1913), *Clivo, a Muse, and other Essays* (1913); *Scenes from Italy's War* (1919). He married in 1904 Janet Penrose, elder daughter of Mrs. Humphry Ward. She published in 1920 *A Short History of the Italian People*.

TRIPOLI (see 27.288).—As the result of the war of 1911–2 between Italy and Turkey, the vilayet of Tripoli, together with that of Benghazi (Cyrenaica), passed from Ottoman to Italian

rule. The newly acquired territories were jointly styled *Libya Italiana*, but Tripolitania and Cyrenaica were organized as distinct entities with separate administrations and governors.

History.—The war of 1911–2 (see ITALO-TURKISH WAR) ended without any formal acknowledgment of Italian sovereignty by the Porte. At an early period of the conflict, on Nov. 11 1911, when the Italians held little more than the town of Tripoli, a royal decree declared that both vilayets were placed "under the full and complete sovereignty of the kingdom of Italy." This was a political move, confirmed (in Feb. 1912) by the Italian Parliament, taken to make plain Italy's intentions to Germany and Austria, her partners in the Triple Alliance (see AFRICA: History). When, in view of the situation in the Balkans, the Turkish Government opened peace negotiations neither Tripoli nor Cyrenaica had been conquered, and the negotiators came to an unsatisfactory "face-saving" arrangement. By an agreement signed at Lausanne on Oct. 15 the Ottoman Government bound itself to issue, within three days, a *firman* renouncing Turkish sovereignty; the form used made the Sultan declare "I concede to you (the inhabitants of Tripoli and Cyrenaica) full and complete autonomy." But at the same time the Sultan was to nominate not only an official to protect Ottoman interests but a religious chief, while the Sultan's name, as Caliph, was to continue to be pronounced in public prayer by the Moslems.

The formal treaty of peace signed at Lausanne three days later (Oct. 18 1912) made no mention of the Italian annexation, but provided for the evacuation of the vilayets by Turkey. France was the first Power formally to recognize the new position created; by a declaration signed at Paris on Oct. 28 the two Governments agreed not to put any obstacles in the way of measures which they should judge opportune in Libya and Morocco respectively. This was in fulfilment of a Franco-Italian agreement reached in 1902, an agreement in which Great Britain acquiesced.

In Tripolitania the article of the Treaty of Lausanne requiring the immediate recall of the Turkish troops was carried out. Neshat Pasha and his force of 2,500 regulars embarked for Constantinople, while the garrisons in the interior, largely composed of natives (Arabs and Berbers), disbanded, or joined the Turks and Senussites in Cyrenaica. The Italians then took in hand the pacification of the interior. The tribes of the Jefera (coast zone) submitted with little difficulty, but there was stout opposition from the Berbers of the adjacent hill region. Suleiman el Baruni, the powerful Berber chief of the Jebel Nefusa, was the principal opponent of the Italians. He had represented Tripoli in the Turkish Parliament, had been created a pasha, was an ardent supporter of the Pan-Islamic movement, and now set up a kingdom in the hills. After having maintained his independence for the greater part of 1913 Suleiman was beaten. He fled to Europe—to reappear at a more convenient season. The occupation of the rest of the province by the Italians presented little difficulty. Murzuk, the capital of Fezzan, was entered unopposed on March 3 1914 by a column under Col. Miani. With the occupation of the oasis and town of Ghat by Col. Giannini on Aug. 12 following, every place of importance in the province was garrisoned by the Italians. In these operations, besides battalions from Italy, troops from Eritrea and native partisans (Arab and Berber) were employed.

Meanwhile, as soon as the coast region had been pacified, the Italians set to work with great energy to improve harbours, make roads, build railways, found schools, open hospitals, organize sanitary and police services and encourage agriculture and trade. By the middle of 1915, when the work had to be abandoned temporarily, a good deal had been accomplished. National feeling had been highly gratified by the acquisition of what was looked upon as the "natural heritage" of Italy, and money and men were forthcoming for the task of regeneration. Many Italians were anxious to settle in the country as agriculturists—but this movement the administration wisely discouraged. Towards the Arabs and Berbers a policy of trust and confidence was adopted, a policy which might have succeeded but for the situation in Cyrenaica. In that province the Treaty of Lausanne had not brought about peace, and Turkish troops aided

the Senussites to continue the conflict (*see* SENUSSI). At the beginning of 1914 the Italians held in Cyrenaica only a strip along the coast. The Senussites were masters in the interior, and thus in a position powerfully to influence the tribes of Tripolitania. Many of the Fezzani were of the Senussi fraternity.

Such was the position when in Aug. 1914 the World War began, Italy however at that time remaining neutral. Towards the end of the next month (Sept. 1914) the Fezzani—instigated by emissaries from the Senussi Sheikh—suddenly rose in revolt and attacked several small garrisons between Murzuk and the coast. By the end of Nov. the rising had assumed large proportions. The Italian Government then ordered that Fezzan should be evacuated, and Col. Miani and his troops fought their way back to the coast. As soon as the Italians had left Murzuk Mahommed el 'Abid, a brother of the Senussi Sheikh, took over control there and declared himself governor of Fezzan. Miani's withdrawal from Fezzan left the Italian garrison at Ghat—600 m. from the coast—isolated, while the garrison of Ghadames, farther N., was also in danger. Both places adjoined the French frontier, and at the invitation of the French Government the garrison of Ghat marched across the desert to Fort Flattere (a distance of 200 m.), while that of Ghadames withdrew into the Tunisian Sahara. General Tassoni, then governor of Tripoli, whose forces were increased by 6,500 fresh troops, directed the reoccupation of both oases. After hard fighting Col. Giannini retook Ghat on Feb. 18 1915, and shortly afterwards Ghadames was also re-garrisoned. But on the eastern side of Tripoli fortune went against the Italians. In an engagement with the rebels between Sokna and the coast on April 29, the Libyan auxiliaries of the Italians went over to the enemy on the field of battle, and the Italian and Eritrean troops were only saved from complete disaster by a skilful retreat to the coast. Turkish, German and Senussi propaganda was very active throughout Tripolitania, and the Italian declaration of war upon Austria (May 23 1915) was the signal for a general rising. In these circumstances the Italians decided to abandon the interior. The withdrawal of the garrisons was not effected without serious losses. In June the troops at 'Aziziya, 40 m. S. of Tripoli city, closely besieged and having exhausted their food, broke out and attempted to reach the coast. Nearly all were killed. The last place evacuated was Ghadames, the garrison on July 19 again crossing into Tunisia. The only places retained by the Italians were the seaports of Tripoli and Homs (Khoms). In this month (on July 15) Gen. Ameglio, governor of Cyrenaica, was also named governor of Tripoli, for the better conduct of the defensive operations. The hostile forces which gathered in the neighbourhood of Tripoli city in the summer of 1915 were beaten back.

The success of the revolt induced the Turkish and German agents in the country, of whom there were a considerable number, to endeavour to bring about revolts in Tunisia and Algeria also. In Algeria they failed, but in the Tunisian Sahara some tribes, aided by forces from Fezzan led by Turkish officers, attacked the French outposts. Sharp fighting in Sept. and Oct. 1915 ended in the reestablishment of order along the frontier by the French forces. At this time, however, the chief effort of the Turks was in Cyrenaica, where Sidi Ahmad, the Senussi Sheikh, was induced to invade Egypt. The only development of note in Tripolitania until after the defeat of Sidi Ahmad by the British was the reoccupation of the seaport of Zuara by the Italians in Aug. 1916.

In Sept. 1916 Sulciman el Baruni reappeared. He landed at Misurata on the 25th of that month accompanied by German and Turkish officers and in possession of a *firman* from the Sultan, appointing him governor-general of the vilayets of Tripoli, Tunis and Algiers.¹ He was joined at Misurata by Ramadhan el Shtewi, the most powerful local chieftain, an ambitious man who proved a doubtful ally and whose real aim was independence of all other parties. He now, however, helped El Baruni, as did also Nuri Bey. Together they organized a fighting force of 6,000 to 7,000 men, with which all through 1917 El Baruni harassed the Italians, whom he boasted he would drive into the sea.

¹ To soothe his wounded feelings Sidi Ahmad was in Nov. 1916 given by the Turks the title of "Viceroy of Africa."

Though he was defeated in four separate engagements the Italians could not follow up their successes. While this fighting was going on Sidi Ahmad's expulsion from Egypt weakened Senussi prestige in Tripoli, and in the summer of 1917 the pro-Turkish party in Fezzan expelled Sidi Ahmad's brother Mahommed el 'Abid from Fezzan.

Notwithstanding the failure of El Baruni's efforts against Tripoli city, the close of 1917 saw the supporters of Turkish designs apparently masters of the country. In reality, the Arab and Berber chiefs were split into factions. El Shtewi had established a so-called republic of Tripoli and ruled at Misurata, the Senussi were divided among themselves, and one party of them, under Sidi Idris, had, as early as April 1917, come to terms with the Italians and British. The impossibility of getting the tribes to act together caused Nuri Bey to leave Tripolitania early in 1918. He was succeeded by Ishaq Pasha, who proved a harsh and unpopular commander. The Turkish Government, however, still believed that it would be possible to expel the Italians from Tripoli, and they sent thither Prince Osman Fuad (a grandson of Sultan Murad V.). The prince, who arrived at Misurata by submarine in April 1918, tried to compose the quarrels among the tribes, but did not succeed. The tribes were as jealous one of another as were the Highland clans in the "45," and powerful chiefs exercised independent authority, El Baruni and El Shtewi being the most important. They combined on occasion, and on occasion quarrelled. Such was the position when the World War ended in Nov. 1918.

The task of pacifying the country and restoring Italian authority was more difficult in Tripoli than in Cyrenaica. Sidi Ahmad had fled and Sidi Idris having consolidated his authority over the Senussi fraternity, it was possible to make with him an arrangement which bound the tribes of Cyrenaica. In Tripoli there were a dozen or more chieftains with whom to deal, and the Italians were not prepared to undertake extensive military operations. They extended their direct authority along the coast and entered into negotiations with El Baruni and the chiefs of other tribes. The result was seen in the issue of a royal decree in June 1919 in which natives of Tripoli were given "complete local citizenship," and in the creation of an elective assembly to deal with legislation and direct taxation. The immediately effective part of the decree was that the country should be governed as far as possible through native chiefs, to whom were attached political officers. El Shtewi was the last chief to agree to this arrangement; he became *mutessarif* of Misurata. As token of re-established amity the Italian flag was rehoisted at the *ksar* of 'Aziziya on June 12 1919. In Aug. Sig. Vittorio Menzinger was appointed governor of Tripoli to carry out the new policy of ruling through a local Parliament, but the chiefs cared little for such an assembly, being more concerned in consolidating their own authority. El Shtewi, particularly, gave much trouble, and in the first half of 1920 he seized and detained for weeks the commander of the troops at Homs and other Italian officers and men. He aroused the hostility of Ahmad Murad, the chief of the Tarhuna tribe, and in the fighting which followed the Italians did not interfere. A new governor, Sig. Luigi Mercatelli, was sent out in July 1920, and gradually the situation improved. The complete accord reached in Cyrenaica with the Senussi (Nov. 1920) had a tranquillizing effect. As marking the period of calm which then prevailed, the young Crown Prince Humbert in Sept. 1921 visited Tripoli and Bengazi, receiving assurances of loyalty from many chiefs.

In Sept. 1919 an agreement was reached with France rectifying the Tripolitan-Tunisian frontier, which was made to sweep in a semi-circle from the coast, so as to leave to Tripoli the direct routes between Ghat, Ghadames and Tunis. Italy also obtained economic concessions in Tunisia and an agreement as to a common railway policy (*see* AFRICA: History).

Economic Conditions, etc.—The number of inhabitants is unknown; for Tripolitania and Cyrenaica combined it may reach 4,000,000. Tripoli city had (1920) a pop. of about 73,000, and Bengazi 35,000. Europeans, mainly Italians and Maltese, number some 10,000. Most of the country is desert and there are no

perennial rivers, but there are numerous fertile oases and grazing grounds. The chief crop is barley; the date palm, the olive and the fig tree flourish. There are large supplies of esparto grass, and saffron and henna are grown. The people possess large numbers of cattle, sheep and goats, and camels, and there are good possibilities of developing the country's pastoral resources. Salt is the only mineral exploited. There are valuable sponge "fisheries" valued roughly at £50,000 yearly.

Both pastoral and agricultural development depend largely on irrigation works. As it is, neglect of cultivation (caused by constant tribal wars, overtaxation and the stoppage of the slave trade) has notably enlarged the desert area, this is obviously the case in Fezzan, where much might still be done to reclaim lands recently fertile. There is little prospect of any great revival of the trade between the central Sudan and Tripoli and Benghazi—ostrich feathers, ivory, and embroidered leather goods are, however, still brought across the Sahara by camel caravans.

The value of exports (Tripoli and Cyrenaica combined) was £213,000 in 1914, sunk to £93,000 in 1916, and had risen to £300,000 in 1918. The chief exports were skins, henna, ostrich feathers and sponges.

The figures of imports in these war years bore little relation to normal trading, imports being largely for Government services. The imports in 1914 were valued at £1,638,000, in 1918 at £3,039,000. Since 1912 the bulk of the trade has been with Italy. Colonial revenue, some £600,000 in 1914, was estimated at £1,000,000 in 1920-1. Expenses considerably exceed revenue, in 1914 the budget was balanced at £2,835,000, in 1920-1 at £5,080,000. Large sums were spent on public works, still larger sums on defence, military expenditure in 1920-1 being put at £1,650,000. In that year 1,030 officers and 25,000 men were stationed in Tripoli (16,000 being Italians). In Cyrenaica there were 540 officers and 17,000 men (6,800 Italians). The non-white troops are principally Abyssinians from Eritrea.

In 1920 there were 157 m. of railway; the principal lines were along the coast westward from Tripoli city to Zuara and southward from Tripoli by *Aziziva* to beyond Gharian. Submarine cables were laid in 1912 between Syracuse and Tripoli and Benghazi, several wireless stations were also erected. Shipping is mainly in Italian hands.

See *A Handbook of Libya*, a British Admiralty publication (1920), and *Italian Libya* (1920), a British Foreign Office handbook, with bibliography; the *Rivista Coloniale* of Rome, and the *Bollettino* of the Italian Geographical Society. (F. R. C.)

TROTSKY, LEV (1877-), Russian Communist leader, of Jewish origin, originally named Leiba Bronstein and often described as Leon Trotsky, was born in 1877, near Elisavetgrad, in the province of Kherson, S. Russia. He studied in a public school at Odessa and afterwards in the university there. He soon joined the left wing of the Social-Democratic party, took part in students' disorders, and was expelled from the university. In 1898 he was arrested for his activity as a member of the "League of Workmen of South Russia," and three years later he was deported to Ust-Kut, on the Lena river, in Siberia. He arrived at the place of his exile at the beginning of 1902, but immediately escaped, and made his way to Geneva, where he took a prominent part in the work of the Russian Social-Democratic group. He collaborated in the *Iskra*, a paper which was founded in 1901 by Lenin, Plekhanov, Martov and others. A follower of the extreme Marxian doctrine, and an irreconcilable enemy of the Liberals, Trotsky tried to create a unified Socialist party in Russia, and he spent his time till the revolution of 1905 in constant travels to and from Russia. At that time he was already well known in Russian revolutionary circles. The events of the revolution of 1905 found him in Russia, where he was publishing the paper *Borba* ("The Struggle"). He took a leading part in the direction of the revolutionary movement, and was one of the organizers of the "Soviet of Workmen of Petrograd"; he became a member of the executive committee and later on vice-president of that body. He was arrested on Dec. 5 1905, with other members of the Soviet, by order of Count Witte's Government. After a year of solitary confinement, he was tried and condemned to perpetual deportation to Siberia. At the beginning of 1907 he arrived at Obdorsk, on the shore of the Arctic Ocean, but he escaped again, took residence at Vienna, and became a constant contributor to the

Arbeiterzeitung. In 1907 he was present at the International Socialist Conference at Stuttgart, and in 1910 at that of Copenhagen. In 1910 he attended the Pan-Slavonic Congress at Sofia, where amid general consternation he delivered a vehement speech against the union of the Slavonic nations. In 1912 he was one of the organizers of the secret conference held at Troppau by the Russian revolutionary organizations abroad.

At the beginning of the World War, Trotsky as a Russian subject was obliged to leave Vienna, and he established himself first at Zurich and later in Paris, where he collaborated in the Russian paper *Golos* (afterwards *Nashe Slovo*). He strongly criticized the Socialist parties of Germany and of the Entente Powers for supporting their Governments in the war and voting for the war credits. He was one of the organizers of the Zimmerwald Conference, but, together with Lenin, he refused to sign the Zimmerwald manifesto, which he considered to be too moderate. In Sept. 1916 the publication of *Nashe Slovo* was suspended by order of the French Government, in consequence of a rebellion among the Russian troops at Marseilles, which was traced to the anti-militarist propaganda of that paper. Trotsky was arrested and ordered to leave France. Switzerland refused to receive him, and he was deported to Spain, but he was arrested again by the Spanish Government almost on the day of his arrival at Madrid. At the beginning of 1917 he sailed for the United States and took part in New York City in the publication of the Russian paper *Novy Mir*.

After the revolution of March 1917 Trotsky immediately started for Russia, but was arrested by order of the British Government and interned in a prisoners' camp at Halifax. He was released by a special intercession of Milyukov, who was at that time Russian Minister for Foreign Affairs. He arrived in Russia in May, and developed the greatest activity in Petrograd as one of the leading members of the Bolshevik party. He was one of the organizers of the Bolshevik rising on July 16 and 17, and was arrested at the beginning of Aug. for "organizing and participating in armed rebellion," but soon released by order of Kerensky. On Oct. 8 he was elected president of the Petrograd Soviet, and after the Oct. revolution he took the portfolio of Foreign Affairs and later that of War in the Council of the Commissaries of the People. He took a leading part in the political activity of the Soviet Government, representing the extreme left wing of the Communist party, and, as such, often opposed the more moderate programme of Lenin. He signed the peace of Brest Litovsk, and, in spite of his former anti-militarist declarations, became the organizer and the commander-in-chief of the Red Army. He introduced again an "iron discipline," more relentless than that practised under the Tsarist régime; deserters and disobedient soldiers were shot; a system of extensive espionage kept officers and men in constant terror; mercenary corps of Letts, Chinese, Kirghizes and Buriats were formed for the purpose of coercing and destroying the Russian elements. Particular attention was paid to the formation of specially trained detachments of cadets, devoted to the Communist régime and ready to serve it on every occasion, like the Janissaries of old Turkey. Trotsky and his friends did not shrink before a plan of a general militarization of industry. In a speech delivered at a meeting of the Third Conference of the Soviets in Moscow, he said: "All artisans will be sent into the works and transferred from one place to another, according to the indication of the Government. We will have no pity for the peasants; we will make labour armies of them, with military discipline and Communists as their chiefs. These armies will go forth among the peasants to gather corn, meat, and fish that the work of the workmen may be assured." A Moscow wireless reported that in another speech (*The Times*, March 4 1920) he declared that "The First Army of Labour so far includes 240,000 Red Army men, 7,000 civilians and employees, 7,000 military horses and 156,000 private horses." In a review of the First Army of Labour he wrote: "The Red Army detachments make a formidable labour force, certainly more efficient than, for example, those civilian detachments mobilized for the clearing of snow. The military detachments have all the advantages of proper organiza-

the Senussites to continue the conflict (*see* SENUSSI). At the beginning of 1914 the Italians held in Cyrenaica only a strip along the coast. The Senussites were masters in the interior, and thus in a position powerfully to influence the tribes of Tripolitania. Many of the Fezzani were of the Senussi fraternity.

Such was the position when in Aug. 1914 the World War began, Italy however at that time remaining neutral. Towards the end of the next month (Sept. 1914) the Fezzani—instigated by emissaries from the Senussi Sheikh—suddenly rose in revolt and attacked several small garrisons between Murzuk and the coast. By the end of Nov. the rising had assumed large proportions. The Italian Government then ordered that Fezzan should be evacuated, and Col. Miani and his troops fought their way back to the coast. As soon as the Italians had left Murzuk Mahommed el 'Abid, a brother of the Senussi Sheikh, took over control there and declared himself governor of Fezzan. Miani's withdrawal from Fezzan left the Italian garrison at Ghat—600 m. from the coast—isolated, while the garrison of Ghadames, farther N., was also in danger. Both places adjoined the French frontier, and at the invitation of the French Government the garrison of Ghat marched across the desert to Fort Flattere (a distance of 200 m.), while that of Ghadames withdrew into the Tunisian Sahara. General Tassoni, then governor of Tripoli, whose forces were increased by 6,500 fresh troops, directed the reoccupation of both oases. After hard fighting Col. Giannini retook Ghat on Feb. 18 1915, and shortly afterwards Ghadames was also regarrisoned. But on the eastern side of Tripoli fortune went against the Italians. In an engagement with the rebels between Sokna and the coast on April 29, the Libyan auxiliaries of the Italians went over to the enemy on the field of battle, and the Italian and Eritrean troops were only saved from complete disaster by a skilful retreat to the coast. Turkish, German and Senussi propaganda was very active throughout Tripolitania, and the Italian declaration of war upon Austria (May 23 1915) was the signal for a general rising. In these circumstances the Italians decided to abandon the interior. The withdrawal of the garrisons was not effected without serious losses. In June the troops at 'Aziziya, 40 m. S. of Tripoli city, closely besieged and having exhausted their food, broke out and attempted to reach the coast. Nearly all were killed. The last place evacuated was Ghadames, the garrison on July 19 again crossing into Tunisia. The only places retained by the Italians were the seaports of Tripoli and Homs (Khoms). In this month (on July 15) Gen. Ameglio, governor of Cyrenaica, was also named governor of Tripoli, for the better conduct of the defensive operations. The hostile forces which gathered in the neighbourhood of Tripoli city in the summer of 1915 were beaten back.

The success of the revolt induced the Turkish and German agents in the country, of whom there were a considerable number, to endeavour to bring about revolts in Tunisia and Algeria also. In Algeria they failed, but in the Tunisian Sahara some tribes, aided by forces from Fezzan led by Turkish officers, attacked the French outposts. As marking the period of calm which then prevailed, the young Crown Prince Humbert in Sept. 1921 visited Tripoli and Bengazi, receiving assurances of loyalty from many chiefs.

In Sept. 1919 an agreement was reached with France rectifying the Tripolitan-Tunisian frontier, which was made to sweep in a semi-circle from the coast, so as to leave to Tripoli the direct routes between Ghat, Ghadames and Tunis. Italy also obtained economic concessions in Tunisia and an agreement as to a common railway policy (*see* AFRICA: History).

Economic Conditions, etc.—The number of inhabitants is unknown; for Tripolitania and Cyrenaica combined it may reach 4,000,000. Tripoli city had (1920) a pop. of about 73,000, and Bengazi 35,000. Europeans, mainly Italians and Maltese, number some 10,000. Most of the country is desert and there are no

perennial rivers, but there are numerous fertile oases and grazing grounds. The chief crop is barley; the date palm, the olive and the fig tree flourish. There are large supplies of esparto grass, and saffron and henna are grown. The people possess large numbers of cattle, sheep and goats, and camels, and there are good possibilities of developing the country's pastoral resources. Salt is the only mineral exploited. There are valuable sponge "fisheries" valued roughly at £50,000 yearly.

Both pastoral and agricultural development depend largely on irrigation works. As it is, neglect of cultivation (caused by constant tribal wars, overtaxation and the stoppage of the slave trade) has notably enlarged the desert area, this is obviously the case in Fezzan, where much might still be done to reclaim lands recently fertile. There is little prospect of any great revival of the trade between the central Sudan and Tripoli and Benghazi—ostrich feathers, ivory, and embroidered leather goods are, however, still brought across the Sahara by camel caravans.

The value of exports (Tripoli and Cyrenaica combined) was £213,000 in 1914, sunk to £93,000 in 1916, and had risen to £300,000 in 1918. The chief exports were skins, henna, ostrich feathers and sponges.

The figures of imports in these war years bore little relation to normal trading, imports being largely for Government services. The imports in 1914 were valued at £1,638,000, in 1918 at £3,039,000. Since 1912 the bulk of the trade has been with Italy. Colonial revenue, some £600,000 in 1914, was estimated at £1,000,000 in 1920-1. Expenses considerably exceed revenue, in 1914 the budget was balanced at £2,835,000, in 1920-1 at £5,080,000. Large sums were spent on public works, still larger sums on defence, military expenditure in 1920-1 being put at £1,650,000. In that year 1,030 officers and 25,000 men were stationed in Tripoli (16,000 being Italians). In Cyrenaica there were 540 officers and 17,000 men (6,800 Italians). The non-white troops are principally Abyssinians from Eritrea.

In 1920 there were 157 m. of railway; the principal lines were along the coast westward from Tripoli city to Zuara and southward from Tripoli by *Aziziva* to beyond Gharian. Submarine cables were laid in 1912 between Syracuse and Tripoli and Benghazi, several wireless stations were also erected. Shipping is mainly in Italian hands.

See *A Handbook of Libya*, a British Admiralty publication (1920), and *Italian Libya* (1920), a British Foreign Office handbook, with bibliography; the *Rivista Coloniale* of Rome, and the *Bollettino* of the Italian Geographical Society. (F. R. C.)

TROTSKY, LEV (1877-), Russian Communist leader, of Jewish origin, originally named Leiba Bronstein and often described as Leon Trotsky, was born in 1877, near Elisavetgrad, in the province of Kherson, S. Russia. He studied in a public school at Odessa and afterwards in the university there. He soon joined the left wing of the Social-Democratic party, took part in students' disorders, and was expelled from the university. In 1898 he was arrested for his activity as a member of the "League of Workmen of South Russia," and three years later he was deported to Ust-Kut, on the Lena river, in Siberia. He arrived at the place of his exile at the beginning of 1902, but immediately escaped, and made his way to Geneva, where he took a prominent part in the work of the Russian Social-Democratic group. He collaborated in the *Iskra*, a paper which was founded in 1901 by Lenin, Plekhanov, Martov and others. A follower of the extreme Marxian doctrine, and an irreconcilable enemy of the Liberals, Trotsky tried to create a unified Socialist party in Russia, and he spent his time till the revolution of 1905 in constant travels to and from Russia. At that time he was already well known in Russian revolutionary circles. The events of the revolution of 1905 found him in Russia, where he was publishing the paper *Borba* ("The Struggle"). He took a leading part in the direction of the revolutionary movement, and was one of the organizers of the "Soviet of Workmen of Petrograd"; he became a member of the executive committee and later on vice-president of that body. He was arrested on Dec. 5 1905, with other members of the Soviet, by order of Count Witte's Government. After a year of solitary confinement, he was tried and condemned to perpetual deportation to Siberia. At the beginning of 1907 he arrived at Obdorsk, on the shore of the Arctic Ocean, but he escaped again, took residence at Vienna, and became a constant contributor to the

Arbeiterzeitung. In 1907 he was present at the International Socialist Conference at Stuttgart, and in 1910 at that of Copenhagen. In 1910 he attended the Pan-Slavonic Congress at Sofia, where amid general consternation he delivered a vehement speech against the union of the Slavonic nations. In 1912 he was one of the organizers of the secret conference held at Troppau by the Russian revolutionary organizations abroad.

At the beginning of the World War, Trotsky as a Russian subject was obliged to leave Vienna, and he established himself first at Zurich and later in Paris, where he collaborated in the Russian paper *Golos* (afterwards *Nashe Slovo*). He strongly criticized the Socialist parties of Germany and of the Entente Powers for supporting their Governments in the war and voting for the war credits. He was one of the organizers of the Zimmerwald Conference, but, together with Lenin, he refused to sign the Zimmerwald manifesto, which he considered to be too moderate. In Sept. 1916 the publication of *Nashe Slovo* was suspended by order of the French Government, in consequence of a rebellion among the Russian troops at Marseilles, which was traced to the anti-militarist propaganda of that paper. Trotsky was arrested and ordered to leave France. Switzerland refused to receive him, and he was deported to Spain, but he was arrested again by the Spanish Government almost on the day of his arrival at Madrid. At the beginning of 1917 he sailed for the United States and took part in New York City in the publication of the Russian paper *Novy Mir*.

After the revolution of March 1917 Trotsky immediately started for Russia, but was arrested by order of the British Government and interned in a prisoners' camp at Halifax. He was released by a special intercession of Milyukov, who was at that time Russian Minister for Foreign Affairs. He arrived in Russia in May, and developed the greatest activity in Petrograd as one of the leading members of the Bolshevik party. He was one of the organizers of the Bolshevik rising on July 16 and 17, and was arrested at the beginning of Aug. for "organizing and participating in armed rebellion," but soon released by order of Kerensky. On Oct. 8 he was elected president of the Petrograd Soviet, and after the Oct. revolution he took the portfolio of Foreign Affairs and later that of War in the Council of the Commissaries of the People. He took a leading part in the political activity of the Soviet Government, representing the extreme left wing of the Communist party, and, as such, often opposed the more moderate programme of Lenin. He signed the peace of Brest Litovsk, and, in spite of his former anti-militarist declarations, became the organizer and the commander-in-chief of the Red Army. He introduced again an "iron discipline," more relentless than that practised under the Tsarist régime; deserters and disobedient soldiers were shot; a system of extensive espionage kept officers and men in constant terror; mercenary corps of Letts, Chinese, Kirghizes and Buriats were formed for the purpose of coercing and destroying the Russian elements. Particular attention was paid to the formation of specially trained detachments of cadets, devoted to the Communist régime and ready to serve it on every occasion, like the Janissaries of old Turkey. Trotsky and his friends did not shrink before a plan of a general militarization of industry. In a speech delivered at a meeting of the Third Conference of the Soviets in Moscow, he said: "All artisans will be sent into the works and transferred from one place to another, according to the indication of the Government. We will have no pity for the peasants; we will make labour armies of them, with military discipline and Communists as their chiefs. These armies will go forth among the peasants to gather corn, meat, and fish that the work of the workmen may be assured." A Moscow wireless reported that in another speech (*The Times*, March 4 1920) he declared that "The First Army of Labour so far includes 240,000 Red Army men, 7,000 civilians and employees, 7,000 military horses and 156,000 private horses." In a review of the First Army of Labour he wrote: "The Red Army detachments make a formidable labour force, certainly more efficient than, for example, those civilian detachments mobilized for the clearing of snow. The military detachments have all the advantages of proper organiza-

tion and the precise order of stern discipline. The fundamental condition of the productivity of Labour Red Army men, and of workmen in the Soviet economy in general, is the arousing of the spirit of emulation. The organization of this spirit is the most important problem of economic reconstruction, and without this subjective force nothing will help, neither peat, nor coal, nor petrol, nor the removal of the blockade. It is necessary to take all measures to foster the feeling of labour conscience, both in the coöperative institutions and in the individual." At a congress of the Soviets at Moscow a resolution was passed on April 4 in favour of his proposal that labour should be organized on the principle of military conscription and obligatory work; also that the inspection of labour should be confided to special inspectors, instead of local Soviets.

Within the Soviet Government organization, as it still held power in 1921, Trotsky, Dzerjinsky and Bukharin were the leaders of the extreme left of the Communist party, and, as such, had repeatedly opposed Lenin when the latter was inclined to conciliatory measures; but the outside world generally associated the names of Lenin and Trotsky together as the embodiments of Russian Bolshevik rule. (P. VI.)

TSCHAIKOVSKY, NICHOLAS VASILIEVICH (1850-), Russian revolutionary politician, was born in 1850, at Viatka. He spent the first part of his life on his mother's estate, and studied at a public school at Viatka and later on in St. Petersburg. In 1868 he entered the St. Petersburg University and got his degree in chemistry in 1872. He took part in the "Narodniki" (populist) movement, and became one of its leaders, working for the creation of a system of societies for self-education. These societies organized lectures and provided their members with cheap and well-selected books. They had a considerable influence on the moral and political development of a whole generation of the Russian "intelligentsia."

But under the political régime of Russia in the 'seventies no public body or society could act freely if its activity was not fully approved by the Government. Every kind of repression was used against the promoters of the "narodniki" movement; and Tschaikevsky was twice arrested. Under these conditions the new party soon lost its educational character and became a revolutionary and terrorist association. Tschaikevsky did not approve of this new tendency and joined the social-religious group, which received the name of "God-men" because its members tried to find in themselves a reflection of God.

In 1874 Tschaikevsky left Russia, and a year later he went to the United States with a small party of men and women who shared his political views and religious feelings. They founded a communistic settlement at "Cedar Vale," near Wichita, in the state of Kansas, and tried to work out their new religious and social teaching. The experiment proved a failure. After two years of hard experience, Tschaikevsky and his friends were obliged to recognize that mankind was not yet ready for the communistic life which they believed to be an imminent development of the future. They regarded communistic life as senseless without a constant feeling of the presence of God in the case of each member of the community, and this essential condition could not be achieved. Therefore they returned to the "old world of antagonism." The awakening was especially hard for Tschaikevsky, who not only found it necessary to reconstruct his conception of the world, but had a family to keep and no means of livelihood. He worked for some time as an ordinary workman in a shipbuilding yard and in a sugar factory near Philadelphia. His health broke down and with his family he joined the religious community of the Shakers, where he remained for a year.

In 1879 he returned to Europe, and in 1880 took up his residence in England, renewing his active participation in the Russian revolutionary organizations abroad; he was a member of the "Red Cross of the Narodnaia Volia," and organized the supply of revolutionary literature to Russia. During the first Russian revolution of 1905-6 he made a tour of America, lecturing on the subject and collecting funds for the struggle against the Imperial

a charge of conspiracy against the Government and spent 11 months in the St. Peter and St. Paul Fortress at St. Petersburg. He was released on bail, £5,000 having been collected by his friends, chiefly in England and America. In 1910 he was brought to trial and discharged for lack of proof. He remained in Russia and took a great interest in the work of coöperative organizations.

During the World War he was very active under the flag of the Russian Red Cross, supplying food to the population of the fighting area. After the revolution of 1917, he was elected member of the Council of Soldiers, Workmen and Peasants, formed at Petrograd, where he used his influence to fight the Bolshevik propaganda. He was also elected member of the Constituent Assembly. After the Bolshevik revolution, as a member of the "Committee for the Salvation of the Motherland and of the Revolution," and of the "Committee for the Defence of the Constituent Assembly," he helped to organize the struggle against the Bolsheviks.

In 1918 he was one of the founders of the "Union of the reconstruction of Russia," an anti-Bolshevik organization of the left parties of Moscow. He was also elected member of the Ufa Directorate. On his way to Siberia, he came to Viatka, where he took the lead in an insurrection against the Bolsheviks and entered into negotiations with the Allied force at Archangel. He took part in the *coup d'état* of Aug. 2 at Archangel and became president of the Supreme Administrative Board of the North Region. After the break-up of a conspiracy of monarchist officers, he organized the Provisional Government of the North Region under his own leadership. Tschaikevsky was sent by his Government to Paris, where he represented the interests of the North Region before the Peace Conference. He was a member of the "Russian Political Delegation" in Paris till its dissolution in Feb. 1921. (P. VI.)

TUBERCULOSIS (see 27.351*).—Since the *bacillus tuberculosis* was discovered by Koch in 1882, the various forms of disease caused by its invasion have been in the forefront of medical research. The disease is known to have existed amongst the earliest civilizations. Bony tuberculous lesions have been described in Egyptian mummies, and in the Nubian collection of bones in the Royal College of Surgeons, London, are two specimens, respectively of the dates of about 3,000 and 2,000 B.C., presenting all the characteristics of tuberculous disease of the spine. Tuberculous disease of the lungs is known to have existed in very early times. The old Greek Hippocrates (born 460 B.C.) first applied the term "phthisis," and a description of its clinical manifestations may be found in his writings and those of Celsus, Aretaeus and Galen. Before the discovery of the bacillus its effects in different parts of the body were classified as distinct diseases, receiving different names:—"consumption" or phthisis for pulmonary tuberculosis, struma or scrofula for bone or gland tuberculosis, lupus for tuberculosis of the skin, and *tubercles mesenterica* of the intestinal glands.

Pathology.—Affected tissues invaded by the tubercle bacillus undergo typical changes, become inflamed, break down and perish. By the irritation which the bacilli excite, epitheloid cells are proliferated from the normal cells of the tissues, forming a tubercle, in which is usually present a "giant" cell surrounded by smaller epitheloid cells encompassed by a zone of leucocytes. Scattered amongst these cells tubercle bacilli may be found. Later the tubercles undergo degenerative changes (caseation) proceeding further to abscess formation. Repair may take place by cicatricial formation of fibrous tissue, these fibrous nodules sometimes undergoing calcareous degeneration. Bayle in the latter part of the 18th century, first described the tubercular nodule, and its distributions in other organs than the lungs.

One organ or part of the patient attacked is generally the seat of these tubercular nodules, some of which may become confluent, but the disease may take the form of an acute specific fever, clinically somewhat resembling typhoid fever, with wide spread dissemination of the infection. In this form the disease is so severe and rapid, that many of the tubercles have no time to get beyond the initial stages of their developmen

before death occurs. Such a manifestation is termed acute miliary tuberculosis. The intra-cellular or extra-cellular toxins produced by the tubercle bacillus in the course of its development are the cause of many of the pathological features associated with the disease the bacillus produces.

The tubercle bacillus is a minute rod-like, often slightly curved, organism, $1.5\mu - 3.5\mu$ in length and 0.3μ in breadth. It may stain uniformly or present a beaded appearance, the unstained beads being regarded by Koch as spores. Metchnikoff advanced the view that the bacillus as ordinarily met with is but a stage in the developmental cycle of a filamentous fungus. The organism is regarded by many as a member of the streptothrix group belonging to the hyphomycetes or mould fungi. It stains with difficulty but retains its stain, once received, with remarkable tenacity, resisting decolorization by strong acids and hence called acid-fast.

Exposed to direct sunlight or ultra-violet radiation it is rapidly slain but is of retentive vitality under certain conditions. Dr. Stenhouse Williams has shown that it remains viable and virulent in cow-dung on pasture land for at least five months, and in dung stored in the dark for twelve months, a discovery of great importance and significance in veterinary practice. It retains its virulence and capacity for development for six weeks or longer in decomposing sputum and for six months in dried sputum. The thermal death point varies between $65^{\circ}\text{C}.$ and $90^{\circ}\text{C}.$ and Swinbank has shown that it will survive a temperature of $-186^{\circ}\text{C}.$ for 42 days.

Certain antiseptics are fatal to the tubercle bacillus, 5% carbolic acid will slay it in less than a minute, and endeavours have been made to destroy the organism in living tissues by the administration of drugs, but hitherto without demonstrable success. Methylene blue and certain copper salts injected into guinea-pigs infected with tuberculosis, can be demonstrated in their tubercle bacilli, and a fascinating, but hitherto unfruitful line of chemotherapeutic research has thus been opened up, aiming at the destruction of the tubercle bacilli while parasitic in their host.

The tubercle bacillus is widely parasitic through the animal world, but different animals show widely varying degrees of susceptibility. Generally, domesticated animals are more liable to infection than wild, and captive wild animals than those in their natural state. Domestic cattle are particularly prone.

Much controversy has arisen as to the communicability of tuberculosis from animals to man. After Koch had thrown doubt on its probability at the British Congress on Tuberculosis in 1901, the British Government appointed a Royal Commission to enquire into the relationship of human and animal tuberculosis. In the second interim report of the Commission, issued in 1907, the conclusions arrived at were: "That there seems to be no valid reason for doubting the opinion, never seriously doubted before 1901, that human and bovine bacilli belong to the same family. On this view, the answer to the question—Can the bovine bacillus affect man?—is obviously in the affirmative. The same answer must also be given to those who hold the theory that human and bovine tubercle bacilli are different in kind, since the 'bovine kind' are readily to be found as the causal agents of many fatal cases of human tuberculosis." In later years the investigation has been further pursued. Pulmonary tuberculosis is rarely bovine in origin, and non-pulmonary tuberculosis does not appear to be so commonly bovine as previously supposed, the latest researches (up to 1921) in England going to show that probably approximately some 30% of cases of non-pulmonary tuberculosis are of bovine and 70% of human origin. While cows are the commonest domesticated animals infected, tuberculosis occurs in pigs, less commonly in dogs, cats, and but rarely in horses and sheep. Tuberculosis in rats has been demonstrated. In domestic fowls another variety of the tubercle bacillus, the avian, is found. Even reptiles, fishes and invertebrate creatures such as worms may be infected. While bovine bacilli are capable of infecting the human subject, especially in childhood, avian bacilli are of little human pathogenic significance.

In the evolution of pulmonary tuberculosis, human or, very rarely, bovine bacilli may be detected in the sputum, and usually are demonstrable in tuberculous pus derived from any focus. The bacilli may also sometimes be found in the blood or stools of infected subjects.

Channels of Infection.—Congenital origin, though rare, has been proved to exist. By Cobbett it has been regarded as commoner than usually supposed. Tubercle may be introduced by direct inoculation. Much more commonly the infection is produced by inhalation of dried sputum as dust into the lungs, or by the ingestion of tuberculous material into the alimentary canal. Cornet has estimated that as many as 7,200,000,000 bacilli may be expectorated by a consumptive patient in the course of a day, and it requires little consideration to show what a ready means is thus presented of infection. Recognition of this fact is of importance in prophylaxis. The vehicle of infection by ingestion is commonly tuberculous milk or butter. The portal of entry, carious teeth, tonsils or some portion of the intestine. Fatal bovine infection, though rare in adults, is not uncommon in children. Dr. Cobbett has calculated that about one-third of all fatal cases of tuberculosis in children under five is attributable to a bovine source, a matter of great importance to farming interests and preventive medicine. There is reason to believe that the relative incidence of bovine or human infection may vary according to locality. Thus in Scotland, bovine infection is probably relatively commoner than in England.

Contagiousness of Tuberculosis.—Tuberculosis is not contagious in the sense that such diseases as measles and other of the exanthemata are. The danger of infection of healthy subjects where reasonable precautions are taken, as in institutions for the tuberculous, is extremely remote. But under conditions due to overcrowding, bad hygiene, imperfect nutrition, when lowered resistance is encountered, where massive doses of bacilli are absorbed and contact is intimate and prolonged, the danger of infection is very real. The vexed question of marital or conjugal tuberculosis has been much discussed of late and should not be neglected.

Predisposing Causes of Infection.—In discussing infection, attention should be drawn to the "soil" of the patient as well as to the "seed" sown. There is variation in both individual and racial susceptibility. Thus the Irish are said to be relatively susceptible, the Jews immune. "It has been learned of late years that the number of individuals who can be shown by radiography, tuberculin tests, and autopsy findings to have some focus of tuberculosis is enormously in excess of those who are usually classed as tuberculous" (Bushnell). Tuberculous infection amongst civilized communities is well-nigh universal. The tubercle bacillus may remain latent in the individual for indefinite periods, may rapidly and in varying degrees give rise to local lesions or generalized dissemination. Its innocuousness depends both on the good health of the individual attacked, his immunity inherited or acquired, and the absence of conditions calculated to break down that immunity. Amongst the more important factors likely to facilitate morbid infection are heredity, a constitutional liability to the disease, general debility due to various circumstances; poverty and its associated conditions; overcrowding, insanitary surroundings, bad hygiene, insufficient or unsuitable food, exposure, trauma, alcoholic excess, insanity, syphilis and other diseases; unfavourable climatic influences, occupations, etc. Dr. Browning has shown that the common age-period of phthisis may vary in different localities. Thus, it is earlier in the Shetland Is. than in London. The age of maximum mortality appears to be increasing. In the middle of the 19th century it was 25 to 35 years; in 1921 it was 45 to 55 in males, 35 to 45 in females.

Control and Eradication of Tuberculosis.—With the discovery of the causal factor of this disease and an ever-extending acquaintance with the conditions favouring its pathogenicity, it became possible to initiate, investigate and undertake scientific methods for its control and eradication. The problem, however, is of infinite complexity. Up to 1921, no certain method of immunization against infection had actually been discovered, and no specific treatment comparable to that employed in dealing with syphilis had been devised. Till the uninfected population can be safely immunized against tuberculosis and the infected population cured by specific measures, the laborious and often complicated methods now employed, constantly improved and elaborated, will constitute both our means of prophylaxis and of attempted cure. Tuberculosis is protean in its manifestations and the methods directed against the disease are of corresponding variety. Certain general principles in treatment may, however, be laid down. These comprise the adoption of all those measures calculated to increase the patient's power of resistance and preserve and restore the part or parts attacked. Life in the open air under suitable climatic and

TUBERCULOSIS

good hygienic conditions, with ample and easily assimilated food, rest while the disease is acute, absence of worry or fatigue, graduated exercise later, and education in the mode of life to be followed are details of first importance. Drugs are chiefly of value in the treatment of symptoms and complications. The introduction of tuberculin by Koch raised vast hopes which have not been fulfilled. Numerous varieties of tuberculin have since been manufactured and employed which still fall short of the anticipations of their originators. Sir Almroth Wright placed tuberculin therapy on a more scientific basis: his opsonic theory giving promise of a means of scientific administration and control. In 1887 Sir Robert Philip introduced the scheme known as the Edinburgh system for the coördination of efforts, applicable to all phases of the tuberculosis problem. It has the tuberculosis dispensary as the centre of its activities, with trained physicians and nurses for educating, treating and directing the patient, examination of contacts, distribution of patients requiring institutional care to the tuberculosis hospital or sanatorium where advanced cases can be segregated, and early cases receive curative treatment. Later, facilities are given for continued aftercare or treatment and training in a farm colony. The scheme is a practical and comprehensive one and has been the pioneer of other analogous efforts elsewhere. The value of this coördination of methods cannot be sufficiently emphasized.

Marcus Paterson by graduated exercise has shown how much may be safely and advantageously done by auto-inoculation of the patient by his own tuberculin. Varrier-Jones at Papworth has demonstrated the value of the tuberculous colony with facilities for treatment of pulmonary tubercle in all stages of the disease, and where prolonged segregation in village settlements is encouraged under reasonable conditions. The patient is trained and his labour subsidized. The value of rest in the treatment of all forms of acute tuberculous disease has inspired surgical interference for securing more complete rest to the diseased and damaged lung in the hope of procuring cure. Forlanini demonstrated the feasibility of introducing by injection gas into the chest to secure the collapse and rest of a tuberculous lung. This manoeuvre, introduced into Great Britain by Lillingston and others, has proved of considerable value in carefully selected cases. This method of treatment is known as the induction of artificial pneumothorax and has proved of dramatic value in the treatment of many patients who were in an apparently hopeless condition.

In non-pulmonary conditions such as tuberculous disease of the bones, joints and glands, for long the condition was regarded as a local disease, comparable to a malignant tumour. This "tuberculome" conception, aided by the discovery of anaesthetics and antiseptics led often to extensive operations being undertaken with a view to the extirpation of infected tissues. The results in the more severe conditions were frequently unsatisfactory, the mortality both direct and indirect high, deplorable orthopaedic results frequent, sinus formation and subsequent secondary infection common. The present trend of surgical opinion is avoidance where possible of severe radical measures and the adoption of conservative treatment. While the disease is acute the patient is kept at rest, the part affected immobilized, orthopaedic measures are employed to prevent or correct the severe deformities which are frequent in tuberculous lesions of the bones and joints, tuberculous abscesses are evacuated, preferably by aspiration. Later, when ambulatory treatment is permissible the lesions are suitably immobilized in appropriate splints. Institutions for these cases should be specially designed and staffed and situated in suitable localities at the seaside or in the country. Auxiliary methods of treatment such as heliotherapy (sun treatment), X-ray treatment, etc., play an important part. As treatment is necessarily lengthy it should be associated with education for children, technical training for adolescents, and occupation for adults. In this way the monotony of long enforced recumbency is relieved and the *moral* of the patient preserved. The value and low mortality of such treatment may be illustrated by Table 1, showing the results achieved at the Treloar Cripples' Hospital, at Alton.

TABLE 1. Analysis of results of treatment of patients suffering from surgical tuberculosis at the Lord Mayor Treloar Cripples' Hospital, Alton, Hants., from the opening of the Hospital in Sept. 1908 to Jan. 31 1921.

Lesion	No. admitted	No. discharged	Disease arrested	Improved	Unimproved	Removed or Transferred	Died	Average length of stay in days
Spine . . .	920	810	674	22	24	68	27	503.2
Hip . . .	880	768	710	18	2	25	13	413.1

Other . . .	354	315	265	16	5	19	9	259.8
	2487	2197	1931	63	31	123	56	382.5

During the decade 1910-20 greatly increased public interest was manifested in serious and organized endeavours to deal with the tuberculosis problem. In England and Wales prior to the passing of the National Insurance Act, 1911, it was competent to sanitary authorities, under the powers of section 131 of the Public Health Act, 1875, to provide dispensaries and residential institutions for the treatment of persons suffering from tuberculosis, and some authorities had initiated a campaign of prevention and treatment. At the beginning of 1912, 1,500 beds in institutions had thus been provided by British sanitary authorities for treatment of tuberculosis; 57 sanitary authorities also had contracted for use of beds in private sanatoria; 30 tuberculosis dispensaries had been established by local authorities; and 50 by voluntary effort. The need for a national campaign assisted by contributions from the British Exchequer became evident. This need was recognized by the National Insurance Act, 1911, which included provision for "sanatorium benefit" of insured persons. Under this Act and the Finance Act, 1912, a capital sum of £1,500,000 was made available in the United Kingdom for the treatment of tuberculosis. After the passing of the National Insurance Act a departmental committee on tuberculosis was appointed to report upon the consideration of the problem in its preventive, curative and other aspects. The recommendations of this committee had an important influence on subsequent policy. Compulsory notification of pulmonary tuberculosis was enforced in 1912, and of all forms the following year. In July 1912 domiciliary treatment of insured patients suffering from tuberculosis was approved by the Local Government Board. Schemes for the institutional treatment of tuberculosis became gradually formulated. The extent to which official schemes had been brought into operation in England and Wales may be gathered from the following figures. On April 1 1921, the number of approved dispensaries was 411; officers and assistant officers for tuberculosis, 341; residential institutions, 418; the number of beds available in these institutions was 17,352; the total gross maintenance cost of tuberculosis schemes for 1919-20 was £1,953,992. The amount of Government grant for 1919-20 was £619,941. All this was accomplished notwithstanding the severe setback to anti-tuberculosis endeavour which was an inseparable effect of the World War.

On July 1 1919 the powers of the Local Government Board in relation to the tuberculosis schemes of local public-health authorities and of the Insurance Commissioners in relation to the administration by the Insurance Committees of the sanatorium benefit of insured persons under the National Insurance Act 1911 devolved upon the Minister of Health, and one central department was made responsible for the guidance and supervision of the work of the two classes of local bodies principally concerned (apart from Poor Law authorities) in the conduct of measures for the prevention and treatment of tuberculosis. The National Health Insurance Act, 1920, was further designed to simplify administration by providing for the discontinuance of sanatorium benefit within 12 months of the passing of the Act, and insurance patients needing institutional treatment for tuberculosis may obtain it at the hands of the local authorities under the schemes undertaken for the provision of such treatment for the population generally of their respective areas. This transfer of authority came into force on May 1 1921. The Tuberculosis Act 1921 carried this legislation a step further by enabling local authorities to provide approved schemes for the treatment of all patients suffering from all forms of tuberculosis, and on their failing to do so empowered the Ministry of Health to deal with the matter, debiting the cost to the authorities concerned.

(ii.) all forms of tuberculosis 1920 1,128

In April 1919 an important inter-departmental committee was pointed jointly by the Local Government Board and Ministry Pensions, "to consider and report upon the immediate practical steps which should be taken for the provision of residential treatment for discharged soldiers and sailors suffering from tuberculosis and for their reintroduction into employment, especially on the land." The report of the committee laid stress on the fact that the problem of the tuberculous ex-soldier or sailor is only one part of the national problem of dealing with tuberculosis, and considered that "the best interests, both of the country and of the service man, will be served first by making the best possible use of all existing means of treatment, and then by expanding, improving, and increasing these means as rapidly as possible." It reported that existing accommodation was most seriously inadequate in quantity, and advocated in addition to the development of schemes for the institutional treatment of tuberculosis, provision of facilities for the training, both occupational and vocational, of sanatorium patients in suitable industrial and other occupations, and also for their permanent settlement, after training, in village communities where they could earn a livelihood under sheltered conditions, owing to considerations of economy, the recommendations of this committee as to developments on the lines of training colonies, village and industrial settlements, were temporarily hampered, but doubtless are destined to fructify as economic conditions improve. Valuable information as to the development of Public Health schemes for the treatment of tuberculosis is in the annual reports of the Chief Medical Officer of the Ministry of Health and other government publications.

While the above records official encouragement and exhortation to the measures calculated to assist in the eradication and treatment of tuberculosis, tribute should be paid to philanthropic and other agencies which have been at work, and which have afforded valuable information on the lines on which policy should be directed. By progressive legislation voluntary work has tended to become more and more subsidized by the state. An instance of such combined activity on a large scale is afforded by the King Edward VII. Welsh National Memorial Association, which was founded in 1910 for the prevention and eradication of tuberculosis and other diseases in Wales. For the furtherance of this aim Wales (with Monmouthshire) is divided into 14 dispensary areas in each area. In each area there are a number of visiting stations at which patients are seen and examined at frequent intervals. There were 90 of such visiting stations in 1921. In addition, hospital beds and sanatoria are provided for the treatment of all forms of tuberculosis. From its inception up to 1921 the association's officers had examined 76,500 patients. If these 7,800 were treated at sanatoria and 14,200 at its hospitals.

Tables 2 (by courtesy of the Ministry of Health), 3 and 4 give details as to the incidence of tuberculosis in Great Britain. Commenting on these tables, Sir George Newman remarks on the considerable decline in the number of new cases, of both pulmonary and non-pulmonary tuberculosis in 1919; in 1920 there were 3,310 fewer new cases of pulmonary tuberculosis than in 1919. Regarding Table 3 he states that the causes of increase of tuberculosis mortality during the war are generally ascribed to underfeeding or lack of particular varieties of food materials, greater industrial employment of women (often in unfavourable conditions and under much stress and strain), exposure and fatigue, and the great outbreak of influenza. Similar increases were observed in other countries, both neutral and those directly engaged in the war. It is significant that the increase during the war was particularly great in lunatic asylums and among women aged 20-25 years—many of whom were employed in munition works. Sir George Newman further adds: "The past history of the decline of tuberculosis is full of instruction as to the future." He suggests that we should (i) fortify the powers of resistance of the individual to disease; (ii) prevent the spread of infection; (iii) undertake all the general health reform which is necessary; (iv) educate and lastly—we must revise and apply in a proper and effectual way the particular methods with which we have made a substantial beginning—notification, domiciliary and dispensary treatment, the sanatorium, the training colony, the village settlement and the proper means of after-care. The local administration of these matters should be unified under the local authority and its medical officer of health.

UNITED STATES

An extraordinary decline in the mortality from tuberculosis in the United States decreased the rate for the whole country from 202 per 100,000 inhabitants in 1900 to 160 in 1910, 21% less, and to 114 in 1920, 29% less than in 1910 and 43.5% less than in 1900. In New York City the decline was even more notable, the rate being 280 for 1900, 210 for 1910 and 126 for 1920; this was a fall of 25% between 1900 and 1910, 40% be-

TUBERCULOSIS

tween 1910 and 1920 and 55% between 1900 and 1920. In 1900 the New York City rate was 29% in excess of the rate for the United States; in 1910 it was 24% higher; but by 1920 conditions had so improved that it was only 9% higher. The chance of dying from tuberculosis in New York City in 1920 was about one-third that in 1900 and a little more than half that in 1910. Such a remarkable improvement in so crowded a city is unparalleled in the history of tuberculosis.

During the decade 1910-20 the fall in the death-rate was by no means uniform. Between 1912 and 1915 the mortality from tuberculosis throughout the country was almost stationary (150 in 1912 and 146 in 1915), while between 1916 and 1918, the period of the World War and the epidemic of influenza, the rate rose from 142 to 150. Virtually the same conditions obtained in New York City (201 in 1912, 196 in 1915, 182 in 1916 and 188 in 1917). The greatest decline was after 1918: from 184 in 1918 to 126 in 1920 for New York City and, during the same period, from 150 to 114 for the United States.

TUBERCULOSIS* DEATH-RATE OF NEW YORK CITY
AND OF THE UNITED STATES† 1900 TO 1920

* All forms of tuberculosis. † U.S. Registration area which in 1920 included 85% of the population or 87,486,713 inhabitants.
G. J. DROLET, Statistician
New York Tuberculosis Association.

The registration of deaths became more exact and complete. A consideration of the conditions described on page 358 of Vol. XXVII, as being widespread late in the 19th century shows how much registration had been needed. Registration, the creation of state, not Federal, legislation was provided for only gradually by the necessary state laws. In 1910 the Registration Area of the United States covered 58.3% of the population; by 1920 nearly three-fourths of the states, with about 80% of the population of the country. The fact, therefore, that the tuberculosis death-rate shows a marked decline at the same time that the reporting of deaths has come under better control accentuates the great improvement. As has always been the case, pulmonary tuberculosis accounts for about seven-eighths of the deaths from tuberculosis of all forms. In 1920 the rate (pulmonary tuberculosis) for large cities ranged from 54 per 100,000 for Portland, Oregon, to 281 for Denver, to which city many tuberculosis patients have resorted. Chicago's rate was 83 and Philadelphia's 121; Boston's was 126, the same as that of New York City.

The decline in mortality was due to many factors, which in 1921 could not be formulated and estimated. The influenza epidemic played its part, but in a manner not definitely understood. The great wave of this disease swept the country in the autumn of 1918. It is significant that for the first time on record there was in that year a marked autumnal increase of tuberculosis deaths above the normal. For example, in Oct. 1917, the deaths from tuberculosis in New York State were 1,080, a rate of 122.2. This was an average incidence which had been maintained for years. In Oct. 1918, the month of the influenza epidemic, 1,520 deaths from tuberculosis were reported—an increase of about 50%. Oct. 1919 showed only 813 deaths, and Oct. 1920 726 deaths. It is conceivable that influenza carried off thousands of consumptives who would have contributed to the tuberculosis

mortality later; and, that these potential deaths for later years, thus compressed into 1918, reduced the rate during the succeeding years. Nevertheless, influenza can have been only one of several or many factors. Economic and social movements played their part. It seems certain that tuberculosis to no small extent has yielded to the remarkable organized efforts directed against it in the United States.

The keynote of the American struggle against the disease has been organization. Founded in 1904, the National Tuberculosis Association developed into probably the most effective public health body in the United States. With its subsidiary state and local societies it reaches into every hamlet. Few men and women, interested actively in tuberculosis, are working otherwise than in connexion with the National Association. Perhaps its greatest achievement is that it calls the attention of a vast proportion of the population to tuberculosis and educates them in it through its unique way of raising funds to carry on its work. Every year, during the month of Dec. its subsidiary societies sell, at one cent each, stamps called Christmas seals, which may be used (not as postage) to fasten and embellish envelopes. Their sale in 1921 had reached the enormous yearly total of more than 500,000,000 and yielded more than \$4,000,000 for the work of the Association.

Treatment.—The elements of the routine treatment of tuberculosis changed but little during 1910-20, but therapeutic resources expanded greatly. In 1920 there were more than 600 sanatoria for the treatment of pulmonary tuberculosis in the United States. These were maintained by states, cities, counties, private individuals and corporations, and by endowments. Under N.Y. State law every county must erect and maintain an institution for the care of its tuberculous population. Some trade unions and fraternal organizations established sanatoria for their members. The Metropolitan Life Insurance Co. of New York built for its employees one of the best sanatoria in the country. The trend away from sanatorium treatment which is to be observed on the continent of Europe has not been manifest in the United States. Artificial pneumothorax is the only surgical measure which has gained anything like a vogue: American observers are unanimous as to its usefulness in selected cases. Heliotherapy and phototherapy for surgical tuberculosis were used, but only sporadically, and very few reports as to their results appeared in American medical literature. Chemotherapy was under extensive experimentation at the Phipps Institute in Philadelphia and at the University of Chicago: results have not warranted its application to human tuberculosis. Tuberculin treatment is practised with more discrimination than formerly.

The decade was notable for the use and development of the X-ray in the diagnosis of pulmonary tuberculosis. As an aid to diagnosis it became indispensable in routine tuberculosis practice. It is the better American opinion that the roentgenologist must work hand in hand with the practitioner and that good diagnostic judgment is attained only by the proper analysis and evaluation of information yielded by physical examination, laboratory procedures and X-ray observation together: no single one of these will alone suffice in routine diagnosis. Diagnosis of tuberculosis by tuberculin was practically abandoned, few cases having proved amenable to this method.

The practitioner of 1920 regarded tuberculosis from a point of view quite different from that of 1910. The relatively recent disclosure that tuberculosis exists as a latent infection in almost all people and that infection confers a measure of specific immunity to reinfection gave rise to the almost necessary presumption that adult pulmonary tuberculosis develops from infection acquired in childhood and that the adult is insusceptible to exposure to infection from without. By 1915 this opinion had become almost a dogma. But during 1918-20 opinion became less positive; an increasing number of studies by American authorities showed that conditions are only relative. Although early infection and immunity therefrom are conceded, it is maintained that infection is capable of complete healing and that immunity may greatly diminish or even disappear; and that, therefore, there is every likelihood that reinfections—and active disease from them—are possible at any period of life.

The study of tuberculosis and medical education in connexion with it received a great impetus from several directions. The Phipps Institute at Philadelphia was established at the opening of the decade; a tuberculosis research laboratory at Johns Hopkins University in 1916; and one in connexion with the National Jewish Hospital for Consumptives at Denver in 1918. Edward L. Trudeau, the recognized pioneer and leader of tuberculosis activities in the United States, died in 1915. During the last year of his life there was planned the Trudeau School of Tuberculosis, the first of its kind, to give systematic instruction to physicians. This held its first session at Saranac Lake, N.Y., in 1916, and was so successful that several others were established in other parts of the country. As a memorial to Trudeau, funds were raised to establish the Edward L. Trudeau Foundation, which aims to carry on research work and the Trudeau School and assist in the administration of the Trudeau Sanatorium. In 1916 *The American Review of Tuberculosis*, a monthly scientific periodical, was founded by the National Tuberculosis Association. It was in 1921 the only tuberculosis journal in the United States and had done much to stimulate the study and investigation of the subject.

Perhaps the most significant and unique achievement of the period was the Framingham (Mass.) Health and Tuberculosis Demonstration. Supported by the Metropolitan Life Insurance Company and the National Tuberculosis Association, this agency undertook a tuberculosis survey of a community of 15,000 people, to extend through six years. The work began in 1916. By 1920 the greater part of the population had been studied in its medical, economic and sociological relations. The survey established many facts, which seemed likely to serve as important data upon which future campaigns against tuberculosis might be based. Between 1916 and 1920 the tuberculosis death-rate of the community fell from 121.5 to 64.5 per 100,000. At the same time it was shown that the ratio of active cases to deaths was 9 or 10 to 1, instead of 3 to 1, the ratio which records of the community had previously shown. The survey supplied standards of diagnosis and treatment, of case detection, of school, factory and home control, of necessary expenditures against tuberculosis, etc., which promised to be of service not only to the whole nation but to the world at large.

(A. K. K.)

TUNISIA (see 27.393).—The pop., according to the 1911 census, consisted of 1,739,744 natives; 11,300 Maltese and 50,477 Jews. There are but few Arabs, the majority of the population being Arabic-speaking Mussulman Berbers. The chief feature of the European population is the presence of large numbers of Italians, who compete with the French in influence, and who have certain privileges with regard to language and education. According to the 1921 census the European pop. amounted to 156,125, of whom 54,477 were French, 84,819 Italian, and 13,509 Maltese. These figures show an increase of 8,000 in the French inhabitants since the census of 1911, and augur well for the further development of French immigration to the protectorate.

Since 1905 Tunis has had a Consulting Conference formed by 45 French members chosen by universal suffrage, and 16 natives, one of whom is Jewish, nominated from among the notables by the Government. This body expresses its views on all financial matters of interest to Tunis, whenever any fresh reforms place further burdens on the country.

The country is essentially agricultural, and cereals are raised on a large scale. In 1919, 514,861 hectares were under wheat, and produced 1,450,000 quintals. Vines are grown intensively over 23,246 hectares, and in 1919, 444,157 hectolitres of wine were produced. Olive trees cover a section of the country, and produced 191,836 quintals in 1919. The export of olives has a promising future. Fishing and the sponge industry occupy quite a number of the population. Iron and zinc are another resource, 360,453 tons of iron were extracted in 1919, their value being 14,500,000 francs. The chief mineral wealth of the protectorate lies in the immense phosphate deposits, which are worked on a big scale. In 1919, 815,385 tons were extracted, of a value of 36,692,325 francs; this is a considerable drop, for in 1915 the tonnage figure was 1,075,214 tons. There are valuable quarries and mineral springs. General trade in 1919 amounted to 487,789,000 francs, of which 285,761,000 francs represented imports. The share of France in the imports was 92,309,893 and of Great Britain 67,106,084 francs. Of the exports France absorbed 129,932,000, and Great Britain 15,670,000. In 1918 the total general trade amounted to 436,990,000 francs, 207,442,000 francs of which were imports. In the last normal year before the World War, the figure was 322,918,000, of which 144,256,000 francs were imports.

TUPPER, SIR CHARLES, BART. (1821-1915), Canadian statesman (see 27.410), died Oct. 30 1915.

TURBINES, STEAM (see 25.823 and 842).—The progress of the steam turbine during 1910-21 was very marked both as regards size and efficiency. The pure Curtis type, in which

velocity compounding exists at every pressure stage, has been abandoned, except possibly for very small powers, and the design of impulse turbines now follows generally along the lines first laid down by Rateau, and developed principally by Rateau and Zoelly. A single Curtis wheel is frequently used to absorb the velocity due to the expansion of the steam in the first stage, as this practice permits of a greater heat drop in that stage, so that the pressure and superheat are considerably reduced before the steam is admitted to the body of the turbine. Velocity compounding is recognized as less efficient than the abstraction of the energy of the steam by single impulse blading, but the practical advantage of obtaining a large heat drop in the first stage is often considered to outweigh a slight loss of efficiency. The typical impulse turbine of to-day consists of a horizontal shaft carrying a number of disc wheels, each furnished with a single row of blades around its circumference, and running in its own separate compartment. The diaphragms which separate the compartments contain nozzles which are so proportioned that the steam expanding in them from the pressure which exists in one compartment to that in the next acquires just the velocity which can be efficiently absorbed by the wheel in the second compartment. The description later of a modern impulse turbine will make clear its construction and principles of action.

The reaction machine still maintains its position as regards efficiency and, like the impulse machine, is employed for very large powers. In modern machines, although the thermodynamic principles are identical with those of the earlier machines, there has been a considerable change in details of construction. The modern reaction turbine is frequently fitted with a velocity compounded impulse wheel, upon which the steam acts before passing to the reaction blading, the reason for this being the advantage of reducing the temperature and pressure of the steam before it is admitted to the body casing. It is not unusual to design the impulse wheel so that it absorbs about one quarter of the available energy of the steam, with the result that the drum may be materially shortened, the number of rows of reaction blading greatly reduced, and the cost of the turbine lessened. Other features which are typical of modern reaction machines are the great care taken to eliminate causes of distortion in the casing, by avoiding ports and irregularities of the metal. The casing is always made as symmetrical as possible.

The Reaction Steam Turbine.—Enormous progress has been made with the reaction turbine invented by Sir Charles Parsons, both as regards size and efficiency, and corresponding mechanical developments have taken place in the design. Land turbines of more than about 10,000 K.W. capacity are usually constructed in two or more parts, each part being a complete turbine, but utilizing only a portion of the total pressure drop of the steam. Sometimes the parts are placed side by side, each driving an independent electric generator, but otherwise they are arranged in tandem on a continuation of the same shaft.

This latter arrangement is illustrated in fig. 1, which shows a section through a large modern two-cylinder machine constructed by Messrs. C. A. Parsons & Co. Ltd. The steam passes from left to right through the blading of the high-pressure cylinder, and is then conducted by means of the circular external pipe to the centre of the low-pressure cylinder. Here it divides, flowing axially in each direction through the blading to the exhaust branches whence it passes to the condenser beneath. The low-pressure cylinder is built on the "double flow" principle in order to avoid the excessive length of blades and size of exhaust branch which would otherwise be required. In turbines of the reaction type there is a difference of pressure between the two sides of every row of blades, and there is thus a corresponding tendency for the steam to leak past the row without passing through the blading. This leakage was a source of considerable inefficiency, and to minimize it, the custom was to employ the smallest practicable radial clearance between the tips of the blading and the opposing surface of the drum or casing. These fine clearances were a source of weakness, as in the event of a slight distortion of the parts by straining or uneven heating, or in case of vibration occurring, there was always a chance of contact occurring, and the danger of this resulting in a stripping of the blades. In order to avoid the fine radial clearances with their attendant danger, Messrs. Parsons introduced the system of end-tightened blading, which now represents their standard practice for the high-pressure end of the turbine where the density of the steam makes fine clearances essential. This is illustrated in fig. 2.

TURBINES, STEAM

FIG. 1

It will be noted that the spacing pieces at the roots of each row of blades project above the surfaces of the rotor and cylinder, as the case may be, and form a continuous barrier. There is a thin brass shrouding strip rivetted to the free ends of the blades, which projects over the side of the blades and is almost in contact with the barrier of the next row. The space between the projecting edge of the shrouding strip and the adjacent barrier forms the actual working clearance which can be adjusted to any desired amount while the machine is running. The radial clearances between the shrouding and the surfaces of the rotor and casing are never less than $\frac{1}{16}$ in., so that contact is out of the question. Considerably greater economy is said to be obtainable with this type of blading.

FIG. 2

The modern type of blading is illustrated in fig. 3. The blades, made of drawn brass strip, are assembled in units, complete with spacing pieces and shrouding. The blades and spacing pieces are brazed solidly together at the roots, and circumferential serrations are then cut in the solid part as shown.

The following table gives the results actually obtained with certain large turbo alternators of the Parsons Company:—

Installation	Chicago	Carville	Lots Road	Dunstan
Date of test	Nov. 1918	Nov. 1919	June 1916	Mar. 1921
K.W. Economical rating	20,000	10,000	15,000	12,000
K.W. Output	21,227	9,991	15,047	11,967
Speed, r.p.m.	750	2,442	1,000	2,400
Gauge pressure at stop valve, lb.	202.4	251	176.5	175.7
Temperature at stop valve, deg. F.	548.7	687	524.3	607.1

Vacuum, ins. Hg.	1.13	0.96	0.97	1.02
Heat drop, B.Th.U. per lb.	408	459.4	402.8	421.2
Steam consump. per K.W.H.	10.84	10.04	11.82	10.80
Efficiency ratio	77.4	73.98	71.80	75.20
Thermodynamic efficiency	25.31	25.7	23.35	24.70
Length of time turbine had been working	5 years.	2½ years.	3 years.	4 years.

In all cases the instruments used were calibrated before and after the tests, and the steam consumption was obtained by weighing the condensate, so that a very high degree of accuracy was obtained. The tests go to show, incidentally, that reaction machines do not fall off in efficiency after several years' operation under commercial conditions of service.

FIG. 3

The Impulse Steam Turbine.—The Rateau steam turbine is a typical modern multistage impulse turbine. Fig. 4 shows a longitudinal section through a machine of this type constructed in 1919 by the Metropolitan Vickers Electrical Co. for the Dalmarnock power station, the machine in question having a maximum continuous rating of 18,750 K.W. at a speed of 1,500 revs. per minute. The shaft carries altogether 15 wheels keyed upon it, each wheel running in a separate compartment. The diaphragms dividing the compartments from each other are fitted with nozzles, in which the steam undergoes successive partial expansions in its progress through the turbine, and from which it emerges with a velocity due to the drop in pressure which it has undergone. This velocity is abstracted by the action of the blading which the steam enters after issuing from each set of nozzles, the steam being brought more or less to rest and the energy due to its partial expansion appearing as useful mechanical work on the shaft.

In all large machines of this type, especially when they are working with a high vacuum, the volume of the steam at the low-pressure end becomes so great that the length of the turbine blades at this part tends to become excessive. In the machine in question a part of the steam, after having passed through 10 wheels, being then at a pressure of about 4 lb. abs. is passed out of the casing and used to heat the boiler feed water, the feed heater for this purpose being shown in section in the illustration. This practice diminishes

to a certain extent, the volume of the steam which passes through the remaining wheels, but in the machine illustrated, the makers have employed a special device to permit a reduction of the length of the last row of blades. The steam which enters the last wheel but one, is divided into two parts, that which acts on the outer annulus of the blade ring passing away directly to the condenser, and only that which acts on the inner annulus being afterwards conducted to the final wheel. The blading on the last wheel therefore only deals with about half the weight of steam which passes through the preceding wheel, and it can handle this amount at a very reduced pressure.

A rigid coupling is fitted to connect the turbine shaft with the shaft of the alternator, and the turbine shaft is located axially by means of an adjustable thrust block of the Michell type which takes care of any unbalanced end pressure along the shaft.

The mean diameter of the blading of this machine is 84 in. and the length of the last row of blades is 24 inches. The mean circumferential velocity of the blading is 550 ft. per second, the tip velocity of the longest blades being 708 ft. per second. The turbine is designed to work with a stop-valve pressure of 250 lb. per sq. in., a temperature of 650° F. and a vacuum of 0.9 in. of mercury, thus having an available heat drop of 455.2 B.Th.U. per lb. of steam. Under these conditions the guaranteed steam consumption is 10.2 lb. per K.W.H., this figure being the same for both 15,000-K.W. and 18,750-K.W. load.

The Ljungstrom Steam Turbine.—In the early days of the reaction turbine, a number of machines were built by the Hon. C. A. Parsons in which the steam passed radially outwards between two discs carrying rings of blades projecting axially from their opposed faces, one disc being stationary and the other driving the shaft of an electric generator. Mechanical difficulties were experienced, principally due to the distortion of the discs by uneven heating, and the design was soon completely abandoned in favour of the axial flow type. In the year 1910 Messrs. Birger and Frederic

Ljungstrom of Stockholm built an entirely new type of radial flow reaction machine which was conspicuous not only for its mechanical merits but for its great efficiency. The Ljungstrom turbine is now being developed in sizes up to 30,000 K.W. capacity, and is manufactured in Great Britain by the Brush Electrical Engineering Co. and in the United States by the General Electric Company. The steam is admitted between two discs and in its passage from their center to their circumference it passes through concentric blading rings mounted alternately on the faces of the discs. The discs revolve at equal speeds in opposite directions, so that the relative blade speed is twice as great as in an ordinary machine of the same

revolutions and diameter, with the consequence that for equal efficiency the number of blade rings is only one quarter as great. Each disc is fastened to the end of a separate alternator shaft, and as the turbine comes up to speed, the alternators come automatically into synchronism and operate in parallel so that they act virtually as a single machine.

The mechanical construction of the Ljungstrom turbine is unique. Fig. 5 shows a section through a machine to develop 5,000 K.W. at 3,000 revs. per minute, the illustration including the two ends of the alternator shafts, upon which the turbine discs are mounted. The construction will be better understood by reference to figs. 6-10 which show the most important details to a larger scale. The steam enters the turbine through the branched pipe shown in fig. 5 and thence passes to the centre of each disc through the holes marked 2 in figs. 6 and 7, which illustrate the disc alone. It will be seen that the face of the disc contains a number of circumferential grooves. Each groove carries a blade ring, shown to a larger scale in fig. 8, in which 1 represents the disc; 2 a seating ring; 3 a caulking strip; 4 an expansion ring; 5 and 6 rolling edges; 7 steam packing ring; 8 caulking strips; 9 strengthening ring; 10 dovetail profile ring; 11 the blade itself. These blade rings are interleaved as they project alternately from the discs, and steam leakage is checked by the thin fins 7. The blades are made from drawn steel strip and are welded solidly into the strengthening rings 10.

The conical steel expansion ring, 4, is a particularly important feature of the blading system, and similar rings will be seen at 1 in fig. 7, where they serve to connect the three parts of which the disc is composed. The ring of holes shown at 3 in fig. 7 is to admit the extra steam necessary for overload conditions, the inner rings of blading being then short circuited. The pressure of steam in the blading naturally tends to thrust the discs apart. It is therefore balanced by an arrangement of "dummies," or labyrinth discs, as shown in fig. 5. A detail of the labyrinth, to a larger scale, is given in fig. 9. To prevent the high-pressure steam leaking along the shafts, these are fitted with labyrinth packings, a portion of one of these packings being illustrated in fig. 10. The whole packing consists of a number of rings keyed alternately to the shaft and to the housing and having deep-grooves turned circumferentially in the

sides. The rings interleave in the manner shown, the edges of the grooves being bent down so as practically to make contact with the walls of the grooves in the adjacent rings. An extremely effective and compact labyrinth is thus formed.

The efficiency of the Ljungstrom turbine is remarkably high for machines of moderate capacity. Independent tests of a 1,500-K.W. machine, after 15 months' service, have shown a steam consumption of 11.95 lb. per K.W.H., with steam at 208 lb. per sq. in. abs. and 569° F. temperature, and a vacuum of 1.29 in. Hg. The no-load consumption of the same machine was only 1340 lb. per hour, or 7.5% of the full-load consumption.

The appearance of a complete Brush-Ljungstrom turbo-alternator is shown in fig. 11.

FIG. 9

Steam Conditions in Turbines.—The steam consumption of a turbine depends not only upon the excellence of its mechanical design but upon the amount of heat in every pound of steam delivered to the turbine which is available for conversion into work. The available heat may be increased by increasing the pressure and temperature of the entering steam and by lowering the pressure at which it is exhausted. Progress in these directions is limited by constructional difficulties, but nevertheless striking advances have been made. The best practice of the time may be exemplified by the 10,000-K.W. machine installed in 1910 at the Carville station of the Newcastle Electric Supply Co., which operated with steam at 190 lb. per sq. in. gauge pressure and a superheat of 150° F. at the stop valve, and a vacuum of one in. of mercury. Under these conditions there was an available heat drop of 407.2 B.Th.U. per lb. of steam. In 1916 a machine of 11,000-K.W. was installed in the same station with a stop-valve pressure of 250 lb. gauge, a superheat of 244° F. and a vacuum of one in. of mercury. This change in steam conditions increased the heat drop to 450.2 B.Th.U. per lb. of steam. In 1921, a machine having an economical rating of 25,000 K.W., installed at Manchester, utilized a stop-valve pressure of 350 lb. gauge, a superheat of 264° F. and a vacuum of 0.9 in. of mercury, thus working with an available heat drop of 484.7 B.Th.U. per lb. of steam. It may be taken that modern practice sanctions steam pressures up to 350 lb. per sq. in., temperatures up to 700° F.

and vacua as high as 29.1 in., with the barometer at 30 inches. No commercial reciprocating engine could work under such steam conditions with anything like the efficiency a turbine would show in similar circumstances.

Speeds of Turbines.—The principal use of steam turbines on land being to drive electric generators, the speed at which these can be run controls to a large extent the speeds for which turbines can be designed. Continuous current turbo generators are comparatively small in size and few in numbers, and as these are almost exclusively driven through reduction gearing on account of the difficulties of commutation at high speeds, their characteristics do not materially affect the design of the turbines. All large land type turbines are directly coupled to alternators and as the frequency of alternation is

FIG. 10

standardized in Great Britain at 50 and 25 cycles per second, and in the United States and Canada at 60 cycles per second, the speeds of turbines have to be correspondingly standardized. If F denotes the frequency, and N the number of pairs of poles of the alternator, then $\frac{F \times 60}{N}$ denotes the only possible speed, in revolutions per minute, at which the turbine can be run. In Great Britain the standard turbine speeds are therefore 3,000, 1,500, 1,000 and 750 revs. per minute, while for 60 cycles they are 3,600, 1,800, 1,200 and 900 revs. per minute. It is naturally desirable to build any turbine for the highest speed at which the desired output can be economically obtained. Considerations of stress limit the dimensions for a given speed, and the dimensions limit the volume of steam which can be

FIG. 11

efficiently utilized, so that in practice a fairly definite limit of power corresponding to each speed is obtained.

Turbo alternators have been satisfactorily built, having a maximum continuous rating of over 6,000 K.W. at 3,600 revs., the limit of economical rating for this speed being at the present time about 5,000 K.W. At 3,000 revs. per minute the maximum continuous rating is about 13,750 K.W., the economical output being 12,500 K.W., the machine built in 1921 for the Liverpool corporation being of this size. There are several turbines with a maximum continuous rating of 30,000 K.W. running at 1,800 revs. per minute, and at 1,500 revs. per minute, a continuous rating of 35,000 K.W. appears to be about the present limit, both for impulse and reaction machines. Machines of this size and speed were installed in Chicago in 1918, and in Paris in 1921. In machines of 30,000 K.W., and over it is not uncommonly the practice to use two or more generators, the whole unit really consisting of mechanically independent high- and low-pressure turbines. Certain units built by the Westinghouse Co. in the United States have a maximum rated output of even 60,000 K.W., but these in fact consist of three independent turbo generators, through which the steam passes in series. This multiplication of cylinders and shafts is of course the usual custom in connexion with marine turbines.

The practice of dividing a turbine into two parts, namely a high- and a low-pressure cylinder arranged in tandem, was first introduced many years ago and the design has been standardized for the larger machines of the reaction type. It has the advantage that the separate casings are shorter and less liable to distortion than an equivalent single casing, while by making the low-pressure drum of larger diameter and of the double flow type, the requisite area for the enormous volume of the low-pressure steam is conveniently provided for. The importance of this will be realized from the fact that in a modern turbine the ratio of expansion of the steam may be over 800:1. Fig. 1 shows a section through a two-cylinder tandem turbine as constructed by the Parsons Co., and fig. 12 illustrates the appearance of a two-cylinder side by side arrangement as used with gearing for marine purposes.

Governing of Steam Turbines.—The speed regulation of turbines is effected by a centrifugal governor driven by worm gearing from the main shaft, which acts in the case of all reaction machines by controlling the pressure at which steam is admitted to the casing. In machines constructed either wholly or partially on the impulse principle, the governor may open up successively extra nozzles or groups of nozzles as the load increases. Loads in excess of the maximum economical load are sometimes provided for by admitting steam to the turbine at some intermediate point, thus raising the pressure there above the normal full load pressure and enabling the turbine to do more work, although at a somewhat reduced efficiency. The by-pass valves for this purpose may be hand operated, but as a rule they are under the control of the governor and are thus automatically opened when the extra steam is required to maintain the speed. In view of the close governing required on turbo generators and of the size and weight of the valves which have to be operated, it is the universal practice to employ a relay arrangement on all but the smallest machines, the governor merely controlling the position of a small balanced piston valve which admits oil under pressure to one side or the other of a piston which does the actual work of operating the valves. The pressure oil is supplied from the lubrication system of the turbine.

Bearings and Lubrication.—The old sleeve bearing, originally devised by Sir Charles Parsons and employed on his earlier machines, has been entirely superseded and turbine bearings are now constructed on ordinary lines, differing only from slow-speed bearings in their proportions and in the provision necessary for their proper lubrication. The bearings are made in two halves, split horizontally, the interior working surfaces being of white metal cast and anchored into the "steps" which are of cast iron or bronze. These are usually fitted with shimplates to provide a fine vertical and lateral adjustment, and are frequently supported in spherical seatings to permit of a certain amount of self-alignment. Safety strips, often of bronze, which normally lie slightly below the surface of the white bearing metal, are usually provided. These are intended to carry the weight of the shaft safely in the event of the white metal being melted out, and thus prevent injury to the blading until the machine can be stopped. In all turbine bearings the important thing is to insure a copious supply of lubricating oil, not so much for lubrication as to carry off the heat generated by friction and to maintain the bearings at a reasonable working temperature. Water-cooled bearings have been used by some makers, but the most approved practice is to rely on the flow of oil through the bearing to keep its temperature down. Oil is usually delivered to the bearings at a pressure of about 15 lb. per sq. in., a gauge being provided on each bearing to indicate whether the pressure is being maintained. On modern turbines an automatic device operated by the oil pressure is fitted, which shuts the machine down in case of any failure of the oil supply.

Bearings up to 8-in. diameter are usually bored larger than the shaft to the extent of about 0.004 in. for every in. of shaft diameter. In larger bearings the clearance is proportionately less. This somewhat large clearance enables the heat to be carried away by the continuous wash of fresh cool oil. The shaft, when running, is kept out of metallic contact with the bearing by a thin film of oil

continually dragged underneath it by its rotation. It is this film which supports the shaft, and the pressure of the latter on the bearing must therefore not be greater than the film can stand. Theory and experiment both indicate that the greater the surface velocity of the shaft, the more effectively is the film established, and the greater therefore the permissible load on the bearing. But the fact that bearings have to start from rest, when the film is imperfect, imposes a practical limit to the load which can be imposed.

A formula connecting permissible pressure with velocity, given by Mr. F. H. Clough, is $P = 17 \sqrt{V}$, in which P denotes the pressure in pounds per sq. in. of projected area, and V = velocity of surface of shaft in ft. per second. This is said to be applicable to bearings of normal design in which the length is from twice to three times the diameter. Many designers, however, use the rule that $P \times V$ must not exceed 5,600, a simple rule which gives good results in practice, and probably has a considerable margin of safety when the speeds are high and when there is no vibration. One large manufacturing firm is said to take the permissible pressure per sq. in. of projected area as ranging from 167 to 235 when the velocity ranges from 20 to 73.5 ft. per second. Modern practice is to give P a value not exceeding 150 lb. in bearings where the velocity is not greater than 30 to 35 ft. per second, and the temperature comparatively low, say, 100° to 110° F. Such conditions would apply to low speed marine turbine bearings. The bearings of land turbines usually work at temperatures from 120° F. to 160° F., but the latter temperature should not be exceeded, as not only is the oil injured, but its viscosity is so low that the supporting film is thinned and the margin of safety becomes low.

For the heat generated in a turbine bearing Stoney gives the formula $B.Th.U. \text{ per hour} = \frac{190 l d v}{t \cdot 32}$ in which l and d are

respectively the length and diameter of the bearing expressed in in., v is the velocity of the surface of the shaft in ft. per second, and t is the temperature on the Fahrenheit scale. The same authority quotes the following formula as often used in slow-speed marine practice: $B.Th.U. \text{ per hour} = l \times d \times v^{.38}$. Treating the heat which escapes by radiation and conduction as negligible, these formulae give the heat which has to be carried away by the oil and extracted by the oil cooler. This heat of course is the equivalent of the work lost by friction in the bearing. The increase of temperature of the oil passing through the bearing should not exceed 10° to 20° F., and if the specific heat of oil be taken at 0.31 the minimum quantity of oil required for each bearing may be readily calculated. In practice it is advisable to increase this calculated fig. by from 30 to 50% to allow a margin for steam heat travelling along the shaft and other contingencies.

Mechanical Gearing of Turbines.—The De Laval steam turbine, consisting of a single impulse wheel running at a speed of 30,000 to 10,000 revolutions per minute according to the size, has always contained reduction gearing as an integral part of the machine because such speeds are far too high for driving ordinary machinery. Turbines of this type have, however, only been built for powers up to a few hundred horse-power, and although the use of reduction gear may be dated from the introduction of the Laval turbine in 1886, it never became a recognized practice for large powers until it was developed by Sir Charles A. Parsons as the solution of the problem of marine propulsion. De Laval had shown that it was possible to transmit power satisfactorily through mechanical gearing running with a circumferential velocity of over 100 ft. per second. The gears he used were of the double helical type with a spiral angle of 45 degrees. The reduction ratio was usually about 10:1, and the pitch of the teeth varied from 0.15 in. to 0.26 in., according to the power of the turbine. The De Laval gear embodied all the features which have been found necessary to the successful performance of modern gears transmitting several thousand horse-power through a single pinion. The double helical form of tooth of comparatively fine pitch has been retained, as this design eliminated end thrust and insured silent running by reason of the number of teeth simultaneously in contact. Ample lubrication of the teeth by means of oil jets was also employed by De Laval, who succeeded in producing durable and satisfactory gears which had an efficiency of about 97 per cent. These gears are used up to about 600 H.P. which is the commercial limit of the type of turbine for which they are designed.

Steam turbines of any type, designed with due regard to efficiency and cost of manufacture, require to run at a far higher speed of revolution than is practicable for screw propellers, especially when the latter are employed to drive ships of moderate speed. The coupling of a turbine, therefore, directly to a propeller shaft involves a compromise in design, in which the speed is greater than desirable for the propeller yet so low as to require the turbine to be of greater size and weight and of lower efficiency than it would otherwise be. In the case of high-speed vessels direct coupling afforded a commercially acceptable solution of the problem of turbine propulsion, and for vessels of eighteen knots speed and over, such as warships, passenger liners and cross-channel boats, the direct coupled turbine soon became the recognized driving power. But ordinary cargo vessels and tramp steamers, with an average speed of 10 or 12 knots, were outside the practical field of the steam turbine until speed reduction gearing was available to couple a high-speed turbine with

a slow moving propeller. It was really the problem of the slow speed ship which brought about the development of marine turbine gearing, and now that the mechanical difficulties have been overcome, the direct coupled marine turbine is likely to be largely displaced by the geared turbine in all classes of vessels.

The first example of marine turbine reduction gearing appears to have been in 1897, in connexion with a twin screw launch, in which the Parsons Marine Steam Turbine Co. fitted a 10-H.P. turbine driving the two shafts by means of helical gearing having a speed ratio of 14:1. The result appears to have been entirely satisfactory. Other experiments followed, and in 1909, the "Vespasian," a cargo vessel of 4,350 tons displacement, was fitted with geared turbines driving a single propeller. This vessel had previously been equipped with triple expansion reciprocating engines of the usual type, and before these were removed they were put into perfect order, and very careful tests were made to determine the efficiency and performance of the vessel. The geared turbines drove the same shaft and propeller as the engines had done and were supplied with steam from the same boilers. The power developed was about 1,000 H.P. and the shaft ran at 70 revs. per minute, the gear reduction ratio being 19.9:1. The installation of the turbines resulted in an increase of about one knot in speed for the same coal consumption, and the results of the trials were highly satisfactory in every respect, and convincing as to the advantages of geared turbines over reciprocating engines. After the "Vespasian" had run 18,000 m. in regular service, the pinion was examined and found to be in perfect condition, the wear not exceeding 0.002 inches. (See *Trans. I.N.A.* 1910 and 1911.)

The success of the "Vespasian" led to rapid developments. In 1910 the British Admiralty adopted gearing, the torpedo boats "Badger" and "Beaver" being the first warships to be equipped with geared turbines. In these vessels each L.P. turbine drove its shaft directly, but the H.P. and cruising turbines were geared to a forward extension of the turbine spindles. At full load about 3,000 H.P. were transmitted through each set of gearing. Six years later complete gear drives had become the standard practice for British war vessels of all types and by 1920 some 652 gears, transmitting an aggregate of 7,280,000 shaft H.P., were fitted, or on order for the royal navy (Foster, *Trans. I.N.A.* 1920).

The appended particulars of H.M. battle cruiser "Hood," of 114,000 shaft H.P., which was completed in 1920, will indicate the development of gearing for turbines and will at the same time indicate the proportions which have been adopted.

Gearing of H.M.S. "Hood."

Horse-power of H.P. turbine	17,500
Horse-power of L.P. turbine	18,500

Value of K in formula $P = K \sqrt{P.D.}$ } L.P.	196
Velocity of pitch line ft. per second	132

The earliest practice with regard to marine gearing was to use a helical angle of 23° in conjunction with a normal pitch of 0.75 inches. Subsequently a helical angle of 45° which had been found successful in the De Laval gears was adopted with the idea of securing quieter running, but modern practice favours an angle of about 30°, as teeth cut at this angle will run silently, while their less inclination to the axis of the shaft results in increased efficiency and greater effective strength. The usual angle of obliquity is 14½°, and the normal pitch except for the very largest gears is nearly always 0.583 inches. The permissible pressure in lb. per in. of axial length of the pinion is determined by the formula $P = K\sqrt{D}$ in which D is the pitch diameter of the pinion in in. and K is a constant which has a value usually between the limits of 160 and 230. This formula represents the practice of the Parsons Co., who have a preponderating experience on these gears. There is reason for believing, however, that the pressure might be made more directly proportional to the pitch diameter. A circumferential velocity of 150 ft. per second on the pitch line has been successfully employed, and it is possible that this might be exceeded with safety.

For turbine gearing the British Admiralty specify that the pinion shall be made of oil-hardened nickel steel, containing not less

than 3.5% of nickel and from 0.30 to 0.35% of carbon, with an ultimate tensile strength of 40 to 45 tons. The gear wheels are to be of steel of 31 to 35 tons ultimate tensile strength with 26% elongation in two inches.

It is essential that the teeth of turbine gearing shall be very effectively lubricated, and to insure this, oil under a pressure of from 5 to 10 lb. per sq. in. issues in jets which flood the teeth immediately before they come into engagement. A further point of primary importance is that the fitting and alignment of the gears must be as perfect as possible and great care must be taken to maintain and insure these conditions. In America the practice has been adopted of carrying the pinion on a floating frame with the object of permitting a certain amount of self-alignment, but the required correction is of such a very small order of magnitude that the advantages of the system are doubted by many engineers.

Gearing of British naval turbines is exclusively of the single reduction type, but double reduction gearing has been largely introduced into cargo vessels during recent years, with the object of efficiently using turbine machinery for ships of comparatively low speed without involving too large a reduction ratio for a single pair of gears. The general design follows—*mutatis mutandis*—that of single reduction gear.

Numerous tests have been carried out to determine the mechanical efficiency of gears of the kind described. The mechanical efficiency of a single reduction gear at full load should be over 98%, and 98.5% has been recorded. With double reduction gear the efficiency is about 97.0%. These figures include bearing friction. No method of obtaining speed reduction by hydraulic or electrical methods has yet been devised which will approach the efficiency obtainable with mechanical gearing.

Fig. 12 gives a good idea of the shafts of the Cunard liner "Transylvania," built by Scotts Shipbuilding & Engineering Co. Ltd. An exactly similar set of machinery was fitted to drive the other shaft. The "Transylvania" was the first Atlantic liner to be fitted with geared turbines. The vessel had a length of 548 ft. and a gross tonnage of 14,500. Each set of turbines and gearing was designed to develop and transmit 5,500 shaft H.P. and they drove the vessel at 16.75 knots. The turbines ran at 1,500 revs. per minute and drove the propellers at 120 revs. per minute, the ratio of the gearing being therefore 12.5:1. In the illustration the pinion in the foreground is driven by the high-pressure turbine, the steam from which operates the low-pressure turbine on the other side of the gear wheel. The astern turbine, consisting of an impulse wheel followed by a comparatively few rows of reaction blading, is seen on the forward end of the low-pressure turbine. The size of the machinery is indicated by the fact that the gear wheel is 10 ft. in diameter and 5 ft. wide.

THEORY OF THE STEAM TURBINE

Throughout the ensuing section, heat is expressed in foot pound centigrade units, and the symbols employed have the following meanings:—

- H = Total heat in one lb. of steam.
- H_w = Total heat in one lb. of steam at the supersaturation limit or Wilson line.
- H_s = Total heat in one lb. of steam at the saturation line.
- V = Volume of one lb. of steam in cub. ft.
- V_w = Volume of one lb. of steam in cub. ft. at the Wilson line.
- V_s = Volume of one lb. of steam in cub. ft. at the saturation line.
- $V\phi$ = Volume of one lb. of steam in cub. ft. after an isentropic expansion.
- p = Absolute pressure in lb. per sq. in.
- t_s = Saturation temperature (centigrade).
- e = Efficiency ratio.
- η = Hydraulic efficiency.
- u = Thermodynamic head expended in isentropic expansion.
- U = Thermodynamic head expended in a practicable expansion.
- γ = Index for adiabatic expansion.
- λ = Index for an expansion at constant efficiency.

w = Flow of steam in lb. per second.
 ν = Number of pressure stages in an ideal turbine.
 n = Number of pressure stages in a practicable turbine.
 h' = Blade height of an ideal turbine, in in.
 h = Blade height of a practicable turbine, in in.
 \bar{d} = Mean diameter in in. of a row of blades.
 D = Drum diameter of a reaction turbine.
 J = Joules equivalent.
 $K = \sum \left(\frac{\bar{d}}{10} \right)^2 \left(\frac{\text{RPM}}{100} \right)^2$ moving rows only being included in the summation.

From the standpoint of hydraulics there is a somewhat close analogy between a steam turbine and one operated by water. An essential feature in both cases is that the potential energy which a fluid possesses in virtue of its pressure is utilized to maintain a flow through a set of nozzles or guide vanes. In the ideal case of frictionless flow the energy possessed by unit mass of the fluid is the same whether it be at rest in the reservoir or whether it forms part of the jet and has accordingly a kinetic energy due to its velocity. The theoretical velocity of efflux of a gas can accordingly be determined by equating the kinetic energy to the work which the same mass of fluid could perform were it allowed to expand, behind the piston of an ideal engine, from the pressure of the reservoir down to that of the receiver into which the discharge takes place. In thus expanding behind a piston, W , the theoretical work done per lb. of the fluid is given by the equation

$$W = 144 \frac{\gamma}{\gamma-1} p_0 V_0 \left[1 - \left(\frac{p_1}{p_0} \right)^{\frac{\gamma-1}{\gamma}} \right]$$

where W denotes the work in foot pounds, p_0 and p_1 the initial and final pressures, respectively, expressed in lb. per sq. in., while V_0 represents the original volume of the fluid in cub. ft. at pressure p_0 and γ is the index of adiabatic expansion, on the assumption that the relationship between the volume and the pressure during such an expansion can be represented by the formula

$$p^\gamma V = \text{constant}.$$

By the principle already stated, the theoretical velocity of efflux will be obtained by writing

$$\frac{v^2}{2g} = W = 144 \frac{\gamma}{\gamma-1} p_0 V_0 \left[1 - \left(\frac{p_1}{p_0} \right)^{\frac{\gamma-1}{\gamma}} \right] \quad (1)$$

From this expression it appears that as p_1 becomes smaller and smaller v becomes greater and greater. When, however, the velocity of efflux becomes equal to the velocity of sound in the escaping fluid, any further reduction in p_1 occasions no increase in the weight discharged from the nozzle per second. This follows because the velocity at which any impulse is transmitted through a medium is the same as that of sound in the medium. Hence, if, starting from an equality of pressure in reservoir and receiver, the receiver pressure is progressively reduced, "news" of each successive reduction is transmitted back along the jet into the reservoir at the speed of sound, and as a consequence the pressure gradients there undergo a readjustment and the flow into the nozzle is increased. Once, however, the speed of issue exceeds that of sound, no "news" as to any further reduction in the external pressure can reach the interior of the reservoir. The pressure gradients therein consequently remain unaltered, and the weight of fluid fed to nozzle per second remains unchanged. This reasoning, which originated with Osborne Reynolds, applies to all cases of the efflux of fluids, although in the case of a liquid such as water it has no practical significance, as the head necessary to generate a velocity equal to that of sound in water would be many miles in height.

In the case of superheated or supersaturated steam, the speed of sound is attained when the ratio of the lower pressure p_1 to the upper pressure p_0 is equal to 0.5457. No further reduction of the lower pressure will increase the weight of steam flowing per second, but final velocities of efflux greatly exceeding the velocity of sound can be attained by making use of a nozzle converging first to the throat and then slowly diverging again. The theoretical velocities under such conditions can be calculated from equation (1).

In practice the actual velocity of efflux is less than the theoretical on account of losses due to nozzle friction. The maximum weight which can be discharged per second from a convergent-divergent nozzle is fixed by the area of the throat. In the case of steam, for each sq. in. of throat area the maximum weight which can be passed per second is

$$w_{\max} = 0.3155 \sqrt{\left(\frac{p_0}{V_0} \right)}$$

where p_0 denotes the absolute pressure of supply in lb. per sq. in. and V_0 the corresponding specific volume of the steam in cub. ft. per lb. This equation holds whether the steam is superheated or wet.

In equation (1) above, the work done from one lb. weight of steam under pressure p_0 is expressed in ft. lb., but in steam turbine prac-

tice it is generally more conveniently expressed in heat units, and

the convenience is the greater because the equation $p^\gamma V = \text{constant}$, is an inexact representation of the relationship between pressure and volume in the adiabatic expansion of steam. By working in heat units this difficulty is avoided.

If lb.-centigrade heat units be adopted, the theoretical velocity of efflux is given by the relation $v = 300.2 \sqrt{u}$ where u denotes the adiabatic heat drop and is conveniently measured from a Mollier chart, of which many have been published. A diagrammatic chart of this kind is reproduced in fig. 13, in which the ordinates represent

entropy, and the abscissae are total heats of steam (see 25.827). The curves drawn on the chart represent lines of constant pressure, constant temperature or constant wetness. The use of the chart is best illustrated by an example. To find the velocity of efflux from a nozzle supplied with steam at an absolute pressure of 200 lb. per sq. in. and at a temperature of 300°C., which is discharging into a receiver maintained at an absolute pressure of 120 lb. per sq. in., the point A is marked on the chart at a position corresponding to the initial conditions and a straight line is drawn horizontally (i.e. with constant entropy) to cut the 120-lb. pressure line at B. The length AB, as measured by the scale of total heats, represents 30.6 lb. centigrade heat units. The theoretical velocity is therefore $300.2 \sqrt{30.6} = 1,660$ ft. per second nearly.

Owing to nozzle friction the actual velocity will be less than this figure, which has accordingly to be multiplied by a coefficient, the value of which is commonly taken to be 0.95 or 0.96. With convergent-divergent nozzles the loss is much greater. The function of the moving wheel of an impulse turbine is to convert the kinetic energy of the jet into useful work on the shaft. The method of drawing a velocity diagram and estimating therefrom the probable efficiency of conversion is explained in the earlier article on STEAM ENGINE (25.843). With impulse steam turbines a stage efficiency of about 0.80 can be realized if the blade velocity be sufficiently high. To obtain such an efficiency the ratio of blade speed to steam speed should be about 0.47. For commercial reasons this figure is seldom obtained, but if δ represents the actual ratio of blade speed to steam speed, and δ_1 the ratio corresponding to maximum efficiency η , then the efficiency η corresponding to δ can be obtained from the equation

$$\eta = \eta_1 \left[\frac{2\delta - \delta_1^2}{\delta_1^2} \right].$$

A steam impulse turbine generally consists of a series of elementary turbines or stages arranged in succession on the same shaft. Suppose the first of the series has unit efficiency and expands the steam from a pressure of say 200 lb. per sq. in. and a temperature of 300°C. to a pressure of 120 lb. per sq. in. Then, as shown above, in the absence of frictional losses, the state of the steam as delivered to the next elementary turbine would be represented by the point B on the chart, fig. 13, where the pressure is 120 lb. per sq. in. and the total heat 698.2 lb. centigrade heat units. The whole of the 30.6 units due in an adiabatic expansion from the initial conditions to a final pressure of 120 lb. per sq. in., would in the assumed case of a perfect turbine be converted into useful work on the shaft. In practice, however, only a part of this adiabatic heat drop will be usefully converted, the remainder being wasted in friction and added as heat to the steam, before it is delivered to the next elementary turbine, or stage. If the efficiency of conversion is 0.7, the heat which would be added to the steam in the above example will be 0.3×30.6 , or 9.18 lb. centigrade units, thus making the total heat of the steam on delivery to the second stage $698.2 + 9.18 = 707.4$ nearly. This gives point C on the chart.

If it be assumed that the second stage expands the steam down to 80 lb. per sq. in., the adiabatic heat drop will be found as before by drawing a horizontal line from C to cut the curve for 80-lb. pressure at D. The length of this line as measured on the scale of total heats is 22.8 lb. centigrade heat units. If, as before, we assume that but 0.7 of this is converted into useful work, the remainder being added to the steam as heat, the total heat of the steam as delivered to the third stage will be $707.4 + 0.7 \times 22.8 = 691.5$ heat units, giving

on the point E on the chart as representing the condition of the steam as supplied to the third stage. Proceeding in this way, a series of "state points" can be marked on the chart, each of which represents the condition of the steam as supplied to the next elementary turbine of the series.

So long as the steam is superheated or supersaturated its volume can be determined, when the pressure and total heat are known, by Callendar's equation

$$V = 2.2436 \frac{H - 464}{p} + 0.0123.$$

The relation between the volume, pressure and temperature under the same condition is

$$(V - 0.016) = \frac{1.0706 T}{p} - 0.4213 \left(\frac{373.1}{T} \right)^{1.0}$$

in which T denotes the absolute temperature on the centigrade scale.

With wet steam expanding in a condition of thermal equilibrium the volume of the steam is equal to the volume of dry saturated steam at the same pressure, multiplied by the dryness fraction as read from the chart. Since the steam in passing through a turbine never does expand in a condition of thermal equilibrium, this case is of no practical importance.

If u_1 denotes the adiabatic heat drop for the first stage of the series, u_2 that for the second stage, and so on, then the aggregate of these values of u for the whole series will be greater, the greater the number of stages into which the whole turbine is divided. The ratio of the aggregate to the value of u obtained when the whole of the expansion is effected in a single stage, is known as the "reheat factor" R. In the case of a reaction turbine the number of stages is so great that the expansion may, for practical purposes, be considered as effected continuously instead of in a series of steps. In this case the reheat factor for superheated or supersaturated steam can be read off from the diagram fig. 14, which is reproduced from Martin's *New Theory of the Steam Turbine*.

FIG. 14

The "efficiency ratio" of a turbine is denoted by ϵ , and is defined as the ratio which the useful work W actually done by the steam bears to that which would be performed by a turbine of unit efficiency, so that $W = \epsilon u$. The hydraulic efficiency, denoted by η , is defined as the ratio of the work done to the total effective thermodynamic head, which head, as pointed out above, is always greater than u in the case of a multistage turbine, as it is the sum of the values of u for each stage. We thus have

$$W = \eta U = \eta R u, \text{ so that } R = \frac{\epsilon}{\eta}.$$

The hydraulic efficiency η of a turbine is a much more fundamental property than the efficiency ratio ϵ , and remains unaltered whatever the number of elementary turbines or stages, into which the whole turbine is divided, or whatever be the total ratio of expansion. In the ideal limiting case in which the expansion is carried down to zero pressure the efficiency ratio is always unity, whatever the hydraulic efficiency may be.

Where the heat drop per stage of a turbine is small, it cannot be measured with accuracy from a chart but must be calculated from formulas or derived from steam tables, of which Callendar's are the most reliable and self-consistent, and accord best with the

most trustworthy experimental data. Callendar's formula for the adiabatic expansion of superheated or supersaturated steam is

$$p^{-\frac{23}{3}} T = \text{constant}$$

where T denotes the absolute temperature.

In a continuous expansion of superheated or supersaturated steam effected with a hydraulic efficiency η , the relation between volume and pressure during the expansion is represented accurately by the expression

$$p^{\frac{1}{\lambda}} (V - 0.016 \frac{\lambda}{1.3}) = \text{constant} \quad (2)$$

$$\text{where } \frac{1}{\lambda} = 1 - 0.230773.$$

A closely approximate expression has been given by Callendar in the form

$$(H - 464) p^{-\frac{3}{13} \eta} = \text{constant} \quad (3).$$

In practice $\frac{\lambda}{1.3}$ in equation (2) may be taken as unity without involving serious error; and since, along the saturation line, the relation between pressure and volume is represented very approximately by the equation

$$0.9406 \log p + \log (V - 0.016) = 2.5252,$$

the point at which the saturation line is crossed in a continuous expansion, effected with an efficiency η , can be found approximately by combining this equation with (2), which gives:

$$\frac{1}{\lambda} \log p + \log (V - 0.016) = \frac{1}{\lambda} \log p_0 + \log (V_0 - 0.016).$$

The pressure thus obtained can be plotted on the steam chart as at M (fig. 13). A single additional point representing the state of the steam at some intermediate pressure gives the "condition line" in the superheated field with sufficient accuracy as the curvature of this line is always very slight. The condition line for wet steam expanding in thermal equilibrium is best obtained from the chart. To this end a horizontal line is drawn from M to cut the exhaust pressure line at S. The length MS then represents, on the scale of total heats, the adiabatic heat drop for an expansion from M in a condition of thermal equilibrium. Denoting this by u , the corresponding useful work done is ϵu , and the heat wasted in friction is $(1 - \epsilon)u$.

If we add this wasted energy to the total heat corresponding to the point S we get J as the state point representing the condition of the steam as finally discharged. A similar procedure gives us the state point K at some intermediate pressure, and the three points M, K, J suffice to fix with practical accuracy the condition line for wet steam expanding from M to S in thermal equilibrium.

From a condition line the total heat of the steam corresponding to any pressure can be read off, and the corresponding volume then obtained as already described. The condition line for steam expanding beyond the saturation line in a condition of thermal equilibrium, has, as already mentioned, no practical significance in steam turbine work. Once the saturation line is passed the expansion never proceeds in thermal equilibrium. This discovery renders obsolete the theory of the steam turbine working with non-superheated steam, as understood up to the end of 1912, at which time attention was directed anew to certain remarkable anomalies observed in experiments on the discharge of non-superheated steam from nozzles. Numerous careful experiments had shown that the weight discharged was often in excess of what the then accepted theory declared to be possible. In discussing these results in *Engineering*, Jan. 10 1913, Martin pointed out that the experiments of Aitken and Wilson on the sudden expansion of dust free vapour afforded conclusive evidence that in expanding through a nozzle, the steam must be in the supersaturated condition and not in thermal equilibrium, so that the accepted theory was based on a fundamental error. Stodola succeeded in confirming this conclusion by direct experiment. He studied, under very strong illumination, the appearance of jets of steam discharged from a nozzle and found that the steam exhibited no signs of condensation occurring until the pressure had been reduced far below the saturation point. Finally, in 1915, Callendar, in a paper published in the *Proceedings of the Inst. Mech. Engineers*, gave an exhaustive study of the whole question and showed that the anomalies observed in nozzle experiments entirely disappeared if the steam were considered to remain in a supersaturated condition up to a point beyond the throat of the nozzles. Moreover, under such an assumption, the computed frictional losses became in good accord with those observed in experiments with air. There is however, of course, a point beyond which steam cannot be expanded without condensation occurring. From experiments of C. T. R. Wilson, H. M. Martin calculated the following table giving the properties of steam at the supersaturation limit, or the "Wilson line" as he called it ("A New Theory of the Steam Turbine," *Engineering* 1913):—

TABLE 1. *Properties of Steam at the Wilson Line.*

Temperature at Wilson Point.	Pressure at Wilson Point.	Volume at Wilson Point.	Total Heat at Wilson Point.	Equilibrium Temperature.	Equilibrium Volume.	Entropy at Wilson Point.
t_w	p_w	V_w	H_w	t_e	yV_e	η_w
deg. C.	lb. per sq. in.	cu. ft. per lb.	F.P.C.	deg. C.	cu. ft. per lb.	
0	0.9888	295.30	593.79	38.52	325.85	1.9098
10	1.739	173.33	598.28	49.41	191.50	1.8641
20	2.935	106.11	602.64	60.33	116.91	1.8220
30	4.764	67.339	606.85	71.19	74.218	1.7825
40	7.478	44.091	610.90	82.13	48.474	1.7476
50	11.39	29.732	614.75	93.00	32.606	1.7141
60	16.86	20.566	618.36	103.89	22.575	1.6830
70	24.36	14.551	621.70	114.80	15.957	1.6537

90	47.60	7.720	627.47	136.57	8.638	1.5998
100	64.64	5.778	630.01	147.48	6.353	1.5748
110	86.28	4.380	632.10	158.40	4.832	1.5508
120	113.37	3.376	633.89	169.48	3.713	1.5278

Along the Wilson line the relation between pressure and volume is given with considerable accuracy by the equation

$$0.9401 \log p_1 + \log (V - 0.016) = 2.4651.$$

At the supersaturation limit moisture is formed and settles out in the form of minute droplets.

To proportion rationally the blading of a steam turbine it is necessary to know the relationship between the pressure and the volume, or between the pressure and the total heat of the steam during the expansion. The discovery that wet steam does not expand through a turbine in a condition of thermal equilibrium, whilst affording an explanation of certain anomalies experienced in practice, has raised new difficulties, since we are no longer in a position to determine with certainty the volume of wet steam at different points of the expansion. So long as the expansion is not carried beyond the supersaturation limit, or the "Wilson line," the behaviour of the steam is in accord with the equations given above. At the supersaturation limit, however, an overdue change abruptly occurs, and it is a matter of general experience that when a condition of unstable equilibrium is suddenly upset the subsequent phenomena are commonly incalculable. In such cases there is frequently found to be a period of transition during which "repeat" experiments fail to give consistent results. Once, however, the transition is fairly effected, a new steady state is generally established. In the case of steam, this steady state appears to be obtained if the expansion is continued considerably beyond the supersaturation limit. In this steady state, such evidence as is available goes to show that the water of condensation which remains suspended in the steam in the form of minute droplets, has a temperature approximating to that of saturated steam of the same pressure, whilst the gaseous portion of the steam has a temperature corresponding to that of steam just on the point of condensing at the supersaturation limit. The dryness fraction of the exhaust steam from a turbine is therefore given approximately by the relation

$$y = \frac{H_e - t_e}{H_w - t_e}$$

where H_e denotes the total heat in one lb. of the exhaust steam, t_e the temperature corresponding to saturation at the same pressure while H_w is the total heat of one lb. of dry steam at the exhaust pressure but at the limit of supersaturation, as given in table 1 above for various pressures. The volume V_e of the exhaust steam is equal to yV_w , where V_w is taken from a table similar to table 1.

In general, engineers express exhaust pressures as so many in. of mercury. The standard barometric height is taken as 30 in. of mercury, and a vacuum of 29 in. of mercury, corresponds therefore to an absolute pressure of one in. of mercury, or 0.491 lbs. per sq. inch. Values of H_w , V_w , and t_w for different vacua are tabulated below:—

TABLE 2.

Vacuum (in. of mercury).	t_w (°C).	H_w lb. centigrade units.	V_w cu. ft. per lb.
29	- 11.37	588.59	569.3
28	- 0.15	593.67	296.3
27	+ 6.98	596.02	202.5
26	+ 12.21	599.22	154.5

It will be seen that the determination of V_e depends upon a knowledge of H_e , whilst $H_e = H_1 - \text{indicated work done}$.

The indicated work done in the expansion of wet steam can only (as matters stand to-day) be found as the result of experience with actual turbines, and our knowledge is accordingly empirical in

character. If we take steam expanding from the saturation line to ordinary exhaust pressures, the following rule for the effective thermodynamic head U_e engendered is in good accord with experience $U_e = \psi u_e$. Where u_e denotes the adiabatic heat drop, assuming the expansion from the initial to the final pressure to be effected under condition of thermal equilibrium, whilst

$$\psi = 1.1070 + 0.02212 \frac{x}{100} - \eta \left(0.1638 + 0.0286 \frac{x}{100} \right).$$

In this expression x denotes the ratio of the initial pressure to the exhaust pressure and η is the hydraulic efficiency, which is taken to be the same as if the turbine were operated with steam in a superheated condition throughout the whole range of expansion.

The coefficients in this formula for ψ have been selected so as to make the indicated work done the same as if computed by Baumann's empirical rule (*Inst. E. E.* 1921), but the relatively small amount of work done by expansion below the saturation line is attributed to the effective thermodynamic head being less than if the expansion had been effected under conditions of thermal equilibrium. Baumann's empirical rule on the other hand assumes that the efficiency decreases by 1% for every 1% of moisture in the steam, the latter being assumed to expand in thermal equilibrium.

From the above expression for U_e we can find H_e from the general relation $H_e = H_1 - \eta U_e$; and from this we can calculate V_e as already explained.

To determine the volume of the steam at other points of the expansion it is perhaps sufficient in the present state of our knowledge to use an interpolation formula which shall give correctly the initial and final volumes at the saturation line and at the exhaust, and which shall also give correctly the work done between these two limits. No doubt there is force in the argument that as we know accurately the relation between the volume and the pressure of the steam in expanding down to the Wilson line, it would be more logical not to make use of an interpolation formula until the necessity actually arose by this line being crossed, but in the present state of our knowledge the simpler procedure seems adequate for practical needs. It is certainly nearer the truth than the assumption hitherto adopted, that the steam expands in thermal equilibrium.

Callendar has devised a very simple and easily applied interpolation formula which satisfies the required conditions. It may be written as

$$\log (H - C) = \log A + u \log p.$$

The value of the constants are determined by writing

$$\frac{H_1 - C}{H_2 - C} = \frac{p_1 V_1}{p_2 V_2} = \left(\frac{p_1}{p_2} \right)^u.$$

In practice it is seldom necessary to determine either A or u , whilst C is most easily obtained by writing

$$H_1 - C = \frac{(H_1 - H_2) p_1 V_1}{p_1 V_1 - p_2 V_2}.$$

The use of the formula will be made clearer by taking a practical example. Thus, suppose dry saturated steam at a pressure of 20 lb. per sq. in. to be expanded down to a vacuum of 29 in. with an hydraulic efficiency of 0.7. (This efficiency is low for a modern turbine but the method is of course applicable whatever the value of η .) Then from Callendar's steam tables it will be found that $H_1 = 642.82$ centigrade heat units; $V_1 = 20.08$ cu. ft. per lb., whilst

$u_e = 125.46$ units. In this case $\frac{x}{100} = \frac{20}{49.1} = 0.4075$, so that

$\psi = 0.9932$ and $U_e = 124.61$ centigrade heat units. The "indicated" work done is therefore $0.7 \times 124.61 = 87.23$ and hence $H_e = H_1 - 87.23 = 555.59$. The dryness fraction at exhaust is therefore

given by $y = \frac{555.59 - 26.09}{588.59 - 26.09} = 0.9413$, so that $V_e = yV_w = 0.9413 \times$

$569.3 = 535.9$ cu. ft. per lb.

Had the steam expanded in thermal equilibrium and an equal amount of work been taken out of it, its volume on exhaust would have been 594.4 cu. ft. per lb. Hence at high vacua the volume of steam to be provided for at exhaust is some 10% less than on the old theory in which it was assumed to expand in thermal equilibrium.

The requisite data for constituting Callendar's interpolation formula are now available. Thus we have $p_1 V_1 = 401.6$; $p_2 V_2 = 263.1$, whilst $H_1 - H_2 = 87.23$. Hence

$$H_1 - C = \frac{401.6 \times 87.23}{38.5} = 253.0.$$

Thus $C = 389.8$ and $H_1 - C = 165.8$.

We therefore get $\log (H_1 - C) - \log (H_2 - C) = 0.1835$

$$\text{and } \log \frac{p_1}{p_2} - \log \frac{p_2}{p_1} = 1.6099.$$

We divide each of these differences by 10 (say) and can then calculate corresponding values of $\log (H_1 - C)$ and $\log p$ by repeated subtraction of these dividends, giving the figures tabulated in columns 2 and 3 in table 3 below. To determine corresponding values of $\log V$ we proceed in an exactly similar manner, determining the difference between $\log V_1$ and $\log V_2$ and repeatedly adding one

tenth of this difference until the value of $\log V_2$ is obtained. This latter procedure is based upon the general relation

$$H_1 - H_2 = \eta U_1$$

so that

$$-dH = \eta dU = \frac{144}{J} \eta V dp$$

and thus

$$V = \frac{J}{144} \eta \frac{dH}{dp}$$

But on differentiating Callendar's relationship above, we get

$$\frac{dH}{dp} = \mu \left(\frac{H-C}{p} \right)$$

which gives us

$$V = \frac{J}{144} \eta \frac{H-C}{p}$$

Since by hypothesis η is constant we may write this as

$$\sigma \log V = \log (H-C) - \log p$$

But $\log p$ is a linear function of $\log (H-C)$ and therefore so also is $\log V$. It may be noted that $\log V$ is accordingly also a linear function of $\log p$, so that this interpolation formula gives between p and V a relationship of the type $pV^k = \text{constant}$. But the value of the integral of $V dp$ is adjusted so as to bring the total work done into accord with the data. The formulas for V and $H-C$ are, in short, empirical interpolation formulas and must be regarded as such. They are not absolutely consistent with each other but the discrepancy is small enough to be negligible in practice.

TABLE 3.

To avoid an accumulation of errors and to facilitate checking, the values of the intermediate logarithms in the above table are tabulated to five figures but only four of these are significant. When the additions and subtractions are accurately carried out the values in the last line of the table must be the values at the exhaust with which the calculation was started. The convenience of this check is so great that it is advisable (even at the expense of the slight inaccuracies involved) to use this type of interpolation formula even in the case of steam superheated throughout its expansion, although in this case exact relationships between the different functions can be stated.

Knowing U , the general characteristics of a turbine intended to operate with a given hydraulic efficiency can be very readily determined.

Thus if we define K as

$$K = \Sigma \left(\frac{d}{10} \right)^2 \left(\frac{\text{R.P.M.}}{100} \right)^2$$

where d denotes the mean diameter in in. of a moving row of blades, and the summation includes the moving rows only; the efficiency of the turbine is a function of $\frac{K}{U}$, as will be readily understood from

the obvious consideration that K is proportional to the mean square of the blade speed, whilst U is proportional to the mean square of the steam speed. If the hydraulic efficiency be plotted against $\frac{K}{U}$ the resultant curve is an ellipse, but this ellipse is not symmetrical about the axis along which $\frac{K}{U}$ is measured. The equation to this ellipse is

$$\left(\eta + \frac{K}{U} \frac{U_1}{K_1} \right)^2 = 4 \frac{K}{U} \frac{U_1}{K_1}$$

where η_1 denotes the maximum value of η , and $\frac{K_1}{U_1}$ is the corresponding value of $\frac{K}{U}$.

The relation between η and $\frac{K}{U}$, as determined by the collation of actual test figures is given in figures 15 and 16. In both cases the expansion is assumed to be continuous in character instead of being effected in finite steps, a circumstance which slightly lowers the apparent hydraulic efficiency of the impulse machine, but the error is small and moreover cancels out when the curve is used for purposes of design.

When the steam is initially superheated the value of U to be used in the formula is given by $U = U' + U_1$, where U' represents the thermodynamic head expended down to the saturation line and $U_1 = \psi u_1$, as explained above.

Suppose that an impulse turbine which is to operate with dry saturated steam supplied at a pressure of 20 lb. absolute and exhausted at a vacuum of 29 in. mercury is to run at a speed of 1,500 revs. per minute, the mean diameter of all the blade rows being 44½ in. whilst the designed hydraulic efficiency is 0.7. Then from fig. 15 it will be seen that $\frac{K}{U} = 436$. Hence as from table 3 the total thermodynamic head is 124.6, the value of K must be $124.6 \times 436 = 54,330$.

But if ν be the number of stages

$$K = \nu \left(\frac{44.5}{10} \right)^2 \left(\frac{1500}{100} \right)^2$$

whence $\nu = 12$, so that a turbine of 12 stages with wheels of 44½ in. mean diameter will give the required efficiency. If ν does not turn out to be an even number, it can be made so by suitably adjusting the value of d . Intermediate values of ν are directly proportional to the corresponding values of U and a series of such values calculated with an ordinary 10-in. slide rule, which is amply accurate for the purpose, are as follows:—

Section	A	B	C	D	E	F
U	0	14.9	29.3	43.0	56.2	68.8
ν	0	1.435	2.82	4.14	5.41	6.63
$\log p$	1.3010	1.1400	0.9790	0.8180	0.6570	0.4961
Section	G	H	I	J	K	...
U	80.9	92.5	103.6	114.3	124.6	...
ν	7.79	8.91	9.98	11.01	12.0	...
$\log p$	0.3351	0.1741	0.0131	-0.1479	-0.3080	...

The values of ν are fractional, but they are used merely for curve plotting, the values of the different functions corresponding to integral values of ν being read from the curves. Thus in fig. 17 $\log p$ has been plotted against ν and it should be noted that the curve is by no means represented by a straight line. Since ν is proportional

to K it follows that if in any turbine $\log p$ when plotted against K gives a straight line, that turbine, whether of the impulse or reaction type, cannot be designed to operate with uniform efficiency. In the diagram fig. 17 the values of $\log p$ represent the pressure of the steam after discharge from the preceding stage, stage No. 1 being thus conceived as being preceded by an imaginary stage No. 0. A corresponding plot of the volume would, however, give not the volume at discharge from the guide blades, but this volume as increased by the heat generated in the passage of the steam through the moving buckets. All stages being similar, the effective thermodynamic head at each stage is the same. But the apparent thermodynamic head, obtained by dividing the total thermodynamic head U by the number of stages, is somewhat greater than the adiabatic heat drop at each stage.

According to what has been stated above, the velocity of discharge from the guide blades of a stage is commonly taken as $w = 300.2 \times 0.95 \sqrt{u}$ where u is the adiabatic heat drop. The weight W discharged per second per sq. ft. of guide blade area is

$$W = \frac{v}{V\phi} = \frac{300 \cdot 2 \times 0.95 \sqrt{u}}{V\phi}$$

where V_0 represents the volume of the steam after an adiabatic expansion between the pressure above and below the stage. Instead of calculating these values it is more convenient to utilize the known values of U and V and to correct the above formula by using an appropriate coefficient ψ . As there are 12 stages in the present

case we get $\frac{U}{12} = \frac{124.6}{12} = 10.38 = q$, and the above equation may therefore be written

$$W = f \frac{300.2 \times 0.95 \sqrt{10.38}}{V}$$

An interpolation formula for f which is applicable for the ordinary range of turbine efficiencies and for convergent guide blades is $f = 1 + 0.13(1 - \eta)\sqrt{x - 1}$ where x denotes the ratio of the pressure above and below the stage. The coefficient f is readily evaluated by the ordinary slide rule with quite sufficient accuracy.

In the case under consideration we note from the curve fig. 17, that when $\nu=1$, $\log p \approx 1.197$ so that $x=1.27$ and f is therefore 1.023. The area available for flow through a row of guide blades is

that when $\nu = 1$, $\log p = 1.107$ so that $x = 1.27$ and y is therefore 1.023. The area available for flow through a row of guide blades is

$$\frac{\pi h' \bar{r} \sin \alpha}{144}$$

where h' denotes the blade height in in., and α is the "effective" angle of discharge, allowing if necessary for the

fact that the blades are of finite thickness. Hence if w be the weight of steam flowing through the turbine per second

$$h' = \frac{wV}{6223 f' d \sin \alpha \sqrt{q}}.$$

Taking $\sin \alpha = 0.30$, $\bar{d} = 44\frac{1}{2}$, $q = 10.38$ and $w = 10.3$ lb. per second, this expression reduces to $h' = 0.3732V$. Values of h' thus calculated for the values of V given in table 3 are plotted in fig. 17 and from the curve thus obtained we read off the theoretical blade heights at the different stages. These are:—

Stage No.	1	2	3	4	5	6
Theor. blade height in in.	0.94	1.18	1.51	1.95	2.48	3.24
Stage No.	7	8	9	10	11	12
Theor. blade height in in.	4.30	5.65	7.69	10.48	14.40	20.0

In practice the nearest even dimensions will be substituted for the calculated heights. The calculated heights for the last three stages are inconveniently long, but they can all be reduced to say 9 in. by suitably increasing the effective angles of discharge. Some builders moreover increase the pressure drop at the exhaust end, and would accordingly combine stages 11 and 12 into one. These expedients decrease the efficiency but are cheaper than the alternative of constructing the low-pressure end on the double flow principle.

The high-pressure end of a turbine can be proportioned in a manner exactly similar to that described, but as the steam there is commonly superheated, the problem is correspondingly simplified and need not therefore be discussed here. It is, however, usually necessary to construct some of the high pressure stages as partial admission stages and it is also a common practice to have a large pressure drop at the first stage with the object (at some sacrifice of efficiency) of making a large initial reduction in the temperature and pressure of the steam, so that the high pressures and temperatures are confined to the nozzle boxes of the first stage. To the same end a velocity compounded wheel is frequently used in the first stage. The general theory of these wheels is described in Prof. Ewing's article (see 25,844), but it may be observed that in practice it has been found necessary to adopt empirical methods of designing such wheels. If designed as pure impulse wheels operated with a fluid which is "freely deviated" the results are very disappointing. One rule which has been used is to assume that only 85% of the total heat drop of the stage is utilized in the nozzles, and of the residue that 5% is utilized in each of the three sets of blading. The wheel therefore works to some extent as a reaction turbine.

Speaking generally, the principle of "free deviation" as embodied in some water wheel designs is inadmissible in steam turbine practice, in which the moving blades should be just sufficiently long to avoid "spilling" of the steam delivered to them from the guide blades. As to the exact form of the moving blades, this does not appear to be of primary importance within reasonable limits, as,

although the practice of different makers varies considerably, all impulse turbines exhibit much the same efficiency under corresponding conditions. Typical Rateau blading is illustrated in fig. 18. The discharge angle is commonly about 30° save at the last row of blading where it is increased to 35° .

As regards nozzle and guide blade efficiencies, generally, reliable experimental data are still lacking. It has been assumed that the efficiency of convergent guide blades is a maximum when the speed of efflux is equal to the velocity of sound, and though this is not improbable from *a priori* considerations no conclusive evidence in support of the view has yet been forthcoming, and turbines which attempt to embody this theory have not shown the slightest superiority over competing designs. A great drawback to high steam speeds is the liability to excessive wear of the blading, and in this respect reaction blading has a great advantage over impulse blading in addition to the higher inherent efficiency of the former. This higher inherent efficiency depends upon the fact that the overall efficiency of a steam turbine depends upon its stage efficiency, a stage being defined as the section of a turbine comprised between two successive heat drops. In the case of impulse turbines for each successive heat drop, frictional losses are experienced in two elements, namely, the nozzles or guide blades and the moving buckets, whereas in a reaction turbine at each heat drop there is loss in one row of blading only.

The Design of Reaction Turbines.—The proportioning of a compound reaction turbine is a somewhat intricate problem, and as a preliminary it will be convenient to discuss the flow of steam through a series of openings or stages. At each of these a certain thermodynamic head q is expended, and this is not, in general, the same for each stage. If however U denote the total thermodynamic head expended in forcing the steam through n stages we have

$$\sum_1^n q = U = \int_0^n \frac{dU}{dn} dn.$$

Now Laplace's theorem in the calculus of finite differences may be written

$$\sum_1^n q = \int_0^n q \, dn + \frac{q - q_0}{2} + \frac{1}{12} (\Delta q - \Delta q_0) - \frac{1}{24} (\Delta^2 q - \Delta^2 q_0) + \text{oc.}$$

If we neglect the terms comprising the differences we get

$$\sum_1^n q = U = \int_0^n q \, dn + \frac{q - q_0}{2},$$

so that

$$\frac{dU}{dn} = q + \frac{1}{2} \frac{dq}{dn}.$$

Now $dU = \frac{144}{J} V dp$ whilst if (as it is frequently permissible to assume) the velocity of flow at each stage is proportional to \sqrt{q} we may write

$$q = Fv^2 = \frac{Fw^2 V^2}{\Omega^2}$$

where F denotes some coefficient, w is the weight of steam flowing per second, V its specific volume, whilst Ω denotes the area through the stage. Making this substitution for q we get

$$-\frac{144}{J} \frac{1}{Fw^2} \frac{dp}{V} = \frac{dn}{\Omega} + \frac{1}{2} \frac{dq}{q}$$

whence

$$n \left(\frac{1}{\Omega^2} \right) + \frac{1}{2} \log_e \frac{q}{q_0} = \frac{1}{w^2} \int_0^n \frac{dp}{V};$$

here $\frac{1}{\Omega^2}$ is the mean value of $\frac{1}{\Omega^2}$ when plotted against n and 1 is a factor depending on the coefficient of discharge. Substituting for q , the above expression reduces to

$$n \left(\frac{1}{\Omega^2} \right) + \log \frac{\frac{V}{\Omega_0}}{\frac{V_0}{\Omega_0}} = \frac{1}{w^2} \int_0^n \frac{dp}{V}.$$

In the case of an ordinary dummy Ω is constant, and the law of expansion is expressed in this case by $pV = \text{constant}$. Whence if the coefficient of discharge be unity we get, on making the proper substitutions

$$w = 68 \Omega \sqrt{\frac{p_0}{V_0} \frac{1 - x^2}{n + \log_e x}}$$

Here x denotes the ratio of the initial pressure to the final pressure. The logarithmic term becomes of great importance when n is small and renders the formula reliable under very extreme conditions.

Suppose it is desired to replace n openings in which the area is varied in direct proportion to the volume of the steam, by n openings all of equal area, the weight of steam passed per second, and

the total pressure difference remaining constant. If we neglect the small change such a substitution will make in the value of $\int \frac{dp}{V}$ and assume that the velocity of discharge at each stage is still proportioned to \sqrt{q} we get

$$\Omega^2 = \frac{n + \log_e \frac{\Omega n}{\Omega_0}}{n} \left(\frac{1}{\Omega^2} \right) \quad (4).$$

Use will be made of this formula in proportioning the blading of a reaction turbine.

Let it be required to proportion the blading for a double flow reaction machine, the conditions being similar to those assumed for the impulse turbine discussed above, save that the total discharge will be assumed to be 27 lb. of steam per second, that is to say, 13.5 lb. each way, whilst the speed is to be 2,400 revs. per minute. The hydraulic efficiency will be taken as 0.7, as before, so that the quantities already tabulated in table 3 can be used without modification.

If it were practicable to construct a reaction turbine with all its blade rows of the same mean diameter, the problem would be as simple as that of the impulse machine, and we shall, in the first instance, compute the blade heights for such an ideal turbine and from the figures thus obtained we shall deduce the blade heights required for the practical machine.

In this ideal turbine the blade heights are varied so that the ratio of blade speed to steam speed is everywhere constant and from the perfect uniformity of conditions it follows that q (the thermodynamic head expended at any stage) is also constant and proportional to v^2 . Since the blade speed is also proportional to its mean diameter, we may write

$$q = \beta^2 d^2 \left(\frac{\text{R.P.M.}}{1000} \right)^2$$

where β is a coefficient. From this it follows that

$$\sum q = U = \beta^2 \sum (d^2) \left(\frac{\text{R.P.M.}}{1000} \right)^2 = \beta^2 2K$$

where K is defined as above. Hence

$$\beta^2 = \frac{U}{2K}.$$

If the hydraulic efficiency be decided on, the value of $\frac{U}{K}$ can be obtained from the curve plotted in fig. 16.

Again since $v = \frac{144}{\pi h' d} \sin \alpha$ we may write $\sqrt{q} = G \frac{wV}{h' d}$ where G is some constant. But \sqrt{q} is, as already shown, equal to

$$\sqrt{\frac{1}{2K}} d \left(\frac{\text{R.P.M.}}{1000} \right)$$

and equating these two expressions we get

$$G \frac{wV}{h' d} = \frac{\text{R.P.M.}}{1000} d \sqrt{\frac{U}{2K}}$$

or

$$h' = \frac{1000 G}{\text{R.P.M.}} \frac{wV}{d^2} \sqrt{\frac{2K}{U}}.$$

The value of G must be determined experimentally, and from careful tests it appears that for normal Parsons blades h' may be written as,

$$h' = \frac{616}{\text{R.P.M.}} \frac{wV}{d^2} \sqrt{\frac{K}{U}} \quad (5).$$

It may be added, however, that the value of the coefficient is not quite independent of the efficiency, and whilst the value 616 is appropriate to an efficiency of 0.7 it increases to 678 for an efficiency of 85%.

For a reaction turbine having an hydraulic efficiency of 0.7 it will be seen from the efficiency curve that $\frac{K}{U}$ has the value 600, and if d be taken as 49 in. we get for the total number of rows (fixed and moving) corresponding to the expenditure of a thermodynamic head U , the expression

$$n = \frac{2K}{d^2} \times \left(\frac{1000}{\text{R.P.M.}} \right)^2 = \frac{1200 U}{d^2} \left(\frac{1000}{\text{R.P.M.}} \right)^2 = 0.08677 U.$$

Taking the values of U from table 3 the corresponding values of n are entered in the fifth column of table 4. Taking the steam passed as 13.5 lb. per second each way, we get for h' the expression

$$h' = \frac{616}{2400} \times \frac{13.5}{49^2} \sqrt{600} \times U = 0.3535 U.$$

From this the values of h' given in the sixth column of table 4 have been deduced.

to K it follows that if in any turbine $\log p$ when plotted against K gives a straight line, that turbine, whether of the impulse or reaction type, cannot be designed to operate with uniform efficiency. In the diagram fig. 17 the values of $\log p$ represent the pressure of the steam after discharge from the preceding stage, stage No. 1 being thus conceived as being preceded by an imaginary stage No. 0. A corresponding plot of the volume would, however, give not the volume at discharge from the guide blades, but this volume as increased by the heat generated in the passage of the steam through the moving buckets. All stages being similar, the effective thermodynamic head at each stage is the same. But the apparent thermodynamic head U by the number of stages, is somewhat greater than the adiabatic heat drop at each stage.

According to what has been stated above, the velocity of discharge from the guide blades of a stage is commonly taken as $v = 300.2 \times 0.95 \sqrt{u}$ where u is the adiabatic heat drop. The weight W discharged per second per sq. ft. of guide blade area is

$$W = \frac{v}{V\phi} = \frac{300.2 \times 0.95 \sqrt{u}}{V\phi}$$

where $V\phi$ represents the volume of the steam after an adiabatic expansion between the pressure above and below the stage. Instead of calculating these values it is more convenient to utilize the known values of U and V and to correct the above formula by using an appropriate coefficient f . As there are 12 stages in the present

case we get $\frac{U}{12} = \frac{124.6}{12} = 10.38 = q$, and the above equation may therefore be written

$$W = f \frac{300.2 \times 0.95 \sqrt{10.38}}{V}$$

An interpolation formula for f which is applicable for the ordinary range of turbine efficiencies and for convergent guide blades is $f = 1 + 0.13(1 - \eta)\sqrt{x} - 1$ where x denotes the ratio of the pressure above and below the stage. The coefficient f is readily evaluated by the ordinary slide rule with quite sufficient accuracy.

In the case under consideration we note from the curve fig. 17, that when $v = 1$, $\log p \approx 1.197$ so that $x = 1.27$ and f is therefore 1.023.

The area available for flow through a row of guide blades is $\frac{\pi h' \bar{d} \sin \alpha}{144}$ where h' denotes the blade height in in., and α is the "effective" angle of discharge, allowing if necessary for the

fact that the blades are of finite thickness. Hence if w be the weight of steam flowing through the turbine per second

$$h' = \frac{wV}{6223 f' \bar{d} \sin \alpha \sqrt{q}}$$

Taking $\sin \alpha = 0.30$, $\bar{d} = 4.41$, $q = 10.38$ and $w = 10.3$ lb. per second, this expression reduces to $h' = 0.3732V$. Values of h' thus calculated for the values of V given in table 3 are plotted in fig. 17 and from the curve thus obtained we read off the theoretical blade heights at the different stages. These are:—

Stage No. . .	1	2	3	4	5	6
Theor. blade height in in. . .	0.94	1.18	1.51	1.95	2.48	3.24
Stage No. . .	7	8	9	10	11	12
Theor. blade height in in. . .	4.30	5.65	7.69	10.48	14.40	20.0

In practice the nearest even dimensions will be substituted for the calculated heights. The calculated heights for the last three stages are inconveniently long, but they can all be reduced to say 9 in. by suitably increasing the effective angles of discharge. Some builders moreover increase the pressure drop at the exhaust end, and would accordingly combine stages 11 and 12 into one. These expedients decrease the efficiency but are cheaper than the alternative of constructing the low-pressure end on the double flow principle.

The high-pressure end of a turbine can be proportioned in a manner exactly similar to that described, but as the steam there is commonly superheated, the problem is correspondingly simplified and need not therefore be discussed here. It is, however, usually necessary to construct some of the high pressure stages as partial admission stages and it is also a common practice to have a large pressure drop at the first stage with the object (at some sacrifice of efficiency) of making a large initial reduction in the temperature and pressure of the steam, so that the high pressures and temperatures are confined to the nozzle boxes of the first stage. To the same end a velocity compounded wheel is frequently used in the first stage. The general theory of these wheels is described in Prof. Ewing's article (see 25.844), but it may be observed that in practice it has been found necessary to adopt empirical methods of designing such wheels. If designed as pure impulse wheels operated with a fluid which is "freely deviated" the results are very disappointing. One rule which has been used is to assume that only 85% of the total heat drop of the stage is utilized in the nozzles, and of the residue that 5% is utilized in each of the three sets of blading. The wheel therefore works to some extent as a reaction turbine.

Speaking generally, the principle of "free deviation" as embodied in some water wheel designs is inadmissible in steam turbine practice, in which the moving blades should be just sufficiently long to avoid "spilling" of the steam delivered to them from the guide blades. As to the exact form of the moving blades, this does not appear to be of primary importance within reasonable limits, as,

Thus with $\nu = 9.92$ we note that $\left(\frac{dn}{dv}\right)_0 = 1.477$, $\left(\frac{dn}{dv}\right)_n = .90$ and $\left(\frac{dn}{dv}\right)_n = 1.311$, whence $n = 12.60$. Proceeding in this way the

figures in the last column of table 5 are obtained. In fig. 21, h is plotted against n as also is $\nu^{0.5}$.

Stages 9.81 and 10.81 of the ideal turbine have already been dealt with so that in proceeding further with the design we start with stage 8.81 of the ideal turbine. From fig. 21, it appears that $\nu = 8.81$ corresponds with $n = 11.51$ and from the curve of blade heights we get the following values for h

n	9.51	10.51	11.51
h	5.94	7.87	9.38

As before, an approximate value of h to replace the blades at 10.51 and 11.51 is the value of h at $n = 11.01$. This value of h is 8.31 inches. Replacing the blades at the high pressure stages $n = 0.51$ and $n = 1.51$ the same method gives us $h = 1.29$ inches.

If we determine the corrections for these two extremes the corrections for the intermediate groups can be determined with sufficient accuracy by linear interpolation. Equation 4 in this case becomes

$$h^2 (h+D)^2 = \frac{n + \log_e \frac{h'_n}{h''_n}}{n} \frac{6}{\frac{1}{h_n^2 (h_n+D)^2} + \frac{4}{h_n^2 (h_n+D)^2} + \frac{1}{h_n^2 (h_n+D)^2}}$$

which gives h as 8.250 in. in place of 8.31 in. as read from the curve. At the high-pressure end of the turbine the calculated value is 1.321 in. as against 1.33 as read from the curve.

It will be seen that with the blading thus derived the pressure at the first row of guide blades is that corresponding to $n = -0.49$ instead of to $n = 0$ as it should be. By plotting $\log p$ against n we find that the pressure corresponding to $n = -0.49$ is 21.5 lb. per sq. in. instead of 20 as assumed. This can be corrected by slightly increasing the height of the first group of blades, for which purpose we can use the approximate expression

$$\frac{h_c}{h} = \frac{\sqrt{p_c^2 - p_0^2}}{\sqrt{p_c^2 - p_0^2}}$$

In this expression h_c denotes the corrected value of h , p_c the pressure corresponding to $n = -0.49$, and p_0 the designed pressure in front of the first row of guide blades, whilst p_0 denotes the pressure on discharge from the group.

We thus get $h_c = 1.45$, so that the computed blade heights are as follow:—

TABLE 5.

Group No.	I.	II.	III.	IV.	V.	VI.	VII.
No. of moving rows in group	1	1	1	1	1	1	1
Calculated blade height in in.	1.450	1.710	2.960	3.540	5.320	8.310	9.800
Allowance for tip clearance	0.093	0.096	0.108	0.123	0.141	0.171	0.186
Net calculated blade heights	1.357	1.614	2.852	3.416	5.179	8.139	9.714
Actual blade height	1½	1½	2½	3½	5½	8½	9½

The length of the blades in group No. VII. is for semi-wing blades as previously explained. In the above table the allowance for tip clearance is not the actual tip clearance, but the amount by which the blade heights must be reduced in order that no more steam shall pass than if there were no tip clearance whatever. This allowance has been taken as 0.002 in. per in. of drum diameter plus 0.010 in. per in. of blade height, and this amount is subtracted from the computed blade heights.

It should, perhaps, be noted that whilst in the ideal turbine the velocity of efflux from a stage is strictly proportional to \sqrt{q} this condition is only approximately fulfilled in the case of a turbine with constant drum diameter.

Had the above turbine been designed to run at 1,000 revs. per minute instead of 2,400, many more rows of blading would have been necessary, and to avoid large losses by the carrying over of kinetic energy to the exhaust a larger drum would have been advisable.

It may be mentioned that the normal blades for which the coefficient in equation 5 applies are of the old type with the opening gauged to about one-third the pitch, these blades being the ones used in the turbine from the test of which the coefficient was deduced. Certain makers now use a different form of blade having a parallel tail, a departure which it is difficult to justify.

TURKESTAN, WEST (see 27.410).—After the revolution in Russia, Western (or Russian) Turkestan became a member of the Federation of Soviet Republics. It was divided into five provinces: Semirychia, Syr Daria, Ferghana, Samarkand and Trans-Caspia. The exact position of the native states of Bukhara and Khiva, which were later occupied by the Soviet Government, remained obscure. Each of the five provinces, by the constitution of the Republic, is governed by a provincial Executive Committee or council which sends representatives to Tashkent, the capital, where the Central Executive Committee of the Republic meets. This Committee consists of 75 members, sending representatives to Moscow to the meetings of the Central Committee of the All-Russian Federation of Soviet Republics, but the Turkestan Republic showed itself very little inclined to accept the control which the Central Committee at Moscow endeavoured to maintain. The Turkestan Committee elects a small council, forming a kind of cabinet and having control of the different branches of the administration. The right of voting being confined to members of the Communist party, the Government represented by no means one really elected by universal suffrage but rather a dictatorship of the lower classes. The Russians in Turkestan form only about 5% of the total pop., and since most of the rural Mussulman pop. take no part in the voting, the country is governed to all intents and purposes by men elected by the very small proportion of Russians of the lower classes living in the towns. Figures for the pop. of some of the large towns in 1916 were:—Khokand, 112,000; Naman-gan, 103,000; Samarkand, 89,000; Tashkent, 201,000. All trade and industry were in 1921 at an absolute standstill owing to Bolshevism.

Great success had attended the cultivation of cotton, and the high prices obtained for the Turkestan article (most of which is grown in Ferghana, where 742,000 acres were cultivated in 1915), coupled with the increase of railways, led to the abandonment of corn in favour of the cultivation of cotton, and, although W. Turkestan is a good wheat-producing country, cereals were actually imported from Russia and Siberia and cotton exported in exchange. Factories for cleaning and baling raw cotton and for extracting cotton oil were set up, and employed a large number of people, mostly in Ferghana. These factories were worked by crude oil from the Baku wells. The total area under cotton in 1916, including that grown in Khiva and Bukhara, was 1,838,215 acres, yielding about 18,000,000 pounds or 200,000 tons of raw cotton.

The cultivation of vines had also increased, and wine industries had been initiated, chiefly in Tashkent and Samarkand. A large product of the vine was in the form of raisins and currants, of which quantities were exported to Russia.

Large quantities of fruits—apples, pears, quinces, peaches, nec turines, apricots, grapes and melons—were exported by special train to central Europe, where the Turkestan crop was received a short time before the south European supplies ripened.

Minerals remained for the most part unworked, though the profit able coal fields and oil wells in Ferghana were used when disturbances in Trans-Caspia cut Turkestan off from the Baku oil, on which it relies entirely for its industrial life. Mining is hampered by the lack of roads and by the want of machinery.

A very large industry in Bukhara is the export of Astrakhan lam skins (called locally Karakul). Enormous flocks of these sheep are kept in the deserts around Bukhara. Attempts to breed these sheep in other countries have always resulted in a deterioration in the quality of the skins owing to some peculiarity of climate. Before the World War about 1½ million skins were obtained annually at a cost of 6 to 8 roubles each.

There are practically no branch roads in Turkestan, and the only means of transport in bulk is either by wagon on the few main road or by railway. The largest new railway project is the Semirych chenskaya railway. This line was intended to leave the Orenburg Tashkent line at Arys (146 versts N. of Tashkent) and go to Viern a distance of about 900 versts. Actual construction was complete to Burnoi (220 versts) when Bolshevism came to crush all enterprise and initiative. Some work was done E. of Burnoi, but the line was

not laid and no trains ran in 1921 beyond Burnoi. It was intended later to continue this line from Vierni to Semipalatinsk (about 900 versts) and join up with the Trans-Siberian line. Important railway lines were constructed from Kagan (the station on the main line 10 m. S. of Bukhara City) to Karshi and Kerki, whence the line runs up the right bank of the Oxus to Termez on the Afghan border. A branch runs from Karshi to Kitab, and the intention was to join Kitab to Samarkand. All these lines were destroyed by the Bukharians in 1918 but could presumably be easily repaired. The total length of these railways in Bukhara was about 400 m. and there are, in addition, lines from Andijan to Jalalabad coal-fields, about 45 m., from Khokand to Namangan, about 57 m., and from Fechenko (N. E. of Skobelev) to Sharikhan, about 11 miles. (F. M. B.)

TURKEY (NATIONALIST).—An organized State of Nationalist Turkey, in its wider aspect an Anatolian State created by Turkish Nationalists in 1919-20, was the outcome of the terms of peace dictated to the Ottoman Empire by the victorious Powers after the war of 1914-18. A severe peace was expected by the Turkish rulers and people. They were resigned to the loss of Turkish Arabia, Palestine, Syria, Mesopotamia; to stringent foreign control of Turkish finance; to the reimposition of the Capitulations; to international control of the waterway between the Aegean and the Black Sea; and to measures for the protection of Christian populations in Turkish territory. Such curtailments of territory and supervision of their internal affairs would doubtless have received their reluctant acquiescence. But the surrender of Ottoman territory—of Smyrna and Thrace—to Greece as part of the terms of peace was a matter that touched all Turks to the quick. The Turkish Nationalist movement received its first great impulse when a Greek force, acting on a decision of the Supreme Council, occupied Smyrna and the surrounding territory in May 1919. Nationalist plans were rapidly matured and put into execution.

General Mustafa Kemal Pasha, an officer who had fought with much credit in the defence of Gallipoli, left Constantinople early in June 1919, ostensibly for his military district in Asia Minor. On June 19 he outlined the Nationalist plan for saving the country at a public meeting held at Khavsa, 50 m. inland from Samsun. It was the official opening of the Nationalist movement. In brief, the scheme was to create a government and army in the heart of Asia Minor to resist the partitioning of Turkish territory within "Armistice limits." The definition of area referred to the armistice of Mudros of Oct. 30 1918, and thus excluded Mesopotamia, Syria and Arabia from the territory to be preserved, but included Smyrna and Thrace. For this area Nationalists professed willingness to accept a single Great Power as mandatory; they would not, however, accept more than one. The movement spread rapidly. A provisional government was set up at Erzerum in August. In Sept. a National Congress was held at Sivas, which affirmed the purpose not only of maintaining the integrity of Ottoman territory within armistice limits, but of upholding the Caliphate and Sultanate. A few weeks later the seat of the government was changed to Angora, as a more central position. By the end of 1919 the Nationalist movement had been accepted by nearly the whole of Asia Minor, and the Ottoman Government at Constantinople became a government representing little, and wielding no authority.

Behind the Nationalist movement was the military class of Turkey, and the still powerful secret society known as the Committee of Union and Progress. In fact, though the movement represented on the part of the people a genuine patriotism and desire to resist what was deemed as aggression, it is doubtful if the Committee were not its real founders. At all events Talaat Pasha, Enver Pasha, Djemal Pasha, Sais Halim Pasha, and many other Committee leaders became exceedingly active in the Nationalist cause. They gave it, too, the Pan-Islamist policy which the Committee had followed when in power behind the Ottoman Government at Constantinople. Owing to this connexion between Turkish Nationalism and Pan-Islamism Moslem sympathy was excited in British India. Doubtless the agitation was arranged, but nevertheless it carried weight. A "Caliphate Committee" to oppose the imposition of harsh terms of peace on Turkey was formed, and a delegation sent to London. The delegation laid much stress on a speech made by Mr. Lloyd

George on Jan. 5 1918, in which he said: "Nor are we fighting to deprive Turkey of its capital, or of the rich and renowned lands of Asia Minor and Thrace which are predominantly Turkish in race." This speech the delegation, and other supporters of a lenient policy towards Turkey, claimed as a pledge. At the Peace Conference of the Allies held in London early in Feb. 1920, to discuss the terms of the Turkish peace, it was decided to leave Constantinople in the possession of Turkey. At this time the Nationalists began military operations against Cilicia. Turkish troops drove the French out of Marash and other places in this region, and used their success to massacre great numbers of Armenians. Simultaneously the Nationalists organized resistance in Thrace under Col. Jaffas Tayar Bey.

The Government at Constantinople were now taken with the idea that they could suppress the Nationalists from within. They sought to rally to their side the sober and religious masses of the Turkish population by the joint influence of the Sultan as Caliph and of the Sheikh ul Islam. An Imperial decree was also issued declaring the Nationalists rebels. At the same time a military effort was made by sending Anzavur Pasha with a considerable force to occupy Brusa. But the appeal of the Caliph and the Sheikh ul Islam had little effect; the decree as to rebels was ignored; and Anzavur Pasha's force deserted to the Kemalists before Brusa was reached.

The Supreme Council sitting at San Remo finally decided the terms of the Turkish peace in April 1920, and the treaty was handed to the Turkish delegates on May 9. The terms of the treaty caused the fiercest hostility in Angora. The Great National Assembly declared for resistance to the last, and formally denied the right of the Constantinople Government to conclude any treaty on behalf of Turkey. It declared further that no treaty made by that Government would be recognized by the Nationalists. It was evident now that nothing but the application of force by the Allies would compel acceptance of the treaty by the Government at Angora. On the proposal of M. Venizelos, then the Greek premier, the Allies therefore entrusted the task to Greece of dealing with the Nationalist forces in western Asia Minor, and imposing the treaty. In support of Greece the Allies undertook minor naval operations. During June and July 1920 the Greek armies conducted a campaign in which they overran the part of Asia Minor lying westward of a line drawn from Brusa to Ushak in the valley of the Menderes. A Greek army also occupied Thrace. As the result of these operations, which destroyed any hope the Ottoman Government may have had of obtaining better terms by delay, the treaty was signed by the Ottoman delegates on August 20 1920.

In spite of their defeat at Greek hands the Nationalists showed no inclination to accept the treaty. Instead, they turned more and more towards Bolshevik Russia, with hostility to the Allies as the common cause in pursuit of which each could assist the other. Arms, munitions and money were the chief Nationalist needs; and for her own ends Russia, to some extent, supplied them. In return she took the opportunity for spreading Bolshevik principles in Asia Minor, though with little success among Moslems, who held that Bolshevik theories were in opposition to the teachings of Mahomet. Towards the end of 1920 the Government of Constantinople made an attempt at peace with the Nationalists by sending a "Mission of Reconciliation" to Angora. But this effort, too, had no results. Notwithstanding defeat in the West, and risings and discontent within the area over which they had power, the Nationalist Government was in a fairly strong position. Nothing but force could overthrow them, and the nature of the country and absence of roads made the application of such force from outside a dangerous and exceedingly difficult undertaking. They were in alliance with Bolshevik Russia. Their country was self-supporting. They had but to wait, and time would assure their ultimate success.

Meanwhile Bolshevik Russia and Nationalist Turkey endeavoured to secure better land communications between their territories, to bring, in fact, their territories to a common frontier. Russia was established in the Transcaucasian Republic of Azerbaidjan; but between Turkey and Azerbaidjan lay the Ar-

menian Republic of Erivan; and the line of railway from Azerbaidjan to Turkish territory passed through the hostile Armenian State. In Sept. 1920 the Nationalists, in agreement with Russia, therefore began military operations against the Republic of Erivan. The upshot was that by the end of Nov. the Republic was crushed, its territory occupied, many thousands of its people massacred, its Government overthrown and replaced by a Soviet Government which accepted Russian mediation and onerous terms of peace. These included the cession of the districts of Kars and Ardahan to Turkey, together with additional territory traversed by the railway from Azerbaidjan to the Turkish frontier.

Nationalist leaders had always urged that time was on their side. During Dec. 1920 the elections in Greece overthrew the Government of M. Venizelos; and the return of the ex-King Constantine took place the same month as the result of a plebiscite. These events changed the whole policy of the Allied Powers towards Greece. But a settlement of Turkish questions remained as necessary to the Allies as ever. They therefore invited the Greek and Turkish Governments to send delegations to a conference in London in Feb. 1921, for the purpose of reaching, if possible, a compromise on the Treaty of Sevres. The condition was made that the Turkish Delegation should include representatives of Angora. The conference finally made an offer to the two delegations, to be accepted or rejected as a whole by their Governments. The offer proposed various important changes in the Treaty, including evacuation of Constantinople by the Allied garrison, an increase in the strength permitted the Turkish army, and the granting of autonomy to the Smyrna zone under Turkish sovereignty, and a Christian governor. These terms were promptly rejected by the Greek Government, who then reopened hostilities against the Nationalists in opposition to Allied advice. The Greek aim was to reach Angora, and destroy the Nationalist army. At the end of March, however, the Greek army was heavily repulsed before Eskishehr and compelled to retreat to its original positions before Brusa and Ushak. At the beginning of July another Greek offensive was made, this time on a much greater scale. Afium Kara Hissar, Kutahia, and Eskishehr were captured, notwithstanding determined Turkish resistance, and the advances continued along the railway towards Angora. But in a great battle at the end of Aug., on the line of the Sakaria river, the Greek army failed to break through the Turkish entrenchments, and again retreated, this time to positions covering Eskishehr and Afium Kara Hissar. (W. J. C.*)

TURKISH CAMPAIGNS.—Under this general heading the operations in the World War involving Turkey in (1) the Caucasus, (2) Mesopotamia, (3) the Sinai area, and (4) Syria, are described.

(I.) OPERATIONS ON THE CAUCASUS FRONT

A firm grasp of the military-geographical conditions on the Russo-Turkish frontier is an essential preliminary to an understanding of the operations in the Caucasus. In this region war, though waged with modern weapons, must be conducted by very old-fashioned methods; for the absence of railways and the rarity of good roads on the Turkish side from the first militated against, and indeed largely precluded, strategic mobility. In the vast area, 600 m. long by 300 wide, bounded by the S. coast of the Black Sea, the Russo-Turkish frontier, Lake Urmia and a line thence by Urfa to Angora, not a single railway exists. The only roads are the steep mountain track from Trebizond to Erzerum, a somewhat easier main road from Angora by Sivas and Erzincan to Erzerum, the very steep mountain road from Kharput to Erzerum which at Garib meets the road crossing the wild Armenian Taurus from Diarbekr, the highway Mosul-Bilis-Mush-Erzerum, and lastly the old caravan route from Erzerum by way of Bayazid into Persia. The only other means of communication are narrow tracks, made by use only and impossible to trace after a snowfall; they serve to indicate to the troops their lines of advance, but can in no sense be said to facilitate their march. Transport, apart from pack-animals, can only move in the few roads mentioned and even on these, which are all in bad condition, only with extreme difficulty. The rivers

as a rule can only be crossed at the fords, as any bridges have long ago broken down, for in Turkey no attempt is made to keep up the roads, the high dues levied for this purpose disappearing into the pockets of the officials.

It must always be remembered that a Turkish army operating in the region of Erzerum has a line of communications over 600 m. long to the nearest railhead at Angora or Ulu Kysla, from which points every shell has to be brought up by camel transport, taking six weeks in transit. It would, therefore, have been of urgent importance to the Turks, for this reason alone, to gain complete command of the Black Sea, which would have made it possible for them to send supplies for the army by sea from Constantinople to Trebizond and thence overland by the comparatively short route to Erzerum. However, they only succeeded for a short period at the beginning of the war, in asserting a sufficient superiority over the Russian Black Sea fleet to allow of safe transit by sea to Trebizond, and it became impossible to count on this. The present writer had in 1913 drawn up for the Turkish general staff a memorandum, in which he fully discussed and recommended the reconstruction of the wholly antiquated fortress of Erzerum, of which the newest works dated from 1864, the erection of barrier forts to secure the Trebizond road, and other measures aimed at facilitating future operations in this area. But this important problem received no attention, and the future theatre of war was left in such a condition as to render impossible the defence of the frontier against a resolute attack.

The main theatre of war of the eastern Anatolian campaigns of 1914-8 was Turkish Armenia. The geographical area of Armenia had no clearly defined limits, having become nothing more than a geographical term for the districts of Russia, Persia and Turkey, which were inhabited by people of Armenian nationality. The geographical limits of Armenia are clearly defined only in the Caucasian isthmus, where the boundary is formed by the little Caucasus, stretching south-eastward between Tiflis and Akhaltsikh. In Persia the Armenian population in the province of Azerbaidjan melts gradually into the Persian from Lake Urmia eastward. To the S. the ethnographic boundary corresponds more or less with the line of the Armenian Taurus and the parts of the Taurus stretching from the Cilician frontier to the Euphrates gorge; but northern spurs of Kurdistan jut out into Armenian territory, e.g. especially in the region of Dersin which extends with its population of Kurdish tribesmen, who have a mortal feud with the Armenians, to just S. of Erzincan. In the W. conditions are the same as in Persia. As one goes towards Sivas, the Armenians melt away into the Turkish Mahomedan population, while to the N. Lazistan cuts off the Armenian highlands from the sea. The course of the Juroch may be taken as the frontier between Pontus and Lazistan on the one side and Armenia on the other. In all this "Armenia" there is no territory inhabited exclusively by Armenians. As against this, countless Armenians are dispersed all over Turkey, and these communities of the dispersion are frequently, as in Adana (Cilicia), numerically strong and economically predominant.

Turkish Armenia is in parts a fertile land, but the climate is most unfavourable from the military point of view. Long cold winters, with heavy and frequent snowfalls, render almost impossible all strategic movement, and large bodies of troops are always in danger of decimation by frost and hunger, while the short summer brings with it oppressive heat. Turkish Armenia, inside the stupendous mountain range which cuts it off from Russian Armenia, is a tangled mass of hills and valleys. The differences in height between the mountain ridges and the deep-cut gorges is very marked. The population is poor and scattered, so that in areas hundreds of square miles in extent there are neither tracks nor habitations to be found. Much of Turkish Armenia has never really been explored, and the representation of it on the maps is largely mere guesswork. Erzerum itself is one of the highest placed towns in the world; it stands over 6,000 ft. above sea-level. Its population was estimated (much too highly) at 120,000 in 1913.

For the Russians the strategic situation was much more favourable than for the Turks. Preparations for the eventualities

of a war with Turkey had for some time been taken in hand by the Russian general staff. Russia fully realized the importance of possessing the Armenian plateau, with its Christian population and great mineral wealth. The frontier fortress of Kars, which with its whole district had passed to Russia in 1878, was modernized, placed in a permanent state of defence, and well provided with guns, ammunition and supplies. A lateral line through Transcaucasia from Baku by way of Tiflis to Poti on the Black Sea was constructed, from which branch lines led to the Turkish frontier. The network of roads was also carefully completed and the frontier area thus converted into an excellent base for strategical deployment.

From the first, then, the Russians had the better strategic position. In this country whichever side was nearest to its railways was bound to have a decisive strategical advantage over the other, especially if in addition it possessed a better network of roads. Enver Pasha, however, failed to realize this. As a strategist he was a hopeless amateur, who believed that his personal will in Constantinople could remedy in a moment the age-old defects of the Turkish military system and the Turkish general staff.

Long before Russia, in Nov. 1914, declared war on Turkey, Gen. Liman von Sanders had planned to create a diversion in favour of the German and Austrian armies in the eastern front by landing several Turkish corps near Odessa and advancing into the Ukraine, where he hoped to rally the numerous German colonists to his standards. This scheme may be considered to have been the one great strategic error which could be laid to the account of Liman von Sanders: for it violated all those canons of prudence, the disregard of which the general himself so often and vigorously censured in the projects of others.

Liman von Sanders earmarked for this operation the I., IV., V. and X. Corps, and proposed to lead the army in person. It is easy to understand that the Turkish High Command looked with disfavour on this plan, if only because it needed all its available forces for operations in the Turkish theatre of war. The project of effecting a landing at Odessa held out no promise of success; for the expedition could never have ventured far from its ships, and could therefore have exercised no effect on the general strategic situation. It might perhaps have served as a centre for a rising in the Ukraine, whose agents were in Constantinople. But, in view of the military strength of Russia at that time, the success of such a rising was more than doubtful. The adventurous scheme was finally abandoned on Sept. 18 1914, largely because the commander of the fleet considered it impossible to guarantee either the smooth disembarkation of the troops or the maintenance of the line of communications by sea between Odessa and Constantinople. The Corps comprising the I. Army were also needed for political reasons in the Adrianople area, where they were to be used to cover the rear of Bulgaria against a Rumanian attack, should the former commit herself to an offensive against Serbia.

For Liman von Sanders' scheme was now substituted Enver's great plan for an advance against Russia, to be carried out by the III. Army, assembling in Sept. and Oct. at Erzerum, under the incompetent Hasan 'Izzet Pasha (not to be confused with the Ahmad 'Izzet who later became commander-in-chief).

This army consisted of the IX. and XI. Corps, the 2nd Cav. Div. and the so-called 2nd Res. Cav. Div. made up of Kurdish irregular bands. This reserve cavalry, useless for fighting purposes, showed great skill in massacring and plundering the defenceless Armenians whenever opportunity offered. In Nov. the X. Corps also joined the III. Army. The condition of the troops may be gathered from a report of the middle of Nov. 1914, according to which the X. Corps alone was short of 17,000 overcoats, 17,400 pairs of boots, 23,000 tents and 13,000 packs—and this just before the Armenian winter, in a country where bivouacking is unavoidable on account of the settlements being far too thinly scattered to allow the housing of large bodies of troops. The III. Army was brought up to strength by reserves from E. Anatolia; they were excellent military material, but shortage of clothing and food in the autumn soon caused them to desert in masses.

Enver's plan of operations involved a frontal advance by the XI. Corps along the Erzerum-Sarikamish road, combined with an attack against the Russian right flank by the two other corps moving to the left over the mountains in the direction of Olti, with the idea of cutting the Russians off from Kars and capturing that fortress. The present writer repeatedly told the Turkish High Command that the whole operation was impossible of execution, and Liman von Sanders endeavoured in a personal interview with Enver to dissuade him from carrying out his plan, which was foredoomed to failure. The latter, who had an exaggerated idea of his own capacity, refused to listen to advice or to take warning. Not only would he not see that his scheme was impracticable, but he expressed to Liman von Sanders his ultimate intention of marching by way of Afghanistan against India. No better proof could be desired of Enver's incapacity to understand what strategy means.

As a matter of fact the scheme as it stood was never put into execution, for the Russians anticipated it by undertaking an advance on Erzerum with a Cossack division and a mixed bde. Hasan 'Izzet attacked them at Köprü Keui on Nov. 8, and by the 12th he had succeeded in taking the Russian positions. Meanwhile, however, the I. Caucasian Corps had taken up a position in rear near Asap, which resisted all the efforts of the Turks to storm it, though they gained ground at certain points. The Turks were already running short of ammunition and the arrival of parts of the II. Turkestan Corps to reinforce the Russians seemed to indicate that the Turkish superiority in numbers would shortly be lost, if it had not already been so. Hasan 'Izzet therefore withdrew the III. Army, gave up all idea of any further offensive, and turned his attention to completing the equipment and supply services of his troops, who were even now beginning to suffer privations. This wise decision must largely be attributed to the influence of his German chief of staff, Guse. The losses of the Turkish army in these first encounters amounted to 1,500 killed, 5,600 wounded—no inconsiderable proportion of the effective strength of the army, estimated at some 90,000 men.

At this point, however, Enver took the bit between his teeth. He ordered a detachment which had been assembled under a German officer at Haidar Pasha to be transported across the Black Sea and landed W. of Batum, and to advance thence into Russian territory—in fact, to attack Russia. The detachment pushed forward boldly to Ardahan, where it encountered overwhelming hostile forces and had to retire to the Russo-Turkish frontier. Enver himself, burning with impatience, and his German chief of staff, Bronsart von Schellendorf, who also was no strategist, sailed on board a warship for Trebizond. Leaving Constantinople on Dec. 6 he reached Erzerum on the 21st, and, taking over the command of the III. Army, set to work at once to carry into action his pet scheme outlined above. The various corps received the following missions. The IX. Corps was to drive the Russians from the pass between Erzerum and Olti and advance on the latter place. The X. Corps, moving from Erzerum northward, was to wheel round south-eastward in front of Olti in order to cut the line of retreat of the enemy in conjunction with the IX. Corps, marching parallel to it. The Russians would then be attacked frontally by the XI. Corps, as soon as the turning movement succeeded.

This scheme was a real piece of geometrical strategy, which in view of the bitter cold, the deep snow and the miserable equipment of the Turkish army was bound to turn out disastrously. Enver, however, persisted in his attempt to ape the deeds of Alexander the Great, and the operation proved a complete failure. The IX. Corps successfully forced the pass, but got utterly out of hand in the tangle of snowclad and pathless mountains. With its units inextricably mixed up it encountered near Sarikamish a superior and well-ordered enemy force, and suffered a complete defeat. The X. Corps, which had an even longer road to traverse, also arrived piecemeal on the battlefield on Jan. 4 1915, when the IX. Corps was already pouring back in complete disorder. The X. Corps shared its fate and retreated in disordered haste over the mountains. Enver attempted to retrieve the position by attacking with the XI.

Corps. Naturally enough, this isolated attack was broken without producing any effect beyond making it possible for the remnants of the IX. and X. Corps to escape to Erzerum.

The III. Army, which owing to the heavy snow had been unable to take its field artillery with it, had suffered appalling losses, which were due not so much to the fighting as to the fact that the troops had had to bivouac in the snow without tents and practically without food. An epidemic of typhus now broke out in its ranks. After the offensive the strength of the army had been reduced to the following totals: IX. Corps 2,000, X. Corps 2,400, XI. Corps 2,400, Artillery and 2nd Cav. Div. 4,800; or 12,400 in all. The army had thus lost 86 % of its effectives, and had suffered a disaster which for rapidity and completeness is without parallel in military history. The miserable survivors were in a pitiable condition. Enver Pasha, with Bronsart von Schellendorf, at once left the army, handing over the command to Havis Hakki Pasha, his brother-in-law, and returned to Constantinople; he never again during the World War attempted to conduct operations, though he often interfered with the decisions of the other army commanders with disastrous results. Thus, soon after the defeat E. of Erzerum, he ordered the despatch of the V. Corps to that theatre from Constantinople, and was only at the last moment persuaded by Liman von Sanders to cancel his instructions. During his return journey he also announced that no orders other than his own should be carried out by the troops, and instructions to this effect were sent to all the Turkish armies. The greatest confusion would have resulted had not the Grand Vizier cancelled this ridiculous order. Havis Hakki Pasha dying in Feb. of typhus, the command was given to Mahmud Kiamil, who knew next to nothing of strategy and owed his rise solely to political considerations and his influential connexions.

It was an undeserved piece of good fortune for Turkey that the Russian losses and the increasing severity of the weather forbade any pursuit, and that the situation on the Polish front was absorbing all the available Russian troops and preventing the despatch of reinforcements to the Caucasus. There ensued therefore a cessation of all activity in this quarter, and Mahmud Kiamil had time to reorganize his army. By occupying the Id and Olti passes he secured his left flank against any raids and surprise attacks which the Russians might be planning. Farther still to the left the small detachment which had carried out the push into Ardahan was wintering at Artvin in Russian territory. It consisted of 1,000 regulars, reinforced by volunteers raised in Constantinople by the Committee of National Defence with the assistance of the German military representatives. More of these somewhat inferior troops were sent to the detachment in Feb. and March, and it was resolved to attempt a *coup de main* against Batum. The fortifications of the town, however, though antiquated, were quite sufficient to repel the attack of these unorganized and half-trained men, and the enterprise was a complete failure. This was all the more unfortunate for Turkey, as she had found herself unable, despite the presence in the Black Sea of the "Goeben" and the "Breslau," which were manned by German crews but had been transferred to the Turkish fleet, to maintain uninterrupted command of that sea. During 1915 the two German ships, the only effective portion of the Turkish navy, were needed to coöperate in the defence of the Dardanelles; so the Russians were able once more to venture out to sea and shell the coal-mines of Zunguldak and Fregli and the town and harbour of Trebizond. Henceforward the line of communication of the III. Army by sea had to be given up, and it now ran overland along the railway from Haidar Pasha (opposite Constantinople) by Konia, to Ulu Kyshla (in the Taurus N.E. of Adana), where everything was loaded onto carts and camels, and proceeded by road via Kaisariyeh and Sivas to Erzinjan, there to be distributed. The length of this line from the railroad at Ulu Kyshla to the main depot at Erzinjan was some 475 miles.

Mahmud Kiamil, with the assistance of the German Lt.-Col. Guse, who was still chief of staff, succeeded during the winter months in bringing the strength of his army up to 35,000 men; most of the new recruits, however, had had little or no training. His

small army had to hold a wide front of some 220 m. from the Black Sea to Lake Van, and in these circumstances Mahmud Kiamil kept the main body of his army concentrated round Erzerum, and protected the rest of the front only by small detachments. This was not difficult, particularly in winter, since few passable paths led over the frontier mountains, which are in places over 9,000 ft. high.

The Russians were not strong enough to fight a battle along the Sarikamish-Erzerum road. They therefore had recourse to wide turning movements, but not until May 1915, when the snow on the roads had melted. They first pressed the Turks back from the Olti pass and pushed on to Turtum. This village lies in a wild and precipitous valley in the midst of the high mountains, and here it was therefore possible for the Turkish reserves to stem the Russian advance. The Id pass was also occupied by the Russians. While the attention of the Turkish Higher Command was thus attracted to the N., far stronger Russian forces began, likewise in May, an offensive over the passes of the Aghri Dagh (W. of Bayazid) in the direction of Lake Van, capturing the weakly defended villages of Dutak and Melassgirt and threatening Van and Bitlis. At the same time the Armenian population rose in arms. A Turkish division, hurriedly despatched to Bitlis, suppressed the rebellion with awful savagery, but the Russians continued their advance from Melassgirt on Bitlis, and on July 13 drove its defenders out.

Again fortune favoured the Turks. The Russians, presumably too weak to venture forward, contented themselves with what they had gained. Before them to the W. of Bitlis lay the high plateau which stretches eastward from Diarbekr. Strong Russian forces might have either descended thence on Mosul and down the Tigris, thus facilitating the British operations against Bagdad, or might have pushed forward in the Euphrates valley on Kharput and turned the whole line held by Mahmud Kiamil's army, which was known to be in no fit state to offer serious resistance, and would have no alternative but to retire hurriedly on Erzinjan or to accept battle before Erzerum with its front facing S.W., with the certainty of complete destruction if it were defeated. However, nothing was done. A few detachments crossed into Persia (Azerbäijän) and occupied Urmia and a few other places W. of the lake of that name. Here, however, they were cut off by a belt of stupendous mountains over 115 m. wide from the Mosul plain, so that this enterprise had no strategic effect and merely exercised some political influence in bringing over to the side of the Russians the Armenian and Persian population of that region.

Summer passed, and as early as Sept. the first snow fell. Mahmud Kiamil had now increased his army to a strength of 58,000 men, and had in addition assembled some 20,000 recruits in special training camps in Erzerum. The governor of Erzerum was a German, Gen. Posseltdt, who exerted himself in every way to put the antiquated works of the fortress in a state of defence. Lack of all material, even wood, however, prevented the construction of anything except earth-works. Erzerum drew all its wood and fuel in peace-time from the Pontic Alps, whence it had to be carried for 115 m. in carts. The Russian bivouacs near Melassgirt were constructed of wood brought up all the way from the mountain forests W. of Kars.

Although Erzerum was by no means a strong fortress, some 60 guns in its outer works and some 40 in the inner line being out of date, it was of great importance as the only road junction in the whole theatre of operations, as the capital of an area disaffected towards Turkey and the central *point d'appui* of a weak army. In Oct. 1915 the situation in Mesopotamia appeared so serious that the Turkish Supreme Command, all being quiet at Erzerum, took away from Mahmud Kiamil two divisions (the 5th and 6th) and sent them to Bagdad. And just at this moment the Russian Grand Duke Nicholas assumed command on the Russian Caucasus front, and brought with him not only reinforcements and material, but—still more important—the will to utilize them to the full.

Nicholas had no need to resort to turning movements, and decided to attack the centre of the Turkish front and break

TURKISH CAMPAIGNS
(CAUCASUS)

PLATE I.

through to Erzerum. The offensive began on Jan. 11 1916, up the Aras valley, and by the 14th the Turkish positions E. of Erzerum had been carried. It was unfortunate for the Turks that at this moment Mahmud Kiamil had been called away to Constantinople, and that his German chief of staff, Col. Guse, was on sick leave after a severe attack of typhus. The temporary commander of the III. Army, 'Abdul Kerim Pasha, was not equal to the situation. The Turkish forces, after losing heavily in a series of rearguard actions, took up a position on the heights N. and S. of Erzerum which had been hastily fortified. The Russians, who expected to overrun these defences at the first attack of their advanced guards, were checked for the moment; but a second assault, delivered by strong forces against the left of the Turkish line from Kara Gobeck, proved decisive of the fate of the fortress, which fell into Russian hands on Feb. 15 1916, the troops of Gen. Yudenich advancing by surprise against the southern front, where no attack was expected.

The defenders of Erzerum had certainly put up a good fight, and the Russian claim to have captured in the fortress 100,000 prisoners, 437 guns in the inner and 374 guns in the outer forts and 200 field guns was certainly greatly exaggerated. The whole Turkish army, if we deduct the heavy losses suffered, was barely 50,000 strong, and the whole artillery of the fortress amounted to barely 10% of the figures given by the Russians.

The Turks, however, whose *communiqués* were easily the most inaccurate of all those issued by the belligerents, sent home on Feb. 16 an entirely fanciful account of what had happened: "On the Caucasus front," it ran, "in the violent position fighting which has continued for the last three days despite the cold and snow, the enemy lost 5,000 dead and 60 prisoners." The loss of Erzerum was not even mentioned, and even the Sultan and his entourage only heard of it some months later; and even when the facts were finally announced to the world the importance of the place was minimized and its evacuation represented as being a voluntary withdrawal on the part of the Turks. The Grand Duke Nicholas, far from resting content with his victory, vigorously followed up the Turks in their disordered retreat, and occupied Mamakhatun. On Feb. 24 the remnant of the beaten army crossed the Euphrates at Kotur. Mahmud Kiamil, who had resumed his command, was now replaced by Wahib Pasha; the greater part of the artillery and material had been left behind in the retreat, and he only succeeded with great difficulty in getting his troops across the river, which here flows from N. to S., and into position on the right bank on the heights of Baiburt. The V. Corps, which was arriving in haste and piecemeal from European Turkey, assisted in checking the Russian advance. In the coastal sector the detachment at Artvin, though reinforced by some units of the V. Corps, was assailed by superior forces and compelled to fall back after stubborn fighting. Maj. Hunger, the German commander, succeeded in making a renewed stand 20 m. E. of Trebizond, but by the middle of April the Russian 123rd Div. forced him back once more and occupied Trebizond.

The Turkish strategic situation had now become serious. The possession of Trebizond allowed the Russians to open up a much shorter line of communications across the Black Sea from the Ukrainian and Crimean seaports, and gave them a base close behind their front. The disadvantage of having this base behind the right wing of their army could be compensated for by reinforcing this wing, so as to avoid any possibility of its being forced away from its line of communications, while the land route to Erzerum from Kars was still in use and would be available to supply the whole army if necessary.

The Turks, therefore, had to expect that in the forthcoming spring the Grand Duke Nicholas, whose forces were continually being reinforced from the Caucasus, would resume the offensive on a large scale. The Turkish Supreme Command was now freed of all anxiety from the side of the Dardanelles, but it still maintained three armies, the I. (Essad Pasha), the II. (Ahmad 'Izzet Pasha) and the V. (Liman Pasha), massed in the Constantinople-Adrianople area, thousands of miles from the theatres of operations, in Mesopotamia and eastern Anatolia.

The loss of Trebizond finally aroused Enver Pasha to a realization of the full extent of the strategic danger in the E., and in March the II. Army was directed to the E. Anatolian front. It was to deploy on the line Lake Van-Mush-Kigi, and advance against the Russian flank and rear in the general direction of Erzerum; it was to be brought up to a strength of 10 divisions by the addition of the forces already in the area of operations, and to be reorganized in four corps. The commander, Ahmad 'Izzet Pasha, had been promoted commander-in-chief of the Turkish army after the Dec. armistice in the Balkan War.

The strategic plan adopted by the Turkish Supreme Command for the II. Army was as usual excellent in theory but impossible of execution. The idea of throwing a whole army on the flank and rear of the Russians must certainly have seemed seductive to anyone sitting over a map in Constantinople; for it seemed to promise a strategic encirclement, it followed famous precedents, and there was plenty of room for the manoeuvre. In practice, however, the plan paid no attention to the actual conditions of time and space. The II. Army was despatched in the spring by rail from Constantinople to Ulu Kyshla; the line, which was a single one, with enormous intervals between stations, was already serving as the line of communication for the Palestine and Mesopotamia armies, so that any *rapid* transport of the II. Army was out of the question. The Turkish Supreme Command made a grave miscalculation in assuming that the army would be assembled and ready for the advance in 40 days; the distance from the railhead at Ulu Kyshla to the area of concentration (some 400 m.), which had to be covered on foot, would itself have taken up all that time. The amateur strategists at Turkish H.Q. took no account of these matters, and were mightily surprised when the event disappointed their expectations. As a matter of fact by July 8 the leading troops of the II. Army (III. Corps 7th and 11th Div.) had barely passed Malatia, and the rest of the army was still on the railway in August.

Meanwhile the situation on the III. Army front was going from bad to worse. At the end of May it had carried out a few successful minor operations; Mamakhatun and Surmene (E. of Trebizond) had been occupied, and the army command, which was now at Gumuskhane, misconceiving the general situation, proposed to carry out a powerful offensive S. of Trebizond early in July. For this purpose it suggested that the units of the II. Army already available should push forward without delay to the area S. of Erzerum—an advance which, with the weak forces which 'Izzet Pasha had at his disposal, could only have been effective as a demonstration or a piece of bluff. But even this could hardly have succeeded, in view of the excellent intelligence as to the Turkish movements which the Russians were known to have, and 'Izzet Pasha rightly declined to fall in with the scheme. As a matter of fact the Russians had full information as to these happenings, and especially the progress of the transport of the II. Army, and seized their chance to attack the III. Army in July, before the II. Army's menace to their flank could become effective. This was the best solution of their problem of operations on the inner line, and it met with complete success. On July 7 the Turkish III. Army was driven from Erzincan and Baiburt with heavy losses in men, guns and material, and was able to make another stand only on the line Kemach (on the Euphrates 30 m. W. of Erzincan)—Chadali Pass-Tireboli on the Black Sea. The most serious result of this defeat was the complete demoralization of the defeated troops; thousands of deserters, plundering and robbing, flooded all the country as far back as Sivas; columns and transport melted away in panic on the appearance of the Russian cavalry, who had broken through the Turkish line at two points and suddenly appeared in its rear. The III. Army reported in Aug. that 13,000 deserters had rejoined their units, but the governor of Sivas estimated that some 30,000 were still at large in his area. The fact that the Mahomedan population in the area evacuated by the Turkish army fled in terror before the advance of the Russians added to the indescribable confusion.

When 'Izzet Pasha with the III. Corps advanced at the end of July into the zone of assembly allotted to the II. Army the

situation was as follows. In the hilly country S. of Bitlis was the 5th Div., which had been driven from that town by the Russians, and the 8th Div. was in the hilly country S. of Mush. 'Izzet formed them into the XVI. Corps. N.W. of them were only a few small detachments, holding the main roads as far as the Eimali valley, in which stood the 11th Cav. Bde. as the extreme right wing of the III. Army.

'Izzet Pasha's intention was to assemble the main body of his II. Army at Diarbekr and the smaller part at Kharput, and only then to advance in the direction of Erzerum and the country to the E. of it. He knew that in front of him the reinforced IV. Caucasian Corps had taken over the task of guarding the flank of the Russian main army.

This plan, however, was not carried out. The Turkish Supreme Command, in view of the disaster to the III. Army and the reports of constantly arriving Russian reinforcements, urged 'Izzet to attack before the assembly of his forces had been finished. 'Izzet had no option but to obey, though he was under no illusion as to the result. He wished at least to concentrate all his few available forces on the left wing of his area of deployment and to make a push into the district W. of Erzerum, in order to relieve the pressure on the III. Army. But this also proved beyond his powers. The 1st, 14th and 53rd Divs., which had arrived at the end of July and the beginning of Aug., were pushed forward against the Russians, who were still being reinforced on the front opposite the II. Army; a few local successes were achieved, and 'Izzet Pasha on Aug. 10 decided to renounce a general offensive and to hold and fortify the line Kigi-Ognot heights S. of Mush.

Thus ended the geometrical strategy of the Turkish Supreme Command, which had from the first been based only on wishes and hopes rather than on definite realities. The administrative deficiencies in the II. Army had been, as usual in Turkey, so great as alone to ruin all hope of success. The army was sent forward into wild and mountainous country, in which only mountain artillery and columns of pack-animals could be moved, and it was supplied with only 18 mountain guns and with ox wagons for transport - and far from enough even of these. Figures as to the number of cattle in the deployment area were accepted without verification, and proved to be exaggerated some five fold. Those responsible for the supply services were, as ever in Turkish wars, quite incompetent to make the best of what turned up, and very disposed to steal the little that was available. Under such conditions the best plans are of no avail, for they can never be translated into actual practice.

Meanwhile Wahib Pasha was displaying praiseworthy energy in reorganizing the III. Turkish Army, of which the headquarters were at Andria. Divisions were formed out of the old corps, regiments out of divisions, battalions out of regiments. The army was divided into two "Caucasian Corps," the I. and II., the former comprising the 5th, 11th and 37th Caucasian Divisions. But even these combined divisions were very weak. The volunteer formations and other irregular bands proved wholly useless, and were soon broken up. German motor transport columns, established in the winter of 1916-7 on the line of communications of the III. Army between Ulu Kyshla and Sivas, prevented a threatened catastrophe due to starvation. All Wahib Pasha's efforts, however, could not restore the spirit of the III. Army and give back to it that confidence which was essential to the prosecution of a successful offensive.

The II. Army, when its concentration was completed, was composed of the XVI., II., IV. and III. Corps. Mustafa Kemal (later to become famous as leader of the Nationalist army) was the army commander. 'Izzet Pasha was entrusted with the general direction of the II. and III. Armies operating on the Armenian front, and moved his H.Q. to Kharput.

The II. Army, which had its H.Q. at Diarbekr, was experiencing even greater difficulties in the matter of its communications than was the III. In the winter, however, the strain was eased by both sides going into winter quarters, as in the old days. Only in the passes small observation detachments stood facing each other. In Nov. most of the troops were moved back into more sheltered districts, so that the Turkish and Russian winter

quarters were some 30 to 40 m. apart, about the equivalent of five days' march in this difficult country. The Turks, however, were still short of food. As early as Nov. the men were getting only one-third of their regular rations, the pack-animals had themselves to find what meagre pasturage they could, and to find any was soon impossible on account of the deep snow; the cavalry horses were getting only 1½ kilogrammes of oats. Hundreds of animals died every day. Again and again outposts, patrols and whole detachments of men were found starved or frozen to death in the holes of the rocks. In the terrible cold, which when snowstorms raged might well chill to the bone even the warmest clad men, the majority of the troops had only their summer clothing. The percentage of sick grew higher day by day. The sanitary arrangements were in the highest degree defective, so that these miserable beings lived and died in boundless wretchedness. In the hospital at Kharput alone the average deaths in the winter of 1916-7 amounted to 900 per month. Medical requisites were insufficient, and there were no means of combating the plague lice and the epidemic of typhus which followed it. Of the III. Army 60,000 men perished between July 1916 and the spring of 1917, and in the autumn of the latter year barely 20,000 men remained at the front.

The strategic position in Armenia at the beginning of 1917 was extremely unfavourable to the Turks. The Russians, who had obtained undisputed control of the Black Sea, had massed such strong forces in front of the II. and III. Armies that there could be no idea of a Turkish offensive. At the same time railways were being built from Sarikamish by Hasan Kala to Erzerum and from Trebizond and Gumushane, on the completion of which the Russians in their turn would be in a position to resume the offensive without being hampered by transport difficulties. This offensive might be directed either against the front of one of the two Turkish armies, or from Lake Urmia along the southern shore of Lake Van against the almost unprotected flank of the III. Army. In view of the fact that a new English advance against Bagdad was in preparation, this latter seemed very probable, and Liman von Sanders did rightly in asking the Turkish Supreme Command, in the late autumn of 1916, to hold another army ready at Mosul. The proposal, however, was rejected by Enver. It would also have been sound policy to have placed the II., III. and VI. Armies (the latter being at Bagdad) under one command; for the transference of forces between Armenian and Bagdad fronts could not be carried out quickly enough from Constantinople, and a junction of the Russian and British fronts by an extension of the former by Urmia and the western frontier of Persia was shortly to be expected. A Russian offensive from Persia against Mosul would certainly place both the III. and the VI. Turkish Army in a perilous position. The completion of the railway from Igdir by Bayazid to Kara Kilissa and its continuance by Tutak and Melassgirt seemed to indicate the probability of a Russian offensive against the right of the II. Turkish Army. The offensive against Mosul did not in fact take place; but this omission was a serious error on the part of the Russians and a piece of good fortune for the Turks, on which they had no right to count. However, Liman von Sanders' request for the establishment of a single command was rejected by the Turkish Supreme Command. The relations between Enver and Liman had in fact gradually become so strained, that Enver made a point of refusing anything that Liman wanted.

The Grand Duke Nicholas had, for his part, been making energetic preparations during the winter of 1916-7 for a powerful new offensive. The III. Turkish Army was opposed by the V. Caucasian, II. Turkestan, and I. Caucasian Corps; the II. Turkish Army by the VI. and IV. Caucasian Corps as far as Van. Thence to the W. of Lake Urmia came the II. Caucasian Cav. Corps and a number of detachments (fortress regiments from Kars, frontier guard units, Armenian and Assyrian irregulars). The VII. and I. Caucasian Cav. Corps prolonged the front from Sauj Bulak along the Persian frontier to W. of Kermanshah.

But the Grand Duke's plans, which in view of the wretched condition of the Turkish armies must have led to a complete

victory and perhaps driven Turkey out of the war in the summer of 1917, were never carried out. This was in part due to the fact that all available Russian forces were being concentrated for Brusilov's great offensive in Volhynia, but mainly to the outbreak of the Russian revolution, which checked all large operations in Asia. When the revolution broke out in April the advance had not begun. In the course of the winter there had been nothing but local skirmishes for the possession of a hill or pass, which, whether they turned out to the advantage of Turks or Russians had no influence on the general strategic situation.

The outbreak of the revolution was taken by many of the Russian troops as a signal that the war was at an end, though there were formations which still maintained their cohesion and discipline. The Turks, however, were prevented partly by the general military situation of Turkey and partly by the peculiar difficulties of the II. and III. Armies, from seizing and exploiting their advantage as they might have been expected to do. The rapid progress of the English towards Bagdad had necessitated the despatch of reinforcements to that theatre, and the maintenance of the Palestine front also absorbed large forces, so that there were neither men nor material left over for the Caucasian front. The two armies, barely 40,000 strong in the spring of 1917, were now formed into the "Caucasian Army Group" under 'Izzet Pasha, whose H.Q. were still at Kharput, and who had now been provided with a German chief of staff, Maj. von Falkenhäusen. All this, however, did not in any way make it possible to resume operations. Typhus was still raging; in Feb. the II. Army lost 42 of its few doctors from this cause. There was so little wood that the delousing stations could not be heated. The deportation of the Armenian population had left the fields unfilled, and the villages deserted and in ruins. Of the craftsmen who exhibit a multitudinous activity behind the armies on the European fronts there was not a sign, and even the workshops which had been busy in peace-time were deserted. The supply often broke down entirely. A shameless traffic in waggons went on on the single railway from Haidar Pasha to Ulu Kyshla, which served the Palestine, Mesopotamian and Caucasian fronts. These waggons, which should have been used for military purposes, were privately hired out by officers and officials to contractors and war profiteers at high prices, and on this railway an illicit carrying trade was developed on a gigantic scale. The higher authorities, who also took their quota of profit, were not inclined to interfere. So for the sake of these brutes thousands of brave Anatolian soldiers perished of cold and starvation without even knowing the true cause of their miserable death.

The reports of the hopeless military position in 1917, which were sent to Berlin by the Turkish Supreme Command, were from first to last lies, and served only to increase the exaggerated estimate of themselves which obsessed the minds of the German Supreme Command as well and caused the loss of every opportunity of arriving at peace of understanding.

When Bagdad fell to the English on the night of March 10-11, the chance offered itself of a successful Russian offensive on Mosul either westward from Lake Urmia or from the region of Lake Van southwards. Had it been carried out even by one good corps it could not have failed to be successful. During the whole of 1917 some 15 infantry and 2½ cavalry divisions remained on the Russian front facing the Turks, but nothing important was undertaken. The front from Trebizond to the Diala near Bagdad, where it connected with the English line in Mesopotamia, measured over 600 m. from flank to flank, and afforded far greater scope for free strategic manoeuvres than the narrow fronts in France, which were actually filled with guns and men. Warlike activity was only resumed in E. Anatolia, however, when Russia at the end of 1917 entered into negotiations with the Central Powers. The political event which decided the resumption of the offensive by the Turks, which took place early in 1918, was the notification by the Turkish plenipotentiaries at Brest Litovsk on Jan. 17 that a Russian retirement from all the area occupied by them in Asia Minor was an essential preliminary to the conclusion of peace. At the same time the Ukrainian delegates were asked by the Turkish delegates how

far they were interested in the retention of the Caucasus by Russia. On their replying that they had no interests in the Caucasus, the Turks resolved to conquer it, and obtained Germany's consent to their doing so, though at the time they did not disclose to her all their ulterior designs.

The Russians retired at the end of Jan. 1917, and in Feb. the Turks advanced across the line Van-Erzurum-Trebizond. The Turkish armies, which together could muster only the strength of a weak army corps, were in such poor condition that even the small, unorganized Armenian bands, who opposed them, were able to give them greater trouble. Their *communiqués* at this time were full of stories of great victories which never took place.

The forward march was carried out in two columns. The northern one, feeling its way very cautiously along the coast of the Black Sea, reentered Trebizond on Feb. 24; the other reached Erzinjan on the 14th, and moved thence by Mamakhatun on Erzurum. Nothing was seen of the Russians, who, as a matter of fact, had long since recrossed the frontier; only a few desperate Armenians endeavoured to dispute the reoccupation of their country by their hereditary tormentors. The Turks were held up for some time by these bands in front of Erzurum, which they only "recaptured" on March 11, and revenged themselves by the usual revolting barbarities on the unhappy Christian population.

While Erzurum was being taken, the left Turkish column advancing from Trebizond was approaching the frontier between Chopa and Maghrali, and the political problem of the provinces of Kars, Ardahan and Batumi, the occupation of which had been the motive of the advance, became acute. Their interest in these provinces caused the Turks to commit their last and decisive strategic blunder, the greatest of which they had been guilty since 1914. The Turkish Government considered these operations in the Caucasus to be of the first importance, although the true decisive theatre for Turkey in 1918 was Palestine. Instead of concentrating in Palestine the few troops it had available, the Supreme Command withdrew troops and war material from that front and despatched them to the "East Caucasian Group." Even the small German contingent, which formed the backbone of the Palestine army, was also sent to the Caucasus. Liman von Sanders' words to Count Bernstorff, the German ambassador in Constantinople, written in June 1918, were fully justified by events: "The Turks are sacrificing all Arabia, Palestine and Syria to these boundless undertakings of theirs in Trans-Caucasia. Germany will some day be burdened with the responsibility for this."

Enver and the German High Command had, however, succeeded in completely deceiving the German ambassador as to the Turkish objective, for the latter, in reply to Liman von Sanders, wrote on June 21 that the German Jäger battalion was being transferred from Palestine to Georgia, "not in response to Turkish wishes, but, on the contrary, for the purpose of restoring order in the Caucasus, so as to allow of the whole Turkish army being transferred thence to Mesopotamia by way of Urmia and Tabriz." This, of course, could have been done more quickly and easily if the Turkish army had never advanced from Armenia into the Caucasus. The motive of the Caucasus adventure lay deeper. Enver's idea of attacking India, childish as it was, had yet proved enticing to the German High Command, and the strategic base for an invasion of India by way of Persia was actually established in the Caucasus in the summer of 1918. And this at a time when the decision of the World War was ripening on the front in France!

Considerations of an economic nature, it is true, carried great weight in the minds of the German Supreme Command at this time. The output of the Rumanian oil wells was insufficient; and it was therefore thought necessary to occupy Baku, and to despatch petroleum thence to the Black Sea by the Tiflis railway. It has been necessary to mention these considerations in order to make clear the motives of the Turkish operations in 1918.

After the occupation of Erzurum the southern Turkish column reached Olti, the first objective of the Turks in the winter of 1914-5, on March 26. Meanwhile the coast column was moving

on Batum. The Georgians, however, who, naturally enough, had little sympathy with the Turkish "restorers of order," banded themselves together to oppose their further advance. The latter were not even able to keep a firm hand on insurgent Armenia. Behind their backs Armenian bands even succeeded in occupying Erzerum for a time and thereby interrupting all movement on the Turkish line of communications. Meanwhile Georgian bands had occupied Batum. The Turks attacked the town and stormed the advanced positions on April 9; one fort fell on the 10th, two others on the 11th, and on the 14th the town surrendered. The Turkish Supreme Command seized the opportunity to telegraph to the world at large the most incredible stories of victory.

Early in April Nuri Pasha, who was now in command of the "East Caucasus" Army, pushed a strong column from Lake Van in the direction of Kars. Vostan, at the S.E. corner, and Arnis, at the N.E. corner of the lake, were occupied after violent conflicts with Armenian bands, who fought with the utmost fierceness. Van fell on April 7.

While this column was advancing on Kars by way of Kara Kilissa, the Erzerum column, which had been brought to a halt after the above-mentioned capture of Erzerum by Armenian bands, pushed forward by Sarikamish, and the two columns thus converged on Kars. As there was no strategically effective enemy to overcome, the operation was successful, despite the late arrival of the Van force. The Erzerum column approached Kars on April 5, after driving off some Armenian irregulars near Sarikamish; the Van column made slow progress through the revolted province of Bagasia, arriving at Kara Kilissa April 18.

On the 26th the Turkish *communiqué* reported the "storming" of the fortress of Kars (which was apparently undefended) with the capture of 860 guns. This number was considerably in excess of the truth. There is no doubt, however, that the provisions secured in the fortress considerably facilitated the further prosecution of the operations. The column advancing along the coast had meantime pushed on from Batum to Kobuleti and Ozurgeti on the edge of the Caucasus mountains.

The Turks now felt themselves to be masters of the situation, and their pretensions became so outrageous as to lead to serious controversies with the German Government, which, for the first time in the war, was compelled to protest energetically against their exorbitant claims. It had, however, only itself to blame for their exaggerated estimates of themselves.

In the middle of May the plenipotentiaries of the Government of Northern Caucasia addressed a note to all the Powers, announcing the formation of an independent state, separated from Russia. Transcaucasia, however, remained in a complete state of confusion, though the proclamation of the independence of the country by the assembly which met early in June at Baku was plainly directed against Turkey. What exactly was meant by Transcaucasia, however, must have been obscure even to the assembly, for a few days earlier there had been set up under Turkish auspices three independent states, known as the Georgian, Tartar (Azerbäijän) and Armenian Republics. Necessity had compelled all three to conclude treaties of perpetual amity and alliance with Turkey, who had every intention of annexing these weak states at the earliest possible moment.

Enver did everything to strengthen his political army in the Caucasus. Accelerated promotion and doubled pay were promised to the officers serving with it, with the result that many officers, who were urgently required in Palestine, got away from that theatre, where they received no pay at all.

In the summer the Caucasus Army was increased to six complete divisions, which were stronger than they had been at any time since 1914, numbering 9,000 men each. The transport of these troops, and their reserves, material and supplies absorbed all the fuel available, so that no trains could be sent to the Palestine Army, on whose fighting force the ultimate decision of the war depended. The Pan-Islamic idea, which had been propagated since the beginning of the war, had produced a complete confusion of mind and robbed Enver and his entourage of

the last vestige of that strategic sobriety which alone could now save Turkey from ruin. Every week 14 coal trains were sent from Germany to Constantinople; of these seven—far more than were necessary—were kept for the use of the capital itself; 2,500 tons were shipped by way of the Black Sea to the E. Caucasian Army, and the rest was absorbed by the Anatolian railway—or in other words the war profiteers, who filled whole trains with their goods and paid out untold sums in bribes to the railway officials to give them priority of passage.

The E. Caucasian Army extended itself in Transcaucasia and N. Persia, from Lake Urmia to Arax, during the course of the summer, without troubling themselves in the least about the dangerous English offensive against Mosul, where 4,000-5,000 Turkish soldiers were posted in conditions of the utmost misery.

The few events that followed in Transcaucasia were of little military interest, and consisted mainly of a few petty scuffles without influence on the general situation, and unsuitable for inclusion in a strategic narrative. Even the despatch of a German division to Georgia in the summer of 1918 had no other object than the furtherance of those plans, on the futility of which we have already insisted.

Nuri Pasha, with Bolshevik help, certainly succeeded in expelling from Baku a small British force which had crossed the Caspian and occupied the town on Aug. 12. This incident, however, had no effect on the strategic position. In Persia Nuri pushed forward to Tabriz.

The final conclusions as to the Transcaucasian operations may be summed up as follows. The position of Turkey and of the Central Powers in 1918 was such that a military victory was out of the question. This fact, however, was recognized neither by Ludendorff, who wasted the defensive strength of the German army in a purposeless spring offensive, nor by Enver, who was obsessed by his vast schemes for annexation of territory. The despatch of a strong German division to the Caucasus, and the operations of large German forces in the Ukraine in the summer of 1918, when the war was being lost in France, show the kind of strategic conception then prevalent. In the case of Turkey the theatres of war which had to be supplied with men and material were too numerous for the resources available. When the Russians collapsed in 1918 a wise strategy would have considered the elimination of one theatre of operations as a relief to be accepted with gratitude, and would have, as a natural consequence, transferred all the forces thus liberated to the Palestine front. Such a course would of itself have relieved the pressure on the Mesopotamian front, which could no longer be saved by direct means. The underlying idea ought to have been that a tenable military position in Palestine would have been more favourable, in the event of negotiations for peace, than any conquests in the Caucasus, which would have to be given up again in case of military defeat. Enver, and with him a whole series of Turkish and German military men, had never had that conception of the limits of the possible which is the prime characteristic of every great strategist. They mistook the elaboration of immense and impracticable schemes for genius, whereas true genius consists of getting the best possible results from the material available. The events on the E. Anatolian front also serve to prove very clearly that strategy is an art not to be mastered, even with the best will in the world, by a layman such as Enver, and that it is governed almost entirely by the geographical conditions of the theatre of operations. This should have been recognized by the office strategists of Constantinople, who had no clear grasp of the geographical conditions of the country in general or in detail, and failed to realize that strategical manœuvres which seem highly promising on the map may be impossible of execution in practice. In the German schools of strategy, and also in Turkey, so-called military geography was before the war treated with complete contempt, as it was believed that it tended to limit freedom of strategic conception. The campaigns in the East proved that freedom of strategic conception, unless based on accurate geographical knowledge, is not only profitless but a fruitful cause of defeat. Finally, the war in Eastern Anatolia may teach us one valuable psychological

lesson, which was insufficiently appreciated by the Turkish Supreme Command. The form of a strategic movement has of itself no driving force; the vital factor, in strategic force too, is the troops. Now the spirit of the troops depends mainly on their physical condition. An army called on, when insufficiently clad and underfed, to face the snows of winter soon loses its fighting value. If strategy depends on the efficiency of the troops, this in its turn depends on the efficiency of the supply and transport services, and the administration of the army in general. Only when this organization is in good order and working well can the leading strategic conception be, in the true sense of the word, free. On this simple truth the strategy of the Turks during the World War always suffered shipwreck, even when they had better leaders than those who appeared during the war in Armenia. (F. C. E.)

(II.) MESOPOTAMIAN OPERATIONS

The Anglo-Indian operations of 1914-8 in Mesopotamia, which ended in the military occupation of almost the whole of that extensive region, were in their initial stages conceived on comparatively modest lines. They were at the outset undertaken merely with the object of (1) protecting the Anglo-Persian oil installations of the Qarun; (2) occupying the greater part of the Basra vilayet, so as to secure possession of the Shatt al 'Arab and to maintain control of the districts immediately round the head of the Persian Gulf; and (3) impressing the Arabs and others in this and neighbouring regions and influencing thereby the inhabitants of the territories intervening between the Ottoman Empire and India. It was foreseen in London and at Simla that the Ottoman Government would be likely, under instigation from Berlin, to send troops in this direction, for the purpose of harassing the Indian executive by stirring up trouble in Persia and Afghanistan; and steps had been taken to deal with the contingency before relations between the Entente Powers and the Porte were actually broken off. The Poona Bde. of the 6th Indian Div. had been dispatched to an island near the head of the Persian Gulf in the middle of Oct., and on Nov. 7, two days after the British Government declared war on Turkey, these advanced troops appeared in their transports at the mouth of the Shatt al 'Arab.

The fort guarding the entrance to the estuary was taken after a brief bombardment, and the brigade then disembarked and encamped some miles up-stream on the right bank. On learning this the Turks hurried all available forces down from Basra to bar the way to the invader; but, the rest of the 6th Div. under Sir A. Barrett having arrived, they were attacked on the 17th and effectually overthrown. Basra fell on the 21st. The vanquished Osmanlis for the most part retired to Qurna, at the junction of the Euphrates with the Tigris, the point where the water-way ceases to be navigable for ocean going vessels proceeding up-stream; but Barrett promptly pushed troops to a point higher up, and the place surrendered on Dec. 9. Considerable Ottoman reinforcements had, however, been on the way from Baghdad towards Basra since the arrival of the Anglo-Indian expeditionary force in the Shatt al 'Arab, and these now began concentrating, partly in the direction of Ahwaz and menacing the oil-fields, and partly about Nasiriya on the Euphrates. Threatened in a measure on either flank, and necessarily dispersed owing to having many posts to hold, the 6th Div. was not comfortably situated; but, as the Turkish fighting forces which had come down from the N. were not as yet organized for active operations nor in an aggressive mood, the invaders were enabled to consolidate their position, and they were little interfered with during the first three months of 1915.

The Indian Government was, however, anxious to obtain a stronger hold upon the district already occupied, and so in March it was decided to raise the expeditionary force to the strength of an army corps. Early in April Sir J. Nixon took over command from Gen. Barrett, who with limited means had conducted the campaign with signal skill and judgment, and Gen. Townshend at the same time assumed charge of the 6th Division. The last units of the new division (the 12th) had arrived by the middle of the month. These changes, as it turned

out, synchronized with a marked increase of activity on the part of the Turks; for they appeared in some force near Qurna and also seriously threatened Ahwaz; they were, however, driven off with no great difficulty at both points. Encouraged by these successes, Nixon decided to assume the offensive and to occupy 'Amara, a town of some importance 60 m. N. of Qurna on the Tigris, but considerably farther if following the sinuosities of the stream. This task was entrusted to Townshend, who carried it out by making free use of water-transport of all kinds for moving his troops. Aided by a naval flotilla, on May 31, he signally defeated a hostile force which tried to bar the way; and then, as the result of a bold stroke, on June 3 made himself master of 'Amara, capturing 17 guns and 1,800 prisoners. This operation accomplished, Nixon resolved on a blow against Nasiriya. The heat was now intense; but, in spite of this, portions of the 12th Div., relying for mobility largely upon water transport, took possession of the town after some hard fighting on July 25, another 17 guns with 1,000 prisoners being the prize of victory. The Anglo-Indian army which had descended upon this corner of the Ottoman Empire could then fairly claim that it had achieved the object for which the campaign had been originally undertaken.

Its triumph had been all the more creditable seeing how seriously it had suffered from want of transport, and taking the inadequacy of its administrative branches into consideration. It must be remembered that the Indian Government had accepted heavy commitments in other fields of military action. Two divisions had been dispatched to the western front. Large forces had been furnished for the protection of Egypt. The E. African campaign also at that stage was an Indian undertaking. The military organization of the great British Asiatic dependency had not in pre-war days been framed with the idea of prosecuting martial operations on an ambitious scale overseas. Large reserves of trained men did not exist to fill those gaps in the ranks that contests with well armed antagonists bring about in the present day. The available departmental services—notably the medical service—had been starved. The troops now operating at the head of the Persian Gulf were, moreover, faced by quite exceptional difficulties, owing to the insufficiency of that shallow-draught water transport upon which their efforts and their maintenance virtually hinged.

Unfortunately, the success which had hitherto attended the combinations of Generals Barrett and Nixon inspired the civil and military authorities at Simla with the desire for a more ambitious programme in Mesopotamia than that which had been contemplated in Oct. 1914, and they readily fell in with Nixon's proposal that an advance up the Tigris to Kut should be undertaken. The Home Government agreed. This meant an advance of some 180 m. up-river into the heart of the enemy's country by troops who had already undergone much hardship, the maintenance of the force depending upon a flotilla that was barely adequate for the purpose and that would become entirely inadequate were the strength of the force to be increased above that of the division and the cavalry brigade already told off for the undertaking. News had come that a Turkish force was assembling at Kut under Nur ed Din Bey. Although Nixon made strong representations with regard to his lack of water transport, he perhaps hardly made the danger of advancing beyond 'Amara unless this were substantially increased sufficiently clear to authorities far away from the scene of action. Nor, perhaps, was the virtual impossibility of rapidly augmenting it realized. Townshend was charged with carrying out the proposed advance and early in Aug. his 6th Div. began gradually to push forward up the Tigris. On Sept. 14 he concentrated his force at Sheikh Sa'd.

On the following day he drove an advanced Turkish force in disarray out of a fortified position at Abu Rumman on the right bank of the Tigris, about 15 m. from Kut, and he then halted for some days to admit of supplies coming up and of reconnoitring the lines which the enemy had established on both banks of the river about Es Sinn. On the 28th he attacked Nur ed Din in his entrenched position and completely defeated him,

taking 1,650 prisoners, 13 guns and much war material, and the cavalry pursued the fleeing Osmanlis as far as 'Aziziya, halfway from Kut to Bagdad. The enterprise had in fact been carried out with a success equal to its audacity.

Kut was a locality of some strategical significance. Issuing here from the Tigris, the Shatt al 'Arab creates a link with the Euphrates at Nasiriya. The natural route for troops from Bagdad proceeding to the lowest reaches of the Euphrates immediately above Qurna would be by way of the Tigris and the Shatt al Hai. Therefore, installed in his new position at Kut, Townshend in a measure blocked both the routes from Upper Mesopotamia to Basra—that following the Tigris right down to Qurna, and that turning off by the Shatt al Hai. Kut was furthermore the most important place between 'Amara or Nasiriya and Bagdad, and its capture was calculated to exert a considerable moral influence over the Arabs who dwell in this region and who were disposed to be troublesome. But almost the whole of the Anglo-Indian troops in the theatre of war, apart from detachments required for garrison duty nearer the Persian Gulf, had now been projected into an isolated situation far within the enemy's territory; they were, moreover, depending upon a long line of water communication, not easy to protect against marauding attacks and served by only a restricted number of steamers and smaller craft. But for the severe defeat suffered by the Turks at Es Sinn, the disposition of the invading forces at the beginning of Oct. would have justified some anxiety.

But the idea of pushing on to Bagdad had already taken shape even before the occupation of Kut. The Aug. discomfiture in the Gallipoli Peninsula (*see* DARDANELLES CAMPAIGN), coupled with a belated realization that the Dardanelles venture would not succeed, had rendered the Home Government eager for some dramatic achievement in Mesopotamia. The Indian Viceroy had advocated an advance to Bagdad when the start up the Tigris from 'Amara was materializing. Townshend's gratifying triumph acted as a stimulus to these aspirations, and during the month of Oct. there was much inter-communication between London, Simla and army headquarters in Mesopotamia on the subject of a further advance. Nixon intimated early in the month that he was strong enough to open a road to Bagdad under the circumstances then existing, but he did not consider himself able to hold the city if taken. The question of even reaching the place, however, depended in reality upon whether the advance were to take place before the enemy was reinforced. The military authorities who were consulted at home, while admitting the possibility of capture, regarded permanent retention as out of the question with the limited forces available; they declared that, if Bagdad was to be held, the army in Mesopotamia must be reinforced by two divisions. Influenced by political considerations, however, the Home Government became more and more insistent. The dispatch of the two Indian divisions that were on the western front at the time to the Persian Gulf was under consideration, but it could not be promised at the moment. Although no reinforcements could be sent him, and although had they been sent him they could not have taken part in the operation owing to the time that must elapse in getting them to the theatre of war and owing to the absence of water transport to move them and to feed them when they got there, Nixon was on the 31st informed that he might advance on the city.

Townshend had pushed large parts of his force from Kut on to 'Aziziya while the discussion was proceeding. He found that the Turks were less demoralized by the reverses they had met with than had at first been supposed, and they had been given time to rally and to reorganize. His own troops had been severely tried, and all his units were short of establishment. He entertained serious misgivings as to progressing farther, in view of the isolation of his force, of the length of his communications, and of the manifest insufficiency of that water transport which was the governing factor in any operations that he might have to undertake. Even after receiving his orders to advance, he was unable to move for a fortnight owing to time lost in getting up supplies to 'Aziziya and in organizing for the hazardous effort. On Nov. 12, however, the advance began, and on the 21st the

Turks were dislodged from a fortified position at Laj. It was known that the enemy was in strong force at Ctesiphon and had constructed elaborate entrenchments at that point; news had also come that hostile reinforcements were expected. A night march was therefore carried out, and at dawn Townshend attacked. The assault was most successful in the first instance. Two lines were carried and many prisoners were captured. But strong Ottoman reinforcements arrived on the battlefield while the fight was still in progress, and these recovered much of the ground that had been lost earlier in the day. For three days the two armies remained facing each other at Ctesiphon, the Turks being much superior in numbers and their array gradually swelling as fresh troops arrived from Bagdad. Townshend was in the meantime making all preparations for a retreat and was getting his wounded away—a service of no small difficulty owing to the insufficiency of transport. Then on the night of the 25th he moved off.

His losses since quitting 'Aziziya amounted to 3,500—nearly one-third of his strength. Except in respect to cavalry, the enemy enjoyed a great advantage in numbers, and as soon as the retreat began the Arabs started harrying the retiring force. Still, thanks to Townshend's skilful dispositions and to the resolute marching of his weary troops, no great difficulty was experienced in evading grave molestation during the first four days of the backward march. But, owing to the flotilla of supply transports, barges and fighting craft being delayed by the shoals, and to some of the craft getting aground, a halt had to be called on the 29th. This enabled the pursuing Ottoman columns to come up, and on Dec. 1 they delivered a resolute attack upon the Anglo-Indian force, but the assailants were beaten off after a sharp encounter and the retreat was then resumed. It had been necessary to abandon three steamers, but so great was the effect of the stalwart resistance offered by Townshend's sorely tried little army that it was little interfered with during its last three days of retreat. It assembled at Kut on Dec. 3, having suffered another 1,000 casualties since quitting Ctesiphon, but bringing in the 1,600 prisoners taken on Nov. 22.

So—for the moment—ended the Bagdad adventure. On Dec. 3 the first of the reinforcements spoken of six weeks before (when London and Simla were pressing for an advance) had only started a few days on their four weeks' voyage from France to the Shatt al 'Arab. Military authorities had admitted the possibility of a successful dash on the city, but had denied the possibility of so small a force holding the city unless reinforced; and even had additional troops been available in the country, the water transport to get them up the river was lacking. When Townshend moved forward the best to be hoped for was that he might reach his goal and might then escape if he straightway hurried down the Tigris again. Seldom in the history of war has a military force been committed to an undertaking so unwarrantable.

But worse, from the British point of view, was to follow. For, with the approval of the Home and Indian Governments, Nixon decided that Townshend should stop where he was, although if he did so he was bound to be invested. They assumed too readily that he would be relieved ere his supplies ran out. So his sick and wounded, his cavalry, most of the flotilla and a proportion of his animals were sent off down Tigris, although the civilian population was unfortunately allowed to remain; preparations for a siege were put in hand; and on the 8th Kut was hemmed in on all sides. Its situation in a deep loop on the left bank of the river rendered the place readily defensible against attack, and the German Field-Marshal von der Goltz, who had just taken supreme command of the Ottoman forces in Mesopotamia, perceived that unless it fell to an early assault the main task of his advanced troops would be to guard against a relief. Nur ed Din had four divisions at his disposal, and on the 10th, 11th and 24th he delivered unavailing onsets upon the narrow front that was not covered by the river. Then the siege became a blockade, part of the Turkish army moved down the Tigris to Sheikh Sa'd and 'Ali Gharbi, and the work of constructing formidable lines at Es Sinn on the right bank of the river, and athwart a defile on

TURKISH CAMPAIGNS
(MESOPOTAMIA)
PLATE II.

the left bank between the channel and the Suwaikiya marshes, was taken in hand. About the end of the year Khalil Pasha assumed command.

Meanwhile the 7th and 3rd Indian Divs. had begun to arrive in the Shatt al 'Arab in the middle of Dec., and Gen. Aylmer took charge of the troops who were to undertake the relief of Kut. Units as they disembarked were pushed on to 'Amara and proceeded thence up the Tigris. The urgency of joining hands with Townshend forbade delay. There was no time to organize the force properly, it lacked powerful artillery for dealing with entrenchments, and the shortage of river transport multiplied its difficulties. The Turks were nevertheless driven out of 'Ali Gharbi and were on Jan. 6 1916 defeated with heavy loss at Sheikh Sa'd. Three days later Aylmer again defeated them, whereupon they fell back to the lines of Hanna at the entrance to the awkward defile on the left bank of the Tigris. The relieving force had hitherto triumphed over every obstacle; but when on the 21st it essayed the storming of the Hanna position the effort failed; and so numerous were the casualties, coming on the top of losses in the previous actions, that Aylmer had to pause in his offensive and to await reinforcements. About the same date Sir P. Lake succeeded Sir J. Nixon in chief command.

Lake set himself to rectify organization in so far as means permitted, to place Aylmer's line of communications on a better footing, to improve the medical arrangements (which had broken down under the stress of Ctesiphon), and to develop the wharves at Basra and Qurna. Material of all kinds was, however, deficient, and the sands were running out. The Home Government transferred the 13th Div. from Egypt to Mesopotamia on receipt of the bad news from Hanna; but it was now too late to so expand the water transport as to enable the growing Anglo-Indian army to act with real vigour and independence during the few weeks that Townshend could still hold out. Aylmer attempted no forward movement during Feb.; but on the night of March 7-8, without waiting for the 13th Div., he advanced from near Sheikh Sa'd against the Es Sinn position, intending a surprise. This involved a long march in the dark hours; when day broke part of the force had not arrived; and although the Turks were at first in no great strength the attack was delayed. Then when the assailants after a pause of some hours advanced against the reinforced enemy, they were beaten back, and they had to retire to Sheikh Sa'd, having suffered severely in the combat.

The garrison of Kut was already on much reduced rations; but Gen. Gorringe, who had succeeded Gen. Aylmer, could make no fresh attempt for nearly a month owing to transport and supply problems. However, on April 5 the 13th Div., under Gen. Maude, stormed the Hanna lines and penetrated well into the defile on the left bank of the Tigris; but, when first the 7th Div., and then the 13th Div. attacked the Sanna-i-yat lines at the farther end, they were in each case repulsed. Kut could hold out only a few days longer, so Gorringe now tried to advance to the right bank. After making some progress on the 17th in spite of almost insuperable difficulties caused by floods, this movement was brought to a standstill. A final effort was made against Sanna-i-yat by the 7th Div. on the 22nd, which nearly succeeded. Then on the night of the 24th a steamer loaded with provisions tried to run the blockade but failed, and on the 29th Kut with its garrison of 9,000 British and Indian troops surrendered. The attempts to relieve it had cost 24,000 casualties.

The tidings of this very grave mishap gave rise to profound dissatisfaction in the United Kingdom, a dissatisfaction that was aggravated by information gradually leaking out with regard to the sufferings of the sick and wounded after the retirement from Ctesiphon. It was feared that so unmistakable a reverse to British arms in Asia might exert a more untoward influence in the East generally than in the event proved to be the case. As a result of strong feeling in the public mind a commission was, it may be mentioned, set up a few months later by Act of Parliament to inquire into the operations that had taken place in Mesopotamia. The commission did not report till nearly a year later, when the military situation in the land of the Two Rivers had come to be very different from that which had prevailed in

May 1916 after the fall of Kut. Its conclusions were to the effect that much in connexion with the undertaking of a campaign on so ambitious a scale without adequate forethought and efficient preparations was worthy of blame, and it animadverted in strong terms on the very unsatisfactory character of the medical arrangements during the early stages of the venture.

No reference has been made hitherto to the Russian forces in Persia. These, based on the Caspian Sea, were actually in occupation of a considerable area of the Shah's northern territories. They did not, however, represent a large body of troops, they were operating in a region of wide extent, and the avenues leading from the tracts in their occupation towards the plains of Iraq traversed rugged and unproductive uplands. For military contingents so situated to have afforded any practical help to the Anglo-Indian army during the critical months that followed Townshend's advance from Kut, was virtually prohibited by the conditions. Nor did their activities furnish indirect assistance to their allies by withdrawing any appreciable proportion of the Turkish forces serving under von der Goltz and Khalil Pasha from the theatre of war on the Tigris.

In view of the disaster which British arms had met with—a disaster directly traceable to those in authority drifting into a comprehensive scheme of warlike operations without providing the necessary means for prosecuting the campaign—it was decided that Kut must if possible be reoccupied. The hot season was, however, at hand. The troops had suffered exhausting trials and had met with cruel loss. Water transport, as well as artillery and war material of almost every kind, remained inadequate. There could be no question of resuming the offensive on the hand-to-mouth lines on which the advance from 'Amara had been initiated a year before, and which Gen. Lake had been obliged to continue when striving against time to relieve Townshend; so that a prolonged pause became inevitable. Von der Goltz had left Mesopotamia and the Turks, as it turned out, manifested no inclination to advance from the scene of their recent triumph—they withdrew, on the contrary, from Es Sinn and formed an entrenched camp nearly all round Kut, while holding on to Sanna-i-yat—and a period of several months in which no active operations took place set in.

Great developments, however, in the meantime took place on the Anglo-Indian line of communications, as also at Basra and Qurna, thanks to Gen. Lake's representations and to his powers of organization. A reasonable amount of heavy artillery was gradually accumulated. A narrow-gauge railway was laid down leading from Sheikh Sa'd to Es Sinn. Landing facilities at the ports were much improved. An additional division arrived from India. Gen. Gorringe was in July succeeded in charge of the troops at the front by Gen. Maude, who, a few weeks later, replaced Sir P. Lake as army commander.

Although much had been effected by the outgoing army commander in respect to organization, Maude realized that there was yet vital work to be done before his forces could act with effect in this peculiarly conditioned theatre of war. A master of administration and endowed with phenomenal energy, he was resolved not to commit his troops to a formidable undertaking until they were furnished with all that was necessary to insure their mobility and their tactical efficiency. From Sept. till the close of Nov. he laboured unceasingly at the base, enjoying full support from the War Office in London, which had definitely taken over charge of the campaign from the Indian authorities. By the beginning of Dec. he had been furnished with enough river craft, his supply arrangements were in a sufficiently forward state, and he had furthermore a sufficiency of war material at his command, to justify his embarking upon offensive operations of a far-reaching kind, and on the 13th he struck suddenly and with signal success.

Being in occupation of the right bank of the Tigris to a little above Es Sinn, while blocked on the left bank by the fortifications of Sanna-i-yat, the Anglo-Indian army, astride the river, was by the conditions of the case necessarily disposed in *échelon*, with its left well pushed forward and its right withdrawn. It was organized in two army corps, the I., under Gen. Cobbe, on

the right on both banks of the water-way, the II., under Gen. Marshall, on the left. Maude's plan was to start by pushing his left still farther forward, to clear the right bank of the Tigris of the enemy to well above Kut, and, when these dispositions had in due course taken effect, to force the lines of Sanna-i-yat with his right. So long as Sanna-i-yat remained in Ottoman hands his flotilla could not advance above that point; but, with the railway from Skeikh Sa'd running to Es Sinn, his troops operating on that side of the Tigris could be supplied, provided they did not advance more than a few miles. Marshall, being on the left, opened the attack by forcing the Shatt al Hai, after a night march, and by capturing some of the Turkish defences which formed a bridgehead S. of Kut. During the struggles that ensued, lasting several weeks, Khalil Pasha's forces offered a stout resistance, and although Maude's operations on the right bank of the great river were uniformly successful, they proceeded slowly and by successive stages. It was not till the middle of Feb. that the whole of the Turkish entrenched camp on that bank was in Anglo-Indian hands and that the Ottoman troops had withdrawn across channel.

No sooner had this part of the programme been accomplished than, on the 17th, Gen. Cobbe attacked Sanna-i-yat. The effort failed for the moment; but five days later the lines were assaulted again, and they were at last carried after a desperate contest in which the Turks lost very heavily. On the same day Marshall's II. Corps by a brilliant feat of arms forced a passage across the Tigris at Shumran. There was then no course left to the Ottoman commander but to abandon Kut in haste and to withdraw his forces as best he could up the left bank of the river. Maude's flotilla instantly pushed up to the front past Kut, which fell automatically into his hands, and the Anglo-Indian army in Mesopotamia could then claim to have won a victory that went far towards wiping out the discomfitures of the previous year. Within the space of two months the military situation had been completely transformed as the result of a happily conceived and resolutely executed plan of campaign that had been rendered possible by prescient and comprehensive organization in rear of the fighting front.

But Maude was not the man to tarry after gaining a signal triumph and thereby to give his vanquished opponents breathing space to recover. His supplies guaranteed by the arrival of his water transport, he pushed on along the left bank of the Tigris on the heels of the fugitive Turks, his troops ready for any exertion in their enthusiasm and full of confidence in their leader. The river channel between Kut and 'Aziziya has many loops and bends, making it difficult for a naval force and a military force to act in tactical concert, but on the 26th the British gunboats, steaming up almost ahead of the mounted troops, destroyed or captured practically the entire Ottoman flotilla after a sharp combat. Great prizes in war material as well as many prisoners were also made by the advancing army. Keeping his own counsel, as was his wont, the army commander had from the outset of his active operations contemplated an immediate advance on Bagdad after expelling the enemy from Kut, and he now requested permission from the Home Government to make the historic city his objective. He received the requisite sanction. But he found himself obliged, in spite of his eagerness to press on, to halt for some days at 'Aziziya for fear of outrunning his supplies—a check which enabled the rear of his army to close up and which afforded the troops a welcome rest, although the brief relaxation in the pursuit gave the Turks time to occupy defensive positions covering the capital.

All being ready, the Anglo-Indian army resumed its advance on March 4, whereupon it was found that the enemy had abandoned Ctesiphon and retired behind the Diala. This river represented a serious military obstacle, and when an attempt was made to force the passage the Turks were discovered to be in such strength and to be so favourably posted that the effort proved in the first instance unsuccessful. Maude thereupon threw a bridge across the Tigris and passed the cavalry and the I. Corps across the channel. Then, his troops pressing forward on either bank, the Diala was forced by Gen. Marshall, opposition

on the other side of the Tigris was gradually overcome, and by the 11th the City of the Caliphs was in British hands, the enemy having withdrawn northwards, unable to stem the resolute advance of the victors. Maude, however, allowed no pause in his offensive operations to take place. Cobbe, pushing up the right bank of the Tigris along which a stretch of railway ran as far as Samarra, heavily defeated a Turkish force which attempted to bar his progress at Mushaida, while Marshall cleared the triangle of country between the Tigris and the Diala in the direction of the Jebel Hamrin. Russian forces in Persia had been penetrating into the mountainous country on the Turko-Persian borders while Maude was advancing from Kut, and it had been hoped that they might coöperate effectively with an Anglo-Indian column which was pushed into the hills towards Khanivin; but this project did not materialize. Marshall, however, conducted a most successful campaign on the Shatt al Adhaim during the month of April, inflicting a number of severe defeats upon the Turkish XIII. and XVIII. Army Corps in that direction, and Cobbe completed the operations on the right bank of the Tigris by the capture of Samarra with many prisoners and much war material. Then, having secured possession of a wide area of fertile territory to the N. of Bagdad and driven the enemy in confusion into the deserts and uplands beyond, Maude was at last enabled to afford his victorious troops rest—just as the hot weather set in.

The virtual conquest of Mesopotamia in a four and a half months' campaign had been brought about by the resolute execution of a plan of operations based on correct calculation of requirements. It had been a triumph of forethought and of strategical and tactical skill on the part of a chief who followed up his successes relentlessly and who inspired his subordinate commanders and his troops with his own unconquerable spirit. Neither the stout resistance offered by the Ottoman troops at the outset and which they had maintained even after the tide began to set against them, nor yet the formidable defences which their engineers had elaborated around Kut, had in reality proved the greatest stumbling-block to be overcome. The vast extent of the theatre of war, the lack of communications, and the fact that fighting forces advancing from the Shatt al 'Arab must almost inevitably adhere to the line of the Tigris constituting virtually one long military defile, had interposed even greater obstacles in the path of conquest. But those obstacles had been surmounted as a result of appropriate and effectual organization consummated during the months which had immediately preceded Maude's advance; and during the torrid summer of 1917, when little fighting took place, he was busily engaged in perfecting administration in the territory won, improving communications, and preparing for a fresh offensive in the cold weather.

A railway was constructed from Kut to Bagdad, as the intervening section of the Tigris channel was shallow and awkward to navigate. Sanitation and policing were secured in the capital. Comfort and recreation were provided for the troops. Steps were taken to tap the supply resources of the fertile districts in occupation of the army. A division that had been in reserve at Nasiriya was brought up to the front. Great efforts were for a time made to arrange for coöperation with the Russian forces in Persia; but the influence of the revolution in Petrograd made itself more and more felt in that quarter as the weeks passed, and before Maude started his autumn campaign it had become manifest that little was to be hoped for from that direction. Indeed the situation in Armenia was becoming such as to affect adversely the prospects of the Anglo-Indian host operating in Mesopotamia, and in the late summer there were indications that under German instigation the Turks were contemplating an effort to recover Bagdad. This merely made Maude the more anxious to resume the offensive, and on Sept. 28 he struck his first blow by the capture of Ramadi on the Euphrates, with much booty. This victory was followed by successful operations in clearing the Jebel Hamrin and by the capture of Tikrit on the Tigris at the beginning of Nov. A few days later, however, the army commander was struck down by cholera, and he died on the 10th. He was succeeded by Sir W. Marshall.

Above Tikrit and extending N. for a long distance, the country traversed by the Tigris is a sterile tract, hilly and broken at some points; the ordinary route from Bagdad to Mosul does not therefore follow the river but takes a line to the E. through Kifri and Kirkuk. Maude had intended to conduct his main advance by this line—a plan of operations which would make it possible for the Russians in Persia to coöperate should they be prepared to do so. The death of the distinguished general, just at the moment when the project was about to be put in execution, created some delay, but his successor set troops in motion through the Jebel Hamrin in Dec. and Kifri was occupied in Jan. Having secured that point, Marshall in the middle of Feb. determined on a sudden advance of his extreme left wing up the Euphrates. Hit was captured, and on the 10th a complete victory was gained over the Turks who had retired up the river from that place; they consisted of the 50th Div., which was surrounded and captured, 5,000 prisoners and all its guns being taken. Difficulties of transport in the meantime hampered the force moving forward beyond Kifri, the distance from railhead being considerable, but on April 29 the Ottoman forces were heavily defeated on the road to Kirkuk, losing 3,000 prisoners, and a week later that town was occupied, much war material falling into the hands of the Anglo-Indian army. In view of the distance of the place from the railway the army commander however decided to withdraw his troops from the place after the booty had been evacuated; the troops then fell back to Kifri, and, the hot weather having now set in, active operations practically ceased for five months. The collapse of Russian fighting power in Armenia had enabled the Ottoman staff to move troops from there down to Mosul and northern Mesopotamia, and scarcely any assistance had been received from the side of Persia; but Gen. Marshall's first campaign had nevertheless been remarkably successful and his position to the N. of Bagdad had been effectually consolidated.

In the meantime a special British mission, sent off in Jan. under charge of Gen. Dunsterville and originally intended for Tiflis with the object of coordinating resistance of Armenians, Georgians and Russians to the Turks threatening Transcaucasia, had been endeavouring to maintain satisfactory relations with the Russians in Persia, and had arranged for supplying food to certain parts of that country which were almost famine-stricken. The allocation of a considerable amount of motor transport to this latter service had indeed somewhat hampered Marshall's operations about Kirkuk and the Persian border. Great difficulties were placed in Dunsterville's way by Russian officials who were tending towards Bolshevism, while open hostility was displayed by certain of the Persian tribesmen. Some Russian troops, however, remained loyal to the Entente and, coöperating with these, small bodies of British troops were gradually pushed up to establish a line of communications between the Anglo-Indian army in Mesopotamia and the Caspian Sea at Enzeli. During the early summer resistance to the Turks in Transcaucasia was gradually breaking down, and at the beginning of July the last of the organized Russian fighting forces in Persia proceeded thither by ship. On the Ottoman troops appearing before Baku shortly afterwards, Dunsterville sailed for that city in Aug., followed by a brigade of British infantry.

He found a complex and disturbing situation to prevail. The Armenian garrison was unreliable. The attitude of the Russian officials was suspicious. Bolshevik armed craft were afloat on the Caspian. The lines constructed for the defence of Baku were of such extent as to require a large force to man them. It soon became apparent that the safety of the city depended entirely upon the meagre British force as the Armenian soldiery displayed little stomach for combat. For a very few weeks Dunsterville and his men did what they could to save the place; but on Sept. 14 the Turks broke through the outer defences, and that night the British reembarked and returned to Enzeli, whereupon Baku fell into the enemy's hands. A somewhat risky venture had proved unsuccessful, but it had at least prevented the dispatch of some of the Ottoman troops in Transcaucasia to confront the Anglo-Indian army in N. Mesopotamia.

On news of the fall of Baku reaching London—it occurred

just when the season was suitable for commencing active operations in the theatre of war farther to the S.—Marshall was instructed to occupy Mosul, an undertaking for which he had been preparing during the summer. The best of the Turkish divisions in Mesopotamia were at this time assembled astride of the Tigris at Fatha, where the river breaks through the Jebel Hamrin range of hills. A naturally strong position had been assiduously fortified, and the enemy possessed a second fortified position a few miles higher up at the confluence of the Lesser Zab and a boat bridge was established at that point. Realizing that a frontal attack would be hazardous and that, owing to the extreme ruggedness of the ground in the immediate vicinity of the hostile lines a turning movement of the ordinary kind was out of the question, resolved nevertheless to strike a decisive blow, Marshall determined on a combination of war by which adequate mobile forces would be thrown right across the Ottoman communications between Fatha and Mosul. He entrusted the conduct of these operations to Gen. Cobbe, and arranged for a column to advance simultaneously by Kirkuk towards Mosul.

The final campaign in Mesopotamia lasted only a single week, the movement beginning on Oct. 23. Two cavalry columns, that with the shorter distance to cover being accompanied by some infantry, crossed the Jebel Hamrin many miles E. of Fatha and passed the Lesser Zab a long way above its junction with the Tigris. In the meantime the 17th and 18th Divs. advanced against the Ottoman position, the 17th on the right bank and the 18th on the left bank of the Tigris. Finding himself threatened in rear, Isma'il Hakki Pasha, who commanded the Turks, withdrew from the Fatha position to that higher up, followed by the two Anglo-Indian divisions, while the cavalry columns made for the Tigris many miles above the confluence of the Lesser Zab and placed themselves across Isma'il Hakki's line of retreat. The 18th Div. forced a passage across the Lesser Zab on the 25th, whereupon Isma'il Hakki withdrew those of his troops that were on the left bank of the Tigris across the river, and pulled up his bridge. On the 26th the 17th Div. was pressing the Turkish main body on the right bank, and that same day the outer one of the cavalry columns forded the river and began moving down that side of the channel. On the 27th and 28th the 17th Div. was heavily engaged, before it finally made itself master of the enemy's position at the confluence of the Lesser Zab, whereupon Isma'il Hakki retired N. to Sherghat, but on the 29th the last hope of the trapped Ottoman force was destroyed owing to a relieving column from Mosul being defeated by the cavalry. All that day Isma'il Hakki resisted the advance of the Anglo-Indian forces on Sherghat, but on the morning of the 30th, just as the 17th Div. was about to launch a final attack, the white flag was displayed and the 14th and the bulk of the 2nd Turkish Divs. surrendered.

Eleven thousand prisoners, 51 guns and much war material were taken as a result of Cobbe's brilliantly successful operations. Two days later tidings of the signing of the Armistice arrived. The Kirkuk column had, in the meantime, been working its way forward, almost unopposed, toward Mosul. That city was occupied within a week; and so, in a blaze of triumph for the Anglo-Indian forces, the long-drawn-out campaign in Mesopotamia, in which they had experienced both extremes of fortune, came at last to an end, concurrently with the most sweeping tactical success gained by either side during the course of the struggle. (C. E. C.)

(III.) THE SINAI CAMPAIGN, 1916-7

When the Dardanelles expedition came finally to an end during the first days of Jan. 1916, the British troops which had been engaged on the Gallipoli Peninsula were dispatched to Egypt, there to refit and reorganize, and to undertake the defence of Egypt against a possible attack by the Turks, who were now freed from any menace on the shores of the Dardanelles. On Jan. 10, the evacuation of Cape Helles having been successfully completed, Gen. Sir Charles Monro handed over his command to Gen. Sir Archibald Murray and returned to France. Sir Archibald Murray's instructions were to protect Egypt against attack

from the E., and to maintain a general strategic reserve of troops for the whole Empire, ready for use wherever required. The reorganization, reëquipping and refitting of the war-worn troops from the Dardanelles was the first consideration. In measure, as this progressed, the "general strategic reserve" was drawn upon to meet the exigencies of other theatres of war; and by the end of June 1916 nine divisions, three infantry brigades, a number of Indian units, and a number of heavy artillery batteries had left Egypt, most of them for the main theatre in France and Flanders. By July, therefore, Sir Archibald Murray's force available for the defence of Egypt against attack from the E. had been reduced to four divisions, three dismounted yeomanry brigades, one mounted division, one mounted yeomanry brigade, and a few Indian and garrison battalions.

During this period, the first half of the year 1916, the scheme of defence on the E. of Egypt had undergone very considerable modification. The rapid depletion of Sir Archibald Murray's force rendered modification essential, while the Russian victory at Erzerum in the spring, and the fact that no Turkish attack on a great scale was to be apprehended during the hot weather, rendered it also practicable. In Jan. Sir Archibald Murray had taken over a scheme, prepared with Lord Kitchener's personal approval, for the construction of a great defensive system, suitable for withstanding an attack with heavy artillery, of which the front line was some 7 or 8 m. of the Suez Canal, and which extended from the head of the Gulf of Suez to the Mediterranean. By Feb. 15, however, Sir Archibald Murray had already written to the chief of the Imperial general staff pointing out that this scheme of defence was very wasteful in men and material, and recommending an advance across the Sinai Peninsula towards the Egyptian frontier, with dispositions for an active instead of a passive defence. He showed that strategically the true base of the defensive zone of Egypt against invasion from the E. was not the 80 odd miles of the Suez Canal, but rather a line less than half as long near the frontier running S. from El 'Arish. From El 'Arish it would be possible to oppose any advance against Egypt directed along the N. Sinai road; to attack in flank an invader moving on the lines of approach farther to the S.; and to undertake rapid offensive operations against enemy concentrations in S. Palestine. Five divisions and not less than four mounted brigades would be required, but this was a considerably smaller force than would be needed adequately to hold the great defensive system prepared from end to end of the Suez Canal. Moreover, the farther the defence was removed from the Nile delta the less would be the unrest and the chances of disturbance in Egypt in the event of attack by the enemy.

As a first step Sir Archibald Murray proposed in Feb. an advance to a suitable position E. of Katia on the N. Sinai road, and the construction of a railway to that place. Katia itself is some 25 m. E. of the Suez Canal, and its importance lay in the fact that round it, and in the district immediately to the E. of it, it is possible to find or to obtain in shallow "wells" a considerable supply of drinkable though brackish water. It was the only district in which any considerable force of the enemy could

possibly be collected, and for a time maintained, within striking distance of the Suez Canal. The organization of camel transport for the troops undertaking this advance was immediately put in hand, and the construction of the railway was begun. By the end of May Sir Archibald Murray had established a strong position near Romani, about 20 m. E. of the Suez Canal at the head of the Bay of Tine. This position was held by the 52nd Div., and from it the Australian and New Zealand Mounted Div. was able to keep under constant observation the whole of the "watered" district round, and E. of, Katia. More advanced positions, E. of Katia, were in course of preparation. A standard-gauge railway had reached Romani, and water from the Sweetwater Canal had been brought there by pipe-lines. Lieutenant-General Hon. H. A. Lawrence was in immediate command of this northern portion of the forces in the Sinai Peninsula. Meanwhile the enemy had not permitted this advance to take place entirely undisturbed. Towards the end of April he had made a partially successful raid, which penetrated to some considerable distance W. of Katia and caused the loss of three and a half squadrons of yeomanry besides other casualties. His raiding force was, however, driven off without difficulty, and for about three months he gave no further sign.

By about the middle of July preparations were well in hand for undertaking the advance across the desert to El 'Arish and the Egyptian frontier. Railhead was some 30 m. E. of the Suez Canal. The construction of a large filter plant at Qantara, of a series of storage reservoirs, and of a great new pipe-line had been ordered, with a view to supplying the troops throughout the advance and as far as El 'Arish with half-a-million gallons of water a day from the Sweetwater Canal. Large numbers of camels were being collected, and all manner of equipment designed to facilitate the passage of the desert—from "ped-rails" for the wheels of the artillery to wire-netting for roads—was being procured and tested.

Then on July 19 an enemy force was found to be advancing, and to have entered the eastern part of the area of "wells" and palm groves which extends about 18 m. E. of Katia. By the 24th this force had come to a standstill within 10 m. of the Romani position on a line on which it entrenched itself. From that day until the end of the month there was little further movement. During this period it became fairly clear that the enemy's force consisted of the Turkish 3rd Div., of three regiments, with a number of machine-gun companies, mountain artillery, some batteries of 4-in. and 6-in. howitzers and a body of Arab camelry. It was commanded by the German Col. Kress von Kressenstein.

Sir Archibald Murray was in no hurry to force the issue. His troops were in a strong position with all their requirements close at hand, while the enemy, if he attacked, would fight with a desert behind him and very far from his base. All that Sir Archibald required was time to complete the provision of camel transport for Gen. Lawrence's force so as to render its mobility adequate for counter-attack or pursuit, or for attack eventually if the enemy should refuse to take the initiative. General Lawrence was, therefore, reinforced, till he had under his orders the 52nd and 42nd Divs., a brigade of the 53rd Div., two battalions of the 54th Div., a dismounted yeomanry brigade, the Australian and New Zealand Mounted Div. and a yeomanry brigade. By Aug. 1 over 10,000 transport camels had been provided for this force. An independent mobile column, composed of camel corps with a few squadrons of yeomanry and light horse, had also been organized for coöperation from the section of the Canal defences which lay to the S. of that for which Gen. Lawrence was responsible.

Not until Aug. 3 did the enemy disclose his intention, but on the night of the 3rd-4th he launched an attack against Gen. Lawrence's southern flank with the aim of outflanking and enveloping the British force. General Lawrence's prepared defences extended from the sea on the N. southward for some 5 or 6 m., into a region of heavy sand-dunes, with the southern flank refused. The enemy's blow fell first on the Australian Light Horse, the Australian and New Zealand Mounted Div. being posted on Gen. Lawrence's right. These troops were obliged

very gradually to give ground, while from daybreak on the 4th the enemy's attack developed also against the British centre and left-center, held by troops of the 52nd and 53rd Divisions. The enemy was evidently now fully committed. He appeared, however, to have miscalculated to some extent the direction of his main enveloping attack. As his captured air-reconnaissance reports subsequently showed, he was probably unprepared to find the British right flank extended so far S., and consequently failed to direct his enveloping movement sufficiently far to the westward. General Lawrence had the 42nd Div. in reserve at Pelusium station, 5 or 6 m. W. of Romani, and he ordered this division up to his right in order to be ready to attack the enemy's outer flank. Sir Archibald Murray, meanwhile, ordered the independent mobile column to move out wide round the enemy's flank against his left rear. Naval coöperation was afforded by monitors, whose fire from the sea helped to keep down the fire of the enemy's heavy howitzers.

The enemy's containing attack against the British left and centre was not pressed; his force was insufficient for any such purpose. His main enveloping attack, in a waterless region of soft sand and high dunes, had spent its force by the early afternoon. The march of the 42nd Div. from Pelusium had been delayed, but long before its leading troops could come up the mounted troops, with the reserve of the 52nd Div., had begun to press back the enemy's left, and by nightfall had removed any danger on the southern flank. At daybreak on the 5th the southern front was completely cleared, the 42nd Div. advancing on this flank. Farther N. the 52nd Div. moved out in a south-easterly direction against the enemy's right wing, which assumed the rôle of rearguard, while the mounted troops on its right pressed on eastward. These converging movements drove the enemy back to Katia in the course of the day.

On the morning of the 6th the enemy was found to have retired from Katia, and the mounted troops took up the pursuit. The Turkish rearguards fought stubbornly against the direct pressure of the mounted troops. The independent mobile column with its camelmen, however, working right round the enemy's southern flank, fought a very skilful and successful little action on the 7th which no doubt had a great effect in hastening the retreat; and by the evening of the 8th the enemy was at Bir el 'Abd, some 20 m. E. of the Romani battlefield.

On Aug. 9 the mounted troops made an attempt to envelop the enemy's position and to cut off his further retreat. This attempt was unsuccessful, and a direct dismounted attack was launched which also failed to dislodge the Turks, who made several determined counter-attacks. During the 10th and 11th the situation at this point remained unchanged. But in the meantime the independent mobile column again worked round the enemy's left and fought a sharp action on the 11th, as a result of which the enemy evacuated Bir el 'Abd during the night. The pursuit had to be abandoned on the 12th, and the remnant of the Turkish force retired to El 'Arish.

Out of a force of about 18,000 troops the enemy must have lost about half. Four thousand prisoners, a mountain battery and a number of machine-guns were left in Gen. Lawrence's hands, besides other booty; but the enemy was able to withdraw his heavy howitzers in spite of the difficulty of moving them through the soft desert sand. It is impossible to say under what pressure Col. Kress von Kressenstein undertook this forlorn hope, nor what real prospects he or his superiors conceived it to offer. It failed completely, with the loss of half the force employed. Yet even so Kress may perhaps be accounted fortunate. Somewhat earlier and more vigorous handling of the 52nd Div. against the enemy's right, at the time when his left began to give way on Aug. 4-5, might have rendered it very difficult to extricate any considerable portion of the Turkish force. Again, as was indicated by the successes of the miniature independent mobile column during the pursuit, wider envelopment, especially on the southern flank, by the mounted troops might have effected more than the direct pursuit actually undertaken, and might have cut off the retreat of more of the enemy's troops and guns. It should be said, however, that the weather was exceedingly hot

and trying for white troops; the difficulties of watering in the desert were very great; and the going in the soft sand of that part of Sinai was so bad that the infantry rate of marching was reduced to 1½ m. a day.

After this action the enemy remained about El 'Arish on the Egyptian frontier, with an advance force at Bir el Mazar, over 40 m. E. of Romani. Apart from a successful reconnaissance in force against Bir el Mazar, carried out by the Australian and New Zealand Mounted Div. in the middle of Sept., no further fighting took place for a considerable period. The enemy, made nervous by the proof of extended radius of action given by the appearance of Gen. Lawrence's mounted troops before Bir el Mazar, withdrew all his forces to the neighbourhood of El 'Arish.

The instructions given to Sir Archibald Murray by the War Cabinet about this time were to the effect that the policy in Egypt was to be mainly defensive, though all preparations should be made for an advance on El 'Arish. Sir Archibald took occasion to point out that he adhered to his previously expressed opinion that, in order both to occupy El 'Arish and to be able effectively to operate from that neighbourhood against an invader on any of the routes crossing Sinai, he required at least five divisions and four mounted brigades. Actually at this time he had only four divisions available for the defence of Egypt on the E., though he disposed of a sufficiency of mounted troops. Nevertheless, in the situation as it then was, he signified his willingness to defend Egypt and to undertake the advance on El 'Arish with the troops actually at his disposal.

After the action at Romani, therefore, arrangements were actively pressed forward for the advance across the desert to El 'Arish and the Egyptian frontier. In Sept. Gen. Lawrence left to take up a new command elsewhere, and was succeeded by Lt.-Gen. Sir Charles Dobell, to whom Sir Archibald Murray now entrusted the whole of the forces in the Sinai Peninsula and on the Suez Canal. Sir Charles Dobell's command was called the "Eastern Force" of the Egyptian Expeditionary Force.

In the great ebb and flow of the war as a whole, the autumn of 1916 marked, almost everywhere, a turning-point. In the main theatre in the W. the great battle of the Somme roared to a conclusion far more momentous than appeared to those who were looking only for a definite breaking of the German line. In the Russian theatre, on the other hand, high-water mark had been reached in the summer, and Brussilov had been checked. In Rumania von Falkenhayn and later von Mackensen swept over the country to the lines of the Sereth. In the Balkans Gen. Sarrail had captured Monastir, but his offensive had failed to bring relief to the Rumanians. Greece was in a state bordering on chaos. Everywhere in Europe the superficial signs seemed to indicate either turn of tide or definite ebb. In the eastern theatres affairs seemed somewhat better. The Russian front had been reconstituted in Armenia, though there was little progress anywhere. In Mesopotamia, since the fall of Kut, the hot weather and the necessity for reorganization and preparation had forced a suspension of active operations. Only in the Sinai desert was any forward movement in progress,—one of the least of all the eddies of the war. In Arabia, the Grand Sheriff of Mecca had proclaimed independence of Turkey.

The new Government in England, pressed by man-power questions after the losses in the Somme battle and increasingly feeling the submarine menace, probably turned its eyes rather naturally to the eastern theatres for something to show in the way of success, when Sir Stanley Maude's preparations should have been made, the Arabs should be in motion, and Sir Archibald Murray nearing El 'Arish. In any case it was pointed out to Sir Archibald Murray early in Dec. that the gaining of a military success in his theatre was very desirable. Sir Archibald Murray continued to adhere firmly to his original opinion that a fifth division would be necessary if he was to hold and to operate from El 'Arish, and he asked for a sixth division if he should be required to make any further advance. In reply, he was told that the War Cabinet was not prepared to send him additional troops. He was to make the utmost effort during the winter, but his primary mission was the defence of Egypt.

In the meantime the movement on El 'Arish had progressed with such speed as was possible where the pace had to be set by that of the construction of the railway and pipe-line. Early in Dec. Gen. Dobell's advanced guard, which was called the Desert Column, came under the command of Lt.-Gen. Sir Philip Chetwode. This force varied in strength from time to time according to circumstances. On Dec. 10, when railhead was within 20 m. of El 'Arish, and the final advance was in view, Gen. Chetwode had under his command the Australian and New Zealand Mounted Div. and the 42nd and 52nd Divs.

The enemy had about 1,600 infantry in El 'Arish with supporting forces at Magdhaba and Abu Aweigila, and he held the only water supplies. The supply of water for the final advance of the Desert Column required the most elaborate arrangements and the establishment of a large reserve of water, rail-borne from Bir el 'Abd, at railhead. Thus the movement had to be delayed till Dec. 20. Just before the advance of the Desert Column the enemy hurriedly withdrew, and Gen. Chetwode's mounted troops, surrounding El 'Arish after a 20-m. night march on Dec. 20-21, found the place unoccupied.

The nearest Turkish force was at Magdhaba, about 20 m. S. of El 'Arish, and consisted of some 1,600 infantry with four mountain guns. During the night of Dec. 22-23, Gen. Chauvel, commanding the Australian and New Zealand Mounted Div., led a column composed of the majority of his mounted troops and the Imperial Camel Bde. against this force. The enemy's position was reached in the early hours of the morning. Some sharp fighting ensued. The enemy was practically surrounded by mid-day; but no water having been found for his horses Gen. Chauvel was faced with a situation in which, if he could not force the enemy's surrender before nightfall, he would have had to withdraw. By the late afternoon, however, the enemy's stout resistance was overborne, and practically the whole of his force was killed, wounded or captured. Four guns and 1,282 prisoners were taken, at a cost of under 150 casualties.

After this the enemy withdrew the few small posts which he had maintained farther S. within the borders of Sinai, and the only Turkish force remaining in Egyptian territory was a detachment about 2,000 strong near Rafa, the frontier post on the "road" into Palestine, some 25 m. E. of El 'Arish. On the night of Jan. 8-9, Gen. Chetwode moved out against this force with the greater part of the Australian and New Zealand Mounted Div., a mounted brigade (yeomanry) and the Imperial Camel Bde. The long night march was carried out with remarkable speed and efficiency; the enemy was completely surprised, and found his position almost entirely surrounded as day broke. As at Magdhaba, however, he offered a very determined resistance, and again he held the only water obtainable for Gen. Chetwode's horses. In the middle of the afternoon a small relieving force approached from Shellal; this force was, however, neither in time nor strong enough to effect its purpose. At one time it looked as if the Turks might hold out long enough to force Gen. Chetwode to relinquish his hold; but by 5:30 P.M. their resistance had been worn down and their position taken. The whole of the Turkish force, with its commander, was accounted for, and Gen. Chetwode returned to El 'Arish with over 1,600 unwounded prisoners, four mountain guns and other booty, his own casualties being less than 500.

As a result of these two actions—both admirable examples of the tactics of mounted troops relying on fire action—the Sinai province of Egypt was finally freed from the enemy.

The defender who holds the country between Gaza and the sea on the W. and Beersheba on the E. commands the access to S. Palestine from the direction of Egypt. East of Beersheba, a mountainous country, lacking roads and water, opposes a barrier which could only be overcome by preparations so long and arduous as hardly to admit of their inception. At the beginning of 1917 the enemy held Gaza and Beersheba, and, after the actions at Magdhaba and Rafa, began to concentrate his advanced force at Shellal, a point on the Wadi Ghuzze nearly equidistant from Gaza and Beersheba, and some 7 or 8 m. in front (from the Turkish point of view) of the general line between those places.

From Shellal he was in a position to watch the approaches to Gaza and to Beersheba, and to cover his lines of communication to those places—especially the railway to Beersheba from the north. Behind the advanced position which the enemy began to prepare at Shellal lay the line of ridges which, running almost direct from Gaza to Beersheba, dominated the open plain to the S.W. and formed a naturally favourable line on which to organize a strong defensive position to bar the way into S. Palestine.

Meanwhile, the desert railway having been pushed on through El 'Arish to within a few miles of the Egyptian frontier, Gen. Dobell advanced his headquarters to El 'Arish before the end of Feb. Sir Archibald Murray, so far from receiving the fifth division which he had always held to be necessary for the further prosecution of the campaign, was now required to send one of his divisions to France—the 42nd. This left available for the eastern force only three divisions, the 52nd, 53rd and 54th, with the nucleus of a fourth—the 74th—to be formed from dismounted yeomanry; but the satisfactory position of affairs in Egypt and the western desert enabled the available mounted troops to be increased to two mounted divisions.

It had by now been made clear to Sir Archibald Murray that the forward policy of Dec. had been altered. The general situation of the Allies, envisaged as a whole, had developed and wore a new aspect. Naturally there could be no ground for surprise at any alteration or transformation of the policy governing the conduct of operations in one of the very minor theatres. On Jan. 11 1917, the day on which, in France, the British attack was launched against the Beaumont Hamel spur, Sir Archibald Murray was told that his primary mission was the defence of Egypt during the summer months and the preparation of an offensive campaign in the autumn. Meanwhile Beaumont Hamel developed into the great German retreat in the west. Nearer to Egypt, the Rumanian retreat came to an end—Wallachia lost but Moldavia held; and Gen. Maude's victorious campaign in Mesopotamia carried him from success to success past the ill-omened Kut to the capture of Bagdad.

Nor were these happenings without effect upon the attitude of the Turks on the confines of Egypt. Early in March the enemy evacuated his positions near Shellal before he could be attacked. His general intention appeared to be to avoid battle, trusting to the severe limitations set to the pace of Gen. Dobell's advance by the difficulties of overcoming the desert. Thus he would conserve his strength, retain his liberty of action in other directions, and choose his ground at leisure for an eventual contest *à outrance* in S. Palestine. Obviously this did not suit Sir Archibald Murray's plans.

In the early days of March the Turkish dispositions were as follows: rather less than a division (say 7,000 fighting troops) held Gaza; about a division was in the neighbourhood of Tellesh Sharia, roughly half way between Gaza and Beersheba and 15 m. distant from either; and a small garrison occupied Beersheba. In these circumstances, apart from the desirability of foiling the enemy's Fabian tactics, to which reference has been made, Sir Archibald Murray was influenced by other considerations of more or less weight. In order to make adequate preparations for a serious autumn offensive, in accordance with the instructions of the War Cabinet, it was necessary to move railhead forward, and for this purpose it was necessary to advance to within a few miles of Gaza and to seize the line of the Wadi Ghuzze. Further, the enemy's detachment at Gaza was a day's march distant from any supporting troops; by an operation of the same nature as—though on a greater scale than—those at Magdhaba and Rafa it might be disposed of by a *coup de main*. Finally, such a *coup de main*, if successful, might result in Gaza passing not only temporarily, but perhaps permanently into British hands. If so, the effect would be to open the gate into S. Palestine and to make it impossible for the Turks to hold the naturally strong Gaza-Beersheba line as their first line of defence, when the time came for the main effort later in the year.

General Dobell commanding the Eastern Force, and Gen. Chetwode commanding the Desert Column under him, agreed that the chances of capturing Gaza by a *coup de main* were on

the whole favourable. General Dobell reported accordingly to Sir Archibald Murray, being careful, however, to add that all would depend on whether or not the enemy's resistance could be broken before nightfall on the day of attack; if the decision should be longer delayed the Turkish force from Tellesh Sharia would probably interfere, and water difficulties might in any case make it necessary to draw off the attacking force. On the whole Gen. Dobell thought the game worth the candle. Sir Archibald Murray, after hesitation, signified his consent.

The problem with which Gen. Dobell had to deal was no easy one. Surprise and celerity were the two essentials. In order to retain the element of surprise he must strike while yet his advanced base was so far off that the Turks should think themselves securely beyond his reach. Actually, when the operation was launched, his railhead was full 20 m. from Gaza. This involved an exceedingly difficult series of approach marches to the place of concentration, in a country where water was very scarce, supplies wholly lacking, and concealment by day very hard to secure. A considerable portion of the force had three consecutive marches to make under these conditions in order to reach the scene of action undiscovered. The movement once started, therefore, no alteration or postponement was possible without the practical certainty of its being discovered, and the chance being lost for all. Moreover, in order so far as possible to insure a rapid decision, Gen. Dobell was obliged to employ a large force. There were two and a half Turkish divisions—somewhat weak, it is true—at, and within a day's march of, Gaza. General Dobell employed the Desert Column (two mounted divisions and the 53rd Div.), the 52nd and 54th Divs. and the Imperial Camel Bde. But even the difficulties of moving this force in secrecy to a place of concentration 20 m. in advance of railhead were less than the difficulties of providing it there with the necessary ammunition, water and supplies, and of maintaining that provision during the action. The whole of the transport of the Eastern Force had to be pooled and rearranged. The troops had to be deprived of all but the barest minimum. Fifteen "trains," each carrying one day's supplies for a mounted division or a division, were improvised in about as many days. Camel water convoys were prepared. Ammunition columns were specially grouped and organized. Every available horse, mule and camel, every available cart and waggon, Ford car and caterpillar tractor, whatever its normal use, was pressed into this service. The troops marched with the barest essentials. And, as the result—no small feat of organization—two mounted divisions were given a 30-m. radius of action, two and a half divisions a 20-m. radius of action, and the remaining half division what was required to enable it to protect and assist the line of communication from railhead forward.

In essence, then, the operation was a raid on a great scale, and, as has been said, Gen. Dobell made it clear that he considered that success depended on his being able to force the surrender of the Gaza garrison before dusk on the day of attack. He came within an ace of succeeding.

The concentration took place successfully and without alarming the Turks by the night of March 25-26. In the early hours of March 26 the mounted troops crossed the Wadi Ghuzze to surround Gaza from the N. to the S.E.; thus they would be in a position to cut off the retreat of the garrison and to prevent or much delay the arrival of Turkish reinforcements whether from the N. or from the direction of Tellesh Sharia. The 53rd Div., which was to attack the enemy's position on the heights E. and S. of Gaza, of which 'Ali Muntar was the chief feature, followed the mounted troops, and was in turn followed by the 54th Div., to support the 53rd and to protect its exposed right flank.

The mounted screen was in position, though not without delay, yet in good time. The infantry was late owing to a cause which no one could either have foreseen or prevented. As dawn broke a dense fog spread over the land from the sea. The troops could only grope their way slowly and uncertainly. They were delayed in reaching their position of deployment. No attack could be delivered until the fog had cleared. Nor did the fog clear until 8 o'clock, when two precious hours had been lost.

At the end of the day those two hours would in all human probability have made victory complete.

By 10 A.M. the battle was joined. By the early afternoon the 53rd Div. had fought its way close to its objectives. But the Turkish position was very strong, and the ground over which the attackers fought their way forward was absolutely devoid of cover. General Chetwode, then, ordered the Australian and New Zealand Mounted Div. to attack the town from the N. and N.E., while the Imperial Mounted Div. and the Camel Bde. were to extend so as to take over the screen on the N. of Gaza as well as on the E., though the Turkish reinforcements were already seen to be approaching from N., N.E. and S.E.

Before 5 o'clock the 53rd Div., strengthened by a brigade of the 54th, had taken 'Ali Muntar and had pushed beyond the crest of the line of heights overlooking Gaza. The Australians and New Zealanders were in the north-eastern outskirts of the town, fighting among the cactus hedges. N.E. and E. of the battle, the weakened mounted screen held off the enemy reinforcements, but was being slowly forced to give ground.

Two more hours of daylight were required. Gaza lies in, and is bordered by, an immense labyrinth of great cactus hedges, impossible to fight through and clear by night. The 53rd Div. and part of the 54th were extended on the hills over Gaza on a line facing nearly N.W. Below among the houses and cactus hedges was the Gaza garrison, still not surrendered. Bearing down on the very point of the exposed right flank of the 53rd Div. was a strong Turkish force, now within a few miles. Approaching the back of that same exposed right flank was another strong Turkish force, also within a few miles, coming from the direction of Tellesh Sharia. The thin mounted screen could not long delay these forces; no water had been found for the horses all day, and it must in any case be soon withdrawn. Part of the 54th Div. protected what was now the rear of the 53rd on the Mansura and Sheikh 'Abbas ridges S. of Gaza. One brigade of the 52nd Div. was available and no more. This was far from sufficient to protect the right of the 53rd Div. in its actual position, and at the same time to join it securely with the 54th. The one day's fighting, for which alone it had been possible to make effective arrangements as regards water supply, was drawing to a close. No water had been found in the Wadi Ghuzze or elsewhere by the parties detailed to search for it; and the water supply of the troops already engaged was now a matter of some anxiety. Half an hour before sunset, then, there were two alternatives. One was to launch the 53rd Div. and the Australian and New Zealand Mounted Div. down into Gaza in an attempt by night to clear up, or even to drive back into the Wadi Ghuzze, the disorganized remnants of the garrison, while using the 54th Div. and the Imperial Mounted Div. as a rearguard during the night. The other was to withdraw the mounted troops while the way between Gaza and the Turkish reinforcements was still open, and to form some sort of line on the ground won, by advancing the left of the 54th Div. and retiring the right of the 53rd until the two flanks met in a secure junction. General Dobell thought the former alternative, on a dark night, in unknown and extremely intricate country, with strong enemy reinforcements already on the very outskirts of the battle, too hazardous. General Chetwode, who was at this time at Gen. Dobell's command post, emphatically agreed.

The second alternative was, therefore, adopted, and Sir Archibald Murray, who had come up in his travelling *poste de commandement* on the railway to Khan Yunis, within a few miles of the action, was informed accordingly. Several hours later Gen. Dobell received from Cairo the decipher of an intercepted wireless message sent by the enemy commander in Gaza indicating his intention to surrender. This message had been sent in the early evening. Its receipt by Gen. Dobell was too late. But even had it reached him earlier it is not easy to see how, with darkness actually falling and the enemy's reinforcements at hand, he was to have taken advantage of it. The two hours' fog on the morning had destroyed his opportunity.

The new dispositions ordered were successfully taken up during the night—not without protest from the commander of the

53rd Div., who had to withdraw his right from 'Ali Muntar. Early on the 27th his patrols again occupied the hill. But the Gaza garrison had now been reinforced, and the patrols were driven off again. The point of junction of the 53rd and 54th Divs. was now the apex of an acute salient. The latter division, in order to join the former, had had to leave the Sheikh 'Abbas ridge, on which the Turks now appeared. The 54th Div. and the Camel Bde. on the S.E. face of this salient were heavily attacked. All attacks were repelled, but the position towards the apex of the salient grew more and more precarious. General Dobell, therefore, ordered a further retirement during the night of the 27th-28th to a strong position on the W. bank of the Wadi Ghuzze. This movement was successfully carried out and the action came to an end.

The advance to the Wadi Ghuzze had been effected, covering the further progress of the railway. The enemy had been brought to battle and was now pinned to the Gaza-Beersheba line. Nearly a thousand of the enemy had been taken prisoner, besides two guns, and he had lost several thousand killed and wounded. The cost of this to Sir Archibald Murray was some 4,000 casualties. Gaza, however, and its garrison had escaped, though this was owing to climatic conditions against which both commander and troops were powerless.

In spite of the fact that an unkind fate had snatched away the fruits of complete success just as they were within Gen. Dobell's grasp, in Sir Archibald Murray's view the military results of the action had justified his anticipations. The enemy had been brought to battle, and had been severely mauled, and the advance of the railway to the Wadi Ghuzze was assured. It will be remembered that the instructions under which Sir Archibald Murray was acting at this time were to defend Egypt during the summer and to prepare for an offensive campaign in the autumn. The railway could now be pushed forward sufficiently to admit of what would be required.

Meanwhile, within three days of the Gaza action, Sir Archibald Murray suddenly received altered instructions. The general strategic situation was again changing. In France the great German retreat was slowing to a halt on the Siegfried line; the preparations for the battle of Arras were in hand, and farther S. the second battle of the Aisne was shortly to begin. In Russia the revolution was fairly launched. In Mesopotamia Sir Stanley Maude was driving the Turks far from Bagdad towards Samarra. Sir Archibald Murray was ordered accordingly, on March 30, in view of the altered situation, to make his objects the defeat of the Turks S. of Jerusalem and the occupation of that city. Sir Archibald replied that he still required the five divisions which he had always considered necessary for a further advance—an estimate from which he had never varied; he also indicated that the prospects of a rapid advance were to say the least doubtful. In reply, he was instructed to push his operations with all energy, though no additional troops could be sent to him, since it was considered that, in view of the military situation of the enemy, his present force would suffice. Undoubtedly the latter portion of this instruction was unhappily expressed. The War Cabinet, with the whole strategic situation in its view, was no doubt more competent than Sir Archibald Murray to judge of the advisability of taking certain risks on the Palestine frontier, so there can be no question but that the alteration in the instructions was justified. But Sir Archibald Murray, on the other hand, was more competent than the War Cabinet to judge of the actual military situation of the enemy opposed to him, and of the probable sufficiency for their task of the forces of which he disposed. However, immediate preparations were begun for a renewed offensive, and on March 30 Gen. Dobell moved forward the Eastern Force headquarters to Deir el Belah, on the coast some 8 or 9 m. from Gaza.

If anything was to be done quickly, as the War Cabinet's new instructions evidently contemplated, there was nothing for it but a renewed attack on Gaza. Already Gen. Dobell's thoughts had been turned in the direction of Beersheba; but, in discussing with Sir Archibald Murray the question of operating by his right, he was constrained to say that it was difficult to estimate

how long a delay would be involved in the preparations necessary for such an undertaking. The whole of the existing organization, and in particular the position of the railway running close to the sea-coast, restricted the area in which it was immediately possible to undertake serious operations on the confines of the desert to within a very strictly limited distance from railhead. To prepare for an effective operation farther to the right would involve weeks of preparation and rearrangement. Sir Archibald Murray decided, therefore, to attack Gaza again, and instructed Gen. Dobell accordingly.

In any case a vast amount of preparation had to be made. The Turks were daily increasing their force on the Gaza-Beersheba line, and it was evident that Gen. Dobell's troops, specially lightly equipped for the passage of the desert, would have to be organized for the battle on more normal lines. The divisional artilleries, which had had to be reduced in the desert, had to be increased again; heavy guns and howitzers had to be railed up and heavy artillery groups formed. A few tanks were brought up, and the troops had to be instructed in methods of coöperation with this new weapon which they had never before seen; they had also to learn the use of gas shell and smoke-clouds. New large-scale maps had to be made and issued, including trench maps hastily prepared and incessantly revised from aeroplane photographs. Aircraft coöperation with the artillery had to be reorganized. The latest methods, in these and a hundred other matters, found advantageous by experience in more important theatres, had to be hurriedly assimilated by an army which had just painfully emerged from a 15-months' sojourn in the wilderness, and whose last pitched battle, so to speak, had been fought on the Gallipoli Peninsula. The limited capacity of the communications and transport available made the organization of the supply of ammunition and engineer stores a matter of great complexity. Preparations for water supply were far more difficult and arduous still. Arrangements had to be made for bringing up rail-borne water from pipe line head at Rafa to Deir el Belah, and for pumping it thence by a small pipe-line into tanks prepared in the Wadi Ghuzze. Scores of wells were sunk in the wadi. Several hundred thousand gallons storage capacity was prepared at these wells, and by repairing and filling the great underground grain-reservoirs of the natives in the neighbourhood. Scores of prepared crossing-places over the Wadi Ghuzze had to be made and allocated to the various formations, arms and transport. Between March 30 and April 15, however, all this work was practically completed, and Sir A. Murray brought up his advanced G.H.Q. to Khan Yunus, on the railway about 6 m. S.W. of Deir el Belah.

By this time the enemy had five divisions and a force of cavalry in line, and he had been considerably strengthened in heavy artillery. The Gaza defences were now strong and well wired, and the Turkish trench system extended S.E. from Gaza for some 7 m. to the Atawine ridge. Farther to the S.E. the defensive system was less continuous, but one division was about Tellesh Sharia (16 m. from Gaza) and between that place and Atawine. Beersheba was also held.

General Dobell disposed of the 52nd, 53rd and 54th Divs., the still incomplete 74th Div. in process of formation from dismounted yeomanry, the two mounted divisions of the Desert Column, and the Imperial Camel Bde. The French battleship "Réquin," and H.M. Monitors 21 and 31 were also to coöperate by fire from the sea when the time came. General Dobell had planned his operations in two stages. The first stage was limited to securing the outer defences from the sea to Sheikh 'Abbas, a commanding feature rather over 4 m. S. of Gaza. The second included the attack on the 'Ali Muntar position and Gaza.

The first stage began at dawn on April 17, and success was complete. The 52nd and 54th Divs. took all their objectives by 7 A.M. with but few casualties. The 53rd Div. on their left pushed forward reconnaissances along the coast. One mounted division protected the right of the 54th Div.; the other watched and immobilized the enemy's force about, and W. of, Tellesh Sharia. The ground gained was consolidated, and final preparations for the second stage completed on the 18th.

On the 19th the bombardment of the enemy reopened at dawn, the "Réquin" and the two monitors now joining in the battle. At 7:15 A.M. the 53rd Div. launched its attack along the coast. A quarter of an hour later the 52nd and 54th attacked—the former astride the ridge running S.W. from 'Ali Muntar, the latter, with the addition of the Imperial Camel Bde., immediately on the right of the 52nd. Farther to the right again the Imperial Mounted Div. made a dismounted attack on Atawine, while the Australian and New Zealand Mounted Div. protected the extreme right flank, and prepared to take advantage of any success gained by the Imperial Mounted Div. The 74th Div. was in reserve W. of Sheikh 'Abbas.

The 52nd Div. was the first to be checked, after progressing about half-way to its objective at 'Ali Muntar. This resulted in checking also the progress of the 53rd Div. on its left, and the left of the 54th Div. on its right. The right of the 54th Div., however, entered the enemy's works at Khirbet Sihān, just W. of the Atawine ridge, while the containing attack of the Imperial Mounted Div. was successful in occupying the defenders of the Atawine works. But the situation of the 54th Div. was far from favourable. Owing to the continued inability of the 53rd to make headway its left was exposed to heavy enfilade fire from 'Ali Muntar, while its right, with the Camel Bde. thrust far forward, was subjected to a series of determined counter-attacks. In this position, reached in the early afternoon, the battle swayed with little change for the rest of the day. Air reconnaissance indicated that the enemy's reserves had not yet been drawn in, and Gen. Dobell, though moving part of the 74th Div. closer up, would not be the first to launch his last reserve, especially in view of the fact that it was the 52nd Div. which was checked and that the reserve brigade of that division had not yet been employed.

Towards evening Gen. Dobell reported the situation to advanced G.H.Q., when Sir Archibald Murray instructed him by telephone that all ground gained must without fail be held and the attack resumed under cover of an intense artillery bombardment at dawn on the 20th. General Dobell issued his orders accordingly, and as night fell every preparation for the pursuance of the offensive was actively in hand. Between 10 and 11 o'clock at night, however, Gen. Dobell was in communication with the Desert Column and all his divisional commanders, who by this time had received more detailed and accurate reports of the situation on their respective fronts. These reports made it clear that the enemy's resistance nowhere as yet showed any signs of weakening, that the British casualties amounted to some 7,000, and that the prospects of being able to make any considerable further progress without a much longer, more intense, and less hurriedly planned artillery preparation, were, to say the least, dubious. By 1 A.M. the new artillery plan, including the divisional arrangements, was ready. General Dobell was not satisfied that in the time, and with the means available, the prospects of success were sufficient to warrant the immediate resumption of the action. Telephonic communication with divisional commanders and their artillery chiefs more than confirmed his doubts. General Chetwode, commanding the Desert Column, was equally clearly of opinion that the prospects were not sufficiently favourable to justify a hurried resumption of the attack. About 4 o'clock in the morning, therefore, Gen. Dobell issued orders to postpone further operations, with Sir Archibald Murray's assent.

The ground gained was consolidated during April 20 and following days. The enemy made no serious counter-attacks. It became clear that, before Gaza, there was nothing for it but the deliberate methods of trench warfare. The alternative involved long preparation, new communications, and an eventual movement far away in the direction of the British right flank. On April 22 Sir Archibald reported to the War Office that with his present force he could not count on more than a local success; and here the Sinai campaign proper came to an end.

There was no further considerable action during the spring or summer. The opposing lines stabilized, and there ensued a period of preparation and training, of trench-raiding, and of enterprises

by mounted troops and camelry in the direction of Beersheba, and against the railway running S. from that place which was demolished. But the Sinai desert had been conquered and passed. The defence of Egypt was secure. And room had been gained for the preparation of a great offensive campaign in the autumn. Thus the mission assigned to Sir Archibald Murray at the beginning of the year had been fulfilled. Meanwhile, at the headquarters of the Eastern Force, where Lt.-Gen. Sir Philip Chetwode had now succeeded Sir Charles Dobell, the plans were already in course of preparation which were to become the basis of the great campaign fought in the autumn by Gen. Sir Edmund Allenby, who succeeded Sir Archibald Murray in the Egyptian command in June. (G. P. D.)

(IV.) THE PALESTINE CAMPAIGN

The successful defence of Gaza on April 19 1917, when Gen. Kress von Kressenstein for the second time in little more than three weeks had beaten off formidable British attacks, was followed by a prolonged pause while both armies went into "summer quarters." Every effort was made on both sides for a resumption of the struggle in the autumn, and by the beginning of Aug. 1917 the German staff, realizing that the next British effort was likely to be considerably more formidable than the last, represented to Constantinople that the Gaza-Beersheba line was inherently weak in that its left flank was "in the air," and that the only remedies were either readjustment, involving withdrawal, or reinforcement on a generous scale.

Unhappily for the Ottoman cause political ambitions came into conflict with military necessities. The loss of Bagdad on March 11 1917 had been a blow to the prestige of the Sultan, more severe in that it followed upon that of Mecca, and the Pan-Islamic party in the capital was insistent that steps should be taken to retrieve the loss and rehabilitate the Ottoman Khalifates in the eyes of the Moslem world by a triumphant recovery of the city of the Khalifs. In this contention the Pan-Islamic leaders were supported by Berlin, where the influence of alliterative war cries indicative of future trade domination was strong. "Berlin to Bagdad" still reigned in official and public esteem, not yet supplanted by "Hamburg to Herat."

In consequence of this political counter-attraction Constantinople sent men and supplies for the reconquest of Iraq (Mesopotamia), until it was persuaded to realize that the Palestine front, if starved of needed reinforcements, would inevitably give way in a *débâcle* which might permit an active enemy to advance up the whole length of Syria and establish himself on the Upper Euphrates, thus cutting off the whole of the force in Mesopotamia from communication with Constantinople except by way of the railless and mountainous Armenia and Kurdistan. The Pan-Islamists fought hard for their policy and succeeded in delaying the dispatch of troops to Palestine until the middle of October. It was then too late, but this was not realized.

As soon as Constantinople had accepted the principle that the presence of a powerful British striking force in front of Gaza constituted a menace to the operations destined for the recovery of Bagdad, Marshal von Falkenhayn, in command of the Yildirim Army Group, then at Aleppo, was directed to drive the British back into the Desert of Sinai. The marshal planned to strike at the British right flank, which, it was thought, had probably been weakened in order to mass troops upon the left for the expected third assault on Gaza. It was proposed to start this Turkish offensive about the middle of Oct., which would forestall the British offensive, calculated by the German staff to be due in the first week of November.

Serious difficulties, however, arose which fatally delayed the completion of these dispositions. In the first place the Turkish transport was poor. The sector of the Turkish lines of communication from Bozanti, the then railhead from Constantinople or, rather, Haidar Pasha on the Asiatic shore of the Bosphorus, to Beersheba, was under the Syrian Western Arabia command of which Ahmad Jemal Pasha was G.O.C.: unfortunately this politician was jealous because the command of the Yildirim Group, which since the beginning of July 1917 had included his

own army, had been given to a German. He made trouble and caused delays in the working of a system which could not really have been efficient even if worked with perfect goodwill.

As the Taurus and Amanus tunnels were not yet open for ordinary traffic, all stores coming from the W. to Bozanti had to break bulk there and, reloaded into narrow-gauge trucks, to be taken through the tunnel by compressed air engines, or hauled by lorry, mule or camel to Dorak, where they were again packed into standard-gauge trucks. The same performance had to be repeated at Baghche for transport across the Amanus to Islamié. Stores could be taken thence in standard-gauge trucks as far as Rayak, where they had to break bulk for the fifth time to be restowed in narrow-gauge trucks for Damascus, where, owing to lack of railway rolling-stock, a portion was sent to the front by lorry via Jisr Banat Ya'qub on the Jordan, Nazareth, Nablus and Jerusalem. Where railway rolling-stock was available fuel was often scarce, locomotives had to be adapted to burn wood, and instances occurred of this being supplied in unsuitable lengths, so that trains were delayed while the crews cut up the wood afresh before it could be fed to the furnaces.

General Allenby, however, having brought his railway right up to the front and constructed a strategic development of his pipe-line in addition, to the considerable improvement of his local water supplies, determined to forestall the impending Turkish offensive. His force was disposed along a front of some 22 m. from Gaza to Gamli and beyond to where the Desert Mounted Corps had detachments as far inland as Asluj, 38 m. from the coast. On the eve of the British attack the rival forces were disposed as follows. Facing one another in the strongly fortified Gaza sector were the Turkish VIII. Army (Gen. Kress von Kressenstein) consisting of the XX. Corps (3rd, 7th and 53rd Divs.—the 7th being in reserve near Herbie, 10 m. behind the line) and the XXII. Corps (16th, 26th, Fakhr-ed-Din Bey, and 54th, Nasuhi Bey, Divs.) aligned out towards Tellesh Sharia, opposing the British XXI. Corps (Lt.-Gen. Sir E. Bullfin) consisting of the 52nd (Lowland), Maj.-Gen. Hill, the 54th (East Anglian) Div., Maj.-Gen. Hare, and the 75th Div., Maj.-Gen. Palin. The British XX. Corps (Lt.-Gen. Sir P. Chetwode), consisting of the 53rd Welsh Div. (Maj.-Gen. Mott), the 60th London Div. (Maj.-Gen. Sir J. Shea) and the 74th Yeomanry Div. (Maj.-Gen. Girdwood), was wheeling into position in support of the Desert Mounted Corps (Lt.-Gen. Sir H. G. Chauvel), consisting of the 4th Cav. Div. (Maj.-Gen. Sir G. Barrow), the Australian and New Zealand Mounted Div. (Maj.-Gen. Sir E. W. C. Chaytor) and the Australian Mounted Div. (Maj.-Gen. Hodgson); this was concentrating near Khalasa for its swoop upon Beersheba, held by Ahmad Feizi Pasha's VII. Army consisting of the III. Corps (Ismet Bey)—composed of the 24th Div. (Wilmer Bey), the 27th (Arab) Div. in Beersheba itself, with the 3rd Cav. Div. in front of it, and the XV. Corps, which was hardly constituted as yet, its 10th Div. (Sedad Bey) being still in the XX. Corps area behind Gaza on its way to the front, and its 20th Div. being still on the lines of communication S. of Aleppo and not destined to arrive even at Ramleh, far in the rear, until Nov. 6. General Allenby further had the support of certain warships, H.M.S. "Grafton" (a "blister"), four monitors, 15, 20, 31 and 32, the destroyers "Staunch" and "Comet" and the gunboats "Amphis" and "Ladybird," which were able to enfilade the Turkish positions near Gaza and destroyed important ammunition dumps.

During the night of Oct. 30–31 1917 the British XX. Corps had moved forward to positions of deployment, and at dawn, when the Desert Mounted Corps had got right round to the E. of Beersheba, the 60th and 74th Divs. were ready to close in from the W., while the 53rd Div. at Abu Irgeig threatened the Turks along the Wadi Saba front in such a position as to break through them and take in flank any reinforcements which might be sent down to the Turkish III. Corps in Beersheba.

At 05:55 (5:55 A.M.) on Oct. 31 a hundred field guns and howitzers opened against a Turkish front of 4,500 yd., while the 96th Bde. R.G.A. was engaged in counter-battery work. At 08:30 the 181st Bde. (Brig.-Gen. Da Costa) of the 60th London

Div. captured the first Turkish position; at 12:15, the guns having moved up to cut the Turkish wire, the main assault was delivered and all objectives gained by 13:30, whereupon the 230th Bde. (Brig.-Gen. McNeill) of the 74th Div., which had formed the extreme left of the main assault, coöperated with the 160th Bde. (Brig.-Gen. Pearson) of the 53rd Div. against the Wadi Saba front and rolled up all the Turkish defences as far as the Beersheba–Tell el Fara road. Meanwhile the cavalry had completed their wide swing round from the E., and after hard fighting the 2nd A.L.H. Bde. (Brig.-Gen. Ryrie), belonging to the Anzac Mounted Div., was astride of the Hebron–Beersheba road by 13:50.

At 16:00 the 4th A.L.H. Bde. (Brig.-Gen. Grant), belonging to the Australian Mounted Div., which had reached Iswaiwin by 11:00, moved forward against Beersheba itself. It charged over a succession of strong Turkish positions, demoralized the defence and captured the town at 18:00 with 1,148 prisoners, and was joined at 18:30 by the 7th Mounted Bde. (afterwards 14th Cav. Bde.—then commanded by Brig.-Gen. Wigan), which had turned the Turkish defences on Ras Ghannam.

Immediately upon its capture the Royal Engineers, upon whose careful preparatory work in the provision of pipe-lines and camel-convoys of water the success of the attack had been based, began to develop the wells in hopes of being able to produce enough water for the horses and men, who required 400,000 gal. per day. Fortunately the Turkish evacuation had been so hurried that the wells were less damaged than had been expected, and two reservoirs were left intact. The discomfort of the thirsty cavalry was much enhanced by the fact that a hot *khamsin* blew up off the desert, and on the afternoon of Nov. 3 the water situation was most acute, as all stored water had been drunk, and the output was barely adequate for the demand, and at 16:00 a brigade some 2,000 strong rode into Beersheba with a 48 hours' desert thirst. Fortunately at 17:00 a new well came into working, and by midnight the brigade was watered, consuming some 8,000 gallons.

Owing to this water difficulty the Australian Mounted Div. had to go into reserve temporarily, and actually returned to Karm for water while preparations were made for the next attack against the positions covering Tellesh Sharia. The fall of Beersheba had cost the Turks over 500 killed, 2,000 prisoners and 13 guns, and exposed the left flank of the Gaza position.

The next step towards the final attack on Gaza was the capture of Umbrella Hill by the 156th Bde. (Brig.-Gen. Leggett) of the 52nd Lowland Div., temporarily attached to the 54th Div., at 11:00 on Nov. 1 as a preliminary to the main assault timed for 03:00 on Nov. 2. This attack with its preliminary bombardment caused severe casualties to the Turks and, so far from being able to detach troops from Gaza to strengthen the left flank, the Yilderim command had to bring the 7th Div. into the line. The attack, therefore, of the 54th Div. had the required effect of "pinning" the Turks in the Gaza sector, and cost them over 1,000 dead in the captured positions, 654 prisoners and 3 guns.

Meanwhile, next day Gen. Allenby delivered another heavy blow with his right when the 53rd Welsh Div., temporarily under the Desert Mounted Corps, attacked the VII. Army at Khuweilfe on the extreme eastern end of the line, and by its obstinate fighting against great odds did much to persuade the Turks that the British were trying to make a great turning movement from the E., whereas in point of fact the 10th, 60th and 74th Divs. were about to break the line between the VII. and VIII. Armies in order to make a gap through which the Desert Mounted Corps could pass. After fighting for three days and nights almost continuously against what was left of the III. Corps and the 10th and 26th Divs. brought across from the coastal sector, the positions were captured by the 158th Bde. (Brig.-Gen. Vernon) and held in spite of counter-attacks on Nov. 6 and 7, and on Nov. 8 the division concentrated in Khuweilfe.

The Turks being thus fully occupied on the extreme left of their front and "pinned" by operations at Gaza, Gen. Allenby at dawn on Nov. 6 broke through the middle of their line with an attack against Kawuka with his 10th, 60th, 74th Divs. and

TURKISH CAMPAIGNS (SYRIA)
 PLATE IV.

the Yeomanry Mounted Div. The Turks opposed him with the right wing of their VII. Army and the left wing of their XXII. Corps, but by 14:30 the 179th Bde. (Brig.-Gen. Edwards) and the 180th Bde. (Brig.-Gen. Hill) had captured Sharia for the 60th Div., while the 74th Div. was stiffly engaged to the right. The Turks, however, still held positions above Sharia, and it was not until 06:00 on Nov. 7 that the 60th Div. was finally able to open the way through the Turkish line for the Desert Mounted Corps. The stout defence made by the VII. Army, the artillery of which was notably accurate, and the XXII. Corps, had delayed the start of the cavalry advance, which was still further hindered by lack of water, and Gen. Allenby was unable to cut off the Gaza troops by a flanking attack from the N.E., the more so as the Turks, under pressure of bombardment by land and sea on Nov. 5 and 6, had begun to withdraw. Their rearguards were unable to hold even the most formidable positions.

Outpost Hill and Middlesex Hill fell to the 233rd Bde. (Brig.-Gen. Colston) during the night of Nov. 6, and by 13:30 on Nov. 7 the 232nd Bde. (Brig.-Gen. Huddleston) had taken 'Ali Muntar itself and a number of strongly fortified works. Farther to the E. the 52nd Div. and the XXI. Corps Cav. had pushed through on the heels of the retiring Turks. The Imperial Service Cav. Bde. (Brig.-Gen. Harbord) actually rode through the ruins of Gaza at 09:00 on Nov. 7. Gaza had fallen, and all that remained for the Yildirim command was to get its armies away.

In places their *moral* was shaken, but for the first stages of the retreat the Turks fought strong rearguard actions, notably at Deir Sineid, where the Turkish XX. Corps four times recaptured the position from the 52nd Lowland Div., and at Huj, where the Turks stood up to a cavalry charge by the 5th Mounted Bde. (Brig.-Gen. Fitzgerald) and served their guns until actually cut down. The VIII. Army retreated along the line of the light railway and the motor road on Ramleh while the VII. Army fell back on Hebron and the main N. road. The line of advance across the Plain of Philistia was easier than that over the hills of southern Judea, consequently British transport was concentrated as far as possible so as to facilitate the advance of the left wing, and the 54th Div. was immobilized at Gaza as all its transport went N. with the rest of the XXI. and Desert Mounted Corps which pressed on regardless of thirst, greatly enhanced by a hot *khamisin* which began to blow on Nov. 19.

The hardest fighting during the pursuit was that at Qatra and El Mughar on the Wadi Tahhana, when the 3rd, 7th and 10th Divs. tried to hold the 52nd Lowland Div. on Nov. 13. In ordinary circumstances perhaps such a pronounced advance of a left wing would have been dangerous, as the VII. Army was still in the Hebron area and even tried to make a diversion, but Gen. Allenby declined to be overawed by a force which he rightly estimated to be largely disorganized and almost destitute of transport. He attached the XX. Corps Cav. to the 53rd Welsh Div. and sent them—to be known as Mott's detachment—to contain the southern detachments of the VII. Army.

General Allenby proposed to push the VIII. Army back beyond Jaffa and contain it while he turned to the E. and struck up through the hills at Jerusalem, upon which the Turks were concentrating. The Holy City, of no great strategic or commercial value in itself, had an immense sentimental value, and the Turks were unwilling to suffer the blow to their prestige which its loss would entail, the more so as Mecca and Bagdad were now no longer in their possession. Ramleh was taken on Nov. 15 and Jaffa by noon next day, while the 54th Div., which had regained its transport, was hurrying up from Gaza, arriving in the Desert Corps area on Nov. 18. Next day the advance toward Jerusalem began and the 60th Div. started N. from Gaza. The 75th Div. had to encounter much resistance near Saris amid the barren and precipitous hills dominating the main road to Jerusalem, while the 52nd Div., moving eastward up the parallel valley of Beth Horon, had turned off up the Beit Likia road in face of Turks on the heights and transport difficulties in the valleys, and the Yeomanry Mounted Div., which was trying to reach the Nablus-Jerusalem road in order to force an evacuation of the Holy City, had even greater difficulties to surmount.

All through Nov. 20 and 21 there was hard fighting during which the Turks were steadily thrust back, a fog being of great value to the 75th Div. just before the attack on the positions covering 'Enab, which the 232nd and 233rd Bdes. (Brig.-Gens. Huddleston and Colston) took at the point of the bayonet at 17:00 on Nov. 20. Kustul and Sobn, two dominating positions, were taken next day by the 232nd and 234th Bdes. (Brig.-Gen. Anley), and at 23:45 Nebi Samwil was successfully stormed by the last-named brigade, and contact was established with the 52nd Div. at this point. Both divisions, however, were suffering much from rain and cold winds, and having come straight from an exhausting and rapid advance from the heat-stricken plains, were marching light with nothing to protect them from the cold. In the plain the 54th Div. went into the Desert Corps area to hold the front N. of Jaffa and Ludd, where it was faced by the 3rd, 7th, 16th and parts of the 10th and 20th Turkish Divs., and the 60th Div. arrived near Mejdal from Gaza where it had had to wait until the 54th was off the lines of communication.

The VII. Army, now consisting of the 3rd Cav. Div., engaged against the Yeomanry on the extreme right of the Turkish line, and the 24th, 54th, 26th, 53rd Divs. covering Jerusalem from the W., while the 27th was observing Mott's detachment as a cover against a possible advance from Hebron, now made strong counter-attacks against Nebi Samwil; and although unable to recover it was at least able to prevent either the 75th or the 52nd from taking Ej Jib. It became apparent that for the moment the British thrust had spent itself. Accordingly the wearied divisions which had forced their way so far into the mountains were taken out of the line and sent to rest near Ramleh; their hard-won positions were turned over to the 60th and 70th Divs.

The delay in the British advance occasioned by this necessary relief gave fresh hope to the Turks, who began, after a period of depression, to hope once more that they might retain Jerusalem; accordingly reinforcements were brought down from the N. and across from beyond Jordan by way of Jericho, and by the time that the British were ready to resume their advance after the 10th Div. had arrived from Gaza, the 10th Div. and parts of the 20th, 48th and 49th Divs. had arrived to strengthen the VII. Army, which held a strong series of positions overlooking from the E. the steep slopes of the deep valley of the Sarar (vale of Sorek) and across the Bethlehem road.

After a preliminary concentration during which Mott's detachment was advanced up the Hebron road to within striking distance, and heavy guns had been brought up into the mountains, the general assault which was to result in the fall of Jerusalem began in driving rain at dawn on Dec. 8. The 60th Div. had great difficulty in capturing the "Heart" and "Liver" redoubts, and the strong works at Deir Yesin, and was hampered by the inability of the 53rd Div. to coöperate with its right flank owing to the strenuous Turkish opposition and the bad weather which were delaying its advance. However, by nightfall the British were established on the crests to the E. of the valley of the Sarar, and the 180th Bde. (Brig.-Gen. Watson) of the 60th Div. took Lifta by dusk, and by 07:00 on Dec. 9 the Worcester Yeomanry had moved across the front of the 53rd Div. and got astride of the Jerusalem-Jericho road.

The news of the capture of Lifta started a panic among the Turks, and a disorderly retreat ensued which would have been disastrous for the Turks had not Gen. Allenby been unwilling to allow any hostilities in the immediate vicinity of the Holy City. It was now militarily speaking untenable, and he was anxious to secure a peaceful occupation even at the cost of sparing the Turks in this panic-stricken withdrawal.

At 07:00 on Dec. 9 the last Turkish troops left Jerusalem, 'Izzet Bey, the Mutesarrif, being the last civil official to depart. Before 08:00 the mayor started out to surrender, and by 09:30 Brig.-Gen. Watson, the first British soldier to reach the Jaffa Gate, arrived and posted guards in anticipation of the formal act of accepting the surrender, which was performed by Maj.-Gen. Shea, in command of the 60th Div., soon after 11:00.

Having thus obtained the chief objective of the campaign all that was now necessary was to thrust back the Turks in order

to remove the Holy City from danger of long-range bombardment. The first steps towards this were taken on Dec. 10 when the 53rd Div. captured ridges to the E. of the city, and was resumed, after Gen. Allenby's formal entry into Jerusalem on foot, on Dec. 11, in conformity with a general plan for improving the front. The 52nd Div. forced a passage of the Nahr el 'Auja, Dec. 20 and 21, and by pushing the front to a point 8 m. N. of Jaffa made it possible to make use of such harbour facilities as did then exist there. Troops were redistributed along the front, and a number of minor advances were made while everything was being prepared for the expected Turkish attempt to recover Jerusalem, the loss of which had much affected Ottoman prestige. This attempt was made at 23:30 on Dec. 26 by the VII. Army, which had been reinforced by the arrival of the 1st Div. and of troops from across Jordan.

A vigorous attack was made on the sector round Tel el Ful, held by the 60th Div. which, in common with the rest of the XX. Corps, was standing by for a general offensive with which Gen. Allenby had intended to forestall the Turkish counter-attack at dawn a few hours later. Consequently the moment for the VII. Army's attack was unhappily chosen, and while every effort was being made to drive the 60th Div. back on Jerusalem and dislodge the 53rd Div. from its advanced positions the British counter-offensive on the part of the 10th and 74th Divs. started according to plan at 06:30. At 12:55 the Turks, who were beginning to feel the pressure of this advance, made redoubled efforts to break through the 60th Div. which lay astride of the Nablus road only some 4 m. N. of Jerusalem. In spite of their courage and energy the Turks were unable to make any impression on the 60th, and were unable to prevent the 10th and 74th from advancing 4,000 yd. on a 6-m. front by nightfall.

Next day, Dec. 28, the whole XX. Corps advanced, the Turkish transport was harassed by aeroplanes, and the VII. Army, having failed to recapture Jerusalem, found itself on the last day of the year 7 m. farther from its objective than when it had started. So ended the first battle of Mount Ephraim, during which the XX. Corps had gone forward on a 12-m. front to a depth of 6 m. on the right and of 3 m. on the left, occupying the Ram Alla-Bire ridge. The N. front was now secure, but the Turkish XX. Corps still held Jericho and the fords and bridge of the Jordan, and remained in positions more than two-thirds of the way up the steep and almost waterless slope leading up from the E. to the Mount of Olives.

During Jan. the standard-gauge railway was pushed forward across the plain of Philistia, and the problem of transport, which all through the Dec. fighting had had to rely on camels and donkeys or mule-drawn wheels over half foundered roads, was greatly simplified by the opening of Ludd as railhead with adequate sidings on Feb. 4 just after the narrow gauge to Jerusalem from Ludd had been restored to use on Jan. 27. It thus became possible to provide supplies for the large hunger-stricken civil population of Jerusalem and to form an advanced base there for further military operations. These were undertaken on Feb. 10, when the 60th Div., which had changed places with the 53rd, coöperated with the 231st Bde. (Brig.-Gen. Heathcote), lent by the 74th Div., the 1st A.L.H. Bde. (Brig.-Gen. Cox), and the N.Z. Mounted Rifles (Brig.-Gen. Meldrum) of the Anzac Mounted Div., in the capture of Jericho, from which the Turks were driven by 08:20 on Feb. 21 after operations over extremely broken and bad country. The acquisition of Jericho prevented the Turks from making use of the Ghoraniye bridge as a means of communication with their forces beyond Jordan, and enabled the British to get command of the Dead Sea, across which the Turks had been bringing up supplies from the wheat-growing area round Kerak.

In March Gen. Allenby raided across Jordan to Es Salt and 'Amman and damaged the Hejaz railway. To do this it was necessary to capture the Ghoraniye bridgehead on the left bank of the river. General Shea of the 60th Div. was given command of a special force, called Shea's group, consisting of his own division, the Anzac Mounted Div., the Imperial Camel Corps Bde. (Brig.-Gen. Smith), some light armoured cars and guns

with bridging-trains. The Jordan was crossed by swimming in spite of the flood-water by 01:20 on March 22 at Hajla as a preliminary to bridge-building, and after hard fighting the Turks lost Ghoraniye. Es Salt was occupied on March 25 at 18:00 by the 3rd A.L.H. Regt., and Brig.-Gen. Meldrum with the N.Z. Bde. reached the Hejaz railway S. of 'Amman at 15:00 on March 27 and cut it. 'Amman itself, however, was successfully held by the Turkish E. of Jordan Group, and the 703rd German Batt. and the Turkish 3rd Cav. Div. which crossed by the Jisr ed Damie from Palestine threatened the lines of communication at Es Salt, which was held by the 179th Bde. (Brig.-Gen. Humphreys) of the 60th Division.

The weather was bad for camel transport, and the camel park at Shunet Nimrin was, moreover, bombed by German aeroplanes; thus the raid, owing to the stout Turkish resistance and the Jordan floods, had been less rapid and less successful than it might have been; but a number of Christian refugees were able to get into safety under cover of the raiding troops, and solid results were obtained in the permanent possession of the Ghoraniye bridgehead and the attraction of some 4,000 or more Turkish troops from the Hejaz to contain it.

The withdrawal of these men and their immobilization just above the Lower Jordan did much to facilitate the operations of the Arab army under the Sherif Faisal, but the Turks had good reason for supposing that this raid was but a single feature in a far wider and more formidable movement on the part of the British, which had been countermanded at the last moment owing to the sudden necessity for sending troops from the Palestine front to help resist the German offensive in France.

As it was, Gen. Allenby by the end of April had to part with his 52nd and 74th Divs., ten British battalions drawn from other divisions, nine yeomanry regiments, five and a half siege batteries and five machine-gun companies, receiving in exchange the 3rd (Lahore) and 7th (Meerut) Divs. of the Indian army from Mesopotamia and Indian cavalry from France—all experienced troops. His reinforcements received, in exchange for his British battalions, were, however, raw troops fresh from India. In May he had to send away 14 more British battalions, and received only a partial equivalent of Indian troops. Thus the character of the force opposed to the Turks was profoundly modified, and its activities were largely suspended during reorganization: yet the Yildirim command, although strengthened by the formation of the Asia Corps with German units in March and the arrival of reinforcements with which the VIII. Corps and the IV. Army were constituted, was unable to make an offensive during these weeks of opportunity. On the contrary Gen. Allenby took pains to sow the seeds of future victory by again raiding into the Oultre Jourdain country, and took Es Salt on April 29; a good deal of fighting ensued, and the raiders were finally turned back by the 24th and 48th Divs. of Turkish infantry and the action of the 3rd Cav. Div. which had been brought across from Palestine by the Jisr ed Damie. Yildirim, however, were deceived by this raid into thinking that the next serious British move would be by way of Gilead towards Damascus; and Liman von Sanders Pasha, who had taken over the command of the group, allowed the 'Amman and Es Salt raids to influence his plans more than the "readjustments of front" in the Sharon and Berukin sectors in April and June, which might otherwise have appeared to him to be directed for the purpose of depriving him of observation posts from which he could overlook some great future concentration.

At the end of the summer, just before Gen. Allenby struck his final blow, the Yildirim Group of Armies was arranged along a front of some 65 m. running from the Mediterranean a little to the N. of Arsuf to a point some 4 m. E. of the influx of the Jordan into the Dead Sea. From his headquarters at Nazareth Marshal Liman von Sanders Pasha commanded the four armies composing the group. On the right the VIII. Army (XXII. Corps, 7th, 20th and 46th Divs., and Asia Corps, 16th and 19th Divs. and 701st, 702nd and 703rd German Bdes.) held some 20 odd miles as far as Furkha. Then came the VII. Army (III. Corps, 1st and 11th Divs., and XX. Corps, 26th and 53rd

Divs.) holding another 20 m. astride of the Nablus road, and running down into the Jordan valley, where it was flanked by the IV. Army (II. Corps, 24th Div. and 3rd Cav. Div. in the Jordan valley, VIII. Corps, 48th Div. and Composite Div. on the hills of Moab). This array of armies and corps would have been exceedingly imposing had the Turkish units of which they were made up been at full strength, but, as it was, the British army commander estimated their numbers as follows: VIII. Army, 10,000 rifles and 157 guns; VII. Army, 7,000 rifles and 111 guns; IV. Army, 6,000 rifles, 2,000 sabres and 74 guns. The Ma'an garrison and the troops on the Hejaz railway were estimated at 6,000 rifles and 30 guns, while the general reserve was 3,000 rifles and 30 guns. All told the troops with which the Turks hoped to hold Syria and what was left of Palestine amounted to some 4,000 sabres, 32,000 rifles and 400 guns, representing a ration-strength S. of Rayak-Beirut of 104,000. Against this Gen. Allenby had at his disposal 12,000 sabres, 57,000 rifles and 540 guns, and arranged his forces so as to strike with an overwhelming force of men and guns at the most favourable point in the Turkish line for making use of his cavalry.

For this purpose the Desert Mounted Corps was brought right across the front and concentrated in the olive and orange groves in the Sarona area. The 60th Div. came from the XX. Corps area and went into the front line at Arsuf, near which the 7th (Indian), 75th and 3rd (Lahore) Divs. were closely concentrated along a front of about 4 miles. The 54th Div. and the French detachment in the foothills immediately E. of Mejdal Yaba formed the hinge upon which the offensive across the plain of Sharon was to pivot. The 31st and 20th Bdes. of the 10th Div. were strung out along a considerable front of some 13 m. from Arara to Rafat, with the 30th Bde. in reserve above the Wadi Ballut. The 53rd Div. held some difficult country in front of Et Taiyibe well to the E. of the Nablus road; and in the Jordan valley a specially formed force, under Maj.-Gen. Sir E. W. C. Chaytor (Australian and New Zealand Mounted Div., 20th Indian Bde., 38th and 30th Royal Fusiliers [Jewish troops], two battalions of the British West Indies Regt. and some guns), was to give the Turks the impression that another offensive in the direction of Es Salt was contemplated.

The necessary concentration of troops in the Sharon sector was effected by a bold policy which left great stretches of the British front either entirely unoccupied or merely watched; and, had the Turkish Intelligence Service been less hampered by Gen. Allenby's counter-espionage measures, advantage might have been taken of the existence of these gaps. As it was, the care with which the concentration was achieved, by silent night marches to the W. while deceptive dust was clearly visible by day going eastward, completely deceived the Turks, who were, moreover, further misled by the strangely faulty reports sent in by the German aeroplane scouts. The ascendancy in the air was so entirely in Gen. Allenby's hands, and had been so for several weeks, that it was only occasionally that the Germans came over, and then at very considerable height, which made observation difficult. That this made for inaccurate observation was amply proved by the German air reconnaissance reports which were subsequently captured with other documents of the Yildirim Group headquarters at Nazareth, since the report for the day before the British advance still shows an entirely erroneous distribution of Gen. Allenby's troops, incorrectly locates his G.H.Q., the headquarters of the XXI. Corps, and even tentatively "identifies" a non-existent division. Thus the surprise for which the British commander had been working was complete.

At 04:30 on Sept. 19 the artillery on the Sharon sector of the front opened, and after a preparation of 15 minutes, during which the whole striking force advanced across the wide "no man's land," the attack was begun at 04:45. The plan provided for a pivoting movement of which the 54th (East Anglian) Div. (Maj.-Gen. Hare) and the French detachment (Col. de Piepape) formed the hinge, while the 3rd (Lahore), 75th, 7th (Indian) and 60th moved like a door opening away from the sea, pushing back the Turks from an ever-widening gap through which

the cavalry poured. The Turks were thus overwhelmed and thrust aside. The cavalry began the advance which was to carry the front beyond Aleppo, and behind them the Royal Engineers, while the action was still in progress, began to lay the pipe-line which by 13:00 had reached Jiljulie from the mill-race on the Nahr el 'Auja 7,000 yd. away, and was able to provide 4,000 gal. per hour to the troops in an area where the water supply was wholly inadequate behind the 3rd Div. By 07:30 the 5th Cav. Div. (Maj.-Gen. MacAndrew) was crossing the Nahr Falik, by noon it had reached and crossed the Iskanderune, and the 4th Cav. Div. (Maj.-Gen. Barrow) and Australian Mounted Div. (Maj.-Gen. Hodgson) swept up behind them.

The speed of the advance was entirely bewildering to the Turks, who could get little or no news of its progress, and only realized its results by actual contact, as every artifice had been employed to cripple the Turkish Intelligence Service. A special bombing squadron had been sent out to reinforce the Royal Air Force, which at the opening of the offensive consisted of a brigade with two wings, seven squadrons, and a balloon company; and during the night of Sept. 18-19 a Handley-Page with more than half-a-ton of bombs attacked the German aerodrome at 'Afule. At dawn on Sept. 10 the special squadron attacked all Turkish telephone and telegraph exchanges behind the line, while the corps squadrons bombed the smaller exchanges just behind the front, with the result that Turkish communication by telephone or telegraph was completely deranged. To prevent Liman von Sanders Pasha from becoming aware of the progress of the advance, steps were taken to keep all German aeroplanes from leaving the ground. For this purpose two scouts at a time hovered over the main German aerodrome at Jenin, each carrying four bombs, which were dropped on the aerodrome at any sign of activity. Each pair was relieved while still patrolling over the aerodrome, and, before leaving, came down and fired machine-guns into the hangars. In this way the German air service was immobilized throughout the day, and the Yildirim command deprived of its only remaining means of obtaining rapid information about the British advance. Furthermore, the general attack on the Sharon front had been preceded at 22:00 on Sept. 18 by a vigorous offensive on a smaller scale by the 53rd Div. (Maj.-Gen. Mott), which by attacking the Turkish XX. Corps diverted attention from the coastal sectors in the last hours during which the Turks could use their field telephones.

In this way, by dint of elaborate preparation, the Yildirim command was kept in the dark as to what was happening, and the Turks had to fight as best they might, relying on lines of communication after they had been cut, relying on reinforcements which never knew when or where they were wanted, and were never sent, and finally trying to retreat along roads already occupied by the British. As a final measure to complete the confusion of the Turks, Gen. Allenby, after his first feint by the 53rd Div. and his main attack across the plain of Sharon, put the whole of the rest of his front W. of Jordan in motion, and began to press the Turks northward through Mount Ephraim.

The main advance pressed northward, and while the 5th and 4th Cav. Divs. headed for the plain of Esdraelon in order to seize 'Afule and its railway junction, the infantry (60th (London) Div., Maj.-Gen. Shea, 7th (Indian) Div., Maj.-Gen. Fane, and 3rd (Lahore) Div., Maj.-Gen. Hoskins), turning eastward, began to drive the XXII. Turkish Corps and the Asia Corps into the hill country. The Londoners captured Tul Keram after fighting and marching for 18 m. over heavy sand before dark, driving a mass of retreating Turks and transport into the narrow defile up which the road and railway ran to Nablus. Here the retreat was scourged from above by aeroplanes, which finally blocked the pass by killing multitudes of transport animals across its narrowest part, while the 5th Australian Light Horse Bde. (Brig.-Gen. Onslow), with cavalry of the French detachment, temporarily attached to the 60th Div., made a detour and came into the pass from the N.E. of Anebta, cutting off all hope of retreat from Tul Keram and engaging the extreme right of the Asia Corps, which tried to hold the upper part of the pass so as to facilitate retreat along

the Nablus and Messudie roads to Jenin. Individual Turkish units fought well. If they were unaware of the disaster which had befallen their cause, they were at least not oppressed by news of defeat; the opposition encountered by the 3rd and 7th Divs. in the W. was tenacious and well organized, and the XX. Turkish Corps in the E., not realizing the necessity for immediate retreat, even made a successful counter-attack against the 53rd Div., and for the moment recovered some minor positions.

While the infantry hammered away at each other Gen. Allenby's cavalry had broken through the Carmel Range by the historic pass of Megiddo, captured Nazareth with the Yilderim headquarters (dawn Sept. 20), and 'Afule (08:00); and the 4th Cav. Div. after cooperating with the 5th in its capture hastened to Beisan, which was taken at 16:30, while part of the 12th Bde. (Brig.-Gen. Wigan) reached Jisr el Mujami', where the railway crosses the Jordan, at 08:00 on Sept. 21, thus cutting off alike all hope of retreat northward from the Turks and guarding against the possible arrival of reinforcements from Damascus. As additional insurance, raiding parties from the Arab N. Army operating in Gilead had broken the railway near Tel 'Ar'ar and at Muzerib on Sept. 17. Meanwhile the 3rd Australian Light Horse Bde. (Brig.-Gen. Wilson), driving in from the N., had captured Jenin (evening of Sept. 20) in spite of the resistance of a German force, and Turkish troops and transport on the road between Jenin and 'Afule and Jenin and Nablus were plentifully bombed from aeroplanes.

On Sept. 21 at 13:45 Nablus was captured, and the Turks, having in vain endeavoured to retreat along the newly restored Roman road from Nablus to Beisan, only to be the target of aeroplanes while on the way and to find the British at the end of it, tried as a last resort to withdraw the wreckage of the VII. and VIII. Armies down the Wadi Fara road, so as to retire upon Es Salt and the IV. Army crossing over the Jordan by the Jisr ed Damie. This movement was detected by an air scout early on the morning of Sept. 21, and the importance of checking the retreat was at once realized, as the Jordan valley troops had not yet been able to capture the Jisr ed Damie, nor could the fords to the N. of it be guarded even by the cavalry at Beisan in time. All available aeroplanes were at once detailed for an intensive air attack upon this line of retirement; departures from the Ramleh aerodrome were so timed that two machines should arrive over the objective every three minutes, and that an additional formation of six machines should come into action every half-hour. Machines on arriving over the objective bombed it first and then swept down to a low altitude and raked the column with machine-gun fire, crawling uneasily along a narrow road cut out of a precipitous slope, before flying back to Ramleh to replenish with bombs and fresh drums of cartridges.

This form of attack continued from 08:00 until noon, when Chaytor's force came within striking distance of the bridge, and the line of retreat itself was blocked for a distance of 5 m. with countless corpses and carcasses and the debris of 87 guns with their limbers, 55 motor lorries, 4 staff-cars and 842 waggons, all of which had been put out of action by the attacks of the Royal Air Force unaided by any surface coöperation. At 01:30 on Sept. 22 Chaytor's force, which had been pressing all through the previous day, captured Jisr ed Damie, and at 08:00 a Turkish column was observed by air scouts to be moving up towards Beisan from the still unoccupied area E. and N.E. of Nablus. It was bombed from above, while the XX. British Corps shepherded it up toward the 4th Cav. Div., which came down to meet its survivors and patrolled along the left (E.) bank of Jordan to cut off such stragglers as might cross the stream.

Meanwhile the Jewish battalions of Chaytor's force had captured Umm esh Shert ford at 03:00, and by nightfall the 2nd Australian Light Horse Bde. (Brig.-Gen. Ryrie) was in contact with the main Turkish position at Shunet Nimrin. A little later it became apparent that the IV. Army had realized how isolated and unsafe its position had suddenly become, and that it had begun to retire in hopes of reaching Damascus before it was too late. It was, however, vigorously pressed by Chaytor's force, its railway had been cut by the Hejaz Camel Corps of the

Northern Army, and the whole country-side appeared to be boiling up into sudden revolt about its path.

The IV. Army still carried a sting in its tail, and although it lost Es Salt by 16:30 on Sept. 23 it held 'Amman gallantly until 15:10 on Sept. 25, in hopes of being able to keep the line of retreat open for the garrison of Ma'an under 'Ali Bey Wahbi, which, though hastening northward amid a perpetual whirl of Arab rifle-fire, was still S. of the town. With all hope of retreat cut off, the Ma'an force became anxious to surrender, and as soon as the 5th Australian Light Horse Regt. was near enough to Qastal to afford protection, the Turks, to the number of over 4,000, with 500 sick and 12 guns, surrendered on Sept. 29. The Australians had some difficulty in saving their prisoners from being massacred by the Arabs who were eager for vengeance and plunder.

The news that the IV. Army was trying to avoid the fate which had overwhelmed the VII. and VIII. caused Gen. Allenby to order his available cavalry to advance upon Damascus, in order to prevent the Turks on the E. of Jordan from reaching it and re-forming in combination with the small force there.

The 5th Cav. Div. was employed during the greater part of Sept. 23 in capturing Acre and Haifa, when the Turks, contrary to the wishes of the Germans, who did not wish to risk the numerous houses of the German colony in a bombardment, put up a stout resistance, and were only quelled by a charge of the 15th (Imperial Service) Cav. Bde. (Brig.-Gen. Harbord). The 5th Cav. Div. then went to Nazareth en route for Damascus with the rest of the Desert Mounted Corps by way of Jisr Banat Ya'qub and the main motor road beyond Quneitara.

At Jisr Banat Ya'qub a stiff resistance was made, chiefly by German technical troops, who had blown one arch of the bridge and formed a laager of lorries and machine-guns commanding the ruin. This delayed the Australian Mounted Div. until the position was turned by the action of the 3rd and 4th Australian Light Horse Bdes. (Brig.-Gens. Wilson and Grant), which crossed the river N. and S. of the bridge late on Sept. 27. The position was taken, but the delay had enabled the 5th Cav. Div. to come up, and by 20:30 on Sept. 28 both divisions had reached Quneitara. To the S. the 4th Cav. Div., having crossed the Jordan at Jisr el Mujami', engaged the Turks on the Zebda-Irbid-Beitras line on Sept. 26, where a good deal of opposition was made, took Irbid during the night, then pressing on through Remte made contact with the Hejaz Northern Army, which had just taken Der'a, a few miles W., at dawn on Sept. 28.

The Arab Camel Corps, with which was Col. Lawrence, had started on its northern raid on Aug. 31, by unfrequented and often waterless paths through the desert from a point near Akaba and had reached the railway between Der'a and Damascus on Sept. 17. The line was wrecked, and in spite of the activity of the garrison and aeroplanes at Der'a the Arabs continued to prey upon the lines of communication, which they kept in a state of disorganization all through the critical days of Gen. Allenby's advance, and now were able to get their fill of fighting in trying to impede the retreat of the IV. Army.

Under the constant pressure of the Desert Mounted Corps and the Arabs, both regular and insurgent, driving in from W., S.W. and S., the IV. Army melted into rout. It still fought when it could, but it was with the spasmodic jerks of a body no longer under control of its brain, and after actions at Kaukab Jasa and Kiswe the end came for the Yilderim Army Group when the Australian Mounted Div., with the French cavalry attached, got across the Damascus-Beirut road on the afternoon of Sept. 30, capturing 4,000 Germans and Turks as they tried to escape along it. Next morning Maj. Olden with men of the 10th A.L.H. Regt. (3rd Bde. A.L.H.) reached the Serail of Damascus, at 06:30 on Oct. 1., just a little ahead of the Hejaz Camel Corps. Damascus had fallen, and a Turkish column trying to reach safety by the desert road to the N.E. was overtaken, attacked and captured near Duma on Oct. 2.

Nor was the victory a day too soon—the British cavalry had been stung by malarial mosquitoes in the plain of Esdraelon, in the marshes round Beisan and in other areas behind the Turkish lines where army sanitation was grossly neglected. The malaria

had incubated for a fortnight, and immediately after the capture of Damascus, officers and men sickened by scores—whole regiments were temporarily out of action, and on top of the malaria came a savage visitation of the so-called "Spanish" influenza, which preyed upon captors and captives alike, particularly the latter, whose resisting power had been greatly impaired by the privations of a fortnight's disaster and rout.

There now remained no formidable Turkish force in southern or central Syria, and all that remained for the victorious general to do was to occupy the starving lands which he had liberated and move northward in search of a Turkish formation to attack. The 7th (Meerut) Div. was ordered to march up the coast, and made remarkable progress, leaving Haifa on Oct. 1, occupying Tyre on the 4th, Sidon on the 6th, Beirut on the 8th, and Tripoli (Tarabulus) on the 18th, while the 5th Cav. Div., less affected by malaria and influenza than other cavalry, moved up through the Biqa' along the railway to Hama (Oct. 20), engaged German armoured cars near Khan es Sebil (Oct. 22), and reached Aleppo, which had just been occupied by Arabs, at 10:00 on Oct. 26. The division passed through Aleppo, engaged the Turks on the Alexandretta road, and on the 28th relieved Arab troops at Muslimie junction astride of the Bagdad railway.

During this advance an uncounted number of Turks were killed, 200 German and Austrian officers and 3,500 men, while over 72,000 Turkish prisoners, 360 guns, 800 machine-guns, and large quantities of locomotives and motor transport were captured. (H. P.-G.)

TURNER, SIR GEORGE (1857-1916), Australian politician, was born at Melbourne Aug. 8 1857 and educated at its Central school, proceeding on to its university. He was called to the Victorian bar and in 1880 was elected to the Victorian legislature as member for St. Kilda. Two years later he became Minister of Health and later held office as Minister of Customs, Solicitor-General and Minister of Defence. From 1894-9 he was Premier and Treasurer of his colony and again from 1900-2. From 1901-5 he was Treasurer of the Commonwealth of Australia. He was also president of the Federal Council of Australasia, which came to an end in 1899. He represented his colony at Queen Victoria's Diamond Jubilee (1897) and was then created G.C.M.G. and sworn of the Privy Council. He retired from politics in 1906 and died at Melbourne Aug. 14 1916.

TURNER, SIR WILLIAM (1832-1916), British anatomist, was born at Lancaster Jan. 7 1832. He was educated at various private schools, and afterwards studied medicine at St. Bartholomew's hospital, and graduated M.B. at London University. In 1854 he became senior demonstrator in anatomy at Edinburgh University, in 1867 professor of anatomy, and in 1903 was elected principal and vice-chancellor of the university. He was from 1898 to 1904 president of the General Medical Council, and in 1900 was president of the British Association. He was knighted in 1886 and made a K.C.B. in 1901. Turner was best known as a brain surgeon, and published various valuable papers on the subject. He died at Edinburgh Feb. 15 1916.

TWINING, LOUISA (1820-1912), English philanthropic worker, was born in London Nov. 16 1820. In early life she was an artist, and published *Symbols and Emblems of Mediæval Christian Art* (1852) and *Types and Figures of the Bible* (1854). In 1853, however, she became interested in movements for social reform, and began the work in connexion with the Poor Law to which she devoted the rest of her life. In March 1861 she helped to establish a home for workhouse girls sent out to service, and in 1864 a Workhouse Visiting Society. In 1867 an act was passed separating infirmaries from workhouses, and after 12 more years of work Miss Twining in 1879 established the Workhouse Infirmary Nursing Association. She was a Poor Law guardian for Kensington during 1884-90, and for Tonbridge Union during 1893-6. She promoted the opening of Lincoln's Inn Fields to the public, helped to start the Metropolitan and National Association for nursing the poor in their homes, did much to secure the appointment of police matrons, and was president of the Women's Local Government Society. She published *Recollections of Life and Work* (1893), *Workhouse*

and Pauperism (1898), and many papers on Poor Law subjects. She died in London Sept. 25 1912.

TYLOR, SIR EDWARD BURNETT (1832-1917), English anthropologist (see 27-498), died at Wellington, Som., Jan. 2 1917. He was knighted in 1912.

TYPHUS FEVER (see 27-508).—This acute specific fever is spread by the agency of the body-louse, and is characterized by a sudden onset, a maculo-petechial eruption, severe toxæmia, lasting some 12 to 15 days, and ending by a rapid lysis. The disease has many synonyms:—Typhus exanthematicus, synochus putrida, spotted fever, gaol fever, famine fever, prison fever, Brill's disease. This last term is often applied to denote a very mild type of the disease occurring in the United States.

Hippocrates mentions the word "typhus," but he applied it to any stuporous and delirious condition and does not appear to have been acquainted with the fever in question. The malady was apparently confused with plague until the 16th century, when Fracastorius differentiated it from the latter disease and called it petechie. During the 18th and 19th centuries typhus fever was well known in Europe, but included typhoid and relapsing fever, from the former of which it was distinguished by a long series of researches beginning with those of Strother, Gilchrist and Huxham in the early 18th century and ending with the classical work of Still in 1837. From relapsing fever typhus was definitely differentiated by Henderson of Edinburgh in 1843.

Climatology and Epidemiology.—Typhus is mostly a disease of temperate and cold climates; in tropical countries it occurs only in the hills or during the cool season. In 1921 typhus was endemic in many parts of E. and S.E. Europe, Poland, Galicia, many provinces of Russia and certain districts of the Balkans. It was endemic also in some parts of Asia, Persia, Afghanistan, and an endemic area exists in India on the W. of the Indus, stretching from Baluchistan in the S. to Yusufzai, Hazara, and Kashmir in the N., and then passing eastwards along the ranges of the Himalayas, where it is especially prevalent at Kulu, and also passing southwards into the district of Rawal Pindi. It also occurs in Indo-China, in N. China and in Japan in the province of Higo. It does not occur in Australasia or Oceania. In America it is endemic in Mexico, in certain districts of Peru and northern Chile.

Before the World War it was eradicated from most European countries where hygienic measures for the destruction of vermin were in existence. During the war, extremely severe epidemics raged in the Balkans, Poland and Russia. Epidemics are caused by anything which favours the propagation and dissemination of lice. The principal factors which do so are:—(1) massing together of people of all classes; (2) retaining these masses under conditions which render personal cleanliness and clean clothing difficult or impossible, typically in times of war or famine; (3) a suitable atmospheric temperature, not too high—i.e. a temperate zone temperature.

Ætiology.—The disease is spread by means of the body-louse, *Pediculus corporis de Geer* (1778). The virus is apparently present in the blood of a patient from the fifth to the twelfth day, but in greatest abundance from the fifth to the seventh day. The louse requires approximately eight days interval before it becomes infective, and probably remains infective for the rest of its life, but it is not certain whether it passes the virus on to the next generation or not. When an infected louse bites a non-immune human being, a period of six days to ten days elapses before symptoms appear. The virus was reported by Nicolle to be filterable, but more recent investigation has shown this to be doubtful. The guinea-pig and the monkey are susceptible. As regards the nature of the virus, innumerable bacteria and protozoa have been described. In 1921 most authorities favoured de Rocha Lima's theory, viz. that the causative agent is an organism which he has called *Rickettsia prowazeki*. Rocha Lima has given this name to some peculiar, minute, gramme-negative, oval bodies often showing polar staining when stained by Giemsa's method, and found in the epithelial cells of the alimentary canal of lice which have fed on the blood of typhus patients. Attempts at cultivation have so far failed. Brumpt and others do not give any etiological importance to these bodies, as, according to them, they are found also in lice which have not fed on typhus patients. Rocha Lima contends, however, that there are two forms of the parasite, one non-pathogenic, *Rickettsia pediculi*, found only in the lumen of the alimentary canal of lice; and the other, pathogenic, *Rickettsia prowazeki*, which multiplies in the cells of the insect's alimentary canal.

Plotz has described an anaërobic, gramme-positive, bacillus which he now identifies with *Rickettsia prowazeki*. (For similar disease-carrying by body-lice, see TRENCH FEVER.)

Morbid Anatomy.—There are no specific anatomical lesions. A certain amount of oedema of the lungs and hypostatic pneumonia is often present. The spleen is enlarged, usually of a dark red colour and juicy red pulp. The liver and kidney show cloudy swelling, and punctate hæmorrhage may be present. In the intestine there are no changes in Peyer's patches, and the mesenteric glands are not enlarged. The heart muscle may show cloudy swelling and fatty degeneration. The cerebral spinal fluid may present a slight lymphocytosis.

Symptomatology.—Incubation varies from 4 to 21 days, but is usually about 10 to 12 days. The onset is usually sudden, being characterized by severe headache, pains in various parts of the body, often rigours, marked rise of the temperature, quick pulse, flushed face and suffused eyes, and quickened respirations. The patient complains of extreme weakness. The duration of the fever on an average is 14 to 15 days. During the first 2 or 3 days the temperature continues to rise at night, with remission in the morning, to a maximum of 104 to 105 on the second to fourth day. During this time the tongue becomes dry, swollen, and coated with a thick brown deposit on the dorsum, while the tip and sides of the organ are red. The patient quickly becomes apathetic, drowsy, with dull expression. As the disease progresses, the rapidity of the pulse increases and may reach 140 a minute, and is usually small and of low tension. The respirations are generally quickened and there are usually signs of laryngitis and bronchitis and occasionally bronchial pneumonia. Delirium is known, especially at night.

Definite preliminary rashes are rare. What one generally sees the first two or three days of the disease is a very marked flushing of the face, neck and upper portion of the chest, with a subcuticular mottling of the skin of the lower part of the chest and abdomen (*cutis marmorata*). It should be noted at once that this symptom is far from being specific, a similar flushing being very often noticeable in many cases of Pappataci fever. The true typhus rash appears generally on the fourth or fifth day in the form of small roseolar spots, indistinguishable from typhoid roseola but often more abundant. According to some of the old authorities, it appears first on the arms and legs, but, in the writer's experience of Serbian and Polish epidemics, the rash generally starts on the abdomen and then spreads to the chest, arms and legs. The spots are at first roseolar and disappear completely on pressure, then some of the spots slowly fade away, while others become of darker hue and do not disappear completely on pressure, becoming petechiae, though it is rare for them to develop the dark blue appearance of petechiae in such eruptions as those of purpura. The rash, in a few cases, may remain purely roseolar-like, without any of the spots becoming petechial. In exceptional cases, the rash may be absent altogether: *typhus exanthematicus sine exanthema*. The medical man with little experience of typhus should be on his guard not to mistake for true typhus rash a petechial rash, the so-called Balkanic rash, due to bites of innumerable fleas, composed of numerous perfectly circular dark red petechiae, which is extremely common in the Balkans and in Galicia in peasants and soldiers. Anyone who has not been to those countries can hardly believe how profuse this rash can be. The whole body, with the exception perhaps of the face, is completely covered with it, while the shirt of the sufferer may be absolutely black from the number of living fleas upon it. With a little practice one soon learns to distinguish the two rashes. Each flea-bite shows at first a central hæmorrhagic spot surrounded by a hyperemic circular zone, which disappears on pressure. This peripheral hyperemic zone fades away spontaneously within a day or two, while the central hæmorrhagic spot remains as a petechial area, which is, as a rule, perfectly circular, not raised, and of a dark red, sometimes copper-like, colour which does not disappear on pressure. In the blood there is often a marked leucocytosis, and a differential count shows a large increase of polymorphonuclears. An interesting feature is the complete absence of eosinophiles in practically every case.

Termination.—On or about the fifteenth day, the temperature generally falls by crisis, or, much more frequently, by rapid lysis which may extend through three to five days.

Convalescence may be slow, and fairly frequently there is danger during this stage, as the general condition may not improve after the cessation of the fever, and death may occur some two to three weeks after defervescence. In certain cases, while the temperature has become normal, the pulse does not improve, and the patient becomes weaker and weaker until he dies.

Complications and Sequelæ.—The most usual complications are: parotitis, ending often in suppuration, gangrene of feet and polyarthritides; neuritis, hemiplegia, severe mental depression amounting almost to melancholia (seen during convalescence) may be mentioned, also bubonic swellings; otitis media, abscesses and boils occur, while jaundice, endocarditis, and meningitis are rare, but myelitis is fairly common.

It is interesting to note that different epidemics of typhus have been reported as being characterized by special features in regard to complications and sequelæ; thus, the Serbian epidemic in 1914-5

showed a great tendency to gangrene of the feet, while those of Ireland have generally been associated with bronchial and pneumonic complications. On the other hand, in the recent epidemics in Poland and Galicia, complications have been comparatively rare.

Diagnosis.—The principal data on which to base the diagnosis are as follows:—

(a) *Incipient Typhus.*—(1) The sudden onset, often with headache, rigours, and vomiting. (2) The congested eyes and face and the subcuticular mottling of the skin over the chest. (3) The mental confusion and stupor, associated with the log like attitude of the whole body. (4) The increased percentage of polymorphonuclear in the differential count.

(b) *Fully Developed Typhus.*—(1) The typical rash. (2) The history of the sudden onset, etc. (3) Leucocytosis and increased polymorphonuclear percentage. (4) The *Weil-Felix reaction*, viz., the blood of typhus patients agglutinates a proteus-like germ, isolated from the urine of some cases of typhus by Weil and Felix and called by them *Proteus X19*.

Prognosis.—The case mortality may be from 10 to 50% and greatly varies in different epidemics. It is low in the young and very high in the old. The malady is slightly more fatal in males than in females, while alcoholism and kidney disease are bad prognostics.

Treatment.—This is merely palliative. Patients suffering from typhus should be placed, whenever possible, in airy, well-ventilated wards, and in the summer months tents may be used with advantage. Cleanliness and good nursing are essential. During the febrile attack the diet should consist of broths and milk and soft solids, while plenty of water is allowed to be drunk. The temperature should be controlled by cool sponging and the nervous symptoms by ice to the head, hyoscin, bromides or morphine, while the heart is supported by hypodermic injections of strychnine and digitalin. Special attention should be paid to the mouth and throat. The legs and feet should be kept warm and pressure on the feet, even from the bed-clothes, should be avoided, lest it contribute to the production of gangrene. Prostration is extreme in most typhus cases, and a most striking fact is the occurrence of many deaths after the period of defervescence, even when severe complications have not developed. To combat this extreme exhaustion, the administration of alcohol in moderate doses is sometimes useful.

Attempts at specific medication have been made by various authors, and Nicolle has prepared a serum, by injecting horses with emulsions of spleen and adrenals of guinea-pigs artificially inoculated, said to have good results, the dosage being 20 c.c. daily.

Prophylaxis.—This consists in taking every possible measure for the destruction of lice. There is no doubt that heat, whenever it can be employed, is the most satisfactory means for the destruction of lice and their eggs in clothes, blankets, bed-sheets, etc. When dry heat is used, a temperature of 68° C. for 15 minutes is the safe standard for routine practice. When steam is used, articles should be submitted to a temperature of 100° C. for 30 minutes to allow the steam to thoroughly penetrate all parts of the clothing. For disinfection of rooms, barracks, etc., sulphur fumigation is probably the most satisfactory routine method. The rooms, whenever possible, should be sealed and rendered approximately airtight, and then the sulphur fumigation is carried out, using 5 to 8 lb. of sulphur per 1,000 cub. ft., the rooms remaining sealed up for a period of not less than 12 hours.

With regard to the usual chemical insecticides, their utility is somewhat limited; among the liquid ones, petrol is, in practice, probably the best; guaiacol is a powerful liceicide but is expensive. Among solid insecticide substances, naphthalene is the most useful and convenient. It is interesting to note that according to Jackson's and the writer's experiments in Serbia insecticide chemicals do not act equally well on lice, bugs and fleas; for instance, pyrethrum (many patent insecticide powders are merely pyrethrum) acts powerfully on bugs while its action on lice is very slight; on the other hand, iodoform, which will kill lice in 10-15 minutes, has no action on bugs and very little on fleas. When an insecticide for general use is required therefore, several chemical substances should be combined, and the following powder has been found fairly efficacious, viz., naphthalene, previously soaked in guaiacol or creosote 3ij pyrethrum 3ij zinc oxide ad. 5. The wearing of undergarments made liceproof by soaking in crude carbolic acid and soft soap, as recommended by Bacot and others, has been found useful.

In badly infected districts a large number of bathing and disinfecting stations should be established and a general disinfection of people should be carried out. The following procedure, as adopted by the American Typhus Commission with most satisfactory results in the Serbian epidemic of 1914-5, is recommended. The infested person goes into a room, takes off the clothes, which are steamed or boiled, passes into another room where he is bathed, then into a third room where he is sprayed with petrol, and finally into a fourth room in which he receives clean or sterilized clothes. The sterilization of the clothes may be conducted by boiling, but better still by making them into lightly packed bundles and placing them in a truck or room into which steam is blown.

TYRRELL, ROBERT YELVERTON (1844–1914), Irish classical scholar, was born at Ballingarry, co. Tipperary, Jan. 21 1844. He was educated at Trinity College, Dublin, where he subsequently became a fellow in 1868 and professor of Latin in 1871. From 1880 to 1898 he was Regius professor of Greek at Dublin, and from 1900 to 1904 professor of ancient history. He was a

Commissioner of Education for Ireland and one of the original fellows of the British Academy. Amongst his published works were an edition of Cicero's *Letters* (7 vols., the later vols. with Dr. Purser, 1870–1900); *Latin Poetry* (1893); *Sophocles* (1897); *Terence* (1902), and *Essays on Greek Literature* (1909). He died in Dublin Sept. 10 1914.

TYRWHITT, SIR REGINALD YORKE, 1ST BART. (1870–), British Admiral, was born at Oxford May 10 1870, the youngest son of the Rev. Richard St. John Tyrwhitt. He entered the navy in 1883, was promoted lieutenant (1892), commander (1903), captain (1908), commodore (1914) and rear-admiral (1919). He was in charge of a landing party at Nicaragua in 1894. During the World War he commanded destroyer flotillas in actions in Heligoland Bight (Aug. and Dec. 1914) and off the Dogger Bank (1915). He was created K.C.B. in 1917, and in 1919 received a baronetcy, a grant of £10,000 and the thanks of Parliament.

UGANDA (see 27.557*).—The area of the protectorate, after taking into account an exchange of certain districts with the Anglo-Egyptian Sudan in 1914, is some 110,300 sq. m., including 16,000 sq. m. of water (chiefly those parts of lakes Victoria and Albert Nyanzas within its limits). The pop., given as 2,843,325 at the 1911 census, was in 1919 officially estimated at 3,318,100 of whom 847 were Europeans and 3,516 Asiatics (mostly Indians). The most numerous races are the Baganda and Banyoro.

Industries, Trade and Communications.—The economic resources of the protectorate greatly increased in the decade 1910-20. This period was marked by the rapid development of cotton-growing—an industry entirely in the hands of the natives—and by the acquisition of numerous plantations by Europeans, who engaged chiefly in the production of coffee and Para rubber. These, with ox-hides, goat-skins and ivory formed the chief exports. Sesame seed, red chillies (which grow wild) and ground nuts were fluctuating crops. Cocoa, tea, tobacco and other plantations were started and a beginning was made in the export of timber. Ghee (clarified butter), in considerable quantities, was sold in Kenya Colony (British E. Africa).

At first the cotton produced was mainly ginned in the E. Africa Protectorate, but by 1919 ginneries established at Kampala, Entebbe, Jinja and other centres by European companies ginned and baled all the cotton exported. The value of the cotton exported (most of it taken by Indian merchants for the Bombay market), £105,000 in 1910-1, had increased to £665,000 in 1918-9. The last-named figure was, however, due to the inflation of prices and represented an export of 4,900 tons; in 1914-5 when 6,866 tons were exported the value was only £351,000. In 1919 a tax of 4 cents per pound on all cotton exported was imposed, the proceeds to be devoted wholly to the development of the industry. In 1920 the tax was reduced to 3 cents per pound, and was to so continue for three years. Progress made in the rubber plantations was shown in the increase of exports from 9 tons in 1914 to 113 tons in 1919. Coffee exports increased from 13 tons in 1910 to 2,716 tons (valued at £106,000) in 1919.

External trade is almost wholly through Kenya Colony by rail to Mombasa. The value of the imports, chiefly textiles and hardware, rose from £347,000 in 1910-1 to £744,000 in 1916-7, exclusive of Government stores, specie and goods in transit. (The transit trade is almost entirely with the north-eastern part of Belgian Congo and consists largely in bullion from the Kilo gold mines.) In the same period the value of exports of domestic produce rose from £306,000 to £637,000. The Customs Depts. of the two protectorates were amalgamated in 1917, and since that date no separate statistics have been kept, except in regard to domestic produce. The value of such produce in 1918-9 was £1,247,000.

The development of trade and the work of administration was aided by a well-planned system of metalled roads suitable for motor traffic. A railway 61 m. long from Jinja (by the Ripon Falls) to Namagali, the first navigable point on the Nile, was begun in 1910 and opened on Jan. 1 1912. It was built entirely by Busoga natives and is called the Busoga Railway. It connects with a line of steamers which serves Lake Kioga and the Bukedi district, where a rich soil and well defined dry season provide excellent conditions for cotton growing. Besides the Busoga Railway there is a 7-m. railway (opened 1915) connecting Kampala, the capital of Buganda, with Port Bell on Victoria Nyanza. It was designed as the first stage in a main line to connect the Victoria and Albert Nyanzas; that is, Uganda and the Belgian Congo. Mechanical transport, introduced in 1908, is much developed. In 1919 Jinja became a station on the Cape to Cairo air route, and the first machines to use its aerodrome arrived in Feb. 1920, coming from Cairo.

The chief towns are Kampala (or Mengo), the capital of Buganda (pop. approx. 40,000); Entebbe, on Victoria Nyanza, the seat of government and 24 m. from Kampala (pop. 12,000); Jinja, chief town of Busoga and headquarters of the cotton industry; Masindi, capital of Bunyoro; Mjanji, a port at the mouth of the Sio river. Kampala, the headquarters of the Buganda Government and of the chief missionary societies, has a number of fine buildings; a new Anglican cathedral, a brick-built domed building with massive stone pillars, was consecrated in Sept. 1919.

Revenue, Administration and Education.—The revenue in 1909-10 was £165,000 against an expenditure of £240,000, the balance being met by an Imperial grant in aid. In that year a poll tax was substituted for a hut tax, and the revenue thus increased. By 1915-6 the revenue had risen to £287,000, while the expenditure was £285,000. This was the first year in which income exceeded outgoings and in which no grant in aid was needed. In 1918-9 the revenue was £351,000 and the expenditure £323,000. The chief source of income is a poll tax on the natives; since April 1919 a poll tax has also been levied on Europeans and other non-natives. An

ad valorem duty of 10% on imports and an export duty on certain commodities are other sources of revenue.

The administration is on the line of a British Crown Colony. An Order in Council passed in 1911 provided, in effect, that the criminal law should be the Indian Penal code, the civil law generally that in force in England. Much of the protectorate consists, however, of native states governed by chiefs (four of whom bear a title equivalent to king) with the aid of a *lukiko* (council or Parliament). This system of local self-government was extended from 1910 onwards as new districts were brought under control.

Education is entirely in the hands of the missionaries, Anglican and Roman Catholic. The Native Anglican Church (formed by the efforts of the Church Missionary Society) had in 1918 some 40,000 scholars. There are elementary, secondary, high and medical schools as well as theological colleges. The Mill Hill (R. C.) Mission had over 18,000 children in its schools the White Fathers Mission nearly 20,000. Education is most advanced among the Baganda, the majority of whom (400,000 out of 676,000) profess Christianity. The kings of Buganda, Bunyoro, Toro and Ankole, and their prime ministers, are all Anglicans.

History.—The history of the protectorate since 1910 was one of steady development, in which the missionaries continued to play a leading part. The World War of 1914-8, though it entailed a serious drain on the man-power of the country, only temporarily checked (and that not to a great extent) its progress. In March 1911 Mr. (afterwards Sir) F. J. Jackson became governor, holding that post till April 1917. During his governorship some few hundreds of planters and commercial men were added to the European residents, hitherto almost entirely Government servants and missionaries, but as Uganda is not, and can never be, a "White Man's Country," the problems presented in lands where large numbers of whites and blacks live side by side did not arise.

The readjustment of the south-western and western frontiers in accordance with agreements made in 1910 and 1911 with Belgium and Germany was completed in 1912. The western shores of Albert Nyanza with the adjacent strip of territory were transferred to the Belgian Congo, while to Uganda was added the district of Kigezi (2,056 sq. m.), a highland region (much of it over 6,000 ft.) containing some of the peaks of the Mfumbiro range of active volcanoes. The northern part of Ruanda lies within the district. The formal transfer of the part of Kigezi which had belonged to German E. Africa took place in Jan. 1912. Two years later Kabale was chosen as headquarters of the district.

In April 1914 another territorial change was effected when the northernmost part of the protectorate E. of the Nile was transferred to the Sudan Government, whose administration was extended S. to Nimuli, this giving the Sudan control of the whole of the stretch of the Nile navigable from Khartum. In return the Sudan surrendered to Uganda some 4,000 sq. m. W. of the Nile and N. of Albert Nyanza, an area which had been part of the Lado enclave, leased to Leopold II. of Belgium. These arrangements tended to make the Uganda Protectorate more compact and manageable. By 1915 effective control had been established over the whole protectorate except the district lying W. of Lake Rudolf—an arid region sparsely inhabited by Turkana and other warlike nomads who owned no paramount chief. This remote district was the scene of an extensive gun-running trade with Abyssinians and Somalis, and of raids on peaceful tribes, involving punitive measures. The most important of these expeditions was carried out during April-June 1918 by a combined force from British E. Africa, Uganda and the Sudan. The operations showed the Turkana that though supported by Abyssinian marauders they could not escape punishment, but they were inconclusive, as neither the Sudan Government nor that of Uganda was prepared effectively to administer their portions of the disturbed area.

The outbreak of the World War found Uganda wholly unprepared. At that time, Aug. 1914, the protectorate troops (4th Batt. King's African Rifles) were engaged against the Turkana. For 180 m. W. of Victoria Nyanza the Uganda

* These figures indicate the volume and page number of the previous article.

frontier marched with that of German E. Africa, and for some time it was defended only by a few policemen and mobs of undisciplined spearmen. The Germans, however, let the opportunity pass, and only outpost actions were fought. With the launching of the Belgian offensive in April 1916 Uganda ceased to be in the sphere of active operations. The chief service rendered by Uganda in the E. Africa campaign was the raising of over 10,000 African soldiers, the formation of a native medical corps—this corps was formed through the efforts of Sir Apollo Kagwa, prime minister of Buganda—the supply of over 60,000 trained carriers and some 100,000 "job porters" (see EAST AFRICA CAMPAIGN).

The Baganda, Banyoro, Busoga and other races, throughout, gave the British authorities prompt and continuous aid. The Buganda Government at once mobilized every militarily-fit man. This was done by direction of the Kabaka (King) Daudi Chwa (b. 1896), who "came of age" four days after war began.

During the war some trouble was caused in the Kigezi district by the Nabinzi, an anti-white society, which took a sheep as totem, put 2,000 warriors in the field and attacked impartially British, Belgian and German troops. The trouble originated in Ruanda, then under German rule. It was temporarily stopped by the sacred sheep being captured, shot and burnt, but in 1920 the Nabinzi, with a new leader and a new sacred sheep, again gave trouble. This society was the only instance of anti-white feeling in Uganda, and affected only a minute part of the protectorate.

On Sir F. J. Jackson's retirement after 23 years' service in E. Africa, Mr. (afterwards Sir) R. T. Corydon was appointed governor (Nov. 1917). A notable event in 1920 was a visit by the Rev. John Roscoe, the chief authority on Baganda ethnology, to study the lesser known tribes of the protectorate.

The problems with which Sir R. T. Corydon had to deal were largely economic and social. The rise in the value, in 1919, of the rupee and the decision of the Colonial Office in 1920 to fix its exchange at 2s. sterling affected Uganda less perhaps than Kenya Colony, but caused a disturbance of trade, while the great fall in the price of cotton from the middle of 1920 onward seriously affected the industry. The introduction by order of the Colonial Office of the differential treatment of Indians enforced in Kenya was another disturbing influence. (See KENYA COLONY.) A step forward in the political status of the protectorate was the creation of a Legislative Council, to which various sections of the community nominated members. The first session of the Council was held on March 23, 1921. The Indian community, in view of the action of the Colonial Office, declined to send a representative to the Council.

See H. R. Wallis, *The Handbook of Uganda* (2nd ed. 1920), an excellent monograph, by a former chief secretary to the Uganda Government, with bibliography; Maj. E. M. Jack, *On the Congo Frontier* (1914); Rev. J. Roscoe, *The Northern Bantu* (1915); R. Kmunke, *Quer durch Uganda* (1913); R. Lorimer, *By the Waters of Africa* (1917).

UHDE, FRITZ KARL HERMANN VON (1848–1911), German painter (see 27.563), died at Munich Feb. 26 1911.

UKRAINE (see 27.564).—In its more recent application the name of Ukraine refers to a region of south-eastern Europe, embracing districts of South Russia and former Austria-Hungary which are said to be predominantly Ukrainian-speaking and which should, it is claimed, for this reason form an autonomous State. The boundary of this territory was in 1921 undefined, but, broadly speaking, the claim was that it extended from the mouth of the river Dniester in a north-westerly direction to the neighbourhood of Cracow, thence running roughly N. towards Byelostok, then E. slightly by S. to the Volga, then S.S.W. to near Rostov, S.E. to the Caspian Sea and W. to the Black Sea. The independence of Russian Ukraine, the eastern section of this territory, was proclaimed in Nov. 1917, and that of Austrian (western) Ukraine in Nov. 1918; and in Jan. 1919 eastern and western Ukraine united as a "Republic of the Ukrainian People."

The total pop. of this "ethnographic Ukraine," according to the census estimate of Jan. 1914, was 46,012,000, giving a

density of 62.3 per sq. km.; of these 32,662,000 were classified as Ukrainians, 5,376,800 Russians, 2,070,500 Poles, 3,975,760 Jews, 871,270 Germans, 435,240 Rumanians and 32,960 Hungarians; or, according to religion, Ukrainian-Orthodox Church 30,653,000, Greek Catholic 6,847,000, Russian Orthodox 4,500,000, Jewish 3,076,000, Roman Catholic 2,000,000 and Protestant 800,000.

The accompanying table shows in fuller detail the area and pop. of the various districts composing the territory, in which, according to the 1914 estimate, the Ukrainian-speaking people are claimed to be in a majority, either absolutely or relatively.

Country.	Province (Government).	Area in sq. km.	Population.		
			Total.	Ukrainian-speaking.	Per-cent.
Russia	Chelm (Kholm)	10,455	841,800	447,650	53

Language.—The Ukrainians claim to have a national language of their own, distinct from the Russian and Polish languages. Mr. Ralph Butler, in his *New Eastern Europe* (1919), says: "Whether Ukrainian is a dialect of Russian or a separate language is a vexed question. But if Ukrainian was a dialect in 1914 it is a separate language now: for whatever may be the ultimate destiny of the two great divisions of the Russian people the events of 1917–8 have carved lines which are beyond effacement in the ethnical development of the Ukrainian race. As written by the Nationalists, Ukrainian differs considerably in appearance from Russian; it discards six of the Russian letters and uses three which Russian has not got. The Nationalists have purposely made the orthography as different from the Russian as possible. They have created a neo-Ukrainian literary language from which they have excluded as far as possible all Great-Russian technical terms." The people furthermore claim to have a national culture of their own.

The Ukrainian Movement.—Briefly the history of the Ukrainian Movement down to 1914 is to all intents and purposes the history of the Ruthenians (see 23.939), inhabiting the eastern parts of Galicja, of which province they constituted slightly less than half the population. Though subservient to the Polish majority in Galicja, the Ruthenians constituted the intellectual centre for the Ukrainian Movement. The books which were not allowed to be published in Russia were published in Lemberg and Cernowitz, and eastern Galicja became the chief centre of Ukrainian propaganda.

By the Treaty of Pereyasavl, 1654, the Ukraine received independence, but acknowledged the Tsar as protector of the republic. By this treaty the Ukraine retained complete self-government and the right of maintaining its own diplomatic representatives abroad. By degrees, however, its autonomous

privileges withered, and by 1847 the Ukrainians saw their national existence in danger of being merged, in spite of ethnographic differences between the two races, in the general subjection of the Russians. A society called the "Cyril-Methodius Brotherhood" was started to keep the national tradition alive, having not only the literary object of promoting the Ukrainian language (till then only in oral use among the peasants) but also a far-reaching political programme. A federation of autonomous Slavonic states was aimed at.

In 1900 the various Ukrainian political parties began to organize themselves. Of these the most important was that of the National Democrats, founded to fight for equal rights to those of the Poles in Galicia and for the autonomy of the Russian Ukraine as a federated Russian State. In the same year the first Revolutionary Ukrainian party was organized in Lemberg, and in 1905 assumed the name of the Ukrainian Social Democratic Working-men's party. Gradually the efforts of these societies were rewarded by the resurrection of the Ukraine as a result of the break-up of the Russian Empire.

The Ukrainians claim that the relation between them and Russia was purely dynastic, inasmuch as the Tsar was, by treaty, Protector of their State, and that when there was no more a Tsar of Russia they declined to permit the Russian people to succeed to the rights and privileges of their deposed sovereign. They therefore resumed their long dormant autonomy and founded a provisional Government in the summer of 1917. This Government, supported by the Ukrainian National Congress and the Central Rada appointed by this body, refused to recognize the Bolshevik regime under which Kerensky was supplanted in Oct. 1917. Accordingly, the independence of the Russian Ukraine was proclaimed on Nov. 21 1917, and accredited representatives from France and Great Britain entered into relations with it in Dec. 1917 and Jan. 1918.

Then came the Brest Litovsk meeting and the Treaties of Feb. 9 and 11 1918, between the Central Powers and the "Ukrainian People's Republic," treaties which were interpreted by the Rada as a formal recognition of Ukrainian independence, but in effect meant annexation by the Germans. In April 1918 a German *coup d'état* overthrew the constitutional Government. Skoropadski was appointed nominally as Hetman but in reality Dictator, and, until the collapse of the Germans on the western front, spared no effort to destroy Ukrainian independence.

After the signing of the Armistice the succeeding steps in the evolution (and subsequent disintegration) of a Ukrainian State were as follows: In Nov. 1918 came the proclamation of the State of the Ukraine of the West (Ruthenian Ukraine), and the conflict of this State with Poland. On Dec. 14 1918 the old Rada of Russian Ukraine was reorganized into a "Directory," with Vinnitchenko and Petlura at its head. On Jan. 3 1919 the union of the Russian and Ruthenian Ukraines was announced, with Hetman Petlura as recognized head of the constitutional Government of the joint republic, having its seat at Kiev.

Subsequently the Ukrainians with varying fortunes resisted in turn or simultaneously the attacks upon their territory made by the Bolsheviks on the one hand and by Gen. Denikin's "White" volunteers on the other.

In Feb. 1920 the nominal Government of the Ukraine presented a note to the Peace Conference asking for recognition as being a *de facto* Administration on the same footing with other states which have arisen amid the ruins of Russia. The note pointed out that the population was firmly opposed to Bolshevistic theories and intent upon independence. It asked for the moral support of "Western Civilization" in its task of overthrowing anarchy, and appealed for material assistance to enable it to reorganize its immense resources. Not only did the Ukraine remain unrecognized, but, by the Peace Treaties, large tracts that were claimed as "Ukrainian" (Galicia, Grodno, Minsk, Volhynia, a part of Podolia, Bukovina, Bessarabia) had been previously assigned to Poland, Lithuania, Czechoslovakia, or Rumania. Against the delivery of eastern Galicia, in particular, to Polish rule, the "Ukrainian Republic" made a strong protest to the United States in Dec. 1919. At about the same date, the

country was described as dotted with a number of miniature republics consisting of a dozen or so towns and villages fortified for defence, each having its own armed force. Gen. Petlura was in Warsaw, and M. Mazeppa, his prime minister, with the nucleus of the Ukrainian National Government and an army of about 6,000 strong, at Kamenets Podolskiy, and the Government was proving itself totally incapable of organizing the country.

In April understandings were reached with Poland and Rumania, and the Ukrainian army was cooperating with the Poles against the Bolshevik army. On April 27 the Polish Government formally recognized the Ukraine—or what remained of their claim—as an independent State, and accepted the provisional National "Directory," with Petlura as head, as the Government of the country. In May it was officially stated by Mr. Bonar Law in the British Parliament that conditions in the Ukraine had not been settled enough to warrant the recognition by the Allied Powers of any government set up there. Later in the year Petlura's Ukrainian Government was temporarily housed at Reshoff, W. of Lemberg, and in Oct. Gen. Wrangel had temporarily become a power in the Ukraine. By Oct. 23 Petlura had reestablished his Government at Kamenets Podolskiy, and his troops were pushing on towards Kiev. On Nov. 4, in a written reply to a question in the House of Commons the Government stated that the Ukraine had not been recognized either as a *de jure* or *de facto* Government. By the Treaty of Riga between Soviet Russia and Poland, in Oct. 1920, a further large part of the Ukrainian claim passed to Poland.

Reports of happenings in the Ukraine during 1921 were extremely meagre. The defeat and withdrawal of Wrangel's army had no tranquillizing effect on the region, but was, on the contrary, followed by a crop of serious peasant risings. Petlura and the "Ukrainian People's Government" had their headquarters in southern Poland, at Tarnow.

Resources, Industry and Trade.—The resources of the Russian Ukraine are naturally very great: covering an area nearly equal to that of France, Italy and England combined, this region contains the best part of the Black Earth zone (the granary of eastern Europe), most of the coal and iron, 80% of the beet, 70% of the tobacco and one-third of the live stock of pre-war Russia. According to figures available during peace-time the total national wealth derived from the different branches of industry in this region was over £265,000,000, of which agricultural products amounted to 158, live stock 26.5, metallurgy and mining 37.5, manufactures 30.5, poultry 4.5, forestry 4.5 and other sources 5 millions of pounds.

Of the land, 65% is arable, 10% forests, 12% pasturage, 6% other products and 6% sterile. The grain crop is the main source of agricultural wealth and normally represents 32% of the total production of grain of the whole Russian Empire. The sugar industry occupies second place: in 1910-1 there were 580,000 ac. under sugar-beet cultivation. The manufacture of sugar is by far the chief manufacturing industry and 143 out of the 238 sugar factories in the whole of Russia were situated in Podolia, Volhynia and Kiev. The tobacco industry is also of importance, including the cultivation of Turkish, American and other lower-grade varieties. At the beginning of the war the census of the live stock of the region was as follows: horses 8,000,000; horned cattle, sheep and goats 27,600,000; and pigs 6,300,000; and the export of stock, meat and animal products, mostly through the ports of Odessa and Nikolayev, was approximately:—cattle (horned), 240,000; horses, 15,000; pigs, 130,000; beef, 9,000 tons; pork and dressed poultry, 12,000 tons; eggs, 65,000 tons; hides, 6,500 tons.

The coal-mining industry is located in the Donets-Basin district, which comprises an area of some 8,000 sq. m. the larger part of which falls within the Ukrainian "claim." The better kinds of coal (anthracite, steam and coke) are obtained in the governments of Ekaterinoslav and Kharkov. Taking the percentage of production in 1915, the Don district amounted to 85.6%, other parts of former Russia 14.4%, and the average production in the years 1913-5 was 20 millions of tons annually. The export is normally carried on at Berdyansk and Mariupol. The output of mercury, found in the district of Ekaterinoslav, increased during the war as follows: 64.5 tons in 1913, 115 tons in 1915, and 100 tons in 1917.

The total exports from nine of the Ukrainian governments between 1909 and 1913 averaged £76,000,000 and the total imports £52,000,000. The exports were, cereals 64% and sugar 22 per cent. Commerce is much facilitated by the navigability of the Ukrainian rivers, that of the Dnieper being 1,250 m., the Desna 537 m. and the Dniester 521 miles. (H. W. M.)

UNDERWOOD, OSCAR WILDER (1862—), American politician, was born at Louisville, Ky., May 6 1862. He studied at

the university of Virginia (1881-4), was admitted to the bar in 1884, and practised law thereafter in Birmingham, Ala. From 1895 to 1915 he was a member from Alabama of the National House of Representatives, and during his last two years chairman of the Committee on Ways and Means. After the Democrats came into power in 1913 he had a large share in framing the tariff bill passed the same year; but his attempt to establish a House Budget Committee was defeated. In 1914 he opposed the Panama Canal Tolls Repeal bill, but supported the resolution authorizing the President to use armed force in Mexico. He was opposed to the woman suffrage amendment to the Federal Constitution, holding that the question was a state issue. He also opposed the national prohibition amendment. In 1914 he was elected to the U.S. Senate, and in 1920 re-elected. In 1910 he favoured the anti-strike clause of the Cummins railway bill. He was a strong supporter of the Peace Treaty of Versailles without changes; but when its ratification had been blocked by the Republicans, he attempted to bring about a compromise. In Dec. 1919 he offered a resolution in the Senate providing that the president of the Senate should appoint a committee of 10 senators to work out some acceptable plan for adopting the Peace Treaty; but this was blocked by Senator Lodge. In April 1920 he was chosen Democratic leader in the Senate. He was one of the four U.S. delegates at the Washington Conference on the Limitation of Armament which assembled in Nov. 1921.

UNEMPLOYMENT (see 27.578)—Subsequently to 1910 the provision made in the United Kingdom for the remedy of unemployment was further fortified and extended. The Unemployed Workmen Act, 1905, was included each year after its enactment in the annual Expiring Laws (Continuance) Act.

The Act empowers local authorities to form distress committees consisting of their own members, of representatives of boards of guardians and of co-opted members possessing special knowledge of problems of distress. Their functions are to maintain a register of unemployed persons, to assist such persons to obtain work, to provide relief works and to assist unemployed persons to emigrate. Funds are provided by Government grants, from charitable money and from a *jd.* rate. Hitherto, Government grants have been made to cover the difference between the actual value of the relief work done and the cost of doing it. The annual amount of Treasury grants never exceeded £300,000 (1908), and from 1911 was £100,000, which was not in any year fully expended. No grant had been made from 1913 to 1921. It proved impossible to provide relief work of a kind to which many of the unemployed applicants were accustomed, and consequently workpeople were employed upon work, generally approximating to navvy's work, for which they were unfitted. A heavy financial loss was incurred in almost every case. It proved impossible to obtain anything like a reasonable standard of work or output upon relief works, and employment upon such works was found to be demoralizing to workpeople of a good type. This method of providing for unemployment is discredited.

Labour Exchanges.—Under the Labour Exchanges Act (1909), 61 labour exchanges were opened in Feb. 1910, and this number was increased to 175 in Feb. 1911 and to 272 in Feb. 1912. As the result of the operation of Part II. of the National Insurance Act of 1911, the number of exchanges was further increased to 425 in Feb. 1913, and in June 1920 there were 395 exchanges.

The organization established by the Board of Trade consisted of a central office in London—the Labour Exchanges Branch—and 11 divisional offices, to which areas covering the whole of the United Kingdom were attached. The number of the divisional offices was subsequently reduced to ten and Scotland, Ireland and Wales each formed a division. Labour exchanges were opened in practically all towns with a population of 15,000 or more. Responsibility for this service was transferred to the Ministry of Labour upon its creation in Jan. 1917, central control being exercised through the Employment Department of the Ministry. The facilities provided by the labour exchanges (whose name was changed to "Employment Exchanges" in Oct. 1916) were made available without charge to all employers and workpeople with the exception of "private" domestic servants over 17 years of age. This exception was suspended during the World War and had not been reimposed up to 1921.

It is an important function of the exchanges to bring together unemployed applicants and suitable vacancies which may exist in different districts, when it has been found that the vacancies can-

not be filled by applicants from the immediate locality. Arrangements are made, therefore, for the prompt circulation of particulars of vacancies which cannot be filled by local applicants, provided that the vacancies are of a character for which it is probable that applicants from a distance can be obtained. Such vacancies are notified as a rule by telephone to neighbouring exchanges within a defined "Clearing Area," and should this fail, the particulars are circulated more widely. Up to 1914 a system of divisional clearing houses was used. Particulars of unfilled vacancies were sent by each exchange to the divisional office to which it was responsible, and a classified list of all the vacancies so received was issued daily by the divisional office to all exchanges in the division. Lists of unfilled vacancies were also exchanged each week as between the divisions. In Aug. 1914, the system was superseded by the institution of a "National Clearing House" in London. While the immediate circulation of particulars within the "Clearing Areas" was retained, the circulation of lists of vacancies by the divisional offices was abandoned in favour of the circulation of a classified list for the whole kingdom. The information for this publication is received direct at headquarters from the various exchanges; a complete printed list of vacancies is issued once a week to all exchanges, and the list is kept up-to-date by the daily issue of a statement of vacancies to be added to the list and of cancellations of vacancies which have appeared upon it and are no longer open.

In order to enable workpeople who have, through the exchanges, found employment at a distance of more than 5 m. from their homes, the exchanges are empowered to advance the amount of the travelling expenses. Such advances are as a rule recovered through the employer by small weekly deductions from wages. During the World War, and until the Unemployment Insurance Act (1920) came into operation (Nov. 8 1920), tickets for railway journeys, etc., were issued at less than the normal rates by the exchanges to all workpeople for whom the exchanges had found employment. The cost was borne by exchequer funds. Under the Unemployment Insurance Act (1920), the exchanges are enabled in the case of insured workpeople who have found work through the exchanges to remit (at the cost of the unemployment fund) one half of the amount by which railway and other fares exceed 4s. for a single journey.

In cases of strikes and lock-outs it was decided not to deny the use of the exchanges to the employers and workpeople concerned. In such cases the officials of the exchanges are bound to accept from an employer the notification of a vacancy created by the dispute and are further bound to bring to the notice of any unemployed applicant, with the particulars of such a vacancy, the fact that a trade dispute exists at the establishment of the employer concerned. As a rule formal notification of the existence of a trade dispute is made to the exchanges either by employers or workpeople and when this occurs the terms of the notification are laid before unemployed applicants. Travelling expenses cannot be advanced to enable workpeople to travel to vacancies caused by a trade dispute, and particulars of such vacancies are rarely, if ever, circulated to other exchanges.

The Labour Exchanges Act authorized the formation of advisory committees to assist in the management of the employment exchanges. The intention of this provision was to secure the cooperation of representatives of industry in the administration of the exchanges. From 1912 onwards advantage was taken of this provision to form 17 advisory trade committees consisting of representative employers and workpeople in equal numbers; the number of the members of each committee varied from 12 to 36, and the usual number was rather more than 20. The chairman was chosen by the committee itself or, in default of agreement between the two sides of the committee, by the Board of Trade. The areas covered by the advisory trade committees were as a rule large, consisting of as many as five counties. It was the duty of the committees to advise the Board of Trade upon matters referred to them, and the matters so referred were as a rule questions of policy arising in the administration of the labour exchange service, e.g. the attitude which should be adopted by the exchanges towards employers and workpeople concerned in trade disputes and the extent to which "references" should be taken up by the exchanges in respect of applicants for employment. It was found that the areas assigned to the committee were too wide to permit of any close association with the current work of individual exchanges, and the restriction of the functions of the committees to the consideration of matters referred to them prevented the development of a sense of responsibility for the conduct of the exchanges. When, therefore, it became evident (in 1917) that upon the conclusion of the World War the exchanges would be faced with tasks of special difficulty in every area, the Minister of Labour, to whom responsibility for the exchanges was transferred upon the creation of that office in Jan. 1917, decided to replace the advisory trade committees by a larger number of local employment committees, associated much more closely with the work of each exchange. Three hundred and two local employment committees were formed in connexion with the 395 exchanges. As a rule, therefore, each committee is associated with a single exchange, and with more than one exchange only in some cases in the provinces where several are situated within a single industrial area.

Members of the local employment committees are appointed by the Minister of Labour, as a rule upon the nomination of local organizations of employers and of workpeople. The chairman of the com-

UNEMPLOYMENT

mitter is chosen and appointed by the minister. The committees are responsible for advising the minister upon every phase of the work of the exchanges with which they are associated. They are free to initiate their business and to carry it out through sub-committees. Two hundred and forty-six committees have formed women's departments at the exchanges. Consisting of representatives of every industrial interest of importance in the locality, the committees are in a position to indicate precisely in what ways each exchange should be adapted to local needs so as to be of most service, and further, the committees have since their formation undertaken much detailed work on behalf of individual workpeople upon the books of the exchanges.

Exchange Statistics.—The scale and character of the work done is shown in Table I.

TABLE I.—*Employment Exchanges.*

Year	Registrations	Individuals Registered	Vacancies Notified	Vacancies Filled	Individuals Found Work
Men	1910	920,000	740,221	261,560	219,069
	1911	1,323,162	978,211	446,035	362,670

During the World War and the period of demobilization (Aug. 1914 to the end of 1919) much work of a special kind (see below) was undertaken by the exchanges, and in order to judge the extent to which they are used by employers and workpeople in normal years attention should be directed to the non-war periods.

It should be noted that at the end of 1918 the age-limit for "boys and girls" was raised from 17 to 18. The table shows that the work of the exchange system increased steadily and reached its maximum

in the latter years of the World War. The figures for 1920 indicate a return after the exceptional war conditions to a normal scale of work. It appears that the exchanges may anticipate roughly the receipt each year of 3,000,000 registrations by unemployed workpeople, of notifications by employers of 1½ million vacancies and the filling of 1,000,000 of those vacancies. It should be remembered that the latter half of 1920 was a period of industrial decline.

Casual Labour.—Schemes intended to lead up to the regularization of employment were devised at the Liverpool docks, the Goole docks, the South Wales ports (ship repairers), and at Manchester (cloth porters). Of these, the Liverpool dock scheme is the most interesting. Managed by a joint committee of employers and workpeople in the docks, the scheme has led, through a system of tallies issued to approved dock workers, to some limitation in the number of the dockers employed in or about the port. The scheme also provides for a single weekly payment of wages to each man employed, irrespective of the number of separate employers for whom he may have worked. The wage-paying arrangements at Liverpool have not been copied elsewhere, but the method of controlling dock labour by the issue through a joint committee to dock workers of tallies, has become almost universal in British ports and provides a basis upon which it is possible to build schemes to regularize the employment of dockers.

Juvenile Employment.—Since 1910 a separate system of committees for dealing with the employment of juveniles (under 17 years of age to Dec. 1918 and under 18 years of age thereafter) has been in operation (see JUVENILE EMPLOYMENT). These committees are either formed by the Ministry of Labour under the Labour Exchanges Act, or by the local education authorities under the Choice of Employment Act, 1910. Their work is, in co-operation with the employment exchanges, to supervise the finding of employment for children; to advise children as to the most promising openings, and generally to take such local action as is calculated to improve the conditions of juvenile employment.

Unemployment Insurance.—On May 4 1911, Mr. Asquith's Government introduced in the House of Commons, as the second part of the National Insurance Bill, proposals for the compulsory insurance upon a contributive basis of 2½ million workpeople. The bill received the royal assent, Dec. 16 1911. This measure, to the extent to which it brought the employed population within the scope of unemployment insurance, completed the policy for dealing with unemployment which had been begun in 1909 by the passage of the Labour Exchanges Act. Part II. of the National Insurance Act also contained provisions intended to encourage voluntary provision for unemployment in the industries which were not included under the compulsory scheme.

All workpeople employed in the "Insured Trades" as defined by a schedule to the Act were compelled to be insured against unemployment. Contributions were payable as from July 15 1912, and benefit was paid from Jan. 8 1913. The trades concerned were building, construction of works, shipbuilding, engineering, construction of vehicles, ironfounding, together with saw-milling in connexion with, or of a kind commonly done in connexion with, any of the insured trades. Questions as to the precise limits of the insured trades were settled by an umpire appointed by the Crown to act for the whole kingdom. An unemployment fund was created out of contributions from workpeople employed in the insured trades and from the employers of such workpeople. The rate of contributions was 2½d. each from employer and workman for each period of employment up to a week, with reduced rates for workmen below 18 years of age and for periods of employment of adults for two days or less, viz. a joint contribution of 2d. for a week's employment of a juvenile worker or for the employment of an adult for a period not exceeding two days. To the amount so collected the State contributed an amount equal to one-third of the joint contributions of employers and workpeople. It was the duty of an employer to affix to an unemployment book each week, or at the earlier termination of the employment, a stamp of the value of his own and the workman's contributions, the employer thereafter deducting the amount of the workman's contribution from wages paid to him. The scheme provided unemployment benefit at the rate of 7s. a week during unavoidable unemployment subject to a maximum of 15 weeks' benefit in any 12 months and to the limitation of payment to one week's benefit for every five full contributions paid by the workman. Benefit was not payable to persons under 17 years of age and was payable at half the adult rates between the ages of 17 and 18. The principal statutory conditions for the receipt of benefit were application for benefit in the prescribed manner, namely at a Board of Trade labour exchange or other local office of the unemployment fund; proofs, secured mainly by daily attendance at the labour exchange, that unemployment had been continuous since the date of application; capacity for work, and inability to obtain suitable employment. Proof that the last condition had been satisfied was obtained mainly by an examination of the register of vacancies at the labour exchange in order to see whether suitable employment was available and the offer to the applicant of any apparently suitable work. A workman was dis-

qualified for benefit if he had lost his employment as the result of a stoppage of work due to a trade dispute at the premises at which he was employed, and in such a case the disqualification lasted during the continuance of the stoppage or until the workman had obtained fresh employment in an insured trade. Disqualification for six weeks from the date of losing employment was involved in discharge through misconduct or in leaving employment voluntarily without just cause. Claims to unemployment benefit were decided in the first instance by a statutory "Insurance Officer." From the decision of this officer the workman had a right of appeal to the court of referees consisting of an employer, a workman and an impartial chairman. Further, the insurance officer had the right to refer the decisions of courts of referees to the umpire for final settlement.

Associations of insured workmen were entitled (Section 105, Nat. Ins. Act) to undertake the payment to their own members of unemployment benefit due to them out of the unemployment fund. Such an arrangement involved the payment of the State benefit by the association together with supplementary benefit out of the association's own funds to the value of at least one-third of the amount to be recovered from the State. In order, however, to establish a claim for the repayment of State benefit already paid, the association was bound to satisfy the Board of Trade that the benefit in question had been paid in circumstances which entitled the individual member to receive State benefit. This involved an approximation of the procedure upon claims to receive benefit through an association, to the procedure upon claims to receive benefit direct from a labour exchange.

The insured workman upon becoming unemployed lodges a claim for unemployment benefit at a labour exchange or other local office of the unemployment fund, viz. at one of the 1,048 branch employment offices which have been established in less populous districts for the administration of the unemployment insurance scheme. In lodging his claim the workman indicates whether he wishes to receive his benefit through an association or direct from the office of the unemployment fund. His claim is then examined, and when a favourable decision has been given, benefit is paid to him by the association or at the office at which he made his claim according to his choice. If the workman has chosen to receive his benefit from an association he will sign the "Vacant Book," provided by his association, as a rule each day. Many of the associations concerned have found it convenient to keep their vacant books at the labour exchanges. In July 1913 over 2,000 vacant books of associations having arrangements for the payment of unemployment benefit were lodged at labour exchanges. At that date arrangements had been made by 105 associations with nearly 540,000 members in the insured trades.

In Nov. 1920, immediately before the operation of the Unemployment Insurance Act (1920), when the number of insured workpeople had been increased from 2½ million to 3½ millions, some 5,180 vacant books, out of a total of about 8,000 maintained by the trade unions concerned, were lodged at employment exchanges. At that date arrangements had been made by 92 associations with an approximate membership of 1,341,000. The reduction in the number of associations was due to the amalgamation of certain trade unions.

Voluntary Insurance.—Part II. of the National Insurance Act, (1911), also contains (in Section 106) a provision intended to encourage voluntary insurance against unemployment, both in the insured trades and in other trades. The arrangement here was based upon the successful experiment made over a number of years at Ghent, and involved the payment of a subsidy to trade unions or other associations of workpeople which make a voluntary provision for unemployment. Under Section 106, the Board of Trade was empowered in such cases to repay out of moneys provided by Parliament, an amount not exceeding one-sixth of the sum spent by the association out of their own funds upon unemployment benefit, with a limit to the amount so repaid of 2s. per head per week in respect of members who have received benefit from the association. By July 1913, 275 associations with a membership of 1,104,000 had been admitted by the Board of Trade as satisfying the required conditions (as to the methods of proving unemployment, etc.) for receiving the grant. During the 12 months ending in March 1914, a total sum of £15,167 was paid under the section to 347 associations with a membership of 1,401,000, and during the 12 months ending March 1920 £1,678 was paid to 397 associations with a membership of 2,608,273. Considerable difficulty was experienced in the administration of the section in obtaining evidence which would satisfy the Government auditors that the payments upon which the associations based their claims for a grant had been properly made. This difficulty was due solely to the varying standards of clerical competence maintained by the associations in keeping their accounts. The section was allowed to lapse in the revision and general extension of unemployment insurance which was undertaken in 1920.

Rates of Contribution.—The requirements governing the payment of unemployment insurance contributions were devised so as to charge a higher rate of contribution for engagements of less than a week's duration than for engagements for more than a week. At the same time provision was made (Section 99) for an employer, and, subject to the extent to which employers made use of the section, for workmen, to escape this higher charge by engaging workpeople through the labour exchanges and by handing over to the exchanges the work of affixing insurance stamps. When employers entered

into an arrangement of this kind they were not charged the higher rate of contribution otherwise appropriate in respect of very short engagements, and as a further inducement to make such arrangements, employers were allowed to hand over to the labour exchanges the work of stamping the health insurance cards as well as the unemployment insurance cards. The intention of this section was to induce employers to give the labour exchanges an opportunity of regularizing employment by "dovetailing" a series of casual jobs so as to afford a reasonable livelihood for a limited number of workmen. Up to July 1913, arrangements under the section had been made by 592 employers in respect of 138,500 workpeople; in July 1914 by 899 employers in respect of 162,192 workpeople and in Nov. 1920 by 124 employers in respect of 29,334 workpeople.

Finally the Act of 1911 contained provisions for reducing the cost of unemployment insurance in respect of workmen who had experienced little unemployment. Thus (Section 94) employers were entitled to obtain a refund of one-third of their contributions in respect of workmen continuously employed by them for 12 months and (Section 96) a refund of the whole of their contributions in respect of periods during which short time was worked. Section 95 enabled workmen who had paid 500 contributions to recover at the age of 60 the amount by which the value of their contributions exceeded the value of unemployment benefit received by them.

Amending Acts.—On Aug. 10 1914, the royal assent was given to an Act amending Part II. of the National Insurance Act upon a number of points, none of them of first-class importance, upon which experience of the administration of the scheme had shown weakness in the principal Act. Thus changes were made in the machinery for the determination of claims to benefit and the arrangements for refunding contributions paid by employers and workmen. The Board of Trade was empowered to exempt workmen upon short time from the payment of unemployment insurance contributions, and associations undertaking the payment of State benefit to their members were definitely required to provide from their own funds benefit equal to one-third more than the amount of the State benefit. The Act of March 16 1915 allowed unemployment insurance contributions to be paid in respect of workmen engaged upon war work abroad.

Extension of Insurance.—In July 1916, the scope of unemployment insurance was extended to include workmen employed upon munitions work, and particularly in the chemical, metal, rubber, and brickmaking industries and in the leather industry. This extension was made in order to bring substantially the whole working population employed in war industries within the scope of insurance, and the operation of the Act was to cease after 5 years or at the end of 3 years after the war, whichever was the later date. As the result of this extension the number of workpeople insured against unemployment became approximately 3½ millions.

In Feb. 1918 the Minister of Labour was empowered by order to exclude from unemployment insurance any branch of trade which had been brought into insurance by the Act of 1916.

Experience proved that the calculations, upon which were based the rates of contribution and benefit contained in the Act of 1911, erred upon the side of caution. From this cause, but also as the result of the period of good trade which followed 1911, of the practical absence of unemployment during almost the whole of the war period, and of the Out-of-work Donation Scheme during 1919, under which unemployed persons were entitled to a much higher rate of weekly payment than they could obtain under the Unemployment Insurance Act, the unemployment fund stood at £18,030,356 in July 1919. In view of this large reserve fund and of the increasing cost of living, a short Act was passed in Dec. 1919, increasing the weekly rate of unemployment benefit under the Unemployment Insurance Act from 7s. to 11s. The requirements as to the amount of benefit to be provided out of their own funds by associations undertaking to pay State benefit to their members were not affected.

Insurance Act of 1920.—On Dec. 23 1919, Sir Robert Horne, as Minister of Labour, introduced on behalf of Mr. Lloyd George's Government an Unemployment Insurance bill containing proposals for a general extension of compulsory and contributory unemployment insurance. These proposals were approved by Parliament, and the bill received the royal assent on Aug. 9 1920. This Act superseded the previous Unemployment Insurance Acts, but the general character of the scheme of unemployment insurance remained unaltered.

The scope of unemployment insurance was extended to include all persons of the age of 16 and upwards employed under a contract of service or apprenticeship with the following principal exceptions:—persons employed in agriculture and private domestic service; established servants of the Crown; persons employed otherwise than by way of manual labour at a rate of remuneration exceeding £250 a year; persons casually employed otherwise than for the purpose of the employer's trade or business, and persons employed by public authorities and by corporations whose status approximates to that of a public authority, upon the certificate of the Minister of Labour that the persons in question are not subject to dismissal except for misconduct or unfitness to perform their duties, and that the conditions of their engagement make insurance unnecessary.

The rates of joint contributions by employers and employed persons were fixed at 8d. for men; 6½d. for women; 4d. for boys between 16 and 18 years of age; 3½d. for girls between 16 and 18 years of age. Out of these amounts the employed person's contribution is 4d. for men; 3d. for women; 2d. for boys between 16 and 18 years of age and 1½d. for girls between 16 and 18 years of age. To the unemployment fund formed by these contributions the State contributes 2d. for each man's contribution; 1½d. for each woman's contribution; 1½d. for each boy's contribution, and 1d. for each girl's contribution. The weekly rate of unemployment benefit was fixed at 15s. for men, 12s. for women, 7/6 for boys and 6s. for girls. Payment of benefit is limited to 15 weeks' benefit in any period of 12 months ending early in July each year, and to the payment of one week's benefit in respect of every 6 weekly contributions paid. In general the conditions for receiving benefit follow the lines of Part II. of the National Insurance Act, 1911. The Act of 1920 requires, however, that the applicant shall have not less than 12 contributions standing to his credit, and requires him to show that he has attended an approved course of instruction if he has been called upon to do so. By a special temporary provision the Act allows all insured persons who have paid 4 contributions to draw up to a maximum of 8 weeks' benefit during the first 12 months. This temporary arrangement was modified by the Unemployment Insurance (Temporary Provisions Amendments) Act of Dec. 1920 which permitted any person to draw up to a maximum of 8 weeks' benefit during the first year of the operation of the Act upon proving that he had been employed during 10 weeks in the course of the year 1920, or during 4 weeks since July 4 1920 in any employment which is within the scope of unemployment insurance. Arrangements for deciding disputes follow the scheme of 1911.

Special Schemes.—Provision is made in the Act for the management by separate industries of the unemployment insurance of workpeople employed therein. Section 18 of the Act enables the Minister of Labour to approve a "Special Scheme" submitted to him by employers and employees in any industry to which compulsory unemployment insurance applies. The main conditions governing the formation of special schemes are that: (1) The scheme must cover all persons employed in the industry either throughout the country or over some defined area. (2) The benefits, which may include payment for short time as well as unemployment benefit, must be, on the whole, not less favourable than those provided under the general scheme. (3) The State contribution to a special scheme will be limited to an amount not exceeding $\frac{2}{10}$ of the contribution the State would have made if the members had remained under the general scheme. (4) The scheme will be administered not by the Ministry of Labour, but by a joint body of employers and employed in the industry specially set up for this purpose.

The Act contemplated the formation of such special schemes before July 1921, and provided for the payment to the responsible body of contributions collected from members of the industry before the scheme is launched. The provisions as to special schemes went far to meet a body of opinion that industries should bear the burden of their own unemployment. When the Act was passed, the Government actually contemplated the formation of special schemes in respect of rather less than 4 million out of a total of some 12½ million insured workpeople. The event seemed likely to prove that this was a generous estimate.

Provision was also made (Section 20) for the creation of supplementary schemes of unemployment insurance by any industry which did not form a special scheme. Such supplementary schemes might, out of special contributions, provide additional benefits including provision for short time or for unemployment not covered by the general scheme. When approved by the Minister of Labour, supplementary schemes have statutory effect.

The Act of 1920 (Section 17) reproduces Section 105 of the Act of 1911, which enables associations of insured workpeople to undertake the payment to their members of unemployment benefit due from the State fund. Of the various provisions made in the Act of 1911 for the refund or reduction of contributions in certain circumstances, the provision for the refund to workmen at the age of 60 of the amount of the value of their contributions over the amount of benefit received is alone reproduced (Section 25). The Minister of Labour is enabled (Section 31) to arrange for keeping and stamping at an employment exchange the insurance contribution cards and books of workpeople engaged through the exchanges.

Statistics of Insurance.—Table II. shows the extent to which unemployment benefit was drawn in the industries covered by the unemployment insurance scheme since Jan. 1913, when unemployment benefit was first payable. During the operation of the out-of-work donation scheme for civilians (Nov. 25 1918 to Nov. 24 1919) unemployed workpeople as a rule availed themselves of their rights under that scheme, and were debarred from drawing unemployment benefit concurrently.

War Work of the Exchanges.—With the outbreak of the World War, the character of the work done at the employment exchanges was necessarily altered to meet the exceptional conditions, and it continued to change with the development of events until the restoration of more or less normal conditions at the end of 1919. Immediately upon the declaration of war, the exchanges were called upon to assist the war departments in mobilization by the supply of large numbers of skilled and unskilled civilian workmen. Up to Aug. 14 1914, nearly 30,000 workmen were supplied through the exchanges for this purpose. In the earlier months of the war, unemployment upon a large scale was anticipated and was experienced in certain industries, particularly in the textile industries. To meet this situation, the exchanges coöperated in the collection of information as to the extent and character of unemployment with the local representative committees which were formed by local authorities at the suggestion of the Government. The exchanges also assisted in the distribution of special grants in aid of unemployment benefit paid by trade unions, upon the lines of Section 106 of the National Insurance Act, 1911. From Aug. 1914 to March 1915, the amount of such special grants was £74,026. Unemployment decreased rapidly with the progress of recruiting and the development of war industries, and from early in 1915 to the end of the war, the employment exchanges were engaged upon a series of schemes to use the man-power of the nation to the best advantage.

Enrolment Schemes.—In order to obtain a body of mobile skilled labour for munitions work, and in order also to make it possible to put pressure upon employers to make full use of the skilled workmen in their establishments, several enrolment schemes were set on foot whereby selected workmen undertook, in return for guaranteed minimum pay and a subsistence allowance, to work at any place at which they might be required (*see* LABOUR SUPPLY AND REGULATION). Thus enrolment of volunteers was begun in 1916.

Priority of Labour.—From 1916 to the end of the war, a system of controlling the available supplies of labour for civilian war work of all kinds was developed apart from the enrolment schemes. As early as April 1915, certain classes of the employers, mainly those engaged

^a Outbreak of war.

^b Unemployment insurance extended to cover 3½ million workpeople (in place of 2½ million).

^c Armistice Nov. 11.

^d Out-of-work donation for civilians ceased Nov. 25.

^e Coal-miners' strike Oct. 15.

^f Unemployment insurance extended to cover total of about 12 million workpeople.

in engineering and shipbuilding, were restrained from enticing workpeople to their establishments from employers elsewhere, and were prohibited from seeking to engage workmen from a distance of more than 10 m. otherwise than through the employment exchanges. In 1916, arrangements were made to reach agreement between the various departments responsible for production as to the order in which demands for labour should be met. In their fully developed form, these arrangements involved frequent periodical consultation between the producing departments, and the grading of current demands for labour according to their importance. The labour needs of employers in war industries were graded as entitled to "Super-Priority," "First" or "Second Class Priority," or as not deserving special treatment. Decisions of this character were given upon the demands of employers as notified to the employment exchanges. Such demands from the whole kingdom were brought together in the central clearing house of the unemployment department, and the classified lists of labour demands issued upon this basis were circulated to all employment exchanges. A general list of vacancies was issued by the clearing house in the manner already described, and a special list known as the "Munition Workers' Gazette," relating especially to the most important labour demands in the engineering industry, was issued by the clearing house upon the authority of the Ministry of Munitions. The employment exchanges working upon the information so supplied, were able to influence appreciably the distribution of any local surplus of labour.

War Employment of Women.—With the development of war production, the demands for women's labour became far greater than the supply which was available immediately. In order to obtain control of the distribution of the available supplies of women's labour, Government and controlled factories were required to engage all women through the employment exchanges. Further, a large proportion of the women employed in other factories engaged upon war work was supplied through the exchanges. The exchanges carried out a continuous campaign for recruiting women for these purposes, the total number supplied by the exchanges amounting to more than 1,080,000. Recruiting for the Women's Service Corps was also undertaken by the exchanges. Forty-three thousand seven hundred women were recruited by the exchanges for Queen Mary's Army Auxiliary Corps (W.A.A.C.), 5,700 for the Women's Royal Naval Service (W.R.N.S.) and 16,300 for the Women's Royal Air Force (W.R.A.F.).

Labour from Abroad.—In order to avoid difficulties with British workmen, employers were compelled to arrange the engagement of alien workpeople required for munition work through the employment exchanges. The principal work in this connexion was finding employment for about 65,000 Belgian workpeople.

Release from the Forces.—In the early stages of the war, large numbers of workmen, possessing skill which was of great value upon civil war work, joined the army. Arrangements were made subsequently for the release from the army of a number of these men. The staff of the employment exchanges were largely employed in selecting such men for release.

Substitution.—During 1917 and 1918, the employment exchanges, and the local employment committees from their formation at the end of 1917, were largely occupied upon endeavouring to obtain substitutes for men in civil life who had been certified as available for military service upon the supply of a substitute. This work was one of great difficulty and was carried out with the National Service Department, subsequently the Ministry of National Service.

Work for Demobilization.—Before the conclusion of the war, an elaborate scheme for the demobilization of the forces according to industrial requirements had been elaborated (see DEMOBILIZATION AND RESETTLEMENT). The employment exchanges and the local employment committees were responsible for preparing and applying the original scheme of demobilization upon its civil side, and upon the introduction of the "Contract" scheme they continued to assist in the work and were responsible for dealing with the increasing numbers of unemployed ex-service men. The local employment committees performed a very valuable service in pressing upon employers in every area the obligation to re-engage the men who had been employed by them before the war.

The employment exchanges assisted in the redistribution of workpeople which followed upon the conclusion of war contracts. They endeavoured to arrange with employers for discharges to be regulated with a view to fresh employment which seemed likely to be available. Workpeople about to be discharged from war work were invited to supply the exchanges with particulars of their industrial experience with a view to fresh employment being found for them, and some 130,000 workpeople took advantage of this arrangement. The exchanges also supplied free railway passes to munition workers who were returning to their homes or were going to fresh employment. Discharges from war work were at their maximum towards the middle of 1919, that is to say at the time when demobilization of the forces was proceeding most rapidly. The effect of this double stream of workpeople seeking employment is to be seen in the particulars of the payment of out-of-work donation.

Throughout the resettlement period, the work of the local employment committees was of the greatest value. In order to strengthen their organization, divisional councils were formed consisting of representatives of the committees in each division.

Out-of-Work Donation.—Early in the war it had been decided that members of H.M. forces should be entitled to certain payments during unemployment following their discharge at the conclusion of the war. Proposals to extend compulsory and contributory unemployment insurance to the bulk of workpeople engaged upon civil work had not fructified during the war. When, therefore, the end of hostilities was in view, the Government decided that the out-of-work donation scheme should apply to civilian workpeople as well as to all non-commissioned members of H.M. forces. The scheme came into operation on Nov. 25 1918.

In the first instance donation was granted to ex-service men at the rate of 20s. a week with allowances for dependent children under the age of 15 at the rate of 6s. for the first child and 3s. each for other children, for 26 weeks, and at the rate of 20s. a week with unreduced allowances for dependent children for a further period of 13 weeks. The period during which this 39 weeks' donation could be drawn was the period of 12 months following the end of a man's demobilization furlough. Civilian workers were entitled to donation for a maximum period of 13 weeks in respect of unemployment occurring during the six months ending May 24 1919, and the donation was at the rate applicable to the first 26 weeks of the donation paid to ex-service men. In order to be entitled to donation, civilian workers were required to show that they had become employed contributors under the National Health Insurance scheme at least 3 months prior to Nov. 25 1918, or if they were under 16 or over 70 years of age, to produce equivalent evidence of employment. Donation was paid at half rates to persons under 18. Persons who were entitled to out-of-work donation applied to the local employment exchange upon becoming unemployed, and produced evidence that they were qualified to receive donation under the conditions of the scheme. Thereafter the procedure approximated to that adopted in the administration of unemployment insurance; that is to say, donation was refused if it appeared that the applicant had left his previous employment without just cause or as the result of misconduct or of a trade dispute, and donation was withdrawn if suitable work was refused. Disputed claims were dealt with by a local court of referees.

The out-of-work donation scheme was modified in respect of civilians in May 1919 by a postponement until Nov. 24 1919 of the date up to which a total of 13 weeks' donation could be drawn. At the same time the rate of donation for civilian workers was reduced to 20s. for men and 15s. for women, together with unaltered allowances for dependents, and the conditions for the receipt of donation were made more stringent by requiring the applicant to prove employment in 20 weeks during 1918 and by a review by the local employment committees of all applications for donation with a view to their rejection unless the committee were satisfied that the applicant was (a) normally in employment, (b) genuinely seeking work, and (c) unable to obtain it. The donation to civilian workers was also extended by the grant in March 1919 of donations for a further maximum period of 13 weeks (making 26 weeks in all) at the rates and under the conditions applied in May 1919 to the original grant of donation. Out-of-work donation ceased to be payable to civilian workers on Nov. 24 1919. Out-of-work donation to ex-service men was extended in respect of all ex-service men who had exhausted their rights under the original scheme by the grant of a further maximum of the 12 weeks' donation at the rate of 20s. a week without children's allowances during the period Nov. 25 1919 to March 21 1920, a further 12 weeks' donation between April 1 1920 and July 31 1920, and a further 14 weeks' donation between July 31 and Nov. 6 1920. By a further extension, donation was granted to ex-service men up to a maximum of 14 weeks during the period ending March 31 1921. The local employment committees were entrusted with a review of the individual grants of donation upon the occasion of each extension. This review involved very heavy work in all localities, as will be realized from the number of donation policies upon which payment was being made in successive months. There were, for civilians (up to Nov. 1919, when their donation ceased):—in 1918, Dec. 350,707; in 1919, Jan. 625,149; Feb. 782,363; March 753,982; April 689,933; May 384,290; June 233,282; July 177,221; Aug. 141,132; Sept. 100,731; Oct. 135,185. For ex-service men the figures were: 1918, Dec. 23,988; 1919, Jan. 53,554; Feb. 166,257; March 306,203; April 403,467; May 386,921; June 372,843; July 363,663; Aug. 336,952; Sept. 302,272; Oct. 344,242; Nov. 358,823; Dec. 370,610; 1920, Jan. 377,116; Feb. 293,144; March 240,508; April 219,226; May 196,508; June 174,224; July 139,860; Aug. 143,186; Sept. 158,759; Oct. 172,834; Nov. 102,144; Dec. 244,061.

In June 1920, the Minister of Labour appointed an independent committee, under the chairmanship of Mr. G. N. Barnes, M.P., "to examine the working and administration of the employment exchanges in Great Britain and to advise as to their future." The committee presented a report signed by all but one of their number in Nov. 1920 (Cmd. 1054). They found that the employment exchanges are a necessary corollary to the State

system of unemployment insurance and they made a number of recommendations designed to insure that the exchanges should be fully effective for their purpose. The committee recommended that the facilities of the employment exchanges should be available to all persons, whether or not they were liable to compulsory unemployment insurance. (J. S. Nc.)

United Kingdom Statistics.

The statistics of unemployment most commonly used—indeed the only statistics available over a long series of years without a special, and laborious, inquiry—are those of unemployment among members of certain trade unions. The principal trade-union statistics of unemployment are therefore given here in Table III. accompanied by some observations as to the limitations of their utility.

It should be remarked at the outset that the figures in Table III. cannot be taken as necessarily an accurate measure of general unemployment; all that can safely be assumed is that they give a fairly trustworthy indication of the *direction* of the curve of rising or falling employment, and some indication of the severity of each successive depression, and of the high-water mark reached by the intervening period of good trade. For this purpose the exaggeration of the fluctuations, due to the preponderance of the metal, engineering, and shipbuilding trades, is no great disadvantage; but it is always necessary to remember that the fluctuations are exaggerated by the use of these figures.

It should also be remembered that the figures relate to members of trade unions, and to those only in certain trades, and are almost confined to (i.) men, as distinguished from women or young persons, and (ii.) to skilled men, as distinguished from labourers. It is instructive to examine the constitution of those sections of the work not covered by the trade-union percentages of unemployment given above. These include:—

- (i.) All those workpeople, whether in the trades covered or not, who do not belong to any trade union.
- (ii.) The great majority of labourers, or of semi-skilled men, whether in the trades covered or not.
- (iii.) Practically the whole of the mining industry and of the textile industries; and the whole of the railway, tramway, and omnibus services; the gas, water, and electricity services; dock and wharf labour; agriculture; the mercantile marine and sea fishing; the clothing and the boot and shoe trades; commerce, banking, and insurance; retail trade; the Post Office, and other branches of the civil service and of the municipal services; and many other industries and services.

It will be observed that many of the industries and services mentioned are less subject to fluctuations in employment than the metal, engineering, and shipbuilding trades, which preponderate in the trade-union figures. The industries or occupations mentioned may, for the present purpose, be roughly grouped under three headings:—

(i.) Industries or services which are subject to relatively slight fluctuations in employment. Examples are the Post Office, and other branches of the civil service and of the municipal services; agriculture; the railway, tramway, and omnibus services; the gas, water, and electricity services; employment in banks, insurance offices, and commercial businesses.

(ii.) Unskilled or semi-skilled occupations. The men and women employed in these occupations generally either do not belong to any trade union, or else their trade unions are not in a financial position to pay unemployment benefit.

(iii.) Industries which meet fluctuations in trade by other means than the discharge of workpeople. Mining and the textile trades are good examples of this group.

The third group is deserving of somewhat detailed consideration, as helping to define, by contrast, the term "unemployment"—a term which does not, as is sometimes supposed, cover a perfectly definite and clear-cut conception.

The most frequent alternative to the discharge of workpeople is "short time." A factory, for example, may be entirely closed on Saturday, and work only seven hours (instead of eight or nine) on the other days of the week. It is important to observe, however, that, when the time worked is reduced (say) to three days in each week, the worker is entitled, under the present system of unemployment insurance, to unemployment benefit for the remaining days when he is not working (after the first

July	27.3	10.1	18.7

¹ It should be observed that this is not necessarily identical with the percentage of trade union members unemployed in *all* trade unions making returns, *taken together*. In the early years of the period the metal, engineering, and shipbuilding trades, which are subject to much more violent fluctuations of employment than most other industries, are over represented. By taking the mean of the fluctuating engineering and shipbuilding figure and of the relatively stable "other trades" figure—in other words, by giving the metal, engineering, and shipbuilding trades a constant "weight" equal to one-half of the total—this source of error is corrected.

UNEMPLOYMENT

837

TABLE IV.—Percentage of Insurance Workpeople in receipt of Unemployment Benefit or Out-of-Work Donation.¹

Total, Insured Industries					0.9	1.7	..	2.7
Number of workpeople insured in the month of July	2,071,000	2,326,000	2,075,000	2,020,000	3,632,000	3,922,000	3,721,000	4,188,000

¹ Sawmilling "of a kind commonly done in connexion with other insured trades." Workpeople engaged in sawmilling actually done "in connexion with" other insured trades are included with the other workpeople in those trades. Other sawmilling was not included at all, prior to the Act of 1916.

² These are workpeople engaged in insurable occupations in businesses whose main work is not insurable, e.g. engineering operatives on the maintenance staff of a cotton factory.

³ Sawmilling other than that covered by the Act of 1911.

⁴ Includes "other workpeople insured under the Act of 1911"; also leather workers and rubber workers.

⁵ Based on the first nine months of 1920, Oct. details not being available owing to the coal strike, and Nov. and Dec. owing to the extension of Unemployment Insurance under the 1920 Act.

three, which constitute "the waiting period").¹ Thus "unemployment" and "short time" are not as is sometimes supposed, mutually exclusive terms. The same applies, of course, in the very common case where workers, during a time of depression, are employed in alternate weeks.

A depression is sometimes met, however, by other devices, entirely different from either "unemployment" or "short time." In the weaving section of the cotton industry, for example, it is a very common practice in times of depression to give a weaver (say) two or three looms to mind, instead of the usual four or six. Again, a common complaint among weavers (by no means confined to periods of acute depression) is that of "playing for warps," i.e. of being kept waiting for a supply of the "warp," through which the "weft" threads are woven.

Some term is clearly needed to describe all forms of partial unemployment, whereby a worker's production is reduced, and his or her earning power with it. The useful term "under-employment" is coming into use to an increasing extent for this purpose; it is more scientific than the term "short time" and covers a wider ground. It might properly be used, for example, to describe the state of employment of a dock labourer, who presents himself for work at the beginning of each 4-hour spell of work during the week, but is only taken on for three of them. This cannot, with strict accuracy, be called either "unemployment," or "short time"; but it is a very good example of "under-employment."

Table IV. shows the percentages unemployed among persons insured against unemployment under Part II. of the National Insurance Act, 1911, and the various amending Acts. Under

¹ Statistics of short time workers are kept separate from those of persons entirely unemployed and are not used in the calculation of the percentage unemployed given in Table IV. Alternate week working is counted as short time.

the original Act, compulsory insurance was confined to the building trades and construction of works; the engineering, ironfounding, and shipbuilding trades; the construction of vehicles; and sawmilling "in connexion with or of a kind commonly done in connexion with" any of the other insured trades. Under the Amending Act of 1916, however, compulsory insurance was extended to a number of the "munition" trades. Apart from the difference in the trade constitution of the workpeople covered, these figures differ from the trade-union percentages given in Table IV. chiefly in including the labourers and semi-skilled men, who are almost entirely excluded from the trade-union figures. The numbers insured under the Act in July of each year, 1913-20, are shown at the foot of Table IV.

Under the Unemployment Insurance Acts, 1920 and 1921, substantially all persons liable for Health Insurance contribution, except outworkers and persons employed in agriculture and private domestic service, were required to be insured against unemployment. Employees of local authorities, railways and certain other public utility undertakings, members of the police forces, and persons with rights under a statutory superannuation scheme might, in certain circumstances, be excepted. Persons employed otherwise than by way of manual labour at a rate of remuneration exceeding in value £250 per annum were excepted, as were also juveniles under 16 years of age. The number of persons insured under the Act at May 31 1921 was estimated at 12,190,790, of whom 8,829,320 were males and 3,361,470 were females.

Payment of unemployment benefit was made subject to certain statutory conditions and disqualifications. The procedure required the "lodging" of an unemployed person's unemployment book, and the records of books lodged thus afford a measure of the extent to which unemployment was prevalent in the insured industries. As a by-product of the administration of

UNEMPLOYMENT

these Acts, reliable statistics of unemployment in respect of over 12,000,000 workpeople became for the first time available. At July 29 1921, the number of unemployment books lodged in respect of total unemployment was 1,802,909, while in addition 787 persons were claiming out-of-work donation, making a total of 1,803,696, or 14.80% of the total number insured.

Table V. shows by main industrial groups and by sex the number of persons insured under the Unemployment Insurance Acts, 1920 and 1921, and the number and percentage of persons totally unemployed whose unemployment books or out-of-work donation policies remained lodged at July 29 1921.

Table VI. analyzes the figures in respect of systematic short time working by main industrial groups and by sex.

An applicant for unemployment benefit under the Acts was required to prove continuous unemployment, and it was provided that two periods of unemployment of not less than two days each, separated by a period of not more than two days during which the insured contributor had not been employed for more than 24 hours, or two periods of unemployment of not less than six days each, separated by an interval of not more than six weeks, should be treated as continuous unemployment for this purpose. Persons employed in establishments where, owing to depression in trade, the number of working days had been reduced on a systematic basis in such a manner as to fall within the above provision, were accordingly eligible for benefit. The number of persons claiming benefit in respect of systematic short time working at July 29 1921 was 534,253, or 4.38% of the total number of persons insured. Among males the percentage amounted to 3.15, while among females the percentage was 7.61.

UNITED STATES

There were in 1921 no exact data on the number of unemployed in the United States. Studies made by the Federal Government and by the states were based chiefly on information received from the labour unions, and represented unemployment among organized labour only. For some years Massachusetts published a *Quarterly Report on Employment*, which combined reports from the trade unions and the employment offices, and later also from Boards of Trade, Employers' Associations and editors of trade journals, as well as statistics of building operations in the cities. The publication is continued from March 1920 in the *Quarterly Massachusetts Industrial Review*. In 1915 New York State inaugurated the practice of compiling statistics

¹ Prior to July 29 1921 a period of three days was admitted.

on unemployment from reports received from representative manufacturers of the state. These statistics are published monthly in *The Bulletin and Labor Market*. The Wisconsin Industrial Commission has adopted the New York plan of employment records for statistical studies covering the period since 1915. Other states do not publish regular records.

TABLE VI.—Short Time: July 29 1921.

Industry	Number of Short Time Workers claiming U. I. Benefit and Donation, July 29 1921			Percentage on Systematic Short Time, July 29 1921		
	Males	Females	Total	Males	Females	Total
Building and Works of Construction	5,930	25	5,955	0.58	0.28	0.58

Studies made by H. Hornell Hart of the Russell Sage Foundation show that while the industrial pop. of the United States increased from approximately 19,500,000 workmen in 1902 to about 30,200,000 in 1917, the demand for labour did not increase at the same ratio. In 1902 an average of 2,750,000 workers was out of employment at all times during the year; in 1903, 1906, 1907, 1910, 1917, the annual average fell below 2,000,000; in the depression of 1908 it was 3,500,000 and in that of 1914-5 it was 4,500,000. Throughout the 16 years 1902-17 the unemployed constituted, on the average, 9.9% of the labour force; but it reached 14.1% in 1902, 14.8% in 1908; 15.8% in 1914 and 16% in 1915. On the other hand it fell to 5.5% in 1906, 7.1% in 1916 and 4.7% in 1917. The other years saw fluctuations between these extremes. In 1903, 1906, 1907, 1910 and 1917 the demand for labour was strong; in 1908, 1914 and 1915 it was weak. In the other nine years it varied less, with a little more than 2,000,000 out of work all the time. No such percentages have been calculated for the years since 1917. Common experience was that the interruption of commerce with Europe in 1914 caused sudden business depression. But as the months passed, and especially after Jan. 1915, war contracts called into industry the "reserve army of the unemployed," and led to a labour shortage, acute in some trades, from 1917 until the signing of the Armistice. Then, in the late fall of 1918, contracts were cancelled and workers were laid off. The public continued to buy, however, and men laid off from war work were absorbed in other industries. There continued to be a demand for labour until Feb. and March 1920, then industry in general began to lay off men. By the end of the year the volume of employment in the factories of New York State had dropped off 20% since March, in Wisconsin it had dropped off 22.5% in the same

According to statistics in the *Industrial Employment Survey Bulletin* for Dec. 1921, 1,428 firms, employing each over 500 persons, located in 65 principal industrial centres of the country, were employing 1,567,374 workers on Nov. 30 1921 as against 1,506,614, on Jan. 1 1921, an increase of 60,760, or 3.7%. Of the 14 industrial groups recognized by the U.S. Census, 9 reported an increase in employment in Nov. 1921 over Oct. 1921, viz.: paper and printing; lumber; vehicles for land transportation; tobacco manufactures; iron and steel; chemicals; stone, clay and glass; textiles; and metals and metal products. A decrease was reported by 5, viz.: liquors and beverages; railway repair shops; food products; leather and its products; and miscellaneous industries. Of 65 cities, 40 reported an increase in employment, 24 a decrease, and 1 no change, since Oct. 31 1921; total net increase reported for the month was 7,219.

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.—

Information as regards earlier years than those here dealt with will be found in 27.508 seq., and as regards England in 9.408 seq.; and similarly in the articles in the earlier volumes on counties and towns in the United Kingdom. See also ENGLISH HISTORY, ENGLISH FINANCE, IRELAND, SCOTLAND, BRITISH EMPIRE, COAL, SHIPPING, RAILWAYS, etc.

Population.—A census of the United Kingdom was taken in April 1911, and one of Great Britain on June 19 1921. On the latter date no census of Ireland could be taken owing to its disturbed condition, and the census in Great Britain was postponed from the customary month of April owing to the coal dispute and attendant industrial troubles. The postponement had certain effects upon the returns, such as enhancing the

TABLE 1.—Population 1911, 1921.

	Area	Population		Pop. per sq. m. 1921 (or +1911)	Increase (+) or decrease (−) %		1921 (or +1911)	
		1911	1921		1901-11	1911-21	Males	Females
England	sq. m. 50,890	34,045,290	35,678,530	701	+10.5	+ 4.8	16,984,087	18,094,443
Wales	7,434	2,025,202	2,206,712	298	+17.7	+ 9	1,098,133	1,108,579
Scotland	30,405	4,760,904	4,882,288	160	+ 6.5	+ 2.5	2,348,403	2,533,885
Ireland	32,360	4,390,219	..	(+135)	− 1.5	..	(+2,192,048)	(+2,198,171)
Isle of Man . . .	227	52,016	60,238	265	− 5	+15.8	27,321	32,917
Channel Islands	75	96,899	89,614	1,194	+ 1.3	− 7.7	41,264	48,350

period, but was 13% greater than in Jan. 1915. In New York State employment in Dec. 1920 was 0% greater than in Dec. 1914, and about equal to that in June 1914. In Jan. 1921 employment in Wisconsin declined 11.3%, the greatest decline in any single month since July 1920, making the total decline since the first quarter of 1920, 29.5% and bringing the number employed to the same as in the first quarter of 1915. The number increased 1.6 in Feb. 1921, the first increase in manufacture as a whole since July; the number decreased 4.5% in March, making a total decline since July 1920 of 32.4 per cent. Metal industries suffered most. The climax of unemployment in New York State came in Jan. 1921, but the increase of employment during that month may have been due to seasonal changes rather than to improvement in business conditions. Between Feb. 1920 and Feb. 1921 the number employed in New York State factories had decreased 23 per cent.

In Jan. 1921 an unemployment survey made by the U.S. Employment Service for 35 states and the District of Columbia showed 9,402,000 employed in Jan. 1920 and 6,070,648 employed Jan. 1921, and estimated 3,473,446 as unemployed in the country as a whole. The greatest reduction in employment during this period was that of 82% in Michigan, 50% in Ohio and Indiana, 44% in Illinois, 43% in Connecticut, 38% in Massachusetts, 28% in New York, 32% in Wisconsin, 22% in New Jersey. In establishments studied by the U.S. Bureau of Labor Statistics, the greatest decreases between Feb. 1920 and Feb. 1921 were 44.2% in hosiery and underwear, and 41% in automobile manufactures; the smallest decreases were 2% in bituminous coal-mining and 0.1% in cotton manufacturing.

apparent population of holiday resorts. Preliminary returns for England and Wales, with total figures only for Scotland and other parts of the United Kingdom excluding Ireland, were issued in Aug. 1921 and are utilized in the following tables. Where administrative areas are given, these are for the year 1921, and the population figures for 1911 are adjusted to them.

The preliminary figures for 1921, for England and Wales, reveal an increase in the decennial period of 4.93%, a figure proportionately much lower than ever recorded before. The effect of the World War is clearly seen in the analysis, which gives, for the intercensal period: births registered 8,275,400; deaths registered in England and Wales, 5,266,000; loss due to excess of outward over inward emigration 1,193,750, of which 560,000 is estimated as representing deaths of non-citizens outside the United Kingdom; leaving a net intercensal increase of 1,814,750. The increase % in intercensal periods is given thus for major divisions:—

	1901-11	1911-21
Wales	18.1	9
Midland counties	11.2	5.9
Northern counties	10.3	4.9
London and adjacent counties	11	4.4
Southern counties	9.5	3.9
Eastern counties	7.6	3

The urban pop. of England and Wales is given as 78.1% of the whole in 1911 and 79.3% in 1921; the rural as 21.9% in 1911 and 20.7% in 1921. A future effect of the World War is seen in the increased preponderance of females over males, which, for England and Wales, was as 1,064 to 1,000 in 1901, 1,068 to 1,000 in 1911, and 1,095 to 1,000 in 1921.

TABLE II.—English and Welsh Counties.

Vital Statistics.—In the separate section below (*Medical Examination of the Nation*) the results of the physical census held during the war are discussed. The birth-rate, death-rate, and marriage-rate for the United Kingdom are given in Table IX. for various years down to 1919. The figures per thousand, for 1916 and following years, are based upon estimates of the population in which allowance is made for conditions of military service, and, in the case of the death-rate, upon the deaths and presumed total number of civilians.

TABLE IX.—*Birth-rate.*

	1910	1914	1916	1918	1919
England	25.1	23.8	20.8	17.7	18.5
Scotland	26.2	26.1	22.8	20.2	21.7
Ireland	22.6	22.6	20.9	19.9	20.0

Emigration.—Table XII. shows the number of emigrants, distinguishing English and Welsh, Scottish, and Irish, who left the United Kingdom in 1910 and 1913. During the war emigration decreased, and full particulars for years during and since the war were not available in 1921.

TABLE XII.—*Emigration.*

Year	English and Welsh	Scottish	Irish	Total
1910	241,767	78,040	50,810	370,617
1913	285,809	59,047	44,662	389,608

In 1915, 104,919 British subjects left for places outside Europe.

Occupations.—Table XIII. shows the occupations of the people (excluding children under ten years old), as distinguished in six great groups, or unspecified and unspecified, according to the census of 1911.

TABLE XIII.—*Occupations.*

	England & Wales	Scotland	Ireland
Government Defence	299,599	47,408	..
Professional	205,817	81,675	131,035

Unoccupied and Un- specified	12,234,914	1,226,242	2,494,958

Pauperism.—Table XIV. gives particulars in regard to the number of persons receiving poor relief in England and Wales on Jan. 1 in each year.

TABLE XIV.—*Pauperism.*

Jan. 1st	Institutional	Domiciliary	Lunatics & Casuals	Total
1914	264,292	388,917	108,509	761,718
1915	258,962	394,843	108,255	762,060
1916	226,466	354,325	103,758	684,549
1917	215,283	321,813	100,231	637,327
1918	198,493	296,104	92,188	586,785
1919	183,110	287,244	84,263	554,617
1920	186,273	305,822	84,323	576,418

In Scotland, on May 15 1916, the figures for paupers were 95,857, and on the same day in 1917, 89,779. Figures for Ireland, on Mar. 31 in each year, were: 1914, 76,093; 1915, 73,508; 1916, 68,864; 1917, 67,522.

Agriculture.—(See also the article AGRICULTURE). The depression in British agriculture, which set in in 1879 and culminated in 1894, continued to show some abatement down to 1914, although in that year arable land in the United Kingdom amounted only to 19,414,166 ac. against 24,092,075 ac. in 1870, and wheat production only to 7,804,041 quarters against 13,419,406 quarters. British agriculture had turned away from the cultivation of cereals and towards the raising of stock. At the outbreak of the World War, therefore, Britain, as a country importing the vastly greater proportion of its food-stuffs, was faced with the possibility of a shortage and of an adverse effect upon exchanges owing to compulsory importation, at enhanced prices, while countervailing exports necessarily diminished. The researches of various Royal Commissions, the efforts of the Government and public bodies, and the effect of high prices, resulted, from the early part of 1917, in a large extension of arable cultivation, 1,497,293 ac. being added to the area under tillage in Great Britain in 1917-8.

Tables XV. and XVI. show the total area of arable land and of permanent grass in the four divisions of the United Kingdom for each year 1912-20.

TABLE XV.—*Arable Land.*

June 4th	England acres	Wales acres	Scotland acres	Ireland acres

1920	7,104,000	8,211,000	22,600,000	6,374,000	281,000

Fisheries.—The war had a profound effect upon British fisheries. They were restricted not merely by military operations, but also by the diversion of so many fishermen and vessels to naval service. The figures in Table XVIII. illustrate the limitation of production and the increase of prices.

TABLE XVIII.—Fisheries.

Year	Wet Fish Landed				Value of Wet Fish £	Value of Shell Fish £
	Eng. & W. Cwt.	Scotland Cwt.	Ireland Cwt.	U. K. Cwt.		
1910	13,117,681	8,709,655	1,041,351	22,868,687	11,382,740	357,314

Minerals and Mining.—Tables XIX. and XX. show the output and value of minerals raised and metals manufactured in the United Kingdom in 1910, 1914, 1917 and 1919, and illustrate the inflation of prices during and since the war. The figures for 1917 also indicate the effect of the war upon output, but at the same time demonstrate that coal production, in spite of all difficulties, was not permitted to decline to the extent that is seen in other cases.

For coal production and statistics see COAL. Iron ore raised in the various counties of the United Kingdom and in the most productive counties in England is shown in Table XXI. in tons for the years 1910, 1915, and 1919.

TABLE XXI.—Iron Ore Production.

	1910 Tons	1915 Tons	1919 Tons
England			
Cumberland	1,334,751	1,323,408	982,143
Lancashire	408,090	338,086	231,534
Leicester	560,410	685,137	534,595
Lincoln	2,128,161	2,806,989	2,787,322
Northampton	2,649,539	2,517,150	2,202,177
Stafford	913,006	703,231	704,376
York	6,198,411	4,821,465	3,732,476
England (including other counties)	14,471,108	13,729,146	11,863,597
Wales	41,455	91,299	65,974
Scotland	648,415	375,241	308,721
Ireland	65,037	39,326	15,903

The home production of tin ore (almost exclusively in the S.W. of England) is shown in Table XXII. to have had some revival in 1910-14, with a marked increase in world prices in and about 1912, and a further increase during the war, followed by a decrease at its close.

TABLE XXII.—Tin Ore Production.

Year	Tin Ore Tons	Value £
1910	7,572	655,871
1912	8,166	1,012,290
1914	8,085	661,865
1916	7,893	712,142
1917	6,573	784,493
1919	5,156	678,823

Textile Industries.—The quantities of raw cotton imported, exported and retained for consumption are given in Table XXIII. for 1910, 1912, 1914 and subsequent years. The restriction of export imposed by war conditions is most clearly illustrated by the figure for 1918. The figures for wool are given in Table XXIV. on the following page.

TABLE XXIII.—Cotton.

Commons totalled 707:—England 402 (an addition of 31), Wales 36 (addition of 2), Scotland 74 (addition of 2), Ireland (the Act did not cover Irish redistribution), 105. On the extension and revision of the franchise under the Act, see ENGLISH HISTORY.

Local Government.—Some important changes were made in the municipal status of towns in England and Wales in the years preceding 1920. Barnsley, Carlisle, Darlington, Dewsbury, Eastbourne, East Ham, Southend-on-Sea, Stoke-on-Trent, Wakefield and Wallasey became county boroughs. Aylesbury, Buxton, Devonport, Fowey, Llanelly and Stourbridge became municipal boroughs. The following were created urban districts:—Ardwick-le-Street, Axminster, Beddington and Wallington, Bedwas and Machen, Bentley with Arksey, Bletchley, Bungay, Chorleywood, Coulsdon and Purley, Cwmaman, Haslemere, Letchworth, Leyland, Long Benton, Market Drayton, Mitcham, Oadby, Prudhoe, Seaton Delaval, Spenborough, Stratford and Wolverton, Tilbury, Yiewsley. The following urban districts changed their names:—Ynseynhaiarn to Portmadoc, Ystradyfodwg to Rhondda, Merton to Merton and Morden, New Shoreham to Shoreham-by-Sea, Presall with Hackensall to Presall, Hunstanton to New Hunstanton, Hucknall Torkard to Hucknall, Newbold and Dunstan Whittington to Whittington and Newbold. The Greater Birmingham scheme, which came into operation Nov. 9 1911, included in the city of Birmingham the former borough of Aston Manor and certain urban districts. (O. J. R. H.)

MEDICAL EXAMINATION OF THE NATION

In order to appreciate the nature and scope of the physical census of men of military age carried out in the United Kingdom by the Ministry of National Service during the last years of the World War, it is necessary to recapitulate briefly the phases through which the recruiting arrangement for the British army passed during the earlier stages of the war.

Before the war the British army was a voluntary army, and only men between 18 and 30 years of age of good physique and free from any physical defect were accepted for enlistment. It was laid down that the height and chest measurements of each recruit should accord with each other and with his age in conformity with the official table of standards. Each recruit whose physical condition did not conform to these standards was re-

garded as unfit and not accepted. In short, the army accepted for service only the best human material.

At the outbreak of war in Aug. 1914, there was a tremendous rush of recruits to the colours, and perforce attempts were made to deal, on the same simple plan, with the tens of thousands of men who besieged the recruiting offices. The need for soldiers was clamant, irresistible, and there was no time to devise another method. The result was inevitable—the army was flooded with men who after a few weeks or months of service broke down and proved useless. The authorities then saw that in this war they were confronted with a new problem—men had to be provided on a scale never before contemplated and the manpower resources of the country were to be strained to the utmost. The army needed would have to employ men of different degrees of physical fitness, since the available number of perfectly fit men would not be adequate for all the needs of the country. It was therefore necessary to classify recruits according to their fitness for the very varied duties for which the army required men—the old simple division into “fit” and “unfit” was no longer sufficient: recruits must be classified or graded so that as far as possible every man called up for service should be allotted to the particular occupation in the army for which he was fitted by his training and degree of physical fitness. Accordingly, a system of categories was introduced whereby recruits were classified by medical boards as being fit for general service, field service at home, garrison service, labour or sedentary work; as experience of this system accumulated various modifications and sub-divisions of these categories were subsequently introduced to meet the difficulties which arose in their application in practice.

Meantime, on Jan. 27 1916, the first Military Service Act, which provided for the compulsory service of unmarried men between the ages of 18 and 41, came into operation, and on May 26, a like obligation was imposed on the married between those ages. By this time, the difficulty of categorization was becoming painfully evident; it consisted essentially of the fact that the category was not a purely medical classification but rather a kind of administrative shorthand founded upon medical information. In other words, medical boards were required to perform the functions of a posting board, as well as their proper medical function of assessing the degree of physical fitness of the men examined. The attempt to combine these functions failed, as in the light of experience we can see it was bound to fail, and was in fact the cause of the growing volume of dissatisfaction which became steadily more general and more emphatic during the latter half of 1916 and the early months of 1917. The examination of men called up under the Review of Exceptions Act in April 1917 caused a storm of hostile criticism; this led to the appointment of the Shortt Committee, which, in Aug. 1917, recommended to the House of Commons that the whole organization and administration of examination should be transferred from the War Office to civilian control. Accordingly, the Ministry of National Service—the Department entrusted with this work—assumed these duties as from midnight Oct. 31 1917.

The immediate medical duties of the Department were: (1) To introduce a new system of grading—the grade of each man to be determined by physical considerations alone—to replace the system of categorization in which administrative as well as medical considerations were taken into account; (2) to lay down definite standards of physical efficiency for the guidance of members of examining boards; (3) to establish National Service Medical Boards for the examination of men of military age.

As regards the personnel of the boards, great care was taken to select suitable chairmen who were generally whole-time medical officers. Members of the boards (1 chairman and 4 members constituted a board) were drawn from a panel of local civilian doctors of good standing—a system which made for efficient work, economized the medical man-power of the country and was at the same time elastic. These boards were established at convenient centres all over Great Britain. At first they numbered 97 and were soon examining some 80,000 men per month. The number of boards steadily increased to cope with

the increasing work. In April 1918 285,631 men were examined, in May 456,999, and in June 475,416; by this time the number of boards was 200. After this the pressure relaxed somewhat, and the numbers in succeeding months were July 371,923, Aug. 158,544, Sept. 97,694, Oct. 110,255.

From the outset instructions were issued to boards that they were to grade all men brought before them according to their physical fitness at the time of examination in conformity with the following standards:—

Grade I.—Those who attain the full normal standard of health and strength and are capable of enduring physical exertion suitable to their age. Such men must not suffer from progressive organic disease, nor have any serious disability or deformity. Minor defects which can be remedied or adequately compensated by artificial means will not be regarded as disqualifications.

Grade II.—Those who for various causes, such as being subject to partial disabilities, do not reach the standard of Grade I. They must not suffer from progressive organic disease. They must have fair hearing and vision, be of moderate muscular development, and be able to undergo a considerable degree of physical exertion of a nature not involving severe strain.

Grade III.—Those who present marked physical disabilities or such evidence of past disease that they are not considered fit to undergo the degree of physical exertion required for the higher grades. Examples of men suitable for this grade are those with badly deformed toes, severe flat-foot, and some cases of hernia and of varicose veins (others are indicated later under the headings of the various diseases and disabilities). The third grade will also include those who are fit only for clerical and other sedentary occupations, such as tailoring and bootmaking.

Grade IV.—All those who are totally and permanently unfit for any form of military service.

In order to assist the boards in their task of grading, and to insure uniformity as far as possible through the country, instructions were also issued to them indicating the effect of some 60 common disabilities and diseases upon the grading. Thus, in the Ministry of National Service, a department was created with the administrative machinery requisite not only to supply the armed forces with recruits, but also to survey the physical fitness of the male population of military age and so provide a physical census of the human material at the disposal of the country for all its needs. It is evident that, until categorization with its administrative factors was abandoned and grading by physical considerations alone introduced, true inferences as to the health and fitness of the male population could not be drawn from the statistical returns of recruiting. With the introduction of the new system on Nov. 1 1917, the statistical returns at once became of great value, and provided for the first time a physical census of part at least of the population.

The number of examinations completed during this last year of the war with the numbers placed in each grade is shown in the accompanying table:—

Medical Examinations (Period Nov. 1 1917 to Oct. 31 1918).
No. of Examinations and Retexaminations.

Grade I.	871,769	(36.0 %)
Grade II.	546,276	(22.5 %)
Grade III.	756,859	(31.3 %)
Grade IV.	250,280	(10.2 %)
Total	2,425,184	

It will be noted that of the 2,425,184 examinations 871,769 resulted in the man being placed in Grade I., 546,276 in Grade II., 756,859 in Grade III., and 250,280 in Grade IV. In other words 36% were placed in Grade I., i.e. were judged to have attained the full normal standard of health and strength, and to be capable of undergoing physical exertion suitable to their age; 22% were placed in Grade II., i.e. were judged to be capable only of undergoing such physical exertion as did not involve severe strain; 32% were placed in Grade III., i.e. presented marked physical disabilities or such evidence of past disease that they were not considered fit to undergo the degree of exertion required for the higher grades; 10% were placed in Grade IV., i.e. were judged to be totally and permanently unfit for any form of military service. This result may be summarized by saying that of every 9 men of military age in Great Britain in the year under review 3 were perfectly fit and healthy, 2 were definitely below the normal standard of health, 3 were unfit to undergo any-

thing but the most moderate degree of exertion, and the remaining man was a chronic invalid.

Exception has been taken to these inferences on the ground that these grading results are not a true reflection of the health of the nation for two reasons:—

First, that the grading was inaccurate. In reply to this criticism it is to be observed that men dissatisfied with their grading had the right to appeal to an independent tribunal against their grading, and that the number of men whose grading was altered on appeal was less than 0·4% of the total number of examinations, in other words an independent tribunal only altered the finding of the board in between 3 and 4 cases out of every 1,000. Further, though we do not know to what extent grading was found by actual experience in the army (the only real criterion) to represent truly the degree of physical fitness, it is certain that any conclusions we may reach from the grading results will, if anything, lead us to overrate the physical fitness of our manhood, since every factor in the situation contributed toward grading men too high rather than too low.

Secondly, that the men examined were the dregs of a population exhausted by 3 years of war. This criticism, though natural and self-evident at first sight, is inadmissible principally for the reason that it is made in ignorance of the extent to which fit men of military age were employed in such industries and occupations as agriculture, mining, shipbuilding, and munition works, and protected from recruitment by law during the earlier years of the war, remaining in civil life until in the fourth year of the war these industries had to be "combed-out" in response to the increasing strain upon the diminishing reserve of man-power. Analysis shows that the men examined during the year under review belonged to one of the five following groups:—

(1) Men in the protected industries, which in the nature of things employed a high proportion of the physically fit, and this group was numerically much the largest.

(2) Men who were now refused further exemption by tribunals owing to the urgent demand for men caused by the military situation.

(3) Lads who attained the age of 18 years during this year; in number 261,137.

(4) Men who had been previously rejected when the need for soldiers was less urgent.

(5) Men between 41 and 51 who became liable for military service under the Military Service No. 2 Act of April 1918.

Inasmuch as group (1), the largest, comprised an abnormally high proportion of the physically fit, group (4) an abnormally low, and group (2) an average proportion, while groups (3) and (5) were a "virgin soil," we can hardly escape the inference that in the aggregate the men examined during the year under review represented the manhood of military age from the standpoint of health and physique, and that therefore the observations made at their medical examinations form a trustworthy criterion of the national health.

With this general picture before us, we may well and rightly ask what are the causes of this great mass of physical inefficiency which low grading means and to what extent is it preventable. After all, the large majority of babies are born healthy, and the conditions and environment subsequent to birth are created by mankind and are capable of a large range of modification. It will be readily understood that such a mass of records and observations require full and detailed analysis before complete conclusions as to the lessons obtained can be reached. While a complete analysis was not yet available in 1921, the matter had been sufficiently explored to reveal several striking results.

First, as to the causes for which such a large proportion of men were placed in Grades III. and IV., viz., 1,007,139 or 41·5% of the total number of examinations. Men placed in these grades, it must be remembered, presented such marked physical disabilities or such evidence of past disease that they were only considered fit to undergo the most moderate degree of exertion, and some were so incapacitated as to be totally and permanently unfit for any form of military service. The reasons for 2 out of every 5 men of military age being so physically unfit clearly requires explanation. The largest group of men in these two grades which has been analysed is 160,545 men, examined in the London region during the period Jan. to Oct. 1918; of these 82,645 were placed in Grades I. and II., the balance of 77,900 (48·5%) falling to Grades III. and IV., namely 60,031 (37·4%) in Grade III. and 17,869 (11·1%) in Grade IV. In the case of the Grade III. and Grade IV. men in this large group the accompanying table shows the disease or disability on account of which they were so graded.

Broadly speaking, this table shows that of this large group of men of military age half were found to be suffering from organic

Disease or disability	No. of men placed in Grades III. & IV.	Percentage of numbers examined	Percentage placed in Grade IV.	Percentage placed in Grade III.
1. Valvular disease of heart	12,562	7·9	1·6	6·3
2. Deformities, congenital and acquired (including flat-foot, hammer toe, kyphosis, etc.)	8,605	5·3	·0	4·3
3. Diseases of circulatory system (other than V. D. H.) including varicose veins	6,275	3·9	·6	3·3
4. Diseases of lungs and bronchi (other than tuberculosis) and of respiratory system	6,188	3·8	·6	3·2
5. Pulmonary tuberculosis	4,327	2·6	2·0	·6
6. Functional diseases of heart	3,385	2·1	·1	2·0
7. Wounds, injuries, etc., including traumatic deformities, amputations, etc.	3,335	2·0	·3	1·7
8. Diseases of ears	3,162	1·9	·3	1·6
9. Diseases of nervous system (other than insanity and epilepsy)	3,066	1·9	·5	1·4
10. Poor physique	2,967	1·8	·2	1·6
11. Defective vision	2,620	1·6	·2	1·4
12. Rheumatism	2,445	1·5	·1	1·4
13. Hernia	2,179	1·3	·2	1·1
14. Diseases of digestive system	2,170	1·3	·2	1·1
15. Diseases of eyes	1,886	1·1	·5	·6
16. Deafness	1,708	1·0	·2	·8
17. Epilepsy	1,265	·7	·5	·2
18. Hemorrhoids	1,140	·7	·05	·65
19. Skin diseases	1,053	·6	·15	·45
20. Diseases of generative organs and of genito-urinary system (other than venereal disease, albuminuria and glycosuria)	983	·6	·075	·525
21. Albuminuria	951	·5	·3	·2
22. Tuberculosis (other than pulmonary)	911	·5	·3	·2
23. Insanity	656	·4	·3	·1
24. Syphilis	556	·3	·1	·2
25. Glycosuria	214	·1	·1	·
26. Venereal disease (other than syphilis)	162	·1	·02	·08
27. Other diseases	3,129	1·9	·375	1·525
	77,900	48·5	11·1	37·4
				11·1
				48·5

disease of one kind or another of a severity sufficient at least to render them incapable of a normally active life. It will be observed that diseases of the heart were the most frequent disability. Valvular disease 12,562 (7·9%) and functional disease 3,385 (2·1%) made up 15,947 cases of heart disease in all, or 10·0% of the number examined. There had been no previous opportunity of gauging the frequency of heart disease among the population, but it can be safely stated that such an incidence as one in ten among men in the prime of life would never have been expected. It indicates the importance that should be attached to insuring that adequate treatment is given to all cases, and to the infections such as rheumatism in which it frequently originates especially in the earlier years of life.

Another figure which naturally attracts attention is that for tuberculosis; 4,327 had pulmonary tuberculosis, 911 had tuberculosis of other organs, 5,238 in all, or 3·1% of the number examined. Of these 3,874 (2·3% of the number examined) were cases sufficiently advanced or sufficiently active to warrant the boards in relegating the men to Grade IV., i.e. totally and permanently unfit for any form of military service. Great doubt and difficulty have always attended all attempts to estimate the frequency of tuberculosis; a disease of many manifestations, it is often impossible to prove its existence in a given case and frequently impossible to exclude it. It is rather striking to find that 2·3% of this large group of men presented sufficiently

definite evidence of its existence to enable the examiners to reject them as useless for any form of military service. This experience was not limited to London, for we find that in Liverpool among 20,704 men the incidence was 2.15% and in Yorks, in a group of 24,281 men, 2.37%. The close correspondence of the incidence found among these 3 large groups of men in different parts of the country suggests very strongly that the figures are trustworthy, and represent with accuracy the frequency of active or established tuberculosis in men in the 3rd, 4th and 5th decades of life.

Apart from specific diseases another feature of this table which invites comment is the 2,067 men (1.8% of the number examined) who were found fit only for the lower grades on account of poor physique. Now the physique of an individual is to be regarded as the effect upon him of his inheritance and environment—it is the net result of all the factors which combine to make him what he is physically. In the absence of evidence of actual racial degeneration poor physique must be attributed to the environment of the individual—to the conditions of life to which he has been subjected. Any evidence that indicates the standard of physique prevailing among men of military age will therefore afford a valuable criterion of the extent to which modern conditions of life do or do not permit of healthy bodily development. Measurements of the height, weight and chest girth are commonly accepted as the practical criteria of physique, and the records of these measurements provide us with an opportunity of investigating and comparing the physique of the men examined.

Now, though the anthropometrical observations made as part of the physical examination of men of military age had not in 1921 been fully worked out, the figures already available are of interest and importance; thus in a group of 71,000 men of all ages between 18 and 41 in the W. Midland region it is shown that at 18 years the average height was 65.6", at 25 years 66.1", at 35 years 65.9", and at 40 years 65.8". On comparing these figures with those of the report of the Anthropometrical Committee of the British Association in 1883, it is found that they are in every case well below the averages then found which were, at 18 years 66.6", at 25 years 67.5", at 35 years 68.0", and at 40 years 67.9". Indeed, these recent W. Midland figures are less favourable than those of Group IV. (the poorest class in the Anthropometrical Committee's report), viz. artisans in towns, and much less favourable than those of Group I., the professional classes in the same report.

Height in Inches.

Age	18 years	25 years	35 years	40 years
W. Midland	65.6"	66.1"	65.9"	65.8"
Group IV.	66.6"	67.5"	68.0"	67.9"
Group I.	68.2"	69.1"	69.1"	69.6"

On the average, therefore, the W. Midland heights are about 1½" below the average stature quoted in the anthropometrical report of 1883.

Turning to the weight tables for the same group of W. Midland men the salient feature is that in no age group in any of the constituent areas (Birmingham, Burslem, Dudley, Worcester, Coventry, Shrewsbury, Hertford, Leamington, Walsall and Wolverhampton) is there a higher average than 137½ lb. Among all the 240 groups in the series only 71 show an average weight of 130 lb. or over, while in all the 24 age groups in Birmingham (which include nearly 20,000 men) there are only 5 groups of 130 lb. and upwards, and no age group under 30 years reaches an average of 130 lb. Comparing the Birmingham figures with those of the Anthropometrical Committee's report (with a deduction of 9 lb. for clothes) it is found that the Birmingham figures are lower throughout to the following extent: at 18 years 11½ lb., at 20 years 14 lb., at 25 years 13½ lb., at 30 years 21 lb., at 35 years 27.5 lb., at 40 years 21.6 lb. The other industrial communities (Burslem, Dudley, Walsall, Wolverhampton and Coventry) show similar deficiencies. The agricultural communities (Worcester and Shrewsbury) show the

best weights, but still below those found by the Anthropometrical Committee to the extent shown in this table:—

Weight in Pounds.

Age	18 years	25 years	30 years	35 years	40 years
Worcester	10 lb.	11 lb.	20½ lb.	22 lb.	21 lb.
Shrewsbury	2½ lb.	9 lb.	19½ lb.	24 lb.	23 lb.

These comparisons speak for themselves.

The average stature and weight of individuals furnish a valuable criterion of the health and physical capacity of a community, and these figures clearly indicate the deleterious effect of modern conditions of life upon the population. This conclusion is further borne out by an investigation of the principal measurements of groups of Grade I. men from every area in Great Britain, which show that the average for a Grade I. man is as follows:—

Height	Weight	Chest girth
5 ft. 6 in.	127.2 lb.	35 in.

Due precautions were taken to insure that these groups were as far as possible representative of the whole, and the results in different parts of the country showed surprisingly small variations from the average. We must therefore conclude that a man presenting the above measurements is to be regarded as an average specimen of the male Briton, who has attained the full normal standard of health and physique—a conclusion which can hardly be regarded with satisfaction. With regard to Grade I. youths of 18 years, similar data for all areas are unfortunately not available, but the average for a considerable group in the N.W. region worked out as follows:—

Height	Weight	Chest girth
5 ft. 5 in.	117.3 lb.	33.4 in.

If we accept this group of youths as representative (and there is no reason to think it is not so) and compare these figures with the corresponding measurements of the Grade I. men, we find that the average increase between 18 years and full development is 1 in. in stature, 9.9 lb. in weight, and 1.6 in. in chest girth. Now we know from the experience of the army, both in peace-time and during the war, that much better results can be obtained by making youths and young men live a hygienic life, with proper food and attention to their physical development. The present figures therefore show clearly that the average conditions of life to-day have produced and are producing physical results on the rising generation which are greatly to be deplored.

One other table printed in the report is of special significance—comment is superfluous.

Average Measurement of 36 Youths of 18 Years Rejected for Poor Physique.

Height	Weight	Chest girth
4 ft. 9 in.	84 lb.	29.9 in.

In conclusion let us consider the main facts of this physical census in the light of the method of comparisons suggested by Prof. Arthur Keith. He shows that on theoretical grounds it is to be expected that the complex quality of physical fitness is distributed among a healthy population in the same proportions as has been found for the distribution of other physical attributes. If this reasoning is correct we ought to find in a healthy population that the numbers of men in each grade of fitness bear a constant relation to each other in the following proportions:—

Grade I.	70 %
Grade II.	20 %
Grade III.	7.5 %
Grade IV.	2.5 %

Actual experience testifies to the truth of this inference: thus a "comb-out" of miners (a group of the community known to enjoy a good standard of health and physique) in the summer of 1918 yielded the following result:—

Grade I.	76 %
Grade II.	12 %
Grade III.	10 %
Grade IV.	4.2 %

Another group of miners yielded Grade I. 76%, Grade II. 19%, Grade III. 11%, Grade IV. 3%. Results such as these

(and there are numerous other examples) prove the soundness of Prof. Keith's reasoning, and show that in healthy sections of the community his standard is reached and even exceeded.

This standard may be represented graphically, and it is instructive to place alongside this representation of what we may regard as the normal standard for a healthy community a similar graph representing the proportions actually found in the total gradings during the whole year's work in Great Britain (the figures have been given above).

These two diagrams show graphically the differences between the relative proportions of men of the four grades of fitness actually found and the standard relative proportions in a healthy community. In actual numbers the difference works out as follows: Among the 2½ million examinations there was in Grade I. a deficiency of 825,000, in Grade II. an excess of 61,000, and the alarming excess of no less than 575,000 in Grade III., and 100,000 in Grade IV.

With such results before them the committee which presented the report express surprise that with human material of such physical quality it was found possible to create the invincible armies which overthrew the Germans. We may well share their surprise, and indorse their opinion that the spirit of the race, which alone made this possible, deserves that no effort should be spared to ameliorate the conditions which had brought about such deplorable effects upon the national health and physique.

(H. W. K.)

THE POST-WAR ARMY

The development of British military organization from 1910 to the end of the World War is treated under the heading *ARMY*, section *British Army*. The period immediately following a war of any importance usually sees many changes in army organization based upon the experiences gained during the war, and the years directly following the War of 1914-8 were no exception in this respect. The years 1919-21 were devoted to incorporating into the British army organization various essential innovations which a war of such magnitude was bound to produce.

Generally speaking, the war had shown that the broad framework of army organization, as it existed in 1914, had been built upon sound lines. In certain respects, it is true, defects had been found in this organization, e.g. an inelasticity in the system which failed adequately to provide for the expansion entailed when a nation is absorbed into military service; but these defects were connected more with details than with broad principles. Army reorganization had still to provide for an expeditionary force, trained garrisons for maintaining the various parts of the

Empire, and home defence. To make provision for carrying out these duties, therefore, the after-war army was organized, in its main outlines, similarly to what it had been in 1914. This organization may be described as an expeditionary force, formed almost entirely of regular soldiers with their reserves, backed up and supplemented by the militia; whilst the territorial army, composed of troops which would require several months' training on mobilization to fit them to take their place in the field, would be available for expanding the expeditionary force, should a state of national emergency arise.

It may be noted that the old name "militia" once again found a place in army nomenclature (although this force had not yet been finally reconstituted by the end of 1921); when organized its functions were to remain identical with those of the Special Reserve in 1914. Briefly, these may be enumerated as completing the establishment of the expeditionary force on mobilization and providing drafts for the regular units during the first few months of war, after those provided from the regular reserves have become exhausted. The militia is also required to produce on mobilization certain technical personnel, whose work in war, being akin to that performed in peace, would need but little military training to fit them to take their place in regular units in the field. The rôle of the reorganized militia, therefore, may be considered as the definite one of being a reserve to the regular army, without any idea of its units being employed as a separate force. It may further be noted that the name of the old territorial force has been changed to that of "Territorial Army." The special functions of this army remain the same as they were in 1914; but the organization to enable those duties to be carried out has been altered in conformity with the lessons learnt during the war. The after-war territorial formations, in fact, have been shaped into an exact counterpart of their prototypes in the regular army, and this has entailed certain units, which had existed in 1914, becoming surplus to requirements; such units had either to be merged into new ones or disbanded. It was on this account that many of the old mounted yeomanry regiments became surplus to the actual needs of the army, and were offered conversion into other arms of the service which the war had shown to be necessary for modern war, but which had no place in the pre-war territorial organization, e.g. army field artillery brigades and armoured car companies. Similarly surplus infantry battalions were asked to convert into other arms of the service in which the pre-war territorial army organization was deficient. The establishment of the territorial force in 1914 was some 314,000, all ranks. The establishment of the reconstituted territorial army in 1921-2 was some 220,000, all ranks.

Whilst the broad outlines of army organization remained in 1921 practically identical with what existed in 1914, the organization of the various formations for war underwent some modifications. Notably was this the case in the additions made to the Royal Artillery and Royal Engineers, both in army and divisional troops, and the new units were added as a result of war experience, e.g. Tank Corps, Signal Corps. But whilst changes naturally had to take place, the infantry allotted to formations still remained unchanged; for instance a division comprised 3 infantry brigades as formerly, and infantry brigades once again were composed of 4 battalions, as in 1914, instead of the 3-battalion brigades which force of circumstances had imposed towards the latter part of the war.

Broadly speaking, the greatest changes which have been made in army organization may be attributed to two main causes:—necessity for increased firepower and improved mechanical science. As coming under the former heading, first and foremost may be cited the artillery. Yearly, as the war had progressed, heavier and still heavier calibres of artillery had been brought into the field; and the number of guns which had been considered sufficient in 1914, had been multiplied several times by the end of the war. The reorganization of the artillery, therefore, had to take into account, and make provision for, this increased need of artillery.

The peace organization of the artillery includes not only horse and field artillery but also medium artillery as well. On the other hand the horse-drawn 60-pdr. battery, which formed part of the divisional artillery in 1914, no longer exists. In pre-war days the heaviest mobile gun or howitzer figuring in the British artillery organization was the 6-in. howitzer. During the war ordnance of heavier calibre

was introduced into the field, and the new peace organization provides for this. Provision is also made for anti-aircraft artillery.

Not only in the artillery has the war led to changes in organization, but practically all arms have undergone some modifications as its result. During the war Hotchkiss guns were introduced into the cavalry, and Lewis guns into the infantry; both these weapons still remain as part of the peace organization of these two arms. The machine-gun also continues to find a place in their organization, as was the case in 1914. In this connexion it may be noted that during the war a Machine-Gun Corps was built up. Shortly after the war ended, however, this corps ceased to form part of the peace organization, because the machine-gun was considered to be a weapon of not sufficiently distinctive type to justify its being considered a separate arm of the service when its rôle was obviously ancillary to both cavalry and infantry.

Under the heading of improved mechanical science, the outstanding feature is the tank. Its success during the war had insured it a place in the army reorganization. It was now incorporated as the Tank Corps. This corps, which is capable of expansion, consists in peace of 4 tank battalions, a depot and an artificer-training battalion. In addition there is an experimental establishment. In peace the organization of a tank battalion consists of 3 companies, each of which is split up into 3 sections. Another product of the war, somewhat akin to the tank and consequently incorporated as part of its organization, is the armoured-car. Armoured-cars are organized in companies. During the war armoured-cars proved so highly efficient for use in some of the outlying portions of the Empire, that their inclusion as part of the peace organization was indicated. But it remained uncertain in 1921 how far the Tank Corps organization might develop.

Another corps which has arisen in the application of science to war, is the Signal Corps. Before the war the Signal Service was in its infancy. The whole service then consisted of 66 officers and 1,534 other ranks, who formed part of the Corps of Royal Engineers. The war showed the need for rapid, accurate and alternative methods of communication, and the result was the formation of the Signal Corps. This corps is so organized as to be capable of division into several self-contained units; thus a divisional signal company not only controls all the signal communications at divisional headquarters, but it detaches a section for work with each infantry brigade, and other sections for work with the divisional artillery. The corps is responsible for dealing with all forms of communication, both visual, airline, cable and wireless, also for despatch riding.

Mechanical science has also led to a much greater use of mechanical transport than had ever been contemplated in pre-war days. The reliability maintained by M.T. vehicles has had the effect of gradually lessening the numbers of horse-drawn vehicles in the army. This can be seen by the increased number of M.T. units now forming part of the peace organization of the R.A.S.C. compared with the number existing before the war.

The war also showed that the 1914 organization included an insufficient number of Royal Engineers allotted to divisions. In 1914 the number of field companies with divisions was two. This new peace organization makes provision for an additional one, and provides as well for the carrying out of the larger R.E. services required by divisions, e.g. electric lighting of divisional headquarters, water supply, accommodation, etc. Moreover, as a result of the war, the Royal Engineers make provision for electrical and mechanical companies. The special rôle of these companies is the repair and construction of electrical installations, mechanical plant and installation of workshops.

It was not only in organization that the war led to changes, but it also had the effect of causing improvements to be made in the education of the soldiers. It was felt that greater advantage might be taken of the age at which the majority of youths entered the army to continue their education. For this reason a new corps, called the Army Educational Corps, was included as part of the army organization. This is a small corps composed mainly of officers, which took the place of the pre-war army schoolmasters. Both at home and abroad officers of the Army Educational Corps are distributed among the various units whose chief duty it is to co-ordinate the education in the various units and to set out the lines on which it is to be carried out.

Yet another addition was made to the peace organization of the army shortly after the war in the shape of the Corps of Military Accountants. This is a completely new corps, by which is meant that it had no counterpart of any description in the pre-war organization. It is a small corps with an establishment of approximately 1,000, all ranks. The purposes for which it was formed was for the compilation of cost accounts.

The development of aerial navigation caused a separate Air Ministry to be set up during the war. This arrangement was continued in the after-war organization; so that whereas in 1914 the Royal Flying Corps formed part of both the navy and army organization, this is no longer the case; the Royal Air Force being almost entirely divorced from army administration.

Shortly after the war alterations and additions were made to the rates of pay of both officers and other ranks throughout the army. In pre-war days the rates of pay varied in different corps; this procedure ceased and a universal rate for all corps was substituted.

The additions were based on the high cost of living existing at the date of alteration, and were subject to revision after five years. As an example, the pay per annum of a second lieutenant and a private in the infantry in pre-war days was approximately £96 and £24 respectively. Their respective rates of pay under the new rates worked out at £237 and £59.

Before the war the total peace establishment of the regular army, exclusive of India, comprised some 9,500 officers and 163,000 other ranks. In 1921-2 the establishments of the regular army, again exclusive of India, made provision for 15,000 officers and 186,000 other ranks. (B. B.-H.)

UNITED STATES. THE (see 27.612*)—This article describes the development of the United States from the close of the first decade of the 20th century, as shown roughly by the census of 1910 and the Congressional elections of that year, to the close of the Washington Conference early in 1922. This period of 12 years, covering the World War and America's part in it, the shifting of the United States from the position of a debtor to that of a creditor nation, a vast increase in wealth and world influence, and many other changes scarcely less important, is from an international as well as a domestic point of view one of the most important in American history. The main facts of the period are outlined in this article, but for many of the details other articles must be consulted; and the reader who would consider the full perspective should read those as well as this, as should also the reader who desires detailed information on any one point. The articles on the various states contain details of their respective population, agriculture, manufactures, education and political history; data more local appear in articles on the more important cities. A full list of the articles relating to the United States will be found in the Classified Table of Articles which precedes the List of Contributors at the end of Vol. XXXII., but we may name here the leading articles in the more important divisions of the subject. Details of population, supplementing the various summaries contained in the first section, *Statistics*, of the present article, will be found in the articles on separate states and in the articles *NEGRO* and *PUBLIC ASSISTANCE*. Many economic questions are treated fully in such articles as *BANKING*, *FEDERAL RESERVE BANKING SYSTEM*, *FEDERAL FARM LOAN BOARD*, *EXCESS PROFITS DUTY*, *INCOME TAX*, *CITY GOVERNMENT*, *INTERSTATE COMMERCE*, *CONSERVATION POLICY*, *INSURANCE*, *COST OF LIVING*, *FOOD SUPPLY*, *RATIONING*, *MARKETING*, *PRICE CONTROL*, *PROFIT-TEERING*, *PROFIT-SHARING*, *SAVINGS MOVEMENT*, etc. For industrial development see also the articles *SHIPPING*, *RAILWAYS*, *TELEGRAPH*, *TELEPHONE*, and *ELECTRICITY SUPPLY*, as well as those on important industries such as *COAL*, *COPPER*, *COTTON* and *COTTON INDUSTRY*, *DYEING*, *PETROLEUM*, *IRON* and *STEEL*. Various phases of labour are discussed under *ARBITRATION* and *CONCILIATION* in *LABOUR DISPUTES*, *LABOUR LEGISLATION*, *LABOUR SUPPLY* and *DEMAND*, *STRIKES* and *LOCKOUTS*, *TRADE UNIONS*, *UNEMPLOYMENT* and *WAGES*. For social and welfare work, read also *HOUSING*; *HOSPITALS*; *JUVENILE EMPLOYMENT*; *CHILDREN*, *LAWS RELATING TO*; *LIQUOR LAWS*; *PROHIBITION*; and *PUBLIC ASSISTANCE*. For recent developments in education, arts and letters, see besides the articles on *HARVARD*, *YALE*, *PRINCETON*, etc., the articles *EDUCATION*, *MEDICAL EDUCATION*, *ARCHITECTURE*, *ARTS* and *CRAFTS*, *PAINTING*, *SCULPTURE*, *AMERICAN LITERATURE*. For recent changes in the status of women, see further *WOMAN SUFFRAGE*; *WOMEN*; *WOMEN'S EMPLOYMENT*; *WOMEN POLICE*; *WOMEN, LEGAL STATUS OF*. The section *History* of the present article may be supplemented by articles such as *ARMY*, *SHIP* and *SHIPBUILDING*, *WORLD WAR*, *LIBERTY LOAN PUBLICITY CAMPAIGNS*, *MUNITIONS OF WAR*, *WOMEN'S WAR WORK*, *WASHINGTON CONFERENCE*, and by the biographies of political leaders and public officials. The present article has eight sections: *Statistics*, *Agriculture*, *Finance*, *Taxation*, *Social and Welfare Work*, *The American Labour Movement*, *Military Law*, and *History*, in the order named.

I.—STATISTICS

In 1920 the pop. of the United States (excluding all outlying possessions) was 105,710,620, as compared with 91,972,266 in 1910. The rate of increase between these two dates, 14.9%,

* These figures indicate the volume and page number of the previous article.

was considerably less than in the preceding decades. Never before in a 10-year period had the rate of increase fallen below 20 per cent. The decline was due to the large falling off of immigration in the last half of the decade, and in some slight degree to the epidemic of influenza in 1918, as well as to the casualties resulting from the World War. It was estimated that the pop. of the outlying possessions was 12,148,875, of which the Philippine Is. furnished more than 10,000,000. The total pop. of the United States with its outlying possessions in 1920, therefore, numbered 117,859,495. Excluding the outlying possessions, the total addition to the pop. in the decade 1910-20 was 13,738,354 as compared with nearly 16,000,000 in the previous decade.

The accompanying table shows the pop. by territorial divisions and component states, with changes between 1910 and 1920.

	3,336,101	2,633,517	702,584	26.7
PACIFIC				
Washington	1,356,621	1,141,990	214,631	18.8
Oregon	783,389	672,765	110,624	16.4
California	3,426,861	2,377,549	1,049,312	44.1
	5,566,871	4,192,304	1,374,567	32.8

There was no change between 1910 and 1920 in the relative rank of the territorial divisions, and only minor shiftings for most of the states, California rising from 12th to 8th place. The territorial divisions may be further condensed into geographic sections—north (comprising New England, Middle Atlantic states, and the two North Central divisions), south (comprising the South Atlantic and South Central divisions) and west (including the Mountain and Pacific states). This gives the following distribution:—

	1920	Per cent of total	Increase over 1910	Rate of increase
North	63,681,845	60.2	7,924,730	14.0
South	33,125,803	31.3	3,736,473	12.7
West	8,902,972	8.5	2,077,151	30.4
Total U.S.	105,710,620	100.0	13,738,354	14.9

More than one-half the increase in pop. was found in the north, and the rate of gain in this section was greater than in the south, but less than in the west represented by the Mountain and Pacific Coast states.

Sex.—By sex the pop. in 1920 was divided: males 53,900,376; females, 51,810,244. This gives 104 males to 100 females. The excess of males is attributable in part to immigration, for in the foreign-born pop. the males greatly outnumber the females. In a few states the females are in excess of males; in Massachusetts the number of males was 96.3 to 100 females; in Rhode Island, 97. This is probably due to the inflow of female operatives to the textile factories. In some of the far-western states the proportion of males to females runs very high, as in Nevada, 148.4; Wyoming, 131.3; Arizona, 121.9. The mining industry accounts for these differences. The two sexes in these sections, however, are nearer in numbers than in 1910. In the earlier year the ratio of males for the Mountain states was 128 to 100 females, while in 1920 it fell to 115.7. In the Pacific states the ratio dropped from 130 to 114. This is evidence that these sections are rapidly approaching the standard forms of family life which obtain in the older portions of the country.

Negroes.—The negro pop. in 1920 was nearly 10% of the total pop.—10,463,131 in a total of 105,710,620. This was an increase of 635,368 or 6.5% since 1910, as compared with 11.4% in the previous decade, and 13.8% between 1890 and 1900. The percentage of negroes in the total pop. is diminishing; in 1900 it was 11.6%; in 1910, 10.7% and in 1920, 9.9%. The number of negroes per 1,000 whites was 132 in 1900; 120 in 1910 and 110 in 1920. Although complete data are not available, it is believed that the birth-rate of negroes declined between 1900 and 1920 while the death-rate did not greatly change. The negro element in the south barely held its own in the 10 years 1910-20, numbering 8,912,259 in 1920 as compared with 8,749,427 in 1910. This was a gain for this section of less than 2 per cent. In the south as a whole the percentage of negroes in the total pop. declined from 29.8 to 26.6. In 1920, in South Carolina and Mississippi the negroes still outnumbered the whites; in Kentucky, Tennessee, Alabama, Mississippi and Louisiana, however, there was an actual falling off in the negro population. There was a marked gain in the number of negroes in the north, 9.43%, showing that negroes were migrating in considerable numbers to the industrial centres of that section. The negro pop. of Michigan increased from 17,000 in 1910 to over 60,000 in 1920. (See NEGRO.)

The number of Indians declined from 265,683 in 1910 to 242,959 in 1920. This apparent decrease, however, is probably due to the fact that in 1910 persons with only slight traces of Indian blood were enumerated as Indians, and in 1920 were classified as whites.

The Chinese also decreased in number, as might be expected from the policy of exclusion; in 1910 there were 71,531 and in 1920 61,686. The number of Japanese, however, increased from 72,157 to 111,025, or 53.86 per cent. About 30,000 of this increase is credited to California and a little over 4,000 to the state of Washington.

Foreign-born.—The foreign-born white pop., owing to the check in immigration resulting from the World War, increased but slightly, from 13,345,545 to 13,712,754, or 2.7% between 1910 and 1920, as against an increase of 30.7% between 1900 and 1910. The numerical increase in this group of the pop., 367,209, was much smaller than in any preceding decade since 1850. This element increased between 1910 and 1920 in 20 states and the District of Columbia, and decreased in 28 states; in the previous decade there was a gain in every state except five. Arizona and Texas showed the largest rate of increase, 67% and 50% respectively, due to Mexican immigration. Table 1 shows the foreign-born whites for the four states having over 1,000,000 of this element in 1920. In 1910 the foreign-born whites constituted 14.5% of the total pop. of the United States and in 1920, 13 per cent. The nativity of the white pop. in

TABLE 1. Foreign-born Whites.

State	1920	1910	1900	Per cent increase 1910-20	Per cent increase 1900-10
Illinois	1,204,403	1,202,560	964,635	0.2	24.7
Massachusetts	1,077,072	1,051,050	840,114	2.5	25.1
New York	2,783,773	2,729,272	1,889,523	2.0	44.4
Pennsylvania	1,387,298	1,438,719	982,543	-3.6	46.4

1920 is shown in Table 2. Little over one-half of the total white pop., 55.3%, was native-born with native-born parents. In New England only 30.8% were in this group; and in Massachusetts less than one-third, 31.9%. According to the post-war map, the countries from which had come the largest numbers of foreign-born whites who were in the United States in 1920, were Germany, 1,686,102; Italy, 1,610,109; Russia, 1,400,489; Poland, 1,139,978; Canada, 1,117,878; Ireland, 1,037,233; England, 812,828; Sweden, 625,580; Austria, 575,625.

TABLE 2. Nativity of Whites, 1920.

	Number	Per cent
Native parentage	58,421,957	55.3
Foreign parentage	15,694,539	14.8
Mixed parentage	6,991,665	6.6
Total native-born	81,108,161	76.7
Foreign-born white	13,712,754	13.0
Total white	94,820,915	89.7
Negro	10,463,131	9.9
Other non-white races	426,574	0.4
Total pop.	105,710,620	100.0

The following figures show the total number of foreign-born whites in certain states, with the foreign country which had furnished the largest number in that state: California, 681,662 (Italy, 88,502); Illinois, 1,204,403 (Germany, 205,491); Massachusetts, 1,077,534 (Ireland, 183,171); Michigan, 726,635 (Canada, 164,502); Minnesota, 486,164 (Sweden, 112,117); New Jersey, 738,613 (Italy, 157,285); New York, 2,786,112 (Italy, 545,713); Ohio, 678,697 (Germany, 111,893); Pennsylvania, 1,387,850 (Italy, 222,764); Texas, 360,519 (Mexico, 249,652); Wisconsin, 460,128 (Germany, 151,250).

In connexion with the problems of Americanization the statistics of citizenship of the foreign-born whites are of interest. In 1920 12,498,334, or 94% of this element, were 21 years of age and over; 6,928,027 were men and 5,570,307 were women. Table 3 shows the number in 1920 naturalized, those who had taken out first papers, aliens and those for whom no reports were obtained.

TABLE 3. Naturalizations, 1920.

	Men		Women	
	Number	Per cent	Number	Per cent
Naturalized	3,314,577	47.8	2,893,785	52.0
First papers	1,116,698	16.1	77,558	1.4
Alien	2,138,205	30.9	2,226,690	40.0
No reports	358,547	5.2	372,274	6.7

In 1910, 45.61% of the men were naturalized as compared with 47.8% in 1920, and only 8.6% had taken out first papers, as compared with 16.1% in 1920.

Statistics of immigration are often inaccurately used, no allowance being made for departures. Increasing facilities in ocean transportation, and the higher wages received by immigrants, enabling them to travel, led to a constant stream of departures in the decade 1910-20. In order to determine the net increase of pop. by immigration, it is necessary, therefore, to determine both arrivals and departures. Table 4 compiled by the Bureau of Immigration, shows the changes for the 11 years 1910-20.

TABLE 4. Immigrants, in thousands.

	Admitted			Departed			Added to pop.
	Immigrant	Non-immigrant	Total	Emigrant	Non-emigrant	Total	
1910	1,042	156	1,198	202	178	380	818
1911	878	152	1,030	296	222	518	512
1912	838	179	1,017	333	282	615	402
1913	1,198	229	1,427	308	304	612	815
1914	1,218	185	1,403	303	330	634	769
1915	327	107	434	204	180	384	50
1916	299	68	367	130	111	241	126
1917	295	67	363	66	80	146	216
1918	111	101	212	94	99	193	19
1919	141	96	237	123	93	216	21
1920	430	192	622	288	140	428	194

Beginning with 1915 there was a marked decline in immigration, due to the World War. In the five years 1910-4, the total number of immigrants was 5,174,000, and in the succeeding five years ending in 1919, only 1,173,000.

Immigrants may be classified (1) as to race or people and (2) as to country of last residence. The first is of importance as an index of the contribution of ethnic traits and characteristics; and the second as throwing light upon previous training of immigrants in social and political institutions. Tables 5 and 6 show immigration by race and by countries, for a few of the most important groups, for the years 1910 and 1920.

TABLE 5. Immigrant Aliens, by Race.

Mexico	52,361	12	18,691	2

It will be observed that in 1920 there was a change in the racial composition of immigration as compared with 1910. The proportion of Italians was about the same, but immigration from eastern European stocks fell off. Immigration from Austria, Hungary, Germany and Russia practically stopped after 1917. Immigration from the northern border, of both English and French Canadians, and from the southern part of Mexico, had greatly increased. Until the World War, Europe was the chief source of immigration to the United States, furnishing 90% of the total. The percentage coming from Europe fell, however, to 60% in 1915, 50% in 1916, 45% in 1917, 28% in 1918 and 17% in 1919. In 1920 it rose to 57%. After the war the return movement to Europe increased, and in 1920 emigration to that continent was in excess of immigration from it. This excess was due to emigration to south-eastern Europe rather than to the northern and western sections. The proportion

of females among the immigrant aliens in 1920 was 42.4%, as compared with 33.4% in the years 1910-4. For Greeks the female percentage increased from 9 to 20, and for Italians from 5 to 48. This suggests that the immigration of these peoples might prove to be more permanent than in the past.

In 1917 a literacy test was imposed upon immigrants, exemptions being made in certain cases, as for example, to those who came to the United States to join relatives or who would have been subject to religious persecution at home. As a result only 15,094 illiterate immigrants 16 years of age and over, or 4.4%, were admitted in 1920. During the years 1908-17, 1,617,000 illiterate immigrants 14 years of age and over were admitted. Undoubtedly the new restriction should show in the course of the decade 1920-30 a marked effect upon the degree of illiteracy in the United States. By the Immigration Act passed in 1921 the number of immigrants admitted from any one country in the year July 1 1921 to June 20 1922, was restricted to 3% of the persons of that nationality resident in the United States in 1910. Only 358,000 immigrants, therefore, could be eligible for admittance during the year 1921-2. The United Kingdom was limited to 77,200; Germany to 68,000; Italy to 42,000; Russia to 34,200 and Poland to 25,800.

Urban and Rural Population.—The tendency of the population to concentrate in towns and cities continued unabated. In 1910 the percentage of the pop. living in urban territory (that is, in cities and other incorporated places of 2,500 inhabitants or more, and in towns of that size in Massachusetts, New Hampshire and Rhode Island) was 46.3 per cent. In 1920 the percentage was 51.4, showing that more than one-half of the pop. was then living in urban territory as defined by the Census Bureau.

Table 7 shows the pop. of cities having 50,000 inhabitants or more in 1920 with comparison for 1910.

TABLE 7. *Cities with 50,000 Inhabitants or More.*

Rank		1920	1910	Percent- age in- crease

The cities with increases of over 100% were Detroit, Mich., due to the development of the automobile industry; Akron, O., the home of several large rubber factories which manufacture tires for automobiles; Flint, Mich., also an automobile city; Tulsa, Okla., a centre of oil activity; Gary, Ind., a city recently built up by the U. S. Steel Corp.; Bethlehem, Pa., also a steel city; Knoxville, Tenn.; and Long Beach, Cal. With the exception of Bethlehem, no one of these cities is in the east.

Nearly one-fourth of the gain in the total pop. was due to the growth of the 12 largest cities, which in 1920 all had more than 500,000 inhabitants each. In 1910 there were only eight cities with a pop. of 500,000 or over. In the earlier year 12.5%, or one-eighth of the total pop., lived in cities of this size; in 1920 the proportion was 15.5%. In 1910 there were 42 cities with a pop. between 100,000 and 500,000; in 1920 there were 56.

Occupations.—The proportion of the pop. engaged in gainful occupations increased from 38.3% of the total pop. in 1900 to 41.5% in 1910. This was largely due to the greater number of females receiving wages. In 1900 the percentage of females 10 years of age and over in gainful occupations was 18.8; in 1910, 23.4, a gain of 4.6 per cent. The percentages for males for the two dates respectively were 80 and 81.3, a gain of only 1.3 per cent. Table 8 classifies those engaged in industry according to the principal divisions of occupations.

TABLE 8. Industrial Occupations.

Occupation	Number		Per cent.	
	1910	1900	1910	1900
Males:—				
Agricultural pursuits	10,760,875	9,404,420	35.8	39.6
Professional service	1,151,709	827,941	3.8	3.5
Domestic and personal service	2,740,176	3,485,208	9.1	14.7
Trade and transportation	6,493,378	4,263,617	21.3	17.9
Manufacturing and mechanical pursuits	9,035,426	5,772,641	30.0	24.3
All occupations (male)	30,091,564	23,753,836	100.0	100.0
Females:—				
Agricultural pursuits	1,807,050	977,336	22.4	18.4
Professional service	673,418	430,597	8.3	8.1
Domestic and personal service	2,620,857	2,095,449	32.5	39.4
Trade and transportation	1,202,352	503,347	14.9	9.5
Manufacturing and mechanical pursuits	1,772,095	1,312,668	21.9	24.7
All occupations (female)	8,075,772	5,319,397	100.0	100.0

Table 8 does not include all those engaged in economic services. Many children and wives work for their parents or husbands; technically they do not receive wages and consequently are not recorded as engaged in gainful occupations, but in reality they contribute to the household economy. If these be included, approximately two-thirds of the pop. was engaged in some degree of creating wealth or in services which might be valued in economic terms. Nearly one-third of all the workers were engaged in agricultural and allied industries, and a little over one-fourth in manufacturing and in tool industries. If we divide the pop. of the United States into groups according to age, the following were the percentages of each age-group engaged in gainful occupation in 1910:—10 to 13 years, males 16.6% and females 8.0%; 14 to 15, 41.4% and 19.8%; 16 to 20, 79.2% and 39.9%; 21 to 44, 96.7% and 26.3%; 45 years and over, 85.9% and 15.7%; 10 years and over, 81.3% and 23.4%. There was a slight decrease between 1900 and 1910 in the two lower age-groups for males and a slight increase for females. More than 8 out of 10 of the gainful workers in the United States as a whole in 1910 were 21 years of age and over, and about 95 out of 100 were 16 years of age and over.

Education.—In 1918 there were 20,853,516 children enrolled in the public schools, constituting 70% of the pop. from 5 to 18 years of age. There were 650,700 teachers in the public schools, or one to every 32 pupils. Of the teachers 16% were males. The total expenditure for public schools was \$763,678,089 or about \$37 per pupil. The above enrolment of pupils includes 1,735,619 attending public high schools. In addition there were 158,745 pupils in private high schools and academies. There were over 300 public and private normal schools with an enrolment of nearly 140,000. Universities, colleges and schools of technology numbered 672 in 1918, having 44,600 students of preparatory grade, 239,707 students of collegiate grade, and 14,406 graduate students. Nearly one-half of the students of collegiate grade were female. Professional schools in 1918 numbered 424, as follows: theology 141, with 9,354 students; law 101, with 11,820 students; medicine 72, with 13,802 students; dentistry 37, with 8,314 students; pharmacy 54, with 4,053 students; and veterinary medicine 19, with 1,250 students. (See EDUCATION, section *United States*.)

The statistics of illiteracy for 1920 showed a diminution compared with those for 1910. The Census Bureau classifies as illiterate any person 10 years of age or over who is unable to write in any language, regardless of ability to read. Illiterates in 1920 numbered 4,931,905, or 6% of the pop. at least 10 years of age, as compared with 7.7% in 1910. The proportion of illiteracy for the individual states in 1920 ranged from 1.1% in Iowa to 21.9% for Louisiana. Illiteracy is very marked in those states in which the colored pop. or the foreign-born pop. is relatively large. In 1910 nearly one-third (30.4%) of the negroes were recorded as illiterate, but this showed a marked decrease from 44.5% in 1900. Of the native whites of native parentage only 3.7% in 1910 were illiterate, but in six of the southern states the percentage ran over 10%.

Vital Statistics.—In 1915 the Census Bureau began the annual analysis and publication of birth statistics based upon data obtained from state registration records. In 1919 the birth registration area covered nearly three-fifths (58.6%) of the total population. The birth-rate varied in the five-year period 1915-9 from 25.1 per 1,000 in 1915 to 22.3 per 1,000 in 1919. The ratio of male births was 1,057 to 1,000 female births. The fecundity of foreign-born mothers was much greater than that of native mothers. For example, in Connecticut, although the white married women of foreign birth, age 15 to 42, constituted only 46% of the total pop. of white married women of that age group, they gave birth to 57% of the children. In Massachusetts 49% of foreign-born mothers gave birth to 53% of the children; and in New York 43% of foreign-born mothers gave birth to 49% of the children. The first and second children formed 50% of all children born to native white mothers, while only 34% born to foreign-born mothers were first and second children.

The registration area for mortality statistics covers more than three-fourths of the population. Between 1900 and 1921 the death-rate varied from a minimum of 13.5 per 1,000 in 1915 to 18 per 1,000 in 1918. This latter high rate was due largely to the great influenza pandemic. The rate of infant mortality (the number of deaths of infants under one year of age per 1,000 born alive) for the registration area in 1918 was 83 for the white pop.; for negro pop., 131; and for the total pop., 87.

A third nation-wide compilation of statistics of marriage and divorce was made by the Bureau of Census, covering the year 1916. There were 1,040,778 marriages, or 10.5 per 1,000 of the population. In some of the southern states the rate ran as high as 11.9 per 1,000. There were 112,036 divorces. The statistics were not analyzed to show ratios of divorce to marriage, but only the ratios to population. For the whole country the ratio of divorce was 112 per 100,000 population. In New England the ratio was 80, Middle Atlantic states 43, Southern states 59, and Pacific states 210. Of the divorces 31.1% were granted to the husband and 68.9% to the wife.

Religious Bodies.—For statistics of Christian churches, see the article CHURCH HISTORY: section *United States*. Statistics of membership in Jewish churches are unsatisfactory for purpose of comparison with other denominations, for they are restricted to heads

of families. In 1920, according to returns published in the *Year Book of Churches* by the Federal Council of Churches, there were 2,900 Jewish congregations with a membership of 260,000; 784 Sunday-schools with a membership of 108,534. These figures may be compared with the report of the Bureau of Census which gives 1,901 congregations and 357,135 members for the year 1916. According to the *American Jewish Year Book* for 1920 there were in 1918 3,390,300 Jews as against 1,777,185 in 1907. According to the same authority nearly one-half, or 48.6%, of the Jews resided in the state of New York in 1918, and 45% in New York City. It is estimated that 26% of the total pop. of New York City is Jewish. Between 1907 and 1918 the Jewish pop. of New York state increased from 905,000 to 1,603,923; Pennsylvania, from 150,000 to 322,406; and Illinois, from 110,000 to 246,637. It was also estimated that the Jewish pop. constituted about 3.2% of the total pop. of the United States; in New York it was 15%; in Connecticut and Massachusetts 5% and in Maryland 4.5%. Jewish immigration 1899-1919 numbered 1,551,315, or 10.4% of the total number of immigrants.

Agriculture.—During the decade 1910-20, the number of farms showed a slight gain, 1.4%. In 1920 there were 6,448,343 as compared with 6,361,502 in 1910. A comparison of these numbers with the total pop. shows that in 1910 there was one farm for every 14 of the pop., and in 1920 one farm for every 16. The decrease in the number of farms was particularly marked in states east of the Mississippi; for example, in Connecticut 15.5%; Massachusetts 13.4%; New York 10.5%; Ohio 5.6%; and Illinois 5.8%. In New England the number of farms decreased by 32,238, giving in 1920 one farm for every 47 persons. The total farm acreage increased somewhat more rapidly than the number of farms, from 878,798,325 ac. to 955,883,715 ac., nearly 8.8%. The greater portion of this increase was due to the use of land for dry farming in the arid states of the Rocky Mountain section and also to the enclosure of large areas for grazing. In 1919 there were 507,000,000 ac. under cultivation. One half of the total land area of the United States was in 1920 included in farms, as compared with 46.2% in 1910. Of the 956,000,000 ac. included in farms, 88,000,000 in 1919 was devoted to corn; 73,000,000 to wheat; 73,000,000 to hay; 38,000,000 to oats; and 33,000,000 to cotton. Nearly one-third of the farm area and nearly one-sixth of the total land area is used for the growing of these five products. The average size of farms slightly increased between 1910-20, from 138.1 ac. to 148.2 acres. Notwithstanding the small increase in the number of farms, and of acreage in farms, the value of all farms, lands and buildings increased from \$35,000,000,000 in 1910 to \$66,000,000,000 in 1920, or 90%. This increase, however, was due largely to the abnormally high prices prevailing in 1920, rather than to new investments and improvement of property. For the same reason the average value of land and buildings per farm for the United States as a whole greatly increased, rising from \$5,471 in 1910 to \$10,284 in 1920. In 1910 62.1% of farms were owned by their cultivators and in 1920 60.9%. In New England, New Jersey, New York and Pennsylvania, there was a decline in tenancy but there was a marked increase in the Mountain and Pacific states. During the decade 1910-20 native white farmers increased from 4,721,063 to 4,917,386; foreign-born white farmers decreased from 669,556 to 581,068; coloured farmers increased from 920,883 to 949,889. The countries furnishing the greater number of foreign-born farmers were, in 1920, Germany (140,667), Sweden (60,461), Norway (51,999), Canada (48,688), Russia (32,388), Austria (30,172), England (26,614), Denmark (25,565), Italy (18,267), Poland (17,352), Ireland (16,562), Holland (15,589), Finland (14,988), Switzerland (13,051), Mexico (12,142), Scotland (7,605), Hungary (7,122), France (6,119).

The United States is an agricultural country, but the question is frequently asked whether agriculture is keeping pace with the growth of the population. A comparison of the annual crop for the three-year period 1907-9 with that for the period 1917-9 for corn, wheat, and oats gives the following:—

	Average 1917-9 bushels	Average 1907-9 bushels
Corn	2,828,000,000	2,678,000,000
Wheat	833,000,000	679,000,000
Oats	1,459,000,000	856,000,000

A comparison of these figures with the population at the respective dates shows that the *per capita* product of corn is slightly less, that of wheat and oats greater.

Table 9 shows the estimated annual crop of some of the most important agricultural staples for each of the 10 years, 1910-9.

TABLE 9. *Annual Crops; in millions.*

	Corn (bus.)	Wheat (bus.)	Oats (bus.)	Cot- ton (bales)	Irish potatoes (bus.)	To- bacco (lb.)	Wool (lb.)
1910	2,886	635	1,186	11.6	349	1,103	321
1911	2,531	621	922	15.7	293	905	319
1912	3,125	730	1,418	13.7	421	963	304
1913	2,447	763	1,122	14.2	332	954	296
1914	2,673	891	1,141	16.1	410	1,035	290
1915	2,995	1,026	1,549	11.2	360	1,062	286
1916	2,567	636	1,252	11.4	287	1,153	288
1917	3,065	637	1,593	11.3	442	1,249	282
1918	2,503	921	1,538	12.0	412	1,439	299
1919	2,346	945	1,055	11.3	290	1,372	307

The annual production of cotton did not greatly change in the 10 years 1910-9, running about 11,000,000 bales (500 lb.). Domestic consumption, however, slowly increased, leaving a smaller amount for export. During the five-year period, 1910-4, the average annual export was 8,811,000 bales, and in the five years 1915-9, 6,310,000 bales, a decline of 28 per cent. The production of wool also remained fairly constant, approximating 300,000,000 lb. annually. Imports in the years 1915-9 were greater than ever before and the total consumption therefore larger, as exports were insignificant. The average annual consumption, domestic and foreign, 1910-4, was 509,000,000 lb., and 1915-9 690,000,000 lb. Since 1914 the United States has been dependent upon foreign countries for more than one-half its wool consumption as compared with two-fifths, or even only one-third in the earlier years of the century.

Strenuous efforts were made during the World War period, even before the entry of the United States, to increase the production of wheat. In 1916 the average farm value per bus. for the first time since the decade following the Civil War, was above \$1. A record crop was produced in 1915, amounting to over a thousand million bushels. The average annual production for the five years 1910-4 was 697,000,000 bus., and in the succeeding five years 1915-9, 822,000,000, giving an average annual increase of 125,000,000; on the basis of an annual *per capita* consumption of five bus. this provided bread for 25,000,000 people. In the years 1910-4 the average annual export was 125,000,000 bus., and in 1915-9, 240,000,000 bushels.

The domestic beet-sugar industry during the 10 years 1910-9 became firmly established. Until 1907 the volume of beet-sugar production was less than that of cane sugar; in later years it has been far in excess. The production, in millions of pounds, was 1,775 in 1910 (cane 750, beet 1,025); 1,937 in 1915 (cane 493, beet 1,444); and 2,091 in 1919 (cane 569, beet 1,522). The outlying possessions of the United States (Porto Rico, Hawaii and the Philippine Is.) provide an amount of sugar approximately equal to that produced at home. This, however, does not meet the demands of domestic consumption, and the United States is still dependent upon foreign countries for half its needs. The annual *per capita* production of sugar was approximately 80 lb. in 1920 as compared with 70 lb. in 1900.

The crops of hay, sweet potatoes, rye, barley, and rice, as estimated by the Department of Agriculture for 1910 and 1919, are seen in Table 10.

In 1919 the production of apples was 26,174,000 bar., of which one state, Washington, yielded one-fourth (6,440,000 bar.). The peach crop amounted to 50,690,000 bus. valued at a little over \$100,000,000. In 1918 1,525,792 ac. were devoted to truck crops.

The number of cattle on farms in 1920 was 66,652,559, as compared with 61,803,866 in 1910. This increase did not keep pace with the growth in population. The number of swine was 59,346,409 as compared with 58,185,676 in 1910, and again the increase was not in proportion to population. The number of sheep as estimated by the Department of Agriculture in 1920 was 48,615,000 as against 52,447,861 in 1910. The wool product in 1919 was 307,459,000 lb. as compared with 321,363,000 lb. in 1910. In 1919 the product of Wyoming was 33,415,000 lb.; Idaho, 22,145,000 lb.; Montana, 17,750,000 lb.; Utah, 15,800,000 lb.; New Mexico, 15,076,000 lb.

The Department of Agriculture in its *Year Book* of 1918 estimates that 350,000,000 ac., or nearly one-fifth of the land area of the United States, is too rough or hilly for the successful cultivation of crops. It may, however, be adapted to the growth of forests or used for grazing purposes. Nearly one-third of the land area, or 600,000,000 ac., receives insufficient rainfall for the profitable production of

TABLE 10. *Hay and other Crops.*

	1919		1910	
	Amount	Farm Value	Amount	Farm Value
Hay (short tons)	91,326,000	\$1,839,967,000	60,978,000	\$747,769,000
Sweet potatoes (bus.)	78,091,000	124,844,000	59,938,000	40,216,000
Rye	88,478,000	119,041,000	34,897,000	24,953,000
Barley	165,719,000	200,419,000	173,832,000	100,426,000
Rice	41,059,000	109,613,000	24,510,000	16,624,000

crops at normal prices and affords no possibility of irrigation. A total of 40,000,000 ac. is absolute desert. It is estimated that 200,000,000 ac. of forest, "cut-over" land, and woodland including that in farms, could be used for crops after clearing. This, if divided into farms averaging 160 ac., would provide 1,250,000 farms, or an addition of about 20% to the number of farms in the country. Moreover, 60,000,000 ac. of swamp land can be drained, and 30,000,000 ac. of potentially irrigable land can be converted into farms if available sources of water supply are fully utilized. In all there are about 850,000,000 ac. of land at present in crops and potentially available. A little over 1,000,000,000 ac. of non-arable land consist of 360,000,000 ac. of absolute forest land, 615,000,000 ac. of grazing land, 40,000,000 ac. desert land and 40,000,000 ac. in cities, roads and railway rights of way. It is also estimated that 360,000,000 ac. of forests will not be sufficient to supply a population of 150,000,000, but that 450,000,000 ac. will be needed for that number. To provide food, therefore, more intensive methods of farming will be required. For corn the average yield per ac. in the five years 1900-4 was 24.2 bus., and in 1915-9, 26.3 bushels. The yields for wheat were 13.4 and 14.3 bus.; for oats 31 and 33.7 bus.; and for barley 25.7 and 25.6 bus., respectively, for the two periods. (See also the section *Agriculture*.)

Manufactures.—A census of manufactures was taken for 1914 and another for 1919. The results of the latter had not been fully published by Jan. 1922. The manufacturing industries as a whole did not increase so rapidly in the five-year period 1909-14 as in the previous five years, but showed great increase in the next five, ending in 1919 (preliminary figures). This is seen from Table 11.

TABLE 11. *Manufactures.*

	Estab- lishments	Wage- earners	Value of products	Value added by manufac- ture
1904	216,180	5,468,383	\$14,793,903,000	\$6,293,695,000
1909	268,401	6,615,046	20,672,052,000	8,529,261,000
1914	275,791	7,036,337	24,246,435,000	9,878,346,000
1919	288,376	9,103,200	62,910,202,000	..
	Increase	Increase	Increase	Increase
1904-9	24.0%	21.0%	39.7%	35.5%
1909-14	2.8%	6.4%	17.3%	15.8%
1914-9	5.0%	29.4%	159.0%	..

Arranged by the 14 general groups of industries according to the classification of the Bureau of Census, Table 12 shows numbers of wage-earners and capital invested.

TABLE 12. *Groups of Industries.*

Group	Wage-earners		Capital in mil- lions of dollars	
	1914	1909	1914	1909
Food and kindred products	496,234	411,575	2,174	1,697
Textiles and their products	1,498,664	1,438,446	2,811	2,488
Iron and steel and their products	1,061,058	1,026,553	4,282	3,579
Lumber and its remanufactures	833,529	911,593	1,723	1,570
Leather and its finished products	307,060	309,766	743	659
Paper and printing	452,900	415,990	1,433	1,134
Liquors and beverages	88,152	77,827	1,016	874
Chemicals and allied products	299,569	267,261	3,034	2,167
Stone, clay and glass products	334,702	342,827	987	858
Metals and metal products other than iron and steel	262,154	249,607	1,014	867
Tobacco manufactures	178,872	166,810	304	246
Vehicles for land transportation	263,076	202,719	803	521
Railway repair shops	365,902	304,592	418	277
Miscellaneous	594,465	489,480	2,048	1,490
All industries	7,036,337	6,615,046	22,791	18,428

The industrial group having the largest number of wage-earners in 1914 was the textile, but the iron and steel was first in capital invested; although the chemicals and allied products group had only 4% of the wage-earners, it was credited with 13% of the total capital; leather and its finished products, which employed 4% of the wage-earners, had less than 4% of the capital.

Table 13 shows the distribution of manufactures in 1909 and 1914 by the three geographic divisions—North (New England, Middle Atlantic, and East and West North Central states), South (South Atlantic, and East and West South Central states), and West (Mountain and Pacific states).

TABLE 13. *Geography of Industries.*

Section	No. of wage- earners		Capital (millions of dollars)		Value of product (millions of dollars)		Per cent in- crease
	1914	1909	1914	1909	1914	1909	
North	5,558,049	5,197,138	18,122	14,278	19,555	16,827	16.2
South	1,161,660	1,120,307	3,046	2,502	3,186	2,637	20.8
West	316,628	288,601	1,623	1,197	1,505	1,208	24.7

In 1914 the North manufactured 81.2% of the product according to value; the South, 12.8%; and the West, 5.9%. New York retained in 1914 first place among the states in manufactures, producing 15.7% of the total value of the product; Pennsylvania was second with 11.7%, followed by Ohio and Massachusetts. Manufacturing establishments as a rule are in large cities. In 1914 cities with a pop. of 100,000 and over, having 24% of the total pop., had 40% of the wage-earners who manufactured 43% of the value of the total production. Ten cities, New York, Chicago, Philadelphia, Detroit, St. Louis, Cleveland, Boston, Buffalo, Pittsburgh, and Milwaukee, with a combined pop. of approximately 13,473,000, or nearly 14% of the total pop., manufactured 25% of the total product value. Districts outside cities having a pop. of 10,000 or over and having 61% of the total pop., had only 33% of the wage-earners, and manufactured only 30% of the total production. Some manufacturing industries tend toward local concentration; for example in 1914, measured by value of product, Michigan produced 62.9% of all the products of the automobile industry in the United States; Massachusetts 43% of the boot and shoe industry; Connecticut 43% of brass, bronze and copper products, and 62% of fire-arms and ammunition; California 25% of canning and preserving products; Illinois 40% of the agricultural implement industry; New York 43% of men's clothing, 73% of women's clothing, 96% of men's collars and cuffs, and 59% of leather gloves and mittens.

Preliminary figures for the census of 1919 showed for value of product an increase of nearly 160% over 1914. This remarkable gain is far in excess of that of any previous five-year or even that of any 10-year period. Table 14 shows the specific industries, which in 1919 manufactured a product valued at more than \$500,000,000.

Complete data were not yet available in Jan. 1922 to show how far the increases shown in Table 14 were due to higher prices and how far due to greater volume of production. To illustrate this distinction the following figures are taken from the preliminary bulletins of the Bureau of Census, to show quantity production in 1914 and 1919 with respective values at each date. In the silk industry there was manufactured in 1914 242,000,000 yd. of broad silk, and in 1919, 307,000,000 yd.; the value more than trebled in the period, from \$137,720,000 to \$435,935,000. Pig-iron production increased in quantity from 23,269,000 tons to 30,543,000 tons, or 31%, and in value 151%; coke from 22,788,000 tons to 30,097,000 tons and in value more than doubled, from \$304,234,000 to \$770,101,000; window glass decreased in quantity from 401,000,000 sq.ft. to 369,000,000 sq.ft., but the value more than doubled, increasing from \$17,496,000 to \$41,106,000. Oil-cloth and linoleum also decreased in quantity from 127,038,000 sq.yd. to 125,448,000 sq.yd., but increased in value from \$25,598,000 to \$68,110,000. Fertilizers decreased in quantity from 8,432,000 tons to 8,291,000 tons, but gained in value from \$153,000,000 to \$280,000,000. In quantity, sole leather increased from 18,075,500 sides to 19,715,800 sides, and in value from \$116,188,000 to \$218,830,000. In food products lard increased in quantity from 1,119,189,000 lb. to 1,372,550,000 lb., and in value more than trebled, \$120,414,000 to \$415,817,000; condensed and evaporated milk increased from 884,647,000 lb. to 2,096,973,000 lb., and in value from \$59,375,000 to \$293,569,000; beet sugar decreased in quantity from 1,486,948,000 lb. to 1,426,890,000 lb., but increased in value from \$58,590,000 to \$138,100,000; cleaned rice increased in quantity from 674,872,000 lb. to 1,062,813,000 lb. and in value from \$21,655,000 to \$83,462,000; wheat flour increased from 116,403,770 bar. to 132,478,513 bar. and in value from \$543,840,000 to \$1,436,589,000. The growing demand for automobiles greatly expanded not only their manufacture but also the refining of petroleum, and the rubber industry. The number of passenger cars manufactured in 1919 was 1,657,000 as compared with 569,000 in 1914 for all motor vehicles. The petroleum refining industry showed a phenomenal development. The output of gasoline increased in five years from 1,195,000,000 gal. to 3,637,000,000 gallons. The increase in quantity was 204% and in value 540%. In 1919 the refineries used 358,000,000 bar. of crude petroleum of which 38,000,000 was of foreign origin and 320,000,000 domestic. The manufacture of rubber goods greatly expanded. Two-thirds of the value in 1919 was represented by tires. The maximum production of lumber was reached in 1908, 42,000,000,000 ft.; in 1918 it was 32,000,000,000 ft., the decline being due to the

fact that readily available timber was becoming less and less accessible. Portland cement is manufactured in larger amounts and has a wide use in the building industry. During the years 1900-9 the average production was 33,000,000 bar.; in 1916 it reached 95,000,000 barrels. The production of tin plates, terne plates, and taggers tin showed a steady development; in 1910 the production amounted to 1,370,788,000 lb. and in 1919 to 3,301,624,000 lb. An export trade was developed, the export of domestic product rising from 26,168,000 lb. to \$27,462,000 lb.; import of this product has practically disappeared.

The cost of new buildings in the principal cities is estimated by the U.S. Geological Survey as follows:— 1910, \$726,437,000; 1911, \$687,507,000; 1912, \$738,990,000; 1913, \$673,221,000; 1914, \$619,752,000; 1915, \$700,413,000; 1916, \$839,706,000; 1917, \$569,011,000; 1918, \$344,622,000; 1919, \$1,019,491,000. The figures show that, although the war checked building, the total value of the buildings constructed in 1919 was much greater than in any preceding year; the cost for 1919 was swollen by high prices and does not accurately represent the volume of new building, measured by physical units.

After 1900 there was but a slight increase in the number of manufacturing establishments, notwithstanding the gain in the number of wage-earners and value of product. In 1914 there were 275,791 establishments, with 7,036,337 wage-earners, and products valued at \$24,246,000,000, or \$87,916 per establishment; in 1919, 288,376 establishments with \$62,588,000,000, or \$217,000 per establishment. In 1914, 2,476,006 wage-earners, or more than one-third (35.2%), were in 3,819 establishments, an average of nearly 650 workers per establishment; nearly one-half (48.6%) of the value of the product was manufactured in this small group of establishments. Of the 8,263,153 persons engaged in manufactures in 1914, 6,613,466, or 80%, were males, and 1,649,687, or 20%, were females.

Minerals.—The value of mineral products, as estimated by the U.S. Geological Survey, increased from \$1,992,406,000 in 1910 to \$5,543,456,000 in 1918. Nearly three-fourths was represented in 1918 by five products, as follows (in millions of dollars):—pig-iron 1,181 (412 in 1910); bituminous coal 1,492 (469 in 1910); anthracite 336 (160 in 1910); copper 471 (137 in 1910); petroleum 704

(128 in 1910). Lead increased in value from \$30,855,000 in 1910 to \$76,667,000 in 1918; zinc from \$27,268,000 to \$89,618,000; aluminum from \$8,956,000 to \$41,159,000; natural gas from \$70,756,000 to \$157,000,000; and cement from \$68,752,000 to \$113,555,000. Platinum had a remarkable development, the product increasing from 8,665 oz., valued at \$478,688, in 1915 to 59,753 oz., valued at \$6,417,980, in 1918.

The production of iron ore increased from 56,889,734 long tons in 1910 to a maximum record of 77,870,553 tons in 1916. In 1918 the production was slightly less, 72,021,202 tons. In the latter year this was manufactured into 39,054,644 tons of pig-iron. More than half of the iron ore produced is mined in Minnesota amounting to 43,263,240 tons, followed by Michigan 17,587,416 tons; Alabama mined 6,121,087 tons. In 1912 the National Conservation Commission estimated the total supply of iron ore profitable to mine at 4,784,930,000 long tons, and 75,000,000,000 tons not worth mining. According to this estimate the profitable ore deposits might be exhausted in 60 years, allowing for no increase in annual rate of production. The ore deposits being worked in 1921 were for the most part on the surface in the region of the Great Lakes. (See IRON AND STEEL.)

The production of anthracite coal in 1910 was 75,433,246 tons (of 2,240 lb.); in 1919 78,653,751 tons, an increase of 4 per cent. The bituminous coal production in 1910 was 417,111,142 short tons as compared with 459,971,070 tons in 1919 (preliminary estimate of the Geological Survey), a gain of 52 per cent. About two-thirds of the coal consumed goes into the production of power, about equally divided between the industries and transportation; about one-sixth is used as a raw material, for making products employed industrially, as coke, gas, and coal-tar products; and about one-sixth for heating homes and other buildings. (See COAL.)

The mining of copper does not follow a regular ascending curve of production. It reached the high point in 1906, 409,735 long tons; declined in 1907; rose to 487,925 tons in 1909; again declined in 1910; rose to 555,031 tons in 1912; fell to 513,454 in 1914; and again advanced to 860,648 tons in 1916. In 1916 more than one-third was produced in Arizona, which has become the principal producing state. In the same year it was estimated by *The Mineral Industry* that the world's production was 1,373,200 long tons. After 1916 there was a marked decline in production. (See COPPER.)

The increased demand for gasoline for automobiles raised the price and led to vigorous efforts to discover new supplies of petroleum. During 1908-19 the production in California more than doubled; in Texas trebled; in Oklahoma more than doubled; in Wyoming new oil-fields were opened. The total production in 1920 was 443 million barrels, as against 281 millions in 1915 and 179 millions in 1908. For details see PETROLEUM. The Director of the U.S. Geological Survey estimated in 1920 that the country's oil resources were over 40% exhausted, and that the supply at the existing rate of consumption would be exhausted within 20 years (see FUEL). Between 1908 and 1916, when active exploration was carried on, the reserve was enlarged by only 1,200 million barrels. Attention has been turned to the possibility of extracting petroleum from the oil shales of Utah, Colorado and Wyoming.

The volume of natural gas produced has risen steadily since the beginning of the century. In 1910 the production was 509,000 million cub. ft., and in 1919, 1,726,000 million cubic feet. Natural gas is found in 23 states, but chiefly in West Virginia, Pennsylvania, Ohio, Oklahoma, and California. Some 2,100 cities and towns are supplied. One-third is used for domestic purposes and two-thirds for industrial plants. The production in 1910 and 1918 is shown in Table 15. The average value in 1910 was 13.9 cents per 1,000 ft. giving a total value of the product, \$70,800,000; in 1918, 21.3 cents per 1,000 ft. and \$154,000,000 total value. About 15,444,000 ac. of land were controlled by natural gas producers in 1917.

TABLE 15. *Natural Gas Production; in million cub. ft.*

	1918	1910
West Virginia	265,000	191,000
Pennsylvania	123,000	127,000
New York	8,000	6,000
Ohio	61,000	48,000
Louisiana and Texas	49,000	8,000
Illinois	4,000	7,000
Oklahoma	124,000	50,000
Kansas	28,000	59,000
California	40,000	3,000
Other states	19,000	10,000
	721,000	509,000

The production of gold reached its maximum in 1915, valued at \$101,035,700; during the war it declined owing to advancing prices of materials and labour and the decreased purchasing power of gold (see GOLD). In 1919 the production was valued at \$58,488,800, less than in any year since 1897. California furnished \$17,398,000; Colorado \$9,736,400; Alaska \$9,036,000. Silver likewise reached its maximum in 1915, amounting to 74,961,075 fine Troy oz., valued at \$37,397,300. In 1919 the bullion produced was less,

55,285,196 oz., but owing to the high price the production was worth \$61,966,412. Montana and Utah seemed to be forging ahead as the great silver-producing states, Nevada remaining stationary.

Fisheries.—According to an estimate made by the Bureau of Fisheries the annual fishery product during the decade 1910-9 amounted to 2,500,000,000 lb., for which about \$80,000,000 was paid to the fishermen. The industry employs about 200,000 persons. The total quantity of fish landed at Boston and Gloucester, Mass., and Portland, Me., the three principal fishing ports in New England, amounted in 1919 to 196,481,000 lb. having a value to the fishermen of \$7,548,000. Cod represented \$2,332,000 and haddock \$2,788,000. The product of the fisheries of the Great Lakes in 1917 was 104,269,000 lb., valued at \$6,295,000. One-half of the product, 53,529,000 lb., was ciscoes (whitefish). The product of the fisheries of the Gulf states in 1918 was 130,924,000 lb., valued at \$6,510,000. The principal products were: inullet, 28,641,000 lb.; shrimp, 27,143,000 lb.; and oysters, 23,754,000 lb. At Seattle, Wash., the fishing fleet landed in 1919 13,651,000 lb., valued at \$1,530,000. The principal product was halibut. The total catch of salmon and steelhead trout on the Pacific coast in 1919 including Alaska was 767,000,000 pounds. It is estimated that the annual yield of oysters for the whole United States is about 30,000,000 bus. giving a return to the fishermen of nearly \$15,000,000. About one-sixth, 5,942,000 bus., come from the New England coast, and over one-half, 18,906,000 bus., from the coast of the Middle Atlantic states.

Production.—Professor Edmund E. Day of Harvard has made an ingenious statistical study of the physical volume of production in the United States for the period 1888-1919, published in *The Review of Economic Statistics* (Harvard University, Sept. 1920-Jan. 1921). His conclusions are shown in Table 16. With 1899 as the base (100) index numbers for subsequent years were calculated for agriculture, representing 12 important crops, for mining, representing 10 minerals; and for manufacturing, representing 12 groups, covering 34 branches of manufacture. The indices for pop. are added in order to compare the growth of production.

TABLE 16. Index Numbers of Production.

	Population	Agriculture	Mining	Manufacture
1899	100-0	100-0	100-0	100-0
1900	101-8	100-6	105-7	101-0
1901	103-8	89-3	114-6	112-4
1902	106-0	113-7	122-7	123-5
1903	108-1	105-0	135-0	128-5
1904	110-3	116-0	136-3	123-2
1905	112-4	117-5	101-6	144-4
1906	114-5	125-0	169-9	155-0
1907	116-7	112-4	185-9	150-3
1908	118-9	118-8	154-2	132-7
1909	121-0	118-1	189-4	163-4
1910	123-1	123-2	201-6	166-0
1911	125-3	117-0	194-4	158-3
1912	127-4	138-1	216-7	181-4
1913	129-6	122-1	227-2	187-1
1914	131-6	135-0	202-6	171-4
1915	133-2	141-0	227-6	187-2
1916	134-8	124-9	267-0	218-6
1917	136-5	135-0	277-2	215-2
1918	138-1	133-2	279-6	214-0
1919	139-7	137-6	228-4	195-3

Table 16 shows that the physical volume of agricultural production has closely followed the growth of population. As Prof. Day points out, "Mining output, on the other hand, completely out-distanced population growth. Since 1897 the development of mining has been phenomenal. . . . Crops are an annual harvest from a soil the fertility of which scientific cultivation carefully preserves; mineral production is a continuing exhaustion of irreplaceable natural deposit. Mining typically lives upon its capital; agriculture upon its income. The rate of production in mining is consequently open to an acceleration which in agriculture is altogether impossible. . . . The fluctuations of manufacturing output appear to be much more cyclical than the variations in agricultural production. In general the fluctuations of production in manufacture resemble closely those in mining."

Commerce, Foreign and Domestic.—Extraordinary movements in foreign commerce, due to the World War, began with 1915. During the years 1900-9, inclusive, the excess of exports over imports of merchandise varied in value from a maximum of \$666,000,000 in 1908 to a minimum of \$351,000,000 in 1909. Beginning with 1915 the annual excess was over a thousand million dollars, reaching in 1919, \$4,016,000,000. Table 17 shows the movement by years, and the excess of exports over imports in each year. The excess of exports over imports in trade with European countries was even greater than the balance from total trade with all countries, amounting in 1919 to \$4,437,000,000. Trade with South America uniformly showed an excess of imports over exports, ranging from \$66,000,000 in 1911 to \$308,000,000 in 1918; and trade with Asia also gave

TABLE 17. Foreign Trade; in millions of dollars.

	Exports	Imports	Excess
1910	1,745	1,557	188
1911	2,049	1,527	522
1912	2,204	1,653	551
1913	2,466	1,813	653
1914	2,365	1,894	471
1915	2,769	1,674	1,094
1916	4,333	2,198	2,136
1917	6,290	2,659	3,631
1918	5,920	2,946	2,974
1919	7,920	3,904	4,016
1920	8,228	5,278	2,950

adverse balances ranging from \$121,000,000 in 1911 to \$308,000,000 in 1918. The figures given here relate to values of exports and imports, and do not, even approximately, reflect the changes in the physical volume of foreign commerce. For some of the commodities recorded in official statistics of exports and imports it is possible to give quantities as well as values; for others only values. In order to illustrate the influence of prices on abnormal values of commodities entering into foreign trade, quantities are given in Table 18 of exports for five commodities: wheat, cotton, bacon, mineral oil and tobacco; for other principal commodities only values are stated.

It will be observed from Table 18 that the quantity of wheat increased six times, while the value increased nearly fifteen times, and the quantity of cotton was less in 1919 than in 1910, but its value more than doubled. High prices also influenced imports, as seen in Table 19. The quantity of coffee imported increased a little over 50%, while the value more than trebled; and the quantity of sugar 67%, but its value 245%.

The enormous excess of exports of merchandise over imports, which began to be so marked in 1915, resulted in unprecedented gold transfers to the United States. In 1916 the import of gold exceeded the export by \$403,760,000, and in 1919 by \$685,255,000. Thus in two years the gold holdings were increased by \$1,089,000,000. In the years 1918-9 \$366,000,000 of this gold was exported, leaving a net additional balance of \$723,000,000. This was in large part reflected in the increase of gold money in circulation, which rose from \$590,000,000 in 1915 to \$1,112,000,000 in 1919.

Railways and Canals.—There was but little new railway construction in the years 1910-21. In the five years 1915-9 less than 5,000 m. of new railway was built, not as much as was constructed in one year in the period 1902-7. In 1919 the miles of track in operation were 253,350 as compared with 242,107 in 1910, a gain of less than 5 per cent. The railways, however, did more work. Passenger-miles increased from 32,338 millions in 1910 to 39,477 millions in 1917, or 22%, and freight-ton-miles from 255,017 millions in 1910 to 394,465 millions in 1917, or 54 per cent. The average tons per freight train increased from 380 to 597. In 1917 1,264 million tons of freight (excluding duplications) were moved by the railways as against 968 millions in 1910. More than one-half of the tonnage carried was the products of mines, coal being by far the largest item. The average number of passengers carried per train rose from 56 to 65. The number of railway employees increased but slightly, from 1,699,420 in 1910 to 1,833,732 in 1917. Electric railways, mostly used for passenger service, have been extended more rapidly than steam railways. In 1907 there were 25,547 m. of electric line and in 1917, 32,548. The number of employees rose from 221,429 to 294,826 and the number of revenue passengers from 7,441 millions to 11,305 millions. (See RAILWAYS.)

In 1916 the Bureau of Census made a study of transportation by water. According to this report the tonnage employed on the Great Lakes and the St. Lawrence river in 1916 was 2,737,491 tons as compared with 2,392,663 tons in 1906, a gain of 14-4 per cent. The freight carried was 125,384,000 tons as against 75,610,000 tons in 1906, a gain of 65-8 per cent. Of this, 73,000,000 tons was iron ore, 30,000,000 tons coal, and 6,000,000 tons grain. The freight handled by the Lakes fleet represented nearly one-half, 48-6%, of the water-borne freight shipments reported for the United States as a whole in 1916 as against 42-6% in 1906. Tonnage on the Mississippi river and tributaries declined greatly, from 4,412,000 tons in 1906 to 1,621,000 tons in 1916. Vessels operating on canals declined both in number and in tonnage. In 1906 the number of such vessels was 2,140 with a tonnage of 259,491; in 1916 the number was 2,049 with a tonnage of 196,426. The decline was on the canals of New York state, where the tonnage dropped from 209,152 tons in 1906 to 115,290 in 1916, showing that the efforts to develop canal transportation in that state had not been successful. The freight carried on the Sault Ste. Marie Canal, connecting lakes Superior and Huron, fluctuated during the decade 1910-9, between 53,477,000 tons in 1911 and 91,888,000 tons in 1915; in 1919 it was 68,236,000 tons.

Mails, Telephone and Telegraph.—Postal statistics show a slight extension of post routes, exclusive of rural delivery routes, from 435,488 m. in 1910 to 455,498 m. in 1919; the number of city carriers from 29,168 to 35,024; the mileage of rural delivery service from 993,068 to 1,143,467; and the number employed in railway mail service from 16,795 to 19,683. The telephone was rapidly

extended. In 1917 there were 28,827,000 m. of single wire in this service as compared with 12,999,000 in 1907. The number of employees nearly doubled during this period, increasing from 144,000 to 244,000. The Bell telephone system operated in 1919 23,281,000 m. of wire, of which 3,334,000 was for long-distance toll service. The number of daily exchange messages of this system alone was 30 millions and of toll messages one million. The telegraph systems made but little extension between 1907 and 1917. In the former year there were 239,646 m. of pole line and in the latter year 241,012. The number of messages sent increased over 50%, from 101 millions to 155 millions; and the number of employees from 26,827 to 49,608. (See TELEGRAPH and TELEPHONE.)

The automobile became an important factor in terminal transportation. Motor-car registration increased nine times between 1912 and 1920, numbering (not allowing for duplicate registration) in the latter year 9,211,295. This represents a motor car for approximately every 11 of the population. (See MOTOR VEHICLES.)

Shipping.—Owing to the great activity in shipbuilding during the World War the tonnage of the American merchant marine showed a marked increase between 1910 and 1919, rising from 7,508,100 tons in 1910 to 16,324,000 tons in 1920. Nearly one-fifth, or 3,138,700 tons, was employed on the Great Lakes. The tonnage on the western rivers continued to decline, being only 120,230 tons in 1920. Sailing vessels decreased both in number and tonnage, and steam vessels declined in number from 12,452 to 8,103, but increased in size. The average tonnage of a steam vessel in 1910 was 394 tons, and in 1919, 1,359 tons. During the five years, 1910-4, the tonnage of new steam vessels built was 1,106,000 tons; and in the next five years ending in 1919, 4,948,400 tons, or more than four times as much. In 1920 new construction amounted to 3,880,639 tons. American shipping is engaged in two distinct branches of trade: coastwise trade between domestic points, and foreign trade. The tonnage in foreign trade increased from 1,076,152 tons in 1914 to 9,928,595 tons in 1920. Coasting tonnage remained about the same. It is estimated that the new tonnage, constructed under the emergency of the war, represented an expenditure of \$3,000,000,000, a sum greater than the book value of all the world's merchant shipping in 1914, aggregating 49,000,000 tons. (See SHIPPING.)

A notable change has taken place in the nationality of shipping entering and clearing from American seaports. Until 1916 the tonnage of vessels sailing under foreign flags for many years was approximately three times as great as that under U.S. registry; in 1920 U.S. tonnage (26,242,332) equalled foreign tonnage (26,178,328).

The total tonnage of vessels entering at all ports from foreign countries increased from 40,235,800 tons in 1910 to 52,420,600 tons in 1920, and the tonnage cleared from 39,705,900 tons to 56,072,300 tons. The tonnage of British shipping entering at seaports of the United States fell from a maximum of 20,416,000 tons in 1914 to 11,237,000 tons in 1919. German tonnage entering in 1915 was 5,035,000 tons, and in the years 1916-9 was practically nil.

National Wealth.—In 1912 the Bureau of Census made an estimate of the wealth of the United States shown in Table 20, amounting to \$187,700,000,000.

This gave an average of \$1,965 for each person as compared with \$1,165 in 1900. More than one-half the wealth consisted of real estate and improvement, largely due to the increase in value of urban real estate. In 1916 the value of taxable real estate in New York City alone was nearly \$8,000,000,000.

Unofficial estimates of the national wealth have been made by statistical experts for dates later than 1912. That of W. R. Ingalls, of the U.S. Bureau of Mines, published in the *Annalist*, Sept. 13 1920, gives \$216,600,000,000 for the year 1916. Other estimates run as high as \$400,000,000,000. These figures, however, have little significance as evidence of domestic welfare. High prices increased appraised valuation; and high valuation, e.g. of real estate, may be a burden upon the productive efforts of the community.

The income-tax statistics published by the Commissioner of Internal Revenue throw light upon the distribution of wealth. In 1918 the number of personal income-tax returns was 4,425,114. The net income reported was \$15,924,639,000; the tax collected on this income was \$1,127,722,000; 34.3% of those making returns reported an income of from \$1,000 to \$2,000; 33.8% an income of \$2,000 to \$3,000; 21.1% an income from \$3,000 to \$5,000; and 7.2% an income of from \$5,000 to \$10,000. Incomes of \$1,000,000 or more were reported by 67 persons. Of the total tax, New York state paid \$354,000,000, or 31.4%; Pennsylvania, \$138,000,000, or 12.2%; Illinois, \$85,000,000, or 7.5%; and Massachusetts paid

TABLE 20. *National Wealth, 1912.*

Items of Wealth	Total Value (in thousands of millions of dollars)	Per cent of Total	Amount Per Capita
Real property and improvements	110.7	59.0	1,150
Live stock	6.2	3.3	65
Farm implements and machinery, etc.	1.4	0.7	14

Furniture, carriages, etc.	8.5	4.5	88
Total	187.7	100.0	1,965

\$81,000,000, or 7.2%. Of the personal income, 73% was from personal service and 27% from property. Corporations reported a net income of \$8,362,000,000, of which those connected with metals and metal products returned \$2,053,000,000 and those connected with transportation and other public utilities \$1,054,000,000. The income, war profits and excess-profits taxes from corporations amounted to \$3,159,000,000 of which those connected with metals and metal products paid 31.76%, or \$1,003,000,000. (See INCOME TAX AND EXCESS PROFITS TAX.)

Public Finance.—The two main sources of Federal revenue are customs duties and internal revenue duties. Revenue from customs although nearly as large in 1920 as in 1910 was relatively unimportant; in 1910 it yielded \$333,683,000 as compared with \$289,934,000 from internal revenue. After that year internal revenue was the larger. Receipts were as follows:—

	Customs	Internal Revenue
1910	\$333,683,000	\$ 289,934,000
1911	314,497,000	386,875,000
1912	311,322,000	380,456,000
1913	318,891,000	405,120,000
1914	292,320,000	442,350,000
1915	209,787,000	415,670,000
1916	213,186,000	512,702,000
1917	225,962,000	809,366,000
1918	182,759,000	3,696,043,000
1919	183,429,000	3,840,231,000
1920	323,537,000	5,399,149,000

On account of the war new taxes were levied, the personal income tax was increased, and excess-profits tax added. The income from these two sources was, in 1918, \$2,839,028,000; in 1919, \$2,600,784,000; and in 1920, \$3,958,000,000. Transportation taxes in 1919 yielded \$238,000,000. Tobacco duties yielded in 1910 \$58,118,000 and in 1919 \$206,003,000; spirits and fermented liquors in 1910, \$209,000,000 and in 1918, \$483,000,000. The total ordinary receipts in 1910 were \$675,512,000, or \$7.48 *per capita*, and in 1919 \$4,647,604,000, or \$43.79 *per capita*. Total ordinary expenditures increased from \$660,000,000 in 1910 to \$15,365,000,000 in 1919, a *per capita* increase from \$7.30 to \$144.77. Expenditures for the War Department increased from \$158,000,000 in 1910 to \$9,273,000,000 in 1919; for the Navy Department from \$124,000,000 to \$2,019,000,000. The interest on the public debt increased from \$24,742,000 in 1917 to \$1,024,024,000 in 1920. Until 1917 the net public debt remained fairly stationary for many years. In 1916 it was about \$1,000,000,000; in 1917 it rose to \$1,909,000,000; in 1918 \$10,924,000,000, and in 1919 \$24,331,000,000. For the Fourth Liberty Loan, the subscriptions were \$6,959,000,000 from 22,777,680 subscribers, or 21.9% of the total population. Of the subscriptions 53% were for \$50, the total in this class making 10% of the total amount subscribed.

The net cost of government, distinguishing between the United States, states, and cities having a pop. of over 30,000, as tabulated by the Bureau of Census for 1919, was:—United States, \$15,740,133,000 (\$149.78 *per capita*); states, \$635,370,000 (\$6.05 *per capita*);

cities over 30,000 \$1,202,324,000. Of the \$635,000,000 representing the cost of state Governments, \$543,000,000 was devoted to current expenses of the general departments, the balance representing payments for outlays and interest on state debts. Of the \$543,000,000 for general departmental services, \$183,000,000 was expended for schools, \$134,000,000 for charities, hospitals and corrections, and \$62,000,000 for highways. The revenue receipts of states were \$675,000,000, of which \$237,000,000 came from the general property tax; \$104,000,000 from special property taxes, as \$46,000,000 inheritance tax, and \$43,000,000 corporation stock taxes; \$123,000,000 was derived from business taxes; and \$48,000,000 from licences other than business, for the most part from the use of motor vehicles. The net indebtedness of states in 1919 was \$520,000,000 or \$4.93 *per capita*. With this may be compared the net indebtedness of the Federal Government amounting to \$24,331,000,000, or \$232.95 *per capita*, and for cities having a pop. of over 30,000, \$2,698,000,000.

Of the total governmental-cost payments for cities having a pop. of over 30,000, 754 millions was for current expenses of general departments; 238 millions was expended for schools, 72 millions for highways; 61 millions for sanitation, 65 millions for fire departments, 81 millions for police departments, and 65 millions for charities, hospitals and corrections. In addition 67 millions was expended for public service enterprises, two-thirds of which was for water-supply systems; 157 millions for interest on debt; and 256 millions for outlays; representing costs of new property and equipment. The governmental-cost payments of 10 large cities for 1919 were as follows:—New York, \$232,061,926 (*per capita*, \$42.28); Chicago, \$93,515,758 (*p.c.*, \$35.66); Philadelphia, \$67,027,257 (*p.c.*, \$37.04); Detroit, \$34,738,091 (*p.c.*, \$36.86); Cleveland, \$29,617,643 (*p.c.*, \$38.84); St. Louis, \$24,188,963 (*p.c.*, \$31.75); Boston, \$37,042,131 (*p.c.*, \$50.13); Baltimore, \$16,372,941 (*p.c.*, \$25.12); Pittsburgh, \$25,527,430 (*p.c.*, \$41.09); Los Angeles, \$24,716,666 (*p.c.*, \$44.81). (See also the section *Finance*.)

Army.—On June 30 1920 the enlisted strength of the army was composed of 15,451 officers and 184,904 men, making a total of 200,355. Of the total 149,869 were on duty in the United States, 19,319 in the Philippine Department, 4,519 in Hawaii, and the remainder were scattered in China, Panama, Alaska, Porto Rico, and Siberia, with the U.S. army in Europe, and at sea. By branches of service the army was composed of Infantry, 52,560; Cavalry, 16,777; Coast Artillery, 16,145; Field Artillery, 15,757; Air Service, 9,358; Corps of Engineers, 4,877; Signal Corps, 4,948; Staff Corps and Departments, 47,165; General Officers and aids, 195; Philippine Scouts, 7,149; and miscellaneous, 25,368. As a result of service in the World War it was estimated by the Chief of Staff of the War Department in 1919 that there were nearly 4,000,000 men and 200,000 officers fit and trained for war. (See *ARMY*.)

Navy.—Owing to the war with Germany, the navy, both in vessels and men, was greatly increased. In 1912 there were 323 vessels fit for service, and 42 under construction; in 1920 the respective numbers were 795 and 165. The principal classes of vessels in 1920, fit for service, were:—battleships 37, armoured cruisers 8, cruisers 26, destroyers 249, submarines 98. In addition there were under construction, 11 battleships, 24 cruisers, 70 destroyers and 50 submarines. In 1910 the number of officers in the regular service was 2,645 and enlisted men 45,076; in 1920 the respective numbers were 8,765 and 116,760. In addition the marine corps contained in 1910 9,659 and in 1920 19,685. (See *SHIP AND SHIPBUILDING*.)

BIBLIOGRAPHY.—Relating to the Thirteenth Census of the United States, 1910 are the following volumes: I. *Population, General Report and Analysis* (1913); II–III. *Population, Reports by States* (1913); IV. *Occupation Statistics* (1914); V. *Agriculture, General Report and Analysis* (1913); VI–VII. *Agriculture, Reports by States* (1913); VIII. *Manufactures, General Report and Analysis* (1913); IX. *Manufactures, Reports by States* (1912); X. *Manufactures, Reports for Principal Industries* (1913); XI. *Mines and Quarries, 1909* (1913). Much of the material in these volumes is summarized in the *Abstract* (1913), and is graphically represented in the *Statistical Atlas of the U.S., 1914*.

The *Census of Manufactures, 1914*, appeared in 2 vols. in 1918–9. Important volumes on special topics have been recently published by the Bureau of the Census: *Negro Population 1790–1915* (1918); *Indian Population in the United States and Alaska, 1910* (1915); *Religious Bodies, 1916*; part I, *Summary and General Tables* (1919), part II, *Separate Denominations* (1919); *Insane and Feeble-Minded in Institutions, 1910* (1914); *Benevolent Institutions, 1910* (1913); *Deaf Mutes in the United States, 1910* (1918); *Paupers in Almshouses, 1910* (1915); *Prisoners and Juvenile Delinquents, 1910* (1918); *Statistical Directory of State Institutions for Defective, Dependent and Delinquent Classes* (1919); *Wealth, Debt and Taxation, 1913* (3 vols. 1915); *Central Electric Light and Power Stations and Street and Electric Railways 1912* (1915); *Telephones and Telegraphs, 1912* (1915); *Transportation by Water, 1916* (1920). The Bureau of the Census has also published a series of volumes on *Financial Statistics of Cities* and on *Financial Statistics of States* and continues the annual compilation on *Mortality Statistics*, begun in 1900. As the registration area is constantly enlarged, these latter statistics are of increasing value.

The Federal Department of Agriculture issues many statistical bulletins relating to crops, supplies and stocks of staple commodities.

The most important of these are summarized in the *Year Book of the Department of Agriculture*. The U.S. Geological Survey of the Department of the Interior issues frequent bulletins on mineral products and stocks which are annually gathered together in the volume *Mineral Resources of the United States*. Statistics of commerce are compiled by the Department of Commerce and published in an annual volume, *Foreign Commerce and Navigation*.

The U.S. Tariff Commission has also published several volumes in which commercial statistics are rearranged for use in tariff discussion, as *The Wool-Growing Industry*. Price statistics both for retail and wholesale trade are gathered and published by the Federal Bureau of Labor Statistics. A valuable series of studies on price statistics of different groups of commodities during the World War was published under the editorship of W. C. Mitchell by the War Industries Board, under the titles *History of Prices during the War* and *Government Control over Prices*. The Bureau of Labor Statistics also issues frequent bulletins showing wages in different trades in different parts of the country. The Interstate Commerce Commission issues an annual report, *Statistics of Railways*. Shipping statistics are published in the *Annual Report of the Commissioner of Navigation*. Immigration statistics are published in the *Annual Report of the Commissioner of Immigration*. Statistical tables in regard to the Federal finances are to be found in the *Annual Report of the Secretary of the Treasury*, sometimes known as the *Finance Report*. This contains abstracts of the reports of the Comptroller, Treasurer, Commissioner of Internal Revenue and Director of the Mint. Of especial value for recent years are the annual reports and the monthly bulletins of the Federal Reserve Board. The bulletins contain a great variety of commercial and trade statistics collected by the 12 different reserve banks. More detailed statistical data may be found in the monthly bulletins issued by the several district banks.

The most serviceable single source-book is the annual volume, *Statistical Abstract of the United States*, first issued in 1878, published by the Department of Commerce. This assembles data on area and population, including census returns, immigration, and vital statistics; education and school statistics; agriculture, forestry and fisheries; manufactures and mines; occupations, labour, and wages; internal communication and transportation; merchant marine and shipping; foreign commerce; consumption estimates; prices; money, banking, and insurance; public finance and national wealth; army, navy, civil service, pensions, and election statistics. Most of the statistics are derived from official publications, but when they are wanting, reliance is placed upon private statistical agencies.

A useful statistical handbook relating to finance, crops, railways, trade and commerce is *The Financial Review*, an annual published by the *Commercial and Financial Chronicle* (New York).

In addition to Government statistics the following volumes should be noted: W. I. King, *The Wealth and Income of the People of the United States* (1917), a scholarly analysis and interpretation of official statistics; Raymond Pearl, *The Nation's Food* (1920), a volume growing out of the author's work as chief of the Statistical Division of the U.S. Food Commission during the war. The Committee on Economic Research of Harvard University has published an important work, *Indices of General Business Conditions*, by W. M. Persons (1919).

(D. R. D.)

II. AGRICULTURE

For the conditions of agriculture in the United States before 1910 see 1.414; for recent statistics see the section *Statistics of the present article*; for general progress since 1909 in biological, chemical and bacteriological research see article AGRICULTURE 30.71; for development in any one state see the article on that state. For various aspects of progress see also, in vol. 32, the index-heading AGRICULTURE and the other index-headings naming the various crops, products, processes, machines, etc.

The main characteristics—economic rather than technical—of agricultural activities in the United States during 1910–20 were the result of significant changes which must be traced through a period of more than one decade. The ten years ending with 1920 witnessed the close of an important epoch and the opening of a new epoch in the agricultural history of the United States. The closing epoch might well be called the pioneer epoch, that of agricultural expansion, or of agricultural exploitation. The new epoch might be called that of agricultural readjustment, development, or utilization. The names by which these two epochs are known are of little importance, but it is of great importance that all who are interested in the development of American agriculture get clearly in mind the fact to which all other facts in this connexion are subsidiary, namely, that ever since the beginning of American agriculture and down to the decade 1910–20 there was ample and fertile field in the West for the expansion of agriculture, but that during 1910–20 virtually the last of the arable part of the public domain passed into private ownership. There was no longer land available for homes for the surplus population from the older portions of the country. The western agricultural migration, which began almost with the first settlements on the Atlantic coast, was, owing to natural barriers and the absence of adequate transportation systems and other causes, more or less sporadic and irregular until about 1860.

The Agricultural Frontier in 1850.—In 1850 the frontier of agricultural development as determined by density of population of 6 or more to the sq. m., or the production of 100,000 bus. of wheat per county per annum had been pushed westward to include portions, varying in size, of the states of Michigan, Wisconsin, Minnesota, Iowa, Nebraska, Missouri, Kansas, Arkansas, Louisiana and Texas. For the next 50 years there was a steady western and northern agricultural movement, until in 1910 virtually the only agriculturally unoccupied territory in the great plains was in Montana, Wyoming, western South Dakota, northwestern Nebraska, southwestern Kansas, New Mexico and western Texas. During the following decade 1910–20 virtually all the agricultural land that remained in the above described regions went into private ownership. By 1921 all the public domain suited to agriculture without irrigation, east of the Rocky Mountains, had ceased to be open to homestead claims and was undergoing agricultural development.

The Agricultural Frontier in 1920.—The 5,000-ft. contour on the eastern slope of the Rocky Mountains is generally considered the western boundary of the great plains, but to simplify computation the great plains may be regarded as including four-fifths of the area of Montana, one-third of Wyoming, one-half of Colorado, one-half of New Mexico, and all of Texas. The tract which came into agricultural production during 1860–1920 includes four-fifths of Montana; one-third of Wyoming; one-half each of Colorado and New Mexico; all of North and South Dakota, and Oklahoma; about seven-eighths of Minnesota; over one-half of Wisconsin; over two-thirds of Michigan; nearly one-half of Iowa; all but six counties (2,494 sq. m.) of Nebraska; all but 10 counties (4,684 sq. m.) of Kansas; all but 25 counties (19,356 sq. m.) of Texas; 14 counties (10,607 sq. m.) in Missouri; 28 counties (20,939 sq. m.) in Arkansas, and all but 27 counties (16,212 sq. m.) of Louisiana; the entire area amounting to no less than 1,006,607 sq. m., or 701,828,480 acres. Not all of this is arable land, but a higher percentage of it is arable than that of any other equal area on the North American continent, and contains at least 250,000 sq. m. of the richest agricultural land on the continent. More than half the total wheat crop of the United States for 1920 was grown in this area.

Coincident with the settlement of this plains region east of the Rocky Mountains was that of the inter-mountain and basin region and of much of the Pacific slope. The percentage of arable land west of the Rocky Mountains is much less than in the plains of the Mississippi Valley and the Lake region, but in the aggregate an immense area of land was brought into cultivation west of the Rockies during 1860–1920. There, as in the plains, practically all the land suitable for agriculture was appropriated and developed. There remained only small valleys and isolated areas and some Indian reservations that were to be soon thrown open to settlement. New reclamation projects were expected to develop, but if all the potentially agricultural land west of the Rocky Mountains were to be developed during 1920–30 the area would be small in comparison with that developed in each decade during 1860–1920. And it is probable that during 1920–30 as much land classed as farm land may be found unfit for that purpose and be devoted to other purposes, such as grazing and forestry, as will be brought into cultivation.

The significance of these facts does not seem to impress as it should either the public or the farmers. The habit of western migration, bred into the American people, during three centuries of practice is about to be broken.

The exhaustion of the public domain means that there is no longer available each year, as there was during 1860–1920, an area of virgin land in the Mississippi Valley, averaging 18,277 sq. m., or 11,697,280 ac., that is to say an area equal to one-third of the state of Iowa. It means that increased agricultural production by the simple process of breaking up virgin prairie is virtually at an end, so that future increases in food production must be attained by a more effective utilization of the land already occupied as farms.

The Increase of Agricultural Production and of Population for 60 Years.—The accompanying tables have been prepared from data contained in the 1920 Yearbook of the Department of Agriculture and the 1920 Census Reports. The yields of grain stated in these tables are not those of the Census Reports, but are the averages of the yields given in the Yearbook for each of the 10 years in each decade, except those for 1860 which represent the single year 1859, and for 1870 which represents the average for four years, 1866–9 inclusive. It is believed that this gives a better expression of the facts than using for each decade a single year's yield, such as is given in the Census Reports.

The two crops, wheat and corn, are chosen as an index of the general agricultural production for each decade since 1860. It is believed that they will serve the purposes of this discussion as well as or better than the more complex indexes used for more detailed investigation.

It will be seen that the proportionate increase by decades in population has been declining, having been 26.6% for 1860 and 14.9% for 1920, the greatest decrease in any decade having been between 1910 and 1920. There has been no such progressive decrease in production of either wheat or corn. The highest proportionate increase in the production of wheat was in 1880, when it was 49.3% over that of 1870. The highest proportionate increase in the yield of corn was also in 1880, when there was an increase of 41.9% over

1870. The percentages of increase of both wheat and corn for 1870 are not very trustworthy, because, as has been said, the yields used in the census of 1860 were the yields of the single year 1859 and those for the year 1870 were the averages of four years—1866-9 inclusive. From 1880 to 1920 there was a general decline in the average increase in production of wheat. In the case of corn its regularity was broken by reason of the very low rates of increase for the decade reported in the census of 1900. This was due to a succession of crop years with unfavourable weather conditions and to a general business depression. The production in bushels per capita of both wheat and corn has been quite constant. There has, therefore, been a regular increase in the bushels per capita of wheat from 5.5 bus. in 1870 to 7.4 bus. in 1920, and an increase in corn from 22.2 bus. in 1870 to 26.2 bus. in 1920. Dividing the percentages of increases for decades by 10 to give the annual percentage of increase shows that the average annual increase in the production of wheat in the United States for a period of 60 years (from 1860-1920) is to the annual increase in population as 2.91 is to 2.25 and that of corn for the same period is as 2.28 is to 2.25.

Both population and production have been increasing at a lessening rate. The retardation in the increase in population has been somewhat greater than that of production, as is indicated by the increase in the per capita production of wheat from 5.5 bus. to 7.4 bus. and of corn from 22.2 to 26.2 bus.

The proportionate rate of increase in production of wheat for the decade ending with 1920 was 13.9% and for corn 11.2%, and for population 14.9%.

TABLE I.—Wheat Production and Population.

Years.	Population.	Production.	Increase in Production Bus.	Percentage Increase of Production.	Percentage Increase of Population.	Bushels Per Capita.
1860	31,443,321	173,105,000	—	—	—	—
1866 to 1869	38,558,371	212,156,000	39,051,000	22.6	26.6	5.5
1870 to 1879	50,155,783	316,820,000	104,664,000	49.3	26.0	6.3
1880 to 1889	62,947,714	444,078,000	127,258,000	40.2	25.5	7.1
1890 to 1899	75,994,575	556,674,000	112,596,000	25.4	20.7	7.3
1900 to 1909	91,972,266	684,434,000	127,760,000	23.0	21.0	7.4
1910 to 1919	105,710,620	779,560,000	95,126,000	13.9	14.9	7.4
Averages			29.1	22.5	6.8	

TABLE II.—Corn Production and Population.

Years.	Population.	Production.	Increase in Production Bus.	Percentage Increase of Production.	Percentage Increase of Population.	Bushels Per Capita.
1860	31,443,321	838,793,000	—	—	—	—
1866 to 1869	38,558,371	854,278,000	15,485,250	1.8	26.6	22.2
1870 to 1879	50,155,783	1,212,013,000	357,735,000	41.9	26.0	24.2
1880 to 1889	62,947,714	1,692,019,000	480,006,000	39.6	25.5	26.9
1890 to 1899	75,994,575	1,995,190,000	303,171,000	17.9	20.7	26.3
1900 to 1909	91,972,266	2,486,274,000	491,084,000	24.6	21.0	27.0
1910 to 1919	105,710,620	2,765,041,000	278,767,000	11.2	14.9	26.2
Averages			22.8	22.5	25.5	

It becomes evident that the record of the annual production of wheat and corn through a period of 60 years, and its relation to the

increase in population as indicated by the figures given in the accompanying tables, is a safe index of the agricultural requirements for the future, the conclusion is that if the general agricultural production of the country can be increased at the rate of 2% per annum for the future, the per capita production of wheat and corn, and probably of most other staple agricultural products, can at least be maintained at the ratio of the decade 1910-19.

The Agricultural Problem of the Future.—Had conditions in all parts of the world remained substantially as they were in 1914, the chief problem in 1921 would have been how to maintain in later years an increase of 2% per annum in the agricultural production of the United States, notwithstanding that virgin land could no longer be counted upon. This is a problem that prior to the World War would have engaged the most earnest effort of American farmers and the various agricultural agencies and organizations, both Federal and State. It would have presented difficulties of adaptation, adjustment, and development. The question of actual food production would have been a minor one as compared with such questions as transportation and distribution, the securing of efficient farm labourers at reasonable wages, and the opportunity for the farmers to purchase at prices comparable with the prices of farm products the things that a farmer has to buy to conduct his business and to live in comfort. Given conditions favourable in these respects, agricultural production undoubtedly could have been increased for many years after 1921 at a rate of 2% per annum. There are many ways in which this increased production could have been brought about: by clearing and bringing into cultivation waste land already included in farms; by draining swamps, and by developing water to enlarge existing irrigation projects; probably most of all by more intensive methods of agriculture. The agriculture of the United States had been and in 1921 still was an extensive, rather than an intensive, agriculture, and properly so. So long as land was plentiful and men were scarce the extensive system was to be encouraged. But as land began to become scarce and men plentiful there came almost unlimited opportunities for the intensifying of agriculture. While this need for closer farming was being discussed the World War brought with it a new set of problems that engaged the attention of the farmers as well as other citizens.

Prices of Farmer's Products and of Commodities He Buys.—The most pressing problem in 1921 was the disproportion between the prices of those things the farmer has to buy and those he has to sell. This difficulty was as great when he paid for labour as when he bought commodities.

Wages of Farm Labour.—The Bureau of Crop Estimates of the Department of Agriculture published in the Yearbook for 1920 a table giving the wages paid farm labourers from 1866 to 1920. Arranging these figures for the different classes of farm labourers as index numbers, and calling the wages of 1913 100 as a base, gives the following results:

Wages—Agricultural Labour.

	1913	1920	1921	Index No.	
				1920	1921
A By the month with board	\$21.38	\$46.89	\$29.48	219	138
B By the month without board	30.31	64.95	42.65	214	141
C Day labourer at harvest, with board	1.57	3.60	2.12	229	135
D Day labourer at harvest, without board	1.94	4.36	2.80	225	144
E Day labourer, not harvest, with board	1.16	2.86	1.60	247	138
F Day labourer, not harvest, without board	1.50	3.59	2.17	240	145

Farm wages declined during 1921. The best information available, Nov. 20 1921, was that wages were about as follows (A) \$29.48, (B) \$42.65, (C) \$2.12, (D) \$2.80, (E) \$1.60, (F) \$2.17. These figures would give an index number about 145, or an increase of about 45% for 1921 over the wages of 1913. In the diagram, fig. 1, the figures for "Day labour, not harvest, without board" have been used as they are considered the most trustworthy. Men of this class are usually married men who either own their own homes or rent them from their employers. They are less inclined to drift than those who are boarded by their employers, and who are usually single and "footloose." The married man who works by the month and boards himself frequently has house, garden, firewood and sometimes milk and pork provided by his employer. This is probably the most stable class of farm labour. It does not, however, yield a conclusive index of the changes in wages because changes in the value of the perquisites above mentioned tend to complicate the calculation.

The index number for the wages of day labourers, not for harvest, without board were as follows:

Year . . .	1913	1914	1915	1916	1917	1918	1919	1920	1921
Index No. . .	100	97	98	108	135	175	208	240	145

Discussion of Diagram.—Fig. 1 (p. 864) shows the index numbers of farm crops, live stock, commodities and farm labour for each year from 1913 to 1921, inclusive.

FIG. 1.

Index Numbers of Farm Crops, Live Stock, Commodities and Farm Labour Each Year from 1913 to 1921 Inclusive.

The two outstanding facts are that in every year from 1913 to 1919 the farm crops index stood higher than any of the others, and that from 1913 to 1918 the farm wage index stood as low as or lower than any other.

Tables III., IV., and V. are based upon data prepared by the Bureau of Crop Estimates, and published by authority of the Secretary of Agriculture.

TABLE III.—Index Numbers of Farm Prices of Crops.

The index numbers of average prices to farmers of the United States of 10 leading crops (wheat, corn, oats, barley, rye, buckwheat, potatoes, hay, cotton, and flax) represent about four-fifths of the value of all crops and may be regarded as representing the trend of all crop prices. (Base 100=average for 12 months of 1913.)

A study of the diagram (fig. 1) confirms the evidence from many other sources that farmers engaged primarily in crop production were reasonably prosperous from 1913 to 1916 inclusive, and that during 1917, 1918 and 1919 they enjoyed unprecedented prosperity followed by two years of heavy losses; the high prices of the early months of 1920 having broken before the products could be marketed and the cost of commodities and farm wages remaining high. It also shows that the live stock grower was only just able to keep pace with the increasing cost of necessary commodities, and but little ahead of the steadily rising farm wages that he had to pay. The conditions of agriculture on Dec. 1 1921, as shown by Tables I., II., III. and V., and fig. 1, indicate that never before in the history of American agriculture had the farmers been confronted with so serious a situation. Unless the prices of what the farmer must sell could be brought into proper relation with prices of what he must buy—commodities and labour—agricultural production would necessarily be so greatly reduced as to bring about a serious shortage of food and textile products, for farmers cannot continue to produce crops at a loss not only of their time, but also of their money.

When, however, the agricultural situation is more closely studied it becomes apparent that even though a proper relation could be restored between the prices of farm products, farm labour, and the commodities the farmer has to buy, many of the farmers would be still unable to operate their farms profitably.

During the decade 1910-20, throughout the first half of which the farmers enjoyed normal prosperity and throughout the latter half of which their prosperity was the greatest ever enjoyed by American farmers, the rural population increased only 5.4% while the urban population increased at the rate of 25.7%. That is to say urban population increased nearly five times as rapidly as the rural population, increased movement to centres showing that farm life and farming had come to be disliked, notwithstanding their new advantages: improved roads, rural free mail delivery, telephones, automobiles, farm electric lighting plants and modern water and heating systems, all developed rapidly during the ten years in question.

Although there were 86,864 or 1.4% more farms in the United States in 1920 than in 1910, there were 23,627 or .6% fewer farm owners. Of the 3,925,090 farms operated by their owners in 1920, 41.3% were mortgaged as against only 33.6% in 1910.

The value of the land and buildings of mortgaged farms was \$6,330,236,951 in 1910, and in 1920 \$13,772,729,610, an increase of 117.6%. In 1910 the mortgaged indebtedness was \$1,726,172,851; in 1920 \$4,012,711,213, an increase of 132.5%. The increase in value ranged from 21% in New Jersey to 480% in Arizona. The increase in mortgaged indebtedness ranged from 10.2% in Rhode Island to 625.7% in Montana. The increase per cent in mortgaged indebtedness by geographical divisions was as follows: New England 56.8; Middle Atlantic 45.5; East North Central 101.0; West North Central 136.3; South Atlantic 161.8; East South Central 194.6; West South Central 154.0; Mountain 379.4; Pacific 215.6.

The average value of land and buildings on all mortgaged farms in 1910 was \$6,289, and in 1920 it was \$11,536, an increase of 117.6%. The average debt per farm was \$1,715 in 1910 and \$3,361 in 1920, an increase of 132.5%. The debt per cent value was 27.3 in 1910 and 29.1 in 1920, the figures being based on 1919 values. These declined and debts increased during 1920 and 1921, and at the end of 1921 it was believed that changes would continue in the same direction, until a shortage of food should increase prices.

There was difference of opinion as to the significance of the heavy increase in mortgaged indebtedness. The published reports of the Bureau of Census do not indicate at what time during the decade this increase took place, nor the purposes for which the money represented by the mortgages was used: whether as purchase money for the land upon which it was placed, for buildings, or other improvements upon the land, for farm equipment, or for the purchase,

operation, and the incidental expenses pertaining to the ownership of an automobile.

Conditions during 1910-5, unforeseen in the beginning of that period, favoured investors in agricultural land and in farm improvements. Values doubled and in some instances quadrupled during 1910-20. And many of those who borrowed to make such investments were enabled during 1915-20 to repay in what were called "thirty cent dollars," because inflated prices made currency redeemable in gold seem worth less than before. Indeed many farmers thus repaid not only the capital they had borrowed, but also their small floating debts, so that when deflation began in the summer of 1920 they could face without fear the inevitable hard times, in which economic readjustments must be made.

Unfortunately not all farmers were safe. Some, because of local crop failures or other unavoidable circumstances—and others, more numerous, because they had yielded to the spending craze that swept the country in 1918 and 1919—found themselves in the summer of 1920 possessed of much property, both real and personal, some of which had been acquired at war-time prices, but heavily indebted and with credit exhausted. It was largely owing to their difficulties that during the decade the mortgaged indebtedness of farmers so largely increased.

The Internal-Combustion Engine as an Agricultural Factor.—In the decade ending with 1919 there was a great development of the internal-combustion engine and adaptation of it not only to the labour, but also to the health, comfort and enjoyment of the American farmer. (See articles: INTERNAL-COMBUSTION ENGINES; TRACTORS; and MOTOR VEHICLES.) It came to be used directly in the automobile, truck, tractor, pumping plant, electric lighting plant; for cutting silage, grinding feed, shelling corn, threshing grain, sawing wood, operating spraying machines and fruit-grading machines; and for many other power purposes. The internal-combustion engine, generating current, also indirectly operates the washing machine, the electric iron, electric fans, the vacuum cleaner, electric heating pads, and (through small portable motors) serves for separating milk, churning, meat grinding and many other household purposes.

A general farm of 150 to 200 ac. growing fruit, a small dairy herd, some truck and general farm crops, was no longer considered well equipped unless it had all the facilities above mentioned and perhaps a milking machine also, if the dairy herd was large. Seven separate internal-combustion engines and an equal number of small electric motors probably would be needed for all these purposes. Such a plant undoubtedly would be a good investment if it were judiciously selected and bought at a fair price, provided always that (1) the farm and the system of farming were adapted to the use of a tractor, (2) that the farmer or some member of his family had the necessary mechanical skill to see that this equipment were properly operated and kept in repair, (3) that the capital of the farmer was sufficient to provide such a plant, and (4) that the income of the farm was sufficient to support such a plant without seriously interfering with the other requirements of the family and the farm business.

Seldom, if ever, are all the above-mentioned conditions fulfilled, but the measure in which they can be approximated will determine the advisability of the purchase of all the above-mentioned equipment, except the automobile. This must be considered apart, for, although any part of a full farm equipment may be misused, the extent to which the privileges conferred by the automobile may be abused is almost without limit. The choice of the make of automobile is a simple matter, so far as mechanical construction is concerned. The buyer gets about what he pays for in any standard make. It is the use to which the car is put rather than its quality which makes it advantageous or harmful. Whether it will contribute to the efficient handling of the farm is not the only question. If the car is used chiefly to take the family away from home and to encourage waste of time and money, then it is a poor investment.

Automotive Statistics, for 1921, published by the Motor List Company of Des Moines, Iowa, states that 3,243,051 automobiles are owned by farmers in the United States. As already mentioned, the increase in the mortgaged indebtedness of the farmer-owned farms of the United States from 1910 to 1920 was \$2,286,538,362. If those 3,243,051 automobiles cost \$705.06 each, which is a fair estimate, they would nearly equal in value the amount of the increase in mortgaged indebtedness between 1910 and 1920. This correlation is accidental; no one believes that those 3,243,051 automobiles were bought with money secured by executing mortgages aggregating \$2,286,538,362 upon farm property. It is nevertheless probable that some of the purchase money would have been better used to pay off mortgages.

Farm Labour.—Mention has been made of the changes in farm wages during and since the World War. The changes in the price paid per day or per month, or in the index numbers, ought to, but do not, fully represent the changes in the costs of units of labour performed. Before the war most farm labourers were willing to give 10 hours of faithful work for a day's pay. The migration of labour during and after the war, by reason of enlistment or employment in cities or in large manufacturing plants, brought many farm labourers into contact with men who preach inadequate work as a duty. Many of the farm labourers were demoralized, and near large cities it

became almost impossible to get an honest day's work at any price. For this reason although the figures in the present article indicate that the price of labour is about 50% more than before the war, the actual cost of labour is from two to three times as much as it was. This is a factor of great importance in all readjustments of the cost of farm products.

Farmers and Consumers.—There was little in the agricultural outlook in Dec. 1921 to encourage the farmers to plan even normal production in 1922, for corn was then selling at from 19 to 28 cents on the farms of North and South Dakota, Minnesota, Nebraska, Iowa, and Kansas; much of the 1920 crop remained unsold; and nearly all farm products were selling at much lower prices than in 1913, although both labour and the commodities the farmer had to buy were much higher. It was evident that farmers must retrench in every practicable way, hiring as little labour as possible; reducing the scale of farm operations as nearly as possible to the point where the farmer and his family could do all the work. They must burn corn or any other agricultural product for fuel, whenever the farm price of that product fell below the cost of equivalent coal, wood, gas, or oil—after adding to the price of such fuel, at the railway station or waterside, the cost of hauling the fuel to the farm and the agricultural products from the farm.

Much could be done toward reducing cash outlay by making each farm produce as much as possible of the food for the family. Much, also, might be accomplished by a system of community exchange. With good roads, automobiles and trucks every farm family should be provided with virtually all necessary food products without expenditure for products, freight or middleman's profit.

In respect of food this generation by reason of the ease and rapidity of communications and country road transportation is better able to develop community self-sufficiency than any previous generation. If there were a demand for home spinning and weaving machinery on a large scale, as there is on a small scale, for home knitting machines throughout the country, homespun clothing again would take its place on the farm. As has been said already, good roads, rural mail delivery, the telephone and the internal-combustion engine have removed practically all but one of the objectionable features which drove many from farm life. That objection is that farming does not yield as large a revenue in proportion to the capital invested and the intelligence, business ability, and enterprise possessed by the farmer, as do other business or professional careers. This must cease to be the case, or American farmers will not continue to produce food and clothing for the rest of the population.

There has been and will continue to be much discussion and agitation of this subject in the public press and on the floors of Congress. Some legislation had already been enacted by 1922 for the purpose of helping the farmer, and further measures were in prospect. It is doubtful whether any real headway can be made in solving the producers' problem until there is an actual and very severe shortage of food in the country. When this occurs, the farmers will obtain fair prices for their products, and may then be able to resume the operation of their farms at full capacity, and to take up the great agricultural problem of the future, which is the adaptation, adjustment and development of the fixed agricultural area of the United States, so that it may continue indefinitely to meet the constantly increasing demands of an increasing population.

(E. C. C.)

III. FINANCE

The movement of public expenditures and receipts in the United States during the decade 1910-20 presents as its most important aspect an instructive contrast between conditions of peace and those of war and readjustment. When the decade opened, education was the largest expenditure, taking all divisions of Government into account; and the financial operations of the state and local Governments were twice as large as those of the national Government. Expenditures, taxes and public debt, it is true, had all been increasing for some time both in the aggregate and *per capita*; but the wealth (expressed in money) of the country had more than doubled between 1900 and 1912, the average rate of the general property tax had decreased between 1902 and 1912, the Federal debt *per capita* was decreasing, and Federal expenditures *per capita* were lower between 1910 and 1914 than in 1908 and 1909. There was, of course, constant protest against rising taxes and "extravagant public expenditures," but the total tax burden was probably increasing less rapidly than wealth or income, and this was certainly true of Federal taxes. War changed all this. Education and the developmental functions yielded first place to military activities; Federal finance threw into the background state and city finance; reduction of the aggregate debt ceased and in less than two years of war the interest charge of the Federal Government alone had become greater than the entire cost of running the Federal

Government before the war. The Federal Government's expenditures and revenues in peace, war and reconstruction are presented in Table I., in which it should be noted that the figures represent net expenditures and net revenues, the expenditures of each department being credited with the earnings of that department and the tax receipts being similarly reduced by the refunds allowed during the same period.

From 1910 to 1916, inclusive, the net expenditures of the Federal Government showed no striking tendency to increase, being only \$35,000,000 greater in 1916 than in 1910. The net expenditures for the army and navy were only \$23,000,000 greater in the fiscal year 1916 than in the fiscal year 1914, which closed so far as Americans knew to the contrary amid conditions of secure peace—a striking commentary upon the attitude of the Administration in power toward preparedness. Between 1917 and 1919, however, the net expenditures of the army and navy rose from \$668,852,048 to \$11,192,817,468. It is needless to add that this expansion checked the development of the civil functions. Even before the World War, expenditures for the army, navy, pensions and interest upon old war debt absorbed about two-thirds of the Federal expenditures, leaving less than one-third for the civil functions. But in 1920, at the close of the decade, the expenditures chargeable to war consumed three-fourths of the very much greater aggregate. The total expenditures for primary governmental functions, research, education and development, and for public works, representing the civil functions, were actually less *per capita* in 1919 (\$2.21) than in 1910 (\$2.24), the principal reductions coming in the expenditures for public works which amounted to \$54,332,139 in 1919 as contrasted with \$79,503,701 in 1910. In 1920, after the war, the expenditures for civil purposes rose materially; but considering the fall in the purchasing power of money, even the later and higher figures suggest decrease in the equipment, personnel and efficiency of the civil branches of the Government.

The cost of the war may be estimated with rough accuracy, defining such cost as the excess of the expenditures which actually occurred over the amounts which probably would have been expended had the war not taken place. The Secretary of the Treasury (*Annual Report*, 1920, p. 105), assuming that expenditures on a peace basis during the three fiscal years 1917-9, would have been \$1,000,000,000 a year and during the following fiscal year \$1,500,000,000, estimated the net war expenditure to June 30 1920 at \$33,455,000,000, and the net war-tax receipts, *i.e.* the excess of the annual tax revenue over the normal tax revenue of peace-times, at \$10,703,000,000. On this basis, 32 per cent of the special war expense was paid from special war taxes. Mr. E. B.

Rosa, in his authoritative analysis, *Expenditures and Revenues of the Federal Government*, makes a more careful estimate, for the four years 1917-20, of the "excess of expenditures over the estimated normal expenditures on a pre-war basis," and reaches a figure of \$35,427,730,074, against which he places an estimate of the special war revenue, *i.e.* "the excess of revenue over the estimated cost of government on pre-war basis," \$11,818,690,300. Mr. Rosa's estimate agrees with that of the Secretary of the Treasury in indicating that one-third of the special war costs were paid from special war revenues. In both cases loans to foreign Governments, \$9,500,000,000 in round figures, are included in the war costs.

Federal revenues during the decade were revolutionized. At its beginning in 1910, customs supplied more than one-half the total receipts; and customs together with the duties on distilled spirits, beverages and tobacco produced more than 95% of the total net revenues. The income tax (special corporation excise tax) was then in the first year of its collection and yielded less than 4% of the total. By the end of the decade, customs and the old duties on alcoholic beverages were subordinate. In the year 1920 customs yielded less than 6%, and the combined duties on imports, distilled spirits, beverages and tobacco yielded only 14% of the total tax revenue; while the income and profits taxes produced \$3,956,936,003 or nearly 70% of the total net tax revenue, which was large enough in this year of readjustment to meet the entire current cost of the Government and to create a surplus of more than \$1,000,000,000. Other noteworthy developments of this decade from the viewpoint of revenue are found in the introduction in 1916 of the Federal estate or inheritance tax, the development of the excess-profits tax, the loss of one of the most important of the older taxes through the adoption of Federal prohibition, and the reestablishment of the Tariff Commission. The most significant change, however, was the revolutionary readjustment of taxes by which a system of taxation, predominantly indirect and regressive, gave way to a system predominantly direct and progressive.

Public credit supplied during the war two-thirds of the revenue or receipts. Details concerning the management and yield of the huge war loans are given in the article LIBERTY LOAN PUBLICITY CAMPAIGNS. Here the subject can only be briefly treated in its connexion with the plan of the Government for the financial management of the war. That plan was based upon the policy of sedulously avoiding the use of Government paper money; of raising at least one-third (and, if possible, one-half) of the necessary revenue by taxation; of keeping the inflation which inevitably accompanies war to a minimum, by restricting "non-es-

(e) Post-office war revenue given as annual average for the two years collected, but averaged over three years, 1917-9, in computing the total.

essential" commercial credit, encouraging subscribers to the Liberty and Victory loans to pay for them from current savings; and (in minor degree) by repressing unnecessary consumption through the adequate taxation of personal incomes and the use of luxury taxes. Financial preparation for a long war, perhaps of three years, was made, with due appreciation of the fact that in the early months the most effective contribution of the United States would take the form of generous supplies of goods and credit to the Allies. As stated by R. C. Leffingwell, Assistant Secretary of the Treasury, who more than any other one man guided the credit operations of the Government during the war:—

"The Treasury's war problem was to meet the financial requirements of the Governments of the United States and the Allies promptly and without stint, and to meet them so far as possible from the saved incomes of the people, avoiding avoidable inflation. These objectives must be pursued in such ways as would not interfere with, but on the contrary facilitate, the mobilization of the Nation for war purposes and the production and transportation of munitions."

As the principal credit instrument with which to achieve these ends, the Government used, for the most part, terminable bonds with moderate but adjustable maturities (in no case exceeding 30 years), partially subject to taxation, issued every six months from the beginning of the war to May 1919, at interest rates which because of the conversion privilege varied with the changing credit conditions but were always high enough to stimulate the instinct of saving, yet low enough to utilize fully the patriotic fervour of the people.

In order to avoid credit strain, with its demoralizing effects upon interest rates and business, the huge bond issues were preceded by practically monthly issues of short-dated tax and loan certificates, to be taken up by the payments for taxes or by the subscriptions to Liberty Bonds. When the war debt was at its peak, at the close of Aug. 1919, the gross debt amounted to \$26,596,701,648 (or to \$25,478,502,113, deducting the net balance in the general fund); of which short-time Treasury certificates constituted \$4,201,130,050. As an essential part of the credit machinery, the Treasury adopted as particularly suited to the decentralized character of the country's banking system, upon which the burden of distributing the war loans fell, the device of "payment by credit," by which banks subscribing for Government loans held their subscriptions as a credit to the account of the Government until the Government called for the funds. This reduced the credit strain by preventing the concentration of funds in the Government coffers, and "developed the further advantage that in the difference between the rate borne by the securities and the rate charged on the deposit, banks found some compensation for their time, trouble and the loss of deposits, resulting from the sale of securities to investors" (Leffingwell). This method of payment by credit has been criticized both as paying huge sums to the banks for creating credit which could have been as easily manufactured by the Government itself; and also as productive of inflation. Neither charge will bear analysis. The banks lost rather than gained by the Government's absorption of the investment resources of the people and by the repression of "non-essential industry"; and the device checked rather than stimulated inflation. If the Treasury had actually drawn into the reserve banks and its own offices the proceeds of these great loans, not only would it have demoralized the money market and increased money rates, but after a period of agitation—perhaps panic—there would have been heavy calls for discounts upon the reserve banks and "upon the re-deposit of the proceeds of certificates, depositary banks would be put in possession of loanable funds. . . . It was better to make one bite of the cherry and to avoid the money strain and inflation which would have been inevitable if the money had been first drawn out of the banks and then re-deposited with them" (Leffingwell).

In its decision of the momentous credit questions arising during the war, the Government steered a middle course, avoiding the mistakes which characterized the Civil War financing in the United States and much of the European financing during

the World War. One set of critics urged much greater reliance upon short-time debt. Another set urged long-time bonds, "sold over the counter," at interest rates high enough to keep the bonds at par when the inevitable post-war reaction set in. The Government took the intermediate course, utilizing but not abusing the patriotism of the people on the sound assumption that no rate of interest could have been sufficiently high to float these huge issues on a commercial basis alone. And its use of anticipatory short-time certificates was designed not only to prevent money stringency during the war, but to keep some pressing war debt current for extinguishment in the prosperous time which usually follows the termination of a great war. "No administration could have resisted the pressure for reduction of taxes and increase of expenditures if the war debt at its maximum of \$25,300,000,000 had been funded, and it had subsequently appeared that taxes and salvage would more than meet current expenditures. The time to pay down a war debt is immediately after the war" (Leffingwell). With the depression that set in in 1921, the Government introduced successfully the device of selling notes running from three to five years along with the more temporary Treasury certificates. And the same middle course was taken, with the results already stated, between the proposals to exempt Government obligations entirely from taxation and to subject them to all Federal taxes at full rates; between those who counselled "conscription of wealth" and those who would have paid practically the whole cost of the war with credit devices of one kind or another. One mistake, the issue of Government paper money, was wholly avoided, and bank credit utilized in its place. But every effort was employed to draw the borrowings from actual savings and to get Government securities as rapidly as possible out of the banks into the hands of investors. These efforts succeeded; on June 1 1921 (according to reports from banks transacting over 40% of the commercial banking business of the country), less than \$600,000,000 of the long-time debt of \$15,271,000,000 outstanding, only \$186,412,000 Victory notes (out of \$4,022,000,000 outstanding) and \$184,086,000 Treasury certificates (out of \$2,572,000,000 outstanding) were pledged with these banks as security for loans and discounts.

The management of the credit operations of the war was not without its shortcomings. The preferential discount rate for loans secured by Government obligations may have been a mistake; perhaps, too, much use may have been made of bank credit and not enough use of taxation—particularly of taxes on the consumption of luxuries and on incomes of the moderately rich; and it seems unquestionable that, owing to inability to gauge the exact time and amount in which the subscriptions to the Liberty loans would be paid, there was an overlapping of Treasury certificates and of bond subscriptions, with the result that the Treasury balance throughout the war was unnecessarily large. But these errors and defects were of secondary importance. The smoothness and efficiency with which the credit machinery worked during the World War—particularly in contrast with its inefficient management during the Civil War—indicate that in essentials the credit policy of the Government was sound and its administration remarkably efficient. The response of the people to the call for bond subscriptions, the cheerfulness with which the heavy war taxes were borne, and the absence of even a temporary breakdown in the credit mechanism with which the war was financed, were all admirable.

State and local finance were affected in unexpected ways by the war. At the beginning of the decade under review, state Government in particular was undergoing an unusually rapid expansion; and both state and municipal expenditures were increasing nearly twice as rapidly as those of the Federal Government. The tax burden, in the case of the state and local Governments, was increasing but not so rapidly as expenditures; increasing deficits were the rule; and the public debt both in total amount and *per capita* was increasing. The situation at the beginning of the decade and the principal financial movements throughout the decade are suggested in Tables II. and III. It should be noted that the Federal expenses or cost payments in Table II. do not include payments made for the purchase of obligations of foreign Governments; and that the *per capita* statistics quoted in Table III. represent net expenditures and revenues after deduction of working credits and tax refunds.

Government before the war. The Federal Government's expenditures and revenues in peace, war and reconstruction are presented in Table I., in which it should be noted that the figures represent net expenditures and net revenues, the expenditures of each department being credited with the earnings of that department and the tax receipts being similarly reduced by the refunds allowed during the same period.

From 1910 to 1916, inclusive, the net expenditures of the Federal Government showed no striking tendency to increase, being only \$35,000,000 greater in 1916 than in 1910. The net expenditures for the army and navy were only \$23,000,000 greater in the fiscal year 1916 than in the fiscal year 1914, which closed so far as Americans knew to the contrary amid conditions of secure peace—a striking commentary upon the attitude of the Administration in power toward preparedness. Between 1917 and 1919, however, the net expenditures of the army and navy rose from \$668,852,048 to \$11,192,817,468. It is needless to add that this expansion checked the development of the civil functions. Even before the World War, expenditures for the army, navy, pensions and interest upon old war debt absorbed about two-thirds of the Federal expenditures, leaving less than one-third for the civil functions. But in 1920, at the close of the decade, the expenditures chargeable to war consumed three-fourths of the very much greater aggregate. The total expenditures for primary governmental functions, research, education and development, and for public works, representing the civil functions, were actually less *per capita* in 1919 (\$2.21) than in 1910 (\$2.24), the principal reductions coming in the expenditures for public works which amounted to \$54,332,139 in 1919 as contrasted with \$79,503,701 in 1910. In 1920, after the war, the expenditures for civil purposes rose materially; but considering the fall in the purchasing power of money, even the later and higher figures suggest decrease in the equipment, personnel and efficiency of the civil branches of the Government.

The cost of the war may be estimated with rough accuracy, defining such cost as the excess of the expenditures which actually occurred over the amounts which probably would have been expended had the war not taken place. The Secretary of the Treasury (*Annual Report*, 1920, p. 105), assuming that expenditures on a peace basis during the three fiscal years 1917-9, would have been \$1,000,000,000 a year and during the following fiscal year \$1,500,000,000, estimated the net war expenditure to June 30 1920 at \$33,455,000,000, and the net war-tax receipts, *i.e.* the excess of the annual tax revenue over the normal tax revenue of peace-times, at \$10,703,000,000. On this basis, 32 per cent of the special war expense was paid from special war taxes. Mr. E. B.

Rosa, in his authoritative analysis, *Expenditures and Revenues of the Federal Government*, makes a more careful estimate, for the four years 1917-20, of the "excess of expenditures over the estimated normal expenditures on a pre-war basis," and reaches a figure of \$35,427,730,074, against which he places an estimate of the special war revenue, *i.e.* "the excess of revenue over the estimated cost of government on pre-war basis," \$11,818,690,300. Mr. Rosa's estimate agrees with that of the Secretary of the Treasury in indicating that one-third of the special war costs were paid from special war revenues. In both cases loans to foreign Governments, \$9,500,000,000 in round figures, are included in the war costs.

Federal revenues during the decade were revolutionized. At its beginning in 1910, customs supplied more than one-half the total receipts; and customs together with the duties on distilled spirits, beverages and tobacco produced more than 95% of the total net revenues. The income tax (special corporation excise tax) was then in the first year of its collection and yielded less than 4% of the total. By the end of the decade, customs and the old duties on alcoholic beverages were subordinate. In the year 1920 customs yielded less than 6%, and the combined duties on imports, distilled spirits, beverages and tobacco yielded only 14% of the total tax revenue; while the income and profits taxes produced \$3,956,936,003 or nearly 70% of the total net tax revenue, which was large enough in this year of readjustment to meet the entire current cost of the Government and to create a surplus of more than \$1,000,000,000. Other noteworthy developments of this decade from the viewpoint of revenue are found in the introduction in 1916 of the Federal estate or inheritance tax, the development of the excess-profits tax, the loss of one of the most important of the older taxes through the adoption of Federal prohibition, and the reestablishment of the Tariff Commission. The most significant change, however, was the revolutionary readjustment of taxes by which a system of taxation, predominantly indirect and regressive, gave way to a system predominantly direct and progressive.

(b) Expenses of Railroad and Administration, Shipping Board and other special war activities.

(c) The minus sign indicates an excess of public debt receipts over public debt disbursements.

(d) Consists principally of seignorage in 1910-6; and of loans to European Governments in 1917-9 and in 1920.

(e) Post-office war revenue given as annual average for the two years collected, but averaged over three years, 1917-9, in computing the total.

State taxes and other receipts during the period 1915-9 for which general statistics could be obtained are analyzed in Table II. The net revenue receipts of all states for the year 1919 amounted to \$670,183,918, and the net governmental-cost payments to \$635,370,153, from which figures the general meaning of the percentages given in the table may be inferred. In arriving at the "net revenue receipts," there have been excluded the proceeds of bond issues and of sale of investments or supplies, refunds returned by reason of error or otherwise, and bookkeeping items representing transfers between governmental departments. The term "net governmental-cost payments" is applied to actual payments for expenses, interest and outlays, less counterbalancing payments and receipts, refunds received on account of error or otherwise, and departmental trans-

(a) Corporations only—excess tax measured by net income.

Table III. describes in figures the more significant movements among city taxes and receipts during recent years; the material increase in the relative importance of the general property tax, the decline of the liquor taxes, the shrinkage in the use of the special assessment since the outbreak of the war, and the slight decrease in the importance of earnings of public service enterprises. Expressed in absolute figures, the total net revenue receipts rose from \$21.14 per capita in 1903 to \$35.26 in 1919; receipts from the general prop-

Government before the war. The Federal Government's expenditures and revenues in peace, war and reconstruction are presented in Table I., in which it should be noted that the figures represent net expenditures and net revenues, the expenditures of each department being credited with the earnings of that department and the tax receipts being similarly reduced by the refunds allowed during the same period.

From 1910 to 1916, inclusive, the net expenditures of the Federal Government showed no striking tendency to increase, being only \$35,000,000 greater in 1916 than in 1910. The net expenditures for the army and navy were only \$23,000,000 greater in the fiscal year 1916 than in the fiscal year 1914, which closed so far as Americans knew to the contrary amid conditions of secure peace—a striking commentary upon the attitude of the Administration in power toward preparedness. Between 1917 and 1919, however, the net expenditures of the army and navy rose from \$668,852,048 to \$11,192,817,468. It is needless to add that this expansion checked the development of the civil functions. Even before the World War, expenditures for the army, navy, pensions and interest upon old war debt absorbed about two-thirds of the Federal expenditures, leaving less than one-third for the civil functions. But in 1920, at the close of the decade, the expenditures chargeable to war consumed three-fourths of the very much greater aggregate. The total expenditures for primary governmental functions, research, education and development, and for public works, representing the civil functions, were actually less *per capita* in 1919 (\$2.21) than in 1910 (\$2.24), the principal reductions coming in the expenditures for public works which amounted to \$54,332,139 in 1919 as contrasted with \$79,503,701 in 1910. In 1920, after the war, the expenditures for civil purposes rose materially; but considering the fall in the purchasing power of money, even the later and higher figures suggest decrease in the equipment, personnel and efficiency of the civil branches of the Government.

The cost of the war may be estimated with rough accuracy, defining such cost as the excess of the expenditures which actually occurred over the amounts which probably would have been expended had the war not taken place. The Secretary of the Treasury (*Annual Report*, 1920, p. 105), assuming that expenditures on a peace basis during the three fiscal years 1917-9, would have been \$1,000,000,000 a year and during the following fiscal year \$1,500,000,000, estimated the net war expenditure to June 30 1920 at \$33,455,000,000, and the net war-tax receipts, *i.e.* the excess of the annual tax revenue over the normal tax revenue of peace-times, at \$10,703,000,000. On this basis, 32 per cent of the special war expense was paid from special war taxes. Mr. E. B.

Rosa, in his authoritative analysis, *Expenditures and Revenues of the Federal Government*, makes a more careful estimate, for the four years 1917-20, of the "excess of expenditures over the estimated normal expenditures on a pre-war basis," and reaches a figure of \$35,427,730,074, against which he places an estimate of the special war revenue, *i.e.* "the excess of revenue over the estimated cost of government on pre-war basis," \$11,818,690,300. Mr. Rosa's estimate agrees with that of the Secretary of the Treasury in indicating that one-third of the special war costs were paid from special war revenues. In both cases loans to foreign Governments, \$9,500,000,000 in round figures, are included in the war costs.

Federal revenues during the decade were revolutionized. At its beginning in 1910, customs supplied more than one-half the total receipts; and customs together with the duties on distilled spirits, beverages and tobacco produced more than 95% of the total net revenues. The income tax (special corporation excise tax) was then in the first year of its collection and yielded less than 4% of the total. By the end of the decade, customs and the old duties on alcoholic beverages were subordinate. In the year 1920 customs yielded less than 6%, and the combined duties on imports, distilled spirits, beverages and tobacco yielded only 14% of the total tax revenue; while the income and profits taxes produced \$3,956,936,003 or nearly 70% of the total net tax revenue, which was large enough in this year of readjustment to meet the entire current cost of the Government and to create a surplus of more than \$1,000,000,000. Other noteworthy developments of this decade from the viewpoint of revenue are found in the introduction in 1916 of the Federal estate or inheritance tax, the development of the excess-profits tax, the loss of one of the most important of the older taxes through the adoption of Federal prohibition, and the reestablishment of the Tariff Commission. The most significant change, however, was the revolutionary readjustment of taxes by which a system of taxation, predominantly indirect and regressive, gave way to a system predominantly direct and progressive.

Public credit supplied during the war two-thirds of the revenue or receipts. Details concerning the management and yield of the huge war loans are given in the article LIBERTY LOAN PUBLICITY CAMPAIGNS. Here the subject can only be briefly treated in its connexion with the plan of the Government for the financial management of the war. That plan was based upon the policy of sedulously avoiding the use of Government paper money; of raising at least one-third (and, if possible, one-half) of the necessary revenue by taxation; of keeping the inflation which inevitably accompanies war to a minimum, by restricting "non-es-

(e) Post-office war revenue given as annual average for the two years collected, but averaged over three years, 1917-9, in computing the total.

in some states grandchildren, parents and in some states grandparents, even brothers and sisters, may be compelled by law to furnish, if able, the necessities of life to the indigent. The laws in American states do not uniformly recognize what in England is called the "right to relief." In New York, for example, an able-bodied man who has no visible means of support and no regular occupation is not, under the law, a "poor person," but is a "vagrant." On his own confession before a magistrate he may be accepted as a public charge, but technically he is punished, not "supported." Harsh as the law sounds when thus stated, it corresponds to the fact that for able-bodied adults in America there is always practically some alternative to starvation besides vagrancy.

Public Relief.—Although a legal right to relief is not formally recognized, there is a tacit assumption that any kind of misfortune which threatens life or physical well-being should be provided for; and that if relatives, friends, or voluntary agencies do not make such provision, the State must, or at least should, do so in some way (see PUBLIC ASSISTANCE: section *United States*).

By the end of the 19th century public opinion had recognized that the almshouse was not a suitable place for tramps, vagrants, and disorderly persons; for children; for the insane, feeble-minded, epileptic, blind, and deaf; for confinement cases; cases of acute illness and contagious disease; but that these should be provided for in special institutions. These theoretical conclusions, however, were by no means completely or uniformly embodied in practice. In many of the newer states, with no correctional institutions except gaols and State prisons, the courts still habitually committed certain minor offenders to the almshouse. Seventeen states in 1900 still maintained their dependent children in almshouses. The greatest progress towards specialized care had been made in the case of the insane, but in most of the states institutions for them were overcrowded, while in many a certain number of insane were still to be found in the county poorhouses or even in the gaols; and the horsewhip was still advocated by some of their official guardians for quieting the violent. State schools for blind and deaf children had been generally established, but there was practically no provision for the instruction of persons who became blind, or deaf, or otherwise disabled in adult life. There were only 26 public institutions for the feeble-minded in the country, and special provision for epileptics was rare. Even in so advanced a state as New York there were about as many "idiots," feeble-minded, and epileptic in the almshouses as in the special institutions for their care. There were still many large cities and towns which had no general public hospitals; confinement cases were generally admitted to the almshouse, and as there was almost no public provision, and little under private auspices, for the care of consumptives, many of these also were found in the almshouses. Except in certain northern cities and in some of the southern states, outdoor relief was generally given by local public officials in the form of groceries, fuel, clothing, and sometimes in money. This and the undifferentiated almshouse were still the public provision available for the majority of dependents.

Private Philanthropy.—Parallel with the various public agencies were many which had been established, and were conducted, under church auspices, or by incorporated societies or less formal associations of private individuals. The private institutions which existed in 1900 were chiefly orphan asylums, hospitals, and homes for the aged. Most churches gave charitable assistance on occasion to their own members, and the larger ones had a Ladies' Aid Society, or a St. Vincent de Paul Society, or some other agency for the purpose. In the cities there were "bread lines" and "soup kitchens" and temporary shelters for the homeless. In many places there were non-sectarian general relief societies, such as the New York Association for Improving the Condition of the Poor, and in about 100 cities there was a Charity Organization Society, or Associated Charities, or United Charities. There were also many societies for assisting certain classes in their own homes—widows, for example, or members of a particular nationality; or for giving some particular kind of help, such as legal aid. There were 161 socie-

ties for the protection of children from cruelty and neglect; and a considerable number of societies performing one or more of the functions of the pioneer Children's Aid Society of New York—to find homes in families for homeless children, to conduct lodging-houses and reading-rooms for newsboys, and in other ways to promote the welfare of city "waifs." "Fresh-air societies" existed to provide outings for city children. "Visiting nursing associations" had demonstrated the value of such service, and some 40 to 50 had been organized, with an aggregate force of not more than 140 nurses for the entire country. In the larger cities and industrial centres day nurseries had been established for the convenience of wage-earning mothers and to reduce the number of children who were candidates for institutional care.

Treatment of Criminals.—Reformatory schools for juvenile delinquents, which had naturally come into existence much earlier than reformatories for adults, were to be found by 1900 in four-fifths of the states—more of them for boys than for girls, even in proportion to their numbers as delinquents. Juvenile courts were at the beginning of their development. Probation also was only beginning to receive attention. Growing out of the privilege of the court to suspend sentence after conviction, it had been the practice in connexion with adult offenders throughout Massachusetts for 20 years, and was established by statute in New Jersey in 1899, but had not spread farther. As applied to children, it had not yet been tried. Probation, indeterminate sentence, reformatory institutions, special courts for children, and even specialized treatment for women and children offenders, were still novelties. Fixed sentences, determined by the nature of the offence, without reference to the needs of the offender, were the rule; and they were served for the most part under conditions dictated by the theory of retribution rather than of reformation. As the characteristic charitable institution of America is the town or county almshouse, so the characteristic correctional institution was and is the county gaol and town "lock-up." Generally small, with poor sanitation, frequently "fire-traps," they are described by a committee of the National Conference of Charities and Correction in 1900 as "foul dens, infested with vermin, reeking with dirt and filth." Boys and girls arrested for a trivial first offence, professional criminals, prostitutes and innocent persons awaiting trial were "herded together" in idleness, dirt, and bad air.

State Supervision.—To insure a certain standard in the conduct of public charitable and correctional institutions, state boards had been established in over half the states. These were of two main types: (1) advisory boards, with authority to inspect, report, and make recommendations, relying for their influence chiefly on the power of publicity; and (2) boards of control, with full executive powers and executive responsibility. The former type was considerably in the majority.

Preventive Philanthropy.—Of "preventive philanthropy" or "constructive social work" there was very little at the beginning of the 20th century. Interest in providing playgrounds and small parks in congested districts and public baths had been growing for several years. The New York Tenement House Committee had begun work in 1899, and was laying the foundations of the modern housing movement. The Consumers' League had exposed the horrors of sweat-shop work, and was preparing the way for a general concern about industrial conditions. But the conspicuous educational agency at this period was the social settlement. Beginning with the Neighborhood Guild on the lower east side of New York City, the number of settlements had increased to over one hundred.

Twentieth-Century Developments.—One of the ideas which became dominant among social workers early in the 20th century was that "prevention is better than relief." A second, in the picturesque phrase of Jacob A. Riis, was that "a man cannot live like a pig and act and vote like a man." Both these ideas grew out of the experiences of men and women who were engaged in work for the relief or the reformation of individuals, or who were living among the poor in social settlements. Out of these ideas naturally developed the organized social movements

Government before the war. The Federal Government's expenditures and revenues in peace, war and reconstruction are presented in Table I., in which it should be noted that the figures represent net expenditures and net revenues, the expenditures of each department being credited with the earnings of that department and the tax receipts being similarly reduced by the refunds allowed during the same period.

From 1910 to 1916, inclusive, the net expenditures of the Federal Government showed no striking tendency to increase, being only \$35,000,000 greater in 1916 than in 1910. The net expenditures for the army and navy were only \$23,000,000 greater in the fiscal year 1916 than in the fiscal year 1914, which closed so far as Americans knew to the contrary amid conditions of secure peace—a striking commentary upon the attitude of the Administration in power toward preparedness. Between 1917 and 1919, however, the net expenditures of the army and navy rose from \$668,852,048 to \$11,192,817,468. It is needless to add that this expansion checked the development of the civil functions. Even before the World War, expenditures for the army, navy, pensions and interest upon old war debt absorbed about two-thirds of the Federal expenditures, leaving less than one-third for the civil functions. But in 1920, at the close of the decade, the expenditures chargeable to war consumed three-fourths of the very much greater aggregate. The total expenditures for primary governmental functions, research, education and development, and for public works, representing the civil functions, were actually less *per capita* in 1919 (\$2.21) than in 1910 (\$2.24), the principal reductions coming in the expenditures for public works which amounted to \$54,332,139 in 1919 as contrasted with \$79,503,701 in 1910. In 1920, after the war, the expenditures for civil purposes rose materially; but considering the fall in the purchasing power of money, even the later and higher figures suggest decrease in the equipment, personnel and efficiency of the civil branches of the Government.

The cost of the war may be estimated with rough accuracy, defining such cost as the excess of the expenditures which actually occurred over the amounts which probably would have been expended had the war not taken place. The Secretary of the Treasury (*Annual Report*, 1920, p. 105), assuming that expenditures on a peace basis during the three fiscal years 1917-9, would have been \$1,000,000,000 a year and during the following fiscal year \$1,500,000,000, estimated the net war expenditure to June 30 1920 at \$33,455,000,000, and the net war-tax receipts, *i.e.* the excess of the annual tax revenue over the normal tax revenue of peace-times, at \$10,703,000,000. On this basis, 32 per cent of the special war expense was paid from special war taxes. Mr. E. B.

Rosa, in his authoritative analysis, *Expenditures and Revenues of the Federal Government*, makes a more careful estimate, for the four years 1917-20, of the "excess of expenditures over the estimated normal expenditures on a pre-war basis," and reaches a figure of \$35,427,730,074, against which he places an estimate of the special war revenue, *i.e.* "the excess of revenue over the estimated cost of government on pre-war basis," \$11,818,690,300. Mr. Rosa's estimate agrees with that of the Secretary of the Treasury in indicating that one-third of the special war costs were paid from special war revenues. In both cases loans to foreign Governments, \$9,500,000,000 in round figures, are included in the war costs.

Federal revenues during the decade were revolutionized. At its beginning in 1910, customs supplied more than one-half the total receipts; and customs together with the duties on distilled spirits, beverages and tobacco produced more than 95% of the total net revenues. The income tax (special corporation excise tax) was then in the first year of its collection and yielded less than 4% of the total. By the end of the decade, customs and the old duties on alcoholic beverages were subordinate. In the year 1920 customs yielded less than 6%, and the combined duties on imports, distilled spirits, beverages and tobacco yielded only 14% of the total tax revenue; while the income and profits taxes produced \$3,956,936,003 or nearly 70% of the total net tax revenue, which was large enough in this year of readjustment to meet the entire current cost of the Government and to create a surplus of more than \$1,000,000,000. Other noteworthy developments of this decade from the viewpoint of revenue are found in the introduction in 1916 of the Federal estate or inheritance tax, the development of the excess-profits tax, the loss of one of the most important of the older taxes through the adoption of Federal prohibition, and the reestablishment of the Tariff Commission. The most significant change, however, was the revolutionary readjustment of taxes by which a system of taxation, predominantly indirect and regressive, gave way to a system predominantly direct and progressive.

Coördination.—In recent years social workers have developed a new sense of the interrelations of social agencies. As affecting case-work, this has showed in an increased appreciation of the idea of registration which had been one of the cardinal principles of the charity organization movement. Under the new name of "confidential exchange" or "social service exchange," there has been established in the leading cities a central record of the families known to the various social agencies, so that each society may learn which other agencies may be, or have been, interested in any particular family and may consult with them. Furthermore, social workers began to think of particular agencies and particular methods as elements in the community's equipment, to consider what place each one should occupy, what its appropriate function was, and what was needed to supplement it. In other words, they began to make "programmes": for a comprehensive campaign against tuberculosis; for a charity organization society in a small town; for an adequate system of care for the insane; for State legislation on behalf of children—"children's codes," as they are called, presenting a harmonized plan of desirable laws; and so on. The national associations in the different educational movements not only outlined in a general way the elements in a "campaign" against the particular evil of their concern, but also suggested concrete programmes for local organizations. Councils of social agencies have been organized in some cities to promote mutual understanding and the development of a community programme, while the financial federations which have been developed for joint raising of funds have, as an incident to their main purpose, perhaps been the strongest influence of all in this direction. Since the World War it has become obvious that there is need for coördinating the work of the national agencies also.

Financial Federations.—The financial federations bid fair to establish themselves as an integral feature of social work in America. Before the end of the 19th century bureaux of advice and information had been created by the charity organization societies in several of the large cities, supplying information about organizations and individuals and appealing for contributions. Beginning with Cleveland about 1900, the chamber of commerce in various cities had established a "charity endorsement committee," which made up a list of approved agencies for the convenience of its members, who, with their families, constituted a large part of the giving public. As social agencies multiplied, competition became so intense that protests from harassed contributors led to the idea of financial federation, viz. that all the agencies in a community which depended on voluntary contributions for their support should form an association, agree on a joint budget for the next year, throw into a common pool their contributors' lists and other information about sources of income, present their united needs to the public in a single campaign, and share in the results in proportion to their budgets. Jewish charities were the first to do this successfully, but by 1917 there were general federations in several cities. When the war brought demands from a host of new and old organizations, in sums that had never before even been imagined, a development of the fundamental idea in federations was forced. "War chests" were set up in some 300 cities by the summer of 1918, to raise the money asked for by the American Red Cross, the Y.M.C.A., the Y.W.C.A., the War Camp Community Service, and other "war work" agencies, and in some places the local charities also were included in the chest. The general satisfaction felt with the experiment led a number of the cities to convert their war chests into "peace chests" or "community funds," and by March 1921 at least 30 important cities had adopted this method of raising their funds. A great deal more money is secured in this way than by separate competitive appeals; a much larger proportion of the population contributes (20-30% instead of an estimated 2-10%); less expense is involved and less annoyance to contributors. The strongest argument in favour of financial federations, however, is that through joint budget-making, joint study of community needs, joint planning for community welfare, they tend to dissipate the narrow institutionalism of the agencies concerned; while, on the other hand,

they increase the public interest in the social work of the community, and provide a channel through which the public may register its judgments of the social agencies and share in directing their development.

Increased Reliance on Government.—Even before the war there was a noticeable tendency away from the old American individualism and distrust of government. Supervision over private social work has been extended, and there has even been a tendency towards some degree of public control. Recourse has been had to legislation to establish minimum standards of housing, of working conditions, even of wages, to protect women and children in industry, and otherwise to promote social welfare; and such legislation has been increasingly sustained by the courts. The great cost of adequate provision for the sick and adequate hygienic education of the well, together with the growing recognition that, to be adequate, such measures must reach all citizens, have made it inevitable that they should be undertaken largely by public authorities. Boards of health have accordingly extended their control over infectious diseases, established sanatoria and all sorts of clinics, distributed much information, and maintained nurses and physicians to visit the poor in their homes and give them oral instruction. Public schools have added physicians, nurses, psychiatrists, dentists and "visiting teachers" to their staffs, have offered evening classes and vocation schools and public lectures and opened their buildings as "community centres," as well as admitted into the curriculum new subjects. Three-fourths of the states have established bureaux of child welfare or child hygiene.

There has even been an extension of public out-door relief, which had fallen into disrepute during the 19th century. Partly as a result of the new conviction that children were better off with their mothers than in institutions or in foster homes, partly from a sudden appreciation of the service performed to the State in the bearing of children and a determination that the State should recognize this service, most of the states of the Union (beginning with Missouri in 1911) made special provision for payments of "widows' pensions" or "mothers' allowances," "mothers' aid," "funds to parents," or "mothers' compensation," to mothers who without this assistance might be obliged to place their children in institutions.

Reliance on the State has gone so far as to demand assistance in promoting social welfare from the Federal Government. Its taxing power has been invoked to discourage the employment of children in factories, mines and quarries, in order to extend some protection to the children in the more backward states. Financial aid for vocational education and (by a measure passed in 1920) for the reeducation of industrial cripples, has been granted by the Federal Government to the states in proportion to their population and their own appropriations. The Department of Agriculture has done social work on a substantial scale in rural districts. The Bureau of Labor has been erected into a separate department, with corresponding increase in importance. A children's bureau, placed almost by chance in the Department of Labor, was created in 1912, at the instance of the social workers of the country.

The World War and Social Work.—The first effect of the war on social work in America, while the United States was still neutral, was to strengthen and improve it. Sympathy for sufferings in Europe quickened sensitiveness to social problems at home. A little later the appeals for war relief tended to drown those of the familiar everyday agencies at home. This was not an unmixed evil, for it compelled scrutiny of plans within each organization to determine what could be spared with least disadvantage. When the United States entered the war, in April 1917, social work leaped into unprecedented prominence. Many of the wonted social problems were intensified and some new ones created, especially by the operation of the draft and the establishment of training camps; while a new demand for persons with experience in human problems sprang up in government departments and war industries. A fervour developed for service, especially for service to American soldiers and sailors and to the civilian sufferers in the Allied countries. The Red

Government before the war. The Federal Government's expenditures and revenues in peace, war and reconstruction are presented in Table I., in which it should be noted that the figures represent net expenditures and net revenues, the expenditures of each department being credited with the earnings of that department and the tax receipts being similarly reduced by the refunds allowed during the same period.

From 1910 to 1916, inclusive, the net expenditures of the Federal Government showed no striking tendency to increase, being only \$35,000,000 greater in 1916 than in 1910. The net expenditures for the army and navy were only \$23,000,000 greater in the fiscal year 1916 than in the fiscal year 1914, which closed so far as Americans knew to the contrary amid conditions of secure peace—a striking commentary upon the attitude of the Administration in power toward preparedness. Between 1917 and 1919, however, the net expenditures of the army and navy rose from \$668,852,048 to \$11,192,817,468. It is needless to add that this expansion checked the development of the civil functions. Even before the World War, expenditures for the army, navy, pensions and interest upon old war debt absorbed about two-thirds of the Federal expenditures, leaving less than one-third for the civil functions. But in 1920, at the close of the decade, the expenditures chargeable to war consumed three-fourths of the very much greater aggregate. The total expenditures for primary governmental functions, research, education and development, and for public works, representing the civil functions, were actually less *per capita* in 1919 (\$2.21) than in 1910 (\$2.24), the principal reductions coming in the expenditures for public works which amounted to \$54,332,139 in 1919 as contrasted with \$79,503,701 in 1910. In 1920, after the war, the expenditures for civil purposes rose materially; but considering the fall in the purchasing power of money, even the later and higher figures suggest decrease in the equipment, personnel and efficiency of the civil branches of the Government.

The cost of the war may be estimated with rough accuracy, defining such cost as the excess of the expenditures which actually occurred over the amounts which probably would have been expended had the war not taken place. The Secretary of the Treasury (*Annual Report*, 1920, p. 105), assuming that expenditures on a peace basis during the three fiscal years 1917-9, would have been \$1,000,000,000 a year and during the following fiscal year \$1,500,000,000, estimated the net war expenditure to June 30 1920 at \$33,455,000,000, and the net war-tax receipts, *i.e.* the excess of the annual tax revenue over the normal tax revenue of peace-times, at \$10,703,000,000. On this basis, 32 per cent of the special war expense was paid from special war taxes. Mr. E. B.

Rosa, in his authoritative analysis, *Expenditures and Revenues of the Federal Government*, makes a more careful estimate, for the four years 1917-20, of the "excess of expenditures over the estimated normal expenditures on a pre-war basis," and reaches a figure of \$35,427,730,074, against which he places an estimate of the special war revenue, *i.e.* "the excess of revenue over the estimated cost of government on pre-war basis," \$11,818,690,300. Mr. Rosa's estimate agrees with that of the Secretary of the Treasury in indicating that one-third of the special war costs were paid from special war revenues. In both cases loans to foreign Governments, \$9,500,000,000 in round figures, are included in the war costs.

Federal revenues during the decade were revolutionized. At its beginning in 1910, customs supplied more than one-half the total receipts; and customs together with the duties on distilled spirits, beverages and tobacco produced more than 95% of the total net revenues. The income tax (special corporation excise tax) was then in the first year of its collection and yielded less than 4% of the total. By the end of the decade, customs and the old duties on alcoholic beverages were subordinate. In the year 1920 customs yielded less than 6%, and the combined duties on imports, distilled spirits, beverages and tobacco yielded only 14% of the total tax revenue; while the income and profits taxes produced \$3,956,936,003 or nearly 70% of the total net tax revenue, which was large enough in this year of readjustment to meet the entire current cost of the Government and to create a surplus of more than \$1,000,000,000. Other noteworthy developments of this decade from the viewpoint of revenue are found in the introduction in 1916 of the Federal estate or inheritance tax, the development of the excess-profits tax, the loss of one of the most important of the older taxes through the adoption of Federal prohibition, and the reestablishment of the Tariff Commission. The most significant change, however, was the revolutionary readjustment of taxes by which a system of taxation, predominantly indirect and regressive, gave way to a system predominantly direct and progressive.

Public credit supplied during the war two-thirds of the revenue or receipts. Details concerning the management and yield of the huge war loans are given in the article LIBERTY LOAN PUBLICITY CAMPAIGNS. Here the subject can only be briefly treated in its connexion with the plan of the Government for the financial management of the war. That plan was based upon the policy of sedulously avoiding the use of Government paper money; of raising at least one-third (and, if possible, one-half) of the necessary revenue by taxation; of keeping the inflation which inevitably accompanies war to a minimum, by restricting "non-es-

TABLE I. Average Annual Net Expenditures and Revenues of U.S. Government for 7 Pre-War Years, 3 War Years, and in 1920. (a)

	Average 1910-6	Average 1917-9	1920
EXPENDITURES (net)			
Primary governmental functions	\$ 97,718,290	\$ 124,509,073	\$ 224,110,594
Research, education and development	25,329,328	33,692,610	57,368,774

(b) Expenses of Railroad and Administration, Shipping Board and other special war activities.

(c) The minus sign indicates an excess of public debt receipts over public debt disbursements.

(d) Consists principally of seignorage in 1910-6; and of loans to European Governments in 1917-9 and in 1920.

(e) Post-office war revenue given as annual average for the two years collected, but averaged over three years, 1917-9, in computing the total.

tuberculous in need of institutional care, still nearly all of the 60,000 beds in the 689 sanatoria and special hospitals, day camps and preventoria (Jan. 1 1921) have been provided since 1900. This is true also of most of the convalescent homes, the many specialized clinics—prenatal, “baby,” dental, venereal disease, psychiatric, etc.—the medical examination of school children, the nursing service of schools and health departments. The level of knowledge about tuberculosis and other preventable diseases and about personal hygiene has risen perceptibly. A new type of agency is now becoming prominent—“health centres” and “well-baby clinics,” for example—directed towards the preservation of the health of those who are well.

Provision for the treatment of mental disease also has continued to increase, until in 1920 there were 232,680 patients in institutions; and the tendency already well established in the 19th century towards public care, by the state rather than by local units, has progressed until, in all but 8 states, all insane who are public charges are in state hospitals (i.e. not in almshouses or other county or city institutions). In 12 states there were, in 1921, psychiatric hospitals, psychiatric wards in general hospitals, detention hospitals, or other provision for the temporary care of mental cases. The corollary, however, is that in 36 states there is no such provision and in these 12 only a fraction of the population is thus served. The hospitals in most states are sadly overcrowded. Notwithstanding this pressure, the Scotch plan of boarding out selected cases of certain types, which has long been followed with success in Massachusetts, has not been adopted elsewhere. National prohibition, however, has already cut down the number of admissions to the alcoholic wards, and it may be that this influence will enable the states within the next few years to match accommodation with applications. A few institutions undertake to keep watch over the patients discharged as cured or improved, and a few private organizations supplement the work of the public institutions in this way, and also try to avert the development of insanity in incipient or suspected cases brought to their attention. In New York a state system of clinics has been organized under the joint auspices of the state hospitals, the state Department of Health, and the Committee on Mental Hygiene. In general, however, the prevention of mental disease and the promotion of mental hygiene are comparatively rare.

For mental defectives provision has increased rapidly as compared with that at the beginning of the century, but slowly as compared with the need. There were about 40,000 feeble-minded in institutions in 1920, which was twice as many as in 1910, but not more than 6% of the estimated total in the country. There were still, in 1921, 14 states which had no separate institution for such patients. In the conduct of the institutions the tendency is towards making them less custodial in their atmosphere, more medical and educational, less like a poorhouse, more like a combination of hospital and school. Special classes for backward children were maintained in 1921 in over a hundred cities, but the aggregate enrolment of over 20,000 represents only a small portion of such children even in these cities.

In connexion with crime the greatest advance has been made in the case of juvenile delinquents, who are now treated rather like neglected children than like criminals. Nearly three-fourths now come before courts intended especially for children's cases, the best of which have facilities for thorough physical and mental examinations and social investigation, and before judges who are expert in this work. All the states except Wyoming had made by 1919 some provision for probation for juvenile offenders, and about half the juvenile courts had a probation service in operation. Children in small villages and the country are hardly touched by these new methods. The proportion of juvenile delinquents sent to institutions is smaller than 20 years ago, and these institutions have become in some instances excellent schools. They have made more progress than those for dependent children in transforming their plants and their methods to correspond with current theories. The interests of adult criminals have not advanced so much. It is more generally admitted, however, that every correctional institution should be a “reformatory,”

and more of them are than formerly. There is increased attention to physical conditions and needs, better ventilation, improved sanitation, more physical exercise, and in the reformatories some use is made of psychological tests and some attention paid to the correction of physical defects. The value of academic instruction and of productive occupation is more generally realized in the state prisons, and the reformatories also provide vocational training. The old perplexity of how to prevent prison labour from competing with free labour has ceased to be a practical problem, with the general acquiescence of organized labour on the “state use” system. Contract labour, however, is still found in many state prisons, and there has been little progress in making the work of the man in prison contribute to the support of his family at home. The convict lease system in the South has almost disappeared. A few county gaols have been remodelled, and a few others have been replaced by farm colonies. The use of probation for adult offenders has increased, though less rapidly for juvenile delinquents.

Private enterprise in the field of correction has concerned itself chiefly with furthering the movement for juvenile courts and probation; promoting specialized provision for women offenders, including policewomen and separate detention houses; developing protective work, especially for girls; securing the establishment of night courts and special courts for cases involving family desertion and other domestic relations; and in a few places, intermittent efforts to secure a rational treatment of beggars, drunkards, and other misdemeanants. Interest in 1921 seemed to centre round protective work for young offenders; the need of separating the feeble-minded from those of normal mental powers in reformatories and of distinguishing between them throughout the correctional system; problems of court organization and procedure, including the proposal for merging juvenile courts and the so-called domestic relations courts into “family courts,” to deal with all cases involving family life.

While it would be out of the question to review in this place the progress which has been made during the 20th century in the general standard of living and the conditions under which the mass of Americans live and work, still so large a part of the social work of these 20 years has been consciously directed towards this object that it would be equally impossible to omit all reference to it. The contribution of organized social work cannot be definitely disentangled from that of any of the other factors which have been influential in bringing about these improvements, but it is patent to any student of the period that it has been an important factor. The educational social movements, through their research, their programmes, their publicity and their propaganda, have to a large extent enlisted the interest of the other factors, determining which questions should have precedence, and how they should be presented to the public.

“Welfare work” in mercantile and industrial establishments has an obvious historical association with those kinds of social work which deal with health, housing, recreation, and the standard of living. In America, however, it is now generally conceived, not as an expression of altruistic interest on the part of the employer, but rather as a subdivision of personnel administration. Scientific management, industrial medicine, vocational guidance and other factors have influenced its development.

In many instances welfare activities have begun with a rest-room, a lunch-room, first-aid appliances. From these modest beginnings they have expanded to include everything which might directly or indirectly increase the efficiency of the workers. Their home life, savings, investments, education of children, and social opportunities have been included. Industrial goodwill between the management and the workers has come to be looked upon as an asset to be cultivated. The Y.M.C.A., and other agencies which prefer to avoid industrial controversies and to operate within the “zone of agreement,” have found here a useful and congenial field. (L. BR.; E. T. D.)

VI. THE AMERICAN LABOUR MOVEMENT

The labour movement in the United States has been distinguished from that in other countries by being less class-conscious,

more individualistic and opportunist. Although there are Socialist factions, and some leaders favour industrial unionism, the majority of organized labour clings to the tactics of federated crafts, and does not aim further than to increase wages, decrease hours and improve the conditions of employment through agreement with the employer. The American labour movement has not been led by "intellectuals." The leaders have come from the ranks—on one explanation of the characteristic opportunism and lack of a social philosophy. The great majority of American working men do not want a Labour party in politics; they do not consider themselves a separate class in the body politic. The American political parties antedate the formation of modern economic classes. Class parties are discountenanced as "un-American." A politician in any party may present himself as a "friend of labour." Moreover, the system of checks and balances of the Government offers resistance to change, and the division of sovereignty between state and Federal Government makes legislative reform measures difficult of passage. More can be accomplished with equal effort by trade-union methods. What part the American Federation of Labor has taken in politics has been to advise the working men to reward their friends and punish their enemies at the polls.

During the World War an attempt was made, without success, by the machinists of Connecticut to form a Labor party. In Nov. 1918 leaders of the Chicago Federation of Labor proposed a Labor party, and suggested 14 planks for the platform, which ranged from the right of labour to organize and bargain collectively to representation of labour as such in all Government departments. Eleven of the planks closely resembled the reconstruction programme of the American Federation of Labor. In Jan. 1919 the Labor party of Cook county (Chicago) was formed, with an official organ *The New Majority*. In April an Illinois state Labor party was formed at the convention of the state Federation of Labor. It elected several mayors and other officials. The same year there sprang up also a Pennsylvania state Labor party, the American Labor party of Greater New York and the Working People's Non-Partisan Political League of Minnesota, which last had the object of coöperating with the farmers' Non-Partisan League. In Nov. a national Farmer-Labor party was organized in Chicago, which aimed to draw together the working man and the farmer. This party nominated a president for the national election; 272,514 votes were polled for him, or 1% of the total votes cast. Other political parties, having as their aim better conditions of labour, are the Socialist party, the Communist party and the Communist Labor party, both of which latter split off from the Socialist party in Aug. 1919, and the Socialist Labor party (organs, *The Socialist*, the *Weekly People*). In the spring of 1920 the Michigan branch of the Communist party became the Proletarian party.

Labour and the World War.—In 1916 when President Wilson established the Council of National Defense he appointed Samuel Gompers, president of the American Federation of Labor, one of the seven members composing the advisory commission, to be in charge of all policies affecting labour. As chairman of a labour committee Gompers appointed about 350 persons, representatives of capital and labour, Government officials and others with technical qualifications, who effected a permanent organization as the full Committee on Labor of the Council of National Defense, April 2 1917. This committee early urged that legislation protecting labourers be not weakened during the war. Such was the sentiment also of labour organizations and civic associations generally. When, in the early spring of 1917, it appeared that the United States would enter the war, Gompers called a conference of the Executive Council of the American Federation of Labor with the presidents of international and national unions, heads of industrial departments and representatives of the railway brotherhoods. Those present at this conference, March 12, offered their services to the country in the event of war, and issued a call to members of their organizations to follow this lead. In order to secure the constant support of the Government by American wage-earners, the conference urged the adoption of trade-union standards for all war work, equal pay for equal work

regardless of sex, the representation of organized labour on all committees which fixed policies for war work, and provision that special exertion of workers in war emergencies should not benefit chiefly the employers by increased profits. On April 17, at a meeting of the Council of National Defense and its Advisory Committee, Gompers gave his pledge that organized labour would support the Government to win the war. In the summer of 1917 the American Alliance for Labor and Democracy was formed by trade unionists, social reformers and non-pacifist socialists to counteract the pacifist propaganda of the People's Council of America. But some members of the trade unions opposed the pro-war stand of the leaders, and formed the Workmen's Council for Maintenance of Labor's Rights; this died out during the next year.

In Nov. the national convention of the American Federation of Labor passed a resolution that the United States was in the war for democracy against autocracy. The convention urged that organized labour be represented at the Peace Conference; that there be no reprisals against conquered nations; the independence of all nationalities; a league of free nations to maintain peace; certain labour standards to be accepted by international agreement as a part of the Peace Treaty and a plan for controlling employment during demobilization. In Feb. 1918 the Executive Council of the American Federation of Labor issued a statement that "this is labor's war."

Early in 1918 the War Labor Policies Board was created, to administer the relations with labour of the Federal Government in its capacity as employer. It aimed to secure uniformity of conditions in all Government work and to stabilize the working force. It took a stand for prohibition of child labour and prison labour, in favour of the right of labourers to organize, a living wage, equal pay for equal work, the basic eight-hour day, and some definite system of settling labour disputes. To meet the grievances of employees on Government work, the National War Labor Board was established in April 1918 to serve as a final court of voluntary arbitration. The American Federation of Labor was given representation on the Emergency Construction Board, on the Fuel Administration Board (the president of the United Mine Workers was assistant to the Fuel Administrator), on the Woman's Board, on the Food Administration Board, and on the War Industries Board. In connexion with the administration of the Military Conscription Law organized labour was given representation on each District Exemption Board. Trade unionists were sent to Russia on the Commission of Investigation in the spring of 1917.

The Mooney Case.—Thomas Mooney, a labour organizer, was accused of having placed the bomb which exploded in the street of San Francisco during the "Preparedness Day" parade, July 22 1916, killing six persons instantly, mortally wounding four more, and injuring 40 others. Mooney pleaded not guilty, but he was sentenced to death. Many organizations of labour protested that the trial was not a fair one. Execution was postponed several times. It then appeared that much of the testimony on which he had been convicted was perjured. This was substantiated by the report of the investigation of the U.S. Department of Labor in July 1919, which condemned the conduct of the trial. Request for retrial, however, was refused, as not provided for by the constitution of California. Radical labour urged a general strike May 1 1918, to protest against letting the verdict stand. At Mooney's request the plan was dropped. In Nov. the governor of California commuted the sentence to life imprisonment. A plan for a general strike July 4 1919, to demand a new trial, was not taken up by the conservative unions.

International Relations.—During the war American labour awoke to an interest in international affairs. The American trade unions sent no delegate to the Inter-Allied Labour Conference in London in 1918, but that year the American Federation of Labor sent three small groups to Europe to confer unofficially with trade unionists in the Allied countries. The American Federation of Labor refused to be represented at the international labour conference in Berne held after the signing of the Armistice, on the ground that the conference would not express

fairly the opinion of labour in the Allied countries. The proposal of American labour for an inter-Allied labour conference at Paris was not accepted. In July 1910, American delegates were present at the International Trade Union Conference in Amsterdam, at which they took issue with the German delegates, and opposed the resolutions passed for the lifting of the Allied blockade of Germany and Russia and those criticizing the labour sections of the League of Nations. Since the United States had not ratified the Peace Treaty, American labour could not be officially represented at the meeting of the Labour Department of the League of Nations held in Washington in the autumn of 1919. The American Federation of Labor Convention of 1919 by a large majority endorsed the labour clauses in the Peace Treaty. The Convention also passed resolutions asking that immigration be stopped for two years, to prevent the underbidding of American labour in the home market.

In 1918 the American Federation of Labor took steps to establish friendly relations with organized labour in Mexico. A conference of trade unionists of the two countries in June urged a conference on the question of the Mexican frontier and a federation of the labour movements of both countries for the protection of workers employed across the border from their homes. In Nov. the conference was held at Laredo, Tex.; 150 delegates were present, representing the United States, Mexico, Central America and Colombia. The U.S. Secretary of Labor was present. A permanent organization was launched. A second conference was held the next year in July in New York.

Reconstruction Programmes.—In July 1919, the national convention of the American Federation of Labor endorsed a programme for reconstruction which advocated first "democracy in industry," that is, workers to have a voice in determining the conditions under which they work "equivalent to the voice which they have as citizens in determining the legislative enactments which shall govern them." The corollary is seen as the right to organize in trade unions. The programme urged better wages to prevent "underconsumption" and consequent unemployment, and to make possible the maintenance and improvement of the American standard of life; the 8-hour day and the 44-hour week; equal pay for equal work regardless of sex; special protection of the health of women; prohibition of labour by children under 16, and compulsory part-time school attendance until the age of 18; the elimination of the middleman; curtailment of the power of the U.S. Supreme Court; Federal supervision and control of corporations; Government ownership or regulation of public utilities; development of waterways and waterpower; a graduated land tax; a special tax on idle lands; progressive taxes on incomes and inheritances; assistance to farmers; the development of Government experiment farms; municipal aid to home-building; workmen's compensation with state insurance; better educational advantages for children and adults; establishment of public employment agencies controlled jointly by capital and labour; and the regulation of immigration so as to facilitate Americanization and to prevent flooding of the labour market in periods of unemployment. The Federation reaffirmed its non-partisan political policy, urged the restoration of freedom of speech and assembly and went on record as opposed to a standing army. At the 1919 convention the Federation voted its support to the "Plumb plan" for Government ownership of the railways and their operation by a board representing equally the executives, the other employees, and the public. The United Mine Workers at their convention in 1919 passed a resolution favouring public ownership of the mines.

Since 1917 the general public has had, as never before, a definite conception of "American" labour standards, endorsed by such Government agencies as the wartime labour boards, the Council of National Defense, and by the consensus of opinion of certain groups in the industrial relations conferences, and of leaders in the national life. These standards include, in general, safety and sanitation in the shop and the home, accident and health insurance, special protection of women and children, abolition of "home work," the eight-hour day and the six-day week, the "living wage," industrial training and a public employ-

ment service. The majority of American working men and women have as their aim the attainment of these standards: not ownership or control of business. The labour movement is a struggle for power to gain control of the "job"—not the business—adequate wages, short hours, security of employment, and sufficient responsibility to command respect and sustain interest in the work to be done.

Education in the Labour Movement.—In recent years there has been developed in the United States a movement on the part of working people to further their education, with a double aim: to give to working people a share in the culture which has been largely the possession of the propertied classes, and to fit them to understand and meet the problems of the modern industrial order. The leaders are trade unionists and socialists who resent the control of education by the class that also controls industry, and who wish to teach their own view of society; also impartial educators, idealists, eager to bring to the many the culture of the few, and to extend to adults educational advantages now provided generally for children. The Rand School of Social Science in New York City, established in 1906 by private gifts, is owned by the American Socialist Society. In 1918-9 the enrolment, including correspondence students, was over 5,000. The school has some five or six regularly appointed instructors. Courses are also given by teachers from colleges near by and by trade-union leaders. The Workers' Training Course, from Nov. to May, prepares leaders for the socialist and labour movements. The Department of Labor Research publishes the American Labor Year Book. The school maintains also a reference library and reading rooms and a book store. In 1914 the International Ladies' Garment Workers' Union took up educational work for its members, in coöperation with the Rand School. About 150 members attended classes at the school. Later classes were held in public-school buildings under the auspices of the union. More advanced classes were given under the name of the Workers' University of the I.L.G.W., especially for business agents and union officials. In 1918 under the leadership of the United Cloth Hat and Cap Makers the United Labor Education Committee was organized in New York City by six labour organizations for the promotion of education among their members, about 200,000 in that city. This committee has conducted weekly courses, in different parts of the city, in art, labour, history, science and elementary English and physical training, and has also provided concerts and motion pictures. It has introduced lectures and musical programmes in connexion with the trade-union shop meetings. The committee planned a workmen's theatre where for popular prices a higher class drama will be presented than can be found in the majority of the theatres of the city. In April 1919 the Trade Union College organized by the Boston Central Labor Union opened with 160 students. Courses, open to all members of the American Federation of Labor and their families, are given in the evening in one of the public schools by members of the faculty of Harvard University and other institutions.

Other labour colleges, under the control of local trade or industrial unions or local federations of unions, are: The Workers' Institute, Chicago; The Workpeople's College, Duluth; The Workers' University, Philadelphia; The People's Lyceum, Philadelphia; Trade Union College, Washington, D.C.; The Women's Trade Union College, Chicago; Hobo College, Chicago; Trade Union College, Minneapolis; People's College, Fort Scott, Kan.; The People's Institute, San Francisco; The Proletarian University, Detroit and other cities; Workers' College, Seattle, Wash.; The Amalgamated Textile Workers' School, Paterson, N.J.; Labor College, Tacoma, Wash. The Trade Union College of Pittsburgh has been organized. The Clothing Workers of Rochester maintain an educational director. The Labor Temple at Los Angeles is under the control of the school-board, and the Community School, Baltimore, has a private management.

All these colleges are financed by small tuition fees, by contributions and by guarantee funds. As a rule the teaching force is not permanent, but the courses depend on volunteers from neighbouring colleges or from the labour movement. Classes are usually in the evening, one hour of lecture followed by one of discussion. The subjects taught are various phases of economics: law, civics, history, English, public speaking, psychology, sociology, biology, hygiene, art, music. In connexion with the colleges plays and motion pictures are shown. The Waistmakers' Union of New York City

has purchased a summer camp near the Delaware Water Gap where members may spend their vacations. The Boston local has built a vacation house on Cape Cod. Bryn Mawr College held a two months' summer school for wage-earning women, which opened in June 1921. Students are supported on scholarships raised by trade unions and other groups of industrial women. It is probable that the education of working men and women will be carried on through coöperation with the extension work of the state universities. Teachers are now sent out from the universities to conduct classes where they have been organized in a community. Correspondence courses offer advantages to isolated students. There has been some public opposition to the labour colleges, where these have been suspected of radical propaganda. In 1918 the Department of Justice conducted raids on the Rand School and on the Proletarian University of Detroit.

The reconstruction programme of the American Federation of Labor included actual universal education, for all ages, in all communities, for which public schools and universities were to be developed. The programme stated: "It is also important that the industrial education which is being fostered and developed should have for its purpose not so much training for efficiency in industry as training for life in an industrial society."

The American Labour Press.—The growth of the American labour press has been rapid. Each international and national union has its official organ, and the trade unions of most large cities publish their local labour papers. Well known are the *Cleveland Citizen*, the *Denver Labor Bulletin* and the *Seattle Union Record*. Some state federations of labour publish bulletins. The monthly *American Federationist* of the American Federation of Labor had a circulation (1920) of 100,000. Among the more important trade union papers are: *The Bricklayer, Mason and Plasterer*; *Carpenter*; *Cigar-makers' Journal*; *Justice* (Ladies' Garment Workers); *Garment Worker*; *Machinists' Journal*; *Miners' Magazine*; *International Molders' Journal*; *Plumbers, Gas and Steam Fitters' Journal*; *Seamen's Journal*; *Shoe Workers' Journal*; *Textile Worker*; *Federal Employer*, and the periodicals of the railway brotherhoods. The Chicago Federation of Labor publishes the *New Majority* (circulation 15,000), as national official organ of the Farmer-Labor party. Jewish workers have the *Freie Arbeiter Stimme*, New York, and *Vorwarts*, of New York, daily circulation about 158,000. The *Chicagoer Arbeiterzeitung* is a German socialist paper. *Zukunft*, a Jewish socialist monthly paper, New York, has a circulation of 65,000. The Amalgamated Clothing Workers publish weekly papers in six languages: English, Yiddish, Italian, Polish, Bohemian and Lithuanian. The Industrial Workers of the World publish the *One Big Union Monthly*, and *New Solidarity* (circulation 10,000), both of Chicago. The Socialist Labor party publishes *The Socialist* and the *Weekly People*, New York, and the *Industrial Worker*, Seattle. *The New York Call*, a socialist daily, has a circulation of 21,800. Radical labour and socialist groups have published many short-lived periodicals of small circulation. During the war the Post Office Department revoked the second-class mail privileges of 25 papers, and held up one or more editions of a number of others.

VII. MILITARY LAW

The U.S. army is subject to a system of military law which had its origin in, and was at first the same as that of, Great Britain. In the French and Indian Wars the colonists had fought side by side with British regulars and under the same rules and regulations. When they revolted they continued the system of military law with which they were already familiar. So little necessity for change existed that even the antiquated language of the British Articles of War was retained and some of it is still found in the American code. Passing over the earlier enactments of separate American colonies for the government of their respective contingents, such as those adopted in 1775 by the local Legislative Assemblies of Massachusetts Bay, Connecticut, Rhode Island and New Hampshire, we find that the Second Continental Congress in 1775 adopted practically the whole British Code of 1774 and furnished the foundation for the Articles of War as they have been known since then in the United States. Reenacted, with enlargements and modifications, in 1776 and amended in 1786, this code survived the adoption of the Federal Constitution and was continued in force by successive enactments until 1806.

In the United States, under the Constitution, the power of establishing military law rests with Congress. It was not, however, until 1806 that Congress concerned itself much with the

military code, the Articles of War. In that year the Articles were redrafted and reenacted though there were no material changes from the Articles as they had existed during the Revolution. Nor did the next large redraft in 1874 include any great changes. Occasionally an Act of Congress would make some change, sometimes, but more frequently not, specifically amending an Article of War. If the effect was that of an amendment the Article was considered as changed. Such Acts were those of 1890 and 1898 establishing the summary court and abolishing the field-officers court; and finally the summary court supplanted the two remaining inferior courts, the garrison court and the regimental court.

In 1910 the Judge-Advocate-General undertook the systematic and logical arrangement of the Articles of War. In 1916 he presented his project to Congress and it became a law. This draft presented no fundamental changes; it was rather a compilation made with the idea of bringing the code to date by incorporating late statutes, by deleting obsolete material and dropping quaint phraseology, and by systematizing the presentation. In short it was a logical up-to-date statement of the greater part of the military law of the nation, rendering it quickly accessible. Not all the statutes, customs or regulations governing rights and procedure were placed in the new code, but by it the President was authorized to prescribe by regulations the procedure, including modes of proof, in cases before military tribunals, so long as such regulations were not inconsistent with the new Articles; and all such prescribed regulations were required to be laid annually before Congress. Under this authority a new manual for courts martial was published by the authority of the President, and in this was embodied so much of custom and regulation that it became a complete exposition of the military laws.

This was the code in effect when the United States entered the World War, and by it its armies were governed during that conflict. Only one important addition was made before the Armistice, and that was by an executive order establishing in fuller detail the power of review of the records and proceedings of general courts martial. Shortly after the Armistice a bill was introduced in the Senate (Sen. 64, 66th Congress, 1st Sess.) which, if enacted, would have made many and vital changes in the administration of military law. Chief among the radical changes proposed were those of making enlisted men members of general courts martial; of establishing a civilian court of military appeals; and of injecting into the principal courts martial a new functionary with powers so extensive and of such a kind as to constitute him the administrator of discipline. At the time the Senate was considering this bill a board of officers was convened by the War Department to recommend any changes it believed to be necessary in the Articles of War and in the methods of procedure which then obtained in the administration of military justice. After considering numerous recommendations from the army at large the board submitted a detailed report accompanied by a redraft of the Articles of War.

At the same time General Crowder, the Judge-Advocate-General, redrafted the Articles of War upon lines that he thought advisable in view of the experience gained during the war. The draft prepared by him was accepted by Congress with little change and became a law June 4 1920, though most of its provisions did not go into effect until six months later. The radical views as expressed in the Senate bill were rejected and the administration of military discipline was left to the military authorities.

This new code contains 122 Articles. In 85 Articles there are no changes except the formal variations made necessary by the creation of grades before unknown, such as warrant officers and nurses, and other analogous alterations. This leaves 37 Articles, a little more than one-fourth, in which there have been substantial changes. Many of these, however, are only statutory enactments of rules already established by administrative interpretation, orders, or customs of the service. Only about 20 Articles contain really new matter and of these it will be necessary to consider here only the more important.

Probably the most important of the changes is that effected by Article 50½ which creates a Board of Review in the office of

the Judge-Advocate-General. Until Jan. 1918 the reviewing authority acted upon a court-martial sentence and immediately ordered it executed if he did not disapprove. By an order of Jan. 1918, it was directed that no sentence of death or of dismissal or dishonourable discharge not suspended should be executed until the record of proceedings of trial had been reviewed in the office of the Judge-Advocate-General or branch thereof. The effect of the new article was to establish by statute much the same procedure. The Board of Review consists of three or more officers in the office of the Judge-Advocate-General, and functions in the following classes of cases:

(a) Where the President is reviewing or confirming authority or where he has ordered a rehearing.

(b) Where the sentence does not require approval or confirmation by the President, but involves death, dismissal or dishonourable discharge not suspended or confinement in a penitentiary, unless, in the two latter cases, the sentence is based upon a plea of guilty.

All other general court-martial records are examined in the office of the Judge-Advocate-General, but do not go to the Board of Review unless found insufficient to sustain the findings and sentence, in which case the record is submitted to the Board of Review. When the Board of Review has acted, its action is submitted to the Judge-Advocate-General. If there be an agreement between the Board of Review and the Judge-Advocate-General that the record is legally sufficient to sustain the finding and sentence, the reviewing authority is notified and the sentence is forthwith ordered executed. If the Board and Judge-Advocate-General agree that the record is not sufficient to sustain the findings and sentence, the findings and sentence are by virtue of the statute vacated and the record is returned to the reviewing authority for action. In case of disagreement between the Board and the Judge-Advocate-General the record is transmitted to the Secretary of War for the action of the President. Provision is made for more than one Board of Review if business requires such and for a branch of the Judge-Advocate-General's office like that in France during the World War.

Another change is that in connexion with a rehearing of a case. In civil cases the defendant asks for a new trial and by so doing is held to waive the guarantee against repeated jeopardy. In the military procedure, if on examining a record prejudicial error be found, the accused receives the benefit of it without any affirmative act on his part. In other words, the appellate review is automatic. This requires some modification of the rules governing new trials before civil courts. It is accordingly provided that no proceedings shall be deemed a trial until final action by the reviewing authority. When a hearing is ordered it is to take place before a different court and the accused cannot be tried for any offence of which he was found not guilty by the first court nor can a sentence be imposed more severe than that of the first court.

Still another change is that which forbids the reviewing authority to return a record to the court for increase of sentence or reconsideration of an acquittal. And the reviewing authority is not permitted to act upon a record until he has referred it to his staff judge-advocate, but this reference was always customary. The prohibition against cruel and unusual punishments is broadened but not more than the customs of the service have already broadened it, and the President is authorized to set limits of punishment in time of war as well as in time of peace. Under the new code voting upon challenges and upon the findings and sentence is by secret ballot, and the majority ballot has been extended, so that a death sentence must be by unanimous vote, sentence to imprisonment for life or over 10 years by three-quarters vote and all other sentences by two-thirds vote.

The new Articles provide for the appointment on each general court martial of a law member who rules upon all objections to the admissibility of evidence and, subject to reversal by the court, rules upon other interlocutory matters except challenges. The investigation of charges before reference to trial has been extended and possibly to an extent such that resulting delay prevents the swift application of justice. But a large part of this procedure is ruled by regulation and can be changed when found necessary.

Another innovation is that of peremptory challenges, each side being allowed one, except that the law member can be challenged only for cause; and the trial judge-advocate's right to challenge is made statutory. The punishing power of summary courts is reduced. The disciplinary powers of commanding officers to handle offences without trial has been somewhat extended, but yet not made so extensive as to lead to unreasonable punishment; and this power extends to junior officers in time of war, but no officer shall be subjected to a forfeiture of more than one-half of one month's pay.

Under the new code there are three classes of courts—the summary, special and the general courts. The summary court consists of one officer and the limits of punishment are one month's confinement and forfeiture of two-thirds of one month's pay. The limits of punishment of the special court are six months' confinement and forfeiture of two-thirds pay per month for six months. The limits of punishment of the general court are established by the President under his statutory power to fix such limits both in peace and war, except where a specific punishment is made mandatory by the particular Article of War, as is dismissal under the 95th Article.

In 1913 the Judge-Advocate-General succeeded in establishing a method of restoration to the colours of men who had been sentenced to severe punishment. This included the establishment of detention barracks, called disciplinary barracks, and a system of drills and vocational training, by means of which a prisoner could earn honourable restoration to his position lost by his offence and sentence therefor. This procedure received Congressional sanction in 1915 and the process of reclaiming those who have made mistakes is probably the most enlightened of all systems of modern penology.

In addition to the foregoing there are many laws, statutory in character as well as those of regulation and custom, that could be properly classed as military laws. But as these are mostly administrative in character they are not usually considered in a brief account of military laws. Among these are the Acts of Congress reorganizing the army, establishing the pay of grades, and making appropriations for the expenses of the army. These laws are administrative and only incidentally affect military justice, but the organization of the army in 1921 was to a great extent covered by the Act of June 4 1920, the Act which also contains the Articles of War already described. (H. A. W.*)

VIII. HISTORY

Conditions in 1908.—The year 1908 seemed one of the quietest in recent American history. The seven previous years of President Roosevelt's administration had been marked by lively contests between the executive and Congress, and also between the Government as a whole and the railways and other strong financial and industrial organizations; but the President possessed the fullest authority and influence. He had established a supremacy in many legislative matters, had carried out a vigorous foreign policy, and might have gone on to a third term had he wished. Instead, he chose to put forward William H. Taft, Secretary of War in his Cabinet, and previously head of the Government of the Philippine Is., as his choice for the Republican candidate in the impending presidential election. With that powerful backing Taft was nominated, and in the election of Nov. 1908 easily defeated William J. Bryan, for the third time the Democratic candidate. The Republican party cast 7,700,000 votes against the Democrats' 6,400,000 and secured 321 of the 483 electoral votes. The Republicans also had a clear majority in both Houses of Congress. The country was prosperous, contented, and aroused by the positive and constructive policies of President Roosevelt and of several state governors, who had furnished the country an example of the possibility of personal leadership by state and national executives, as against the leadership of self-constituted groups which had been usual in both state and national Legislatures.

The people of the United States were much more conscious of themselves in 1908 than in recent periods, because they had come to recognize the variety of their make-up. The total pop. in 1910

in the continental United States was 92,000,000. Of these, only 50,000,000 were native whites of native parentage; while 13,000,000 were foreign-born and 19,000,000 others were of foreign-born or mixed parentage. The negroes and Indians were 10,000,000. This meant that out of the white pop., three-eighths were substantially foreign, and nearly one-half went back to a foreign ancestor not more than two generations behind them. Nearly one-half of this half came from S. or E. Europe. The urban pop. (in places having more than 2,500 inhabitants) was 43,000,000, or 46% of the whole. Here were elements of greatness and also of dissension and bitterness. Race riots, except where the negro was concerned, were very infrequent, because the non-English-speaking groups tended to establish "islands" of population in the great cities and manufacturing towns and live by themselves. Their children, however, went to public schools, learned English, and began to consider themselves Americans.

Americans were of various kinds. Everybody in the United States except the American Indian is an immigrant from some other country or a descendant of an immigrant. The main race groups were, first, the descendants of the colonists, who were mainly Anglo-Saxons with some Germans and Scotch-Irish and small elements of other races. The descendants of that ante-Revolutionary population naturally thought of themselves as the preëminently American-born Americans. Next in the account were descendants of the foreigners who began to come over in great numbers about 1820. Lastly came the large number of recent immigrants and their children. In 1910 there were in the United States, 2,266,535 unnaturalized aliens, many of whom expected to return to their native country; or if they remained, to cleave to their own kind, use their native language and keep up their own schools, language press, and home connexions.

The country was not yet aroused to the dangers arising from this mixture of unassimilated races. The theory was that in the 20th century, as in the 18th and 19th, all comers would find the United States the great "melting pot." The process was one in which the public schools were supposed to play, and did play, an important part. Few voices were raised against admitting not only western Europeans, whose languages and customs were much like those of the United States, but men and women from E. and S.E. Europe and from W. Asia—Russians, Poles, Jews, Bulgarians, Greeks, Turks, Serbians and many other races. The only bar to immigration based on race in 1908 was the prohibition of Chinese immigration and the practical exclusion of Japanese labourers by a "gentlemen's agreement" with the Japanese Government (1907), which undertook to refuse passports to Japanese labourers intending to come to the United States. There was as yet no organization, public or private, to aid the in-comer in acquiring the language and knowledge of the Government of his adopted country. There was no intelligence qualification, no provision that a man who sought naturalization should be able to read, write, or understand the language of the nation he wished to join. Some of the states permitted an alien to vote if he had filed a declaration of intention to become a citizen, without even troubling themselves to see that he carried out that intention. The undigested load was becoming heavy.

The immigrants were not the only burden on the State. Millions of American-born, many of them descended from the old colonial stock, were poor and ignorant and criminal. The southern mountaineers, the frontier farmers, the loggers and the miners, included a host of men and families who lived a rough life. Parts of the rich United States were infested by tramps and vagabonds. In the wealthiest cities there was grinding poverty and degradation in the slums. The situation was saved by general prosperity and the American spirit of cheerfulness, and of confident waiting for things to come right. Furthermore, out of the most unpromising conditions arose some of the strongest figures in American history. Presidents Jackson, Lincoln, Johnson and Grant were all children of the rude frontier. Two other race problems complicated the social and political life of the country. The American Indians were a small group of only about 250,000, most of them living in tribes on Government reservations. The problem was to make them individuals; but in 1908 they were

still a race group. The negroes, about 10,000,000 in number, were unorganized as a race, and were scattered over a large area, mostly in the South. Descendants of forced immigrants, they had no culture and no traditions but those of the United States. The results of their former servitude still clung about them; they were shut out from their constitutional suffrage in some of the southern states. Legally equals of the whites, they were subject to humiliating discriminations, and both in N. and S. were held in an inferior social position from which there was no escape.

Defects in Government.—The units of American society were held together by a complicated, but strong, democratic Government, well fitted to rule a diverse population. The political forms were familiar to every schoolboy—a group of (in 1908) 46 states, each with its own government, rigidly cast by the traditional principle of "checks and balances" into three departments; legislative, executive, and judicial. A national Government, also balanced, had under the Federal Constitution large powers in national affairs. A widely distributed franchise was almost equivalent to universal suffrage for adult males. There was a belief that the courts were the highest authority, not only as to questions of personal rights and duties, but as to the validity of the laws and acts of the other two departments. In addition a third type of government in the city, town and county, set up by the states, was considered to be an essential part of the system. This combination of governments governed reasonably well. It was expensive, it was not highly skilled, but it performed its tasks to the general satisfaction of most of the people. It was supported by the conviction of a large part of the population that it was the "best Government on earth."

The boast of the United States was its equal opportunity; the pride of the United States was its popular government, in which the will of the people was the only ultimate force. As a nation, Americans believed that they had, more than any other country in the world, the blessings of personal liberty, of free public education, of sharing in their government, of impartial judges. Everybody was supposed to have a fair chance in life. Few Americans could bring themselves to realize that equal opportunity was denied to those who chanced to be outside the advantages of education and of contact with their fellows; that the personal liberty of workers in mills, mines, or cotton-fields was much restricted; that some 10,000,000 negroes were subject to legal and social discrimination; that the public schools failed to reach at least one-fourth of the children who needed enlightenment and instruction; that the actual government of the country was in many communities carried on by a self-selected group of men who dictated nominations, controlled legislation and decided policies; that in matters of property or even personal rights, court proceedings were long, expensive and uncertain.

In the organization and conditions of business could be traced another startling contradiction between the word and the fact. Nominally all kinds of business not prohibited by law were open to all comers in free and honourable competition. In reality, by 1908 a great number of both employers and employees were engaged in a combat outside the laws, constant and conscienceless. Although the country grew wealthy fast, and commercial transactions increased, the small dealer or manufacturer or miner found himself shut in by a thick growth of corporations which had the great advantage of limited liability and the privilege of operating through the country under the legal fiction that a corporation was a "citizen" in the constitutional sense of the word. It was hard for individuals and firms to compete with corporations, and hard for small corporations to compete with large ones in the same line of business. For many years the steady accumulation of capital tended to flow into these expanding units, a process veiled by the use of parallel and "holding" corporations. The railways were among the most conspicuous of the large corporations, because everybody used them and because they, too, tended to combine into larger and more powerful units. The whole system was under suspicion, because railways and some other large corporations made it their business to get control of majorities in city and state Legislatures, and of party

management. For example, the governors of California were in effect designated by the heads of a railway company. The states could not deal adequately with these powerful bodies because most of the railways and many of the other corporations operated from state to state, and could not be controlled at either end by anything short of Federal power.

The appeal to Congress for action, first against railways and then against other corporations, had led to the Interstate Commerce Act of 1887 and the Sherman Anti-Trust Act of 1890. It was a centralizing process; the more Congress did, the more eager became the desire to push Congress to restrict, and then to make restrictions still closer. The U.S. Supreme Court fell in with this process more readily than could have been expected of a body so conservative and so withdrawn from the arena of dubious business methods. Yet, notwithstanding a few decisions against railways and "trusts," the powerful corporations prospered and increased. They were bound to live, because they were economically effective; they found means of carrying on immense lines of business in an orderly manner; they supplied the demand. Their profits were large, but they gave employment to multitudes of every degree of skill.

Political organizations were on nearly the same basis as business companies—they also grew bigger and more powerful and gathered into fewer groups. Nominally, parties are simply associations of voters for common ends. Actually, they are armies acting under commanding leaders who in many cases hold no offices. The evils of this "invisible government" were apparent. Many states and cities were badly governed by unscrupulous men who were tools of the leaders, or by too competent men who plundered their fellow citizens. The average voter was honest, but stood by his party. Committees of voters, non-partisan leagues and citizens' parties tried to organize the voters for reform, but no permanent improvement was made. The political philosophy of the Americans was based on the belief that mankind was steadily growing better. Hence a tendency to look to laws and political devices to correct the ills of popular government. Millions of voters believed that if they could only get laws enough, they could break the power of the "bosses" and chain the corporations. They overlooked the fact that the real evil was the party managed by men who made politics a business, who were responsible for "getting out the vote," and always got out the votes of their friends, who knew from long experience that the weary and listless voter at last would cease to protest. On the other hand, the pressure of the trusts on small corporations and individuals was felt by masses of voters who protested against the corporations that felt strong enough to break the law and defy the voters. There was a glacier-like force of public opinion that could break down all opposition. What was most needed was the leadership of bold and far-seeing men. Roosevelt, a man of the type needed, retired to private life when President Taft was inaugurated, March 4 1909.

Political Reform.—When Roosevelt left the presidency the position of President was at the highest point of authority that it had ever known. Most Presidents are obliged to strive with Congress in behalf of their policies, inasmuch as their only means of officially proposing legislation is through public messages, and their heads of departments work directly only through Congressional committee hearings; American tradition is against the framing of bills by the executive, and the President's initiative is limited. Most Presidents have found their principal legislative influence in the veto, by which they have the weight of one-sixth of both Houses. President Roosevelt followed the McKinley method of emphasizing his wishes by personal discussion with members of Congress. He did more; he revived the Jacksonian method of announcing a legislative plan, and if Congressmen hung back, of appealing over their heads to the country at large.

This policy was adopted by President Taft, who was not afraid of a fight and who saw the advantage of assuming that the President was the natural party leader. William H. Taft had many of the qualities of leadership. He was large, happy, genial, fond of his many friends; a cheerful, balanced man. He was also experienced in the public service. Born in 1857, he graduated at Yale,

and became a lawyer and a state judge in Ohio. In 1890 he was made solicitor-general of the United States and thus introduced into the Federal service. He was then selected as a Federal circuit judge and his decisions were valued. In 1897 he was appointed chairman of the Philippine Commission and was the first civil governor of the Islands. From 1904 to 1909 he was Secretary of War in Roosevelt's Cabinet, and proved himself an excellent executive. He made few enemies and had a most powerful friend in the President, who selected him as his successor. Throughout his career, including the presidency, he was an easy and popular speaker, a head of the Government who worked well with his associates and subordinates. Nevertheless, from the beginning of his term he found obstacles in his way. As an avowed successor to Roosevelt's policies he drew upon himself the opposition of Roosevelt's enemies. At the same time it soon became apparent that he was not relying on Roosevelt's friends.

President Taft's Cabinet was as follows: Secretary of State, Philander C. Knox of Pennsylvania, a man by experience and temperament, allied with the "stand pat" element of the Republican party; Secretary of the Treasury, Franklin MacVeagh, of Illinois, a business man of large experience; Secretary of War, Jacob M. Dickinson of Tennessee, succeeded in 1911 by Henry L. Stimson of New York; Attorney-General, George W. Wickersham of New York; Postmaster-General, Frank H. Hitchcock of Massachusetts; Secretary of the Navy, George von Lengerke Meyer of Massachusetts; Secretary of the Interior, Richard A. Ballinger of the state of Washington; Secretary of Agriculture, James Wilson of Iowa, remaining from the time of McKinley; Secretary of Commerce and Labor, Charles Nagel of Missouri. In the building of the Panama Canal Colonel Goethals continued as chief engineer. Maj.-Gen. Leonard Wood, as chief of the general staff, urged reform in the organization of the army, and the training of additional officers. Ballinger very soon involved himself in a bitter controversy with Pinchot, a warm personal friend of Roosevelt, over alleged irregularities in the disposal of public lands in Alaska. Ballinger was sustained by the President and a committee of Congress; but public pressure was such that he was obliged to resign, March 6 1911, and was succeeded by Walter L. Fisher of Illinois.

Taft's appointments were in the main good, including the elevation of Justice White to the chief justiceship of the Supreme Court, and the appointment as a justice of Charles E. Hughes, previously governor of New York. Nevertheless, a few months after the President's inauguration, his influence on Congress declined and he lost his hold on two powerful elements in his own party. The important business men—capitalists, bankers, managers of corporations, commonly called the "interests"—thought him disposed to interfere with them; while he found himself out of accord with the rising spirit of reform which aimed to give better expression to the will of the voters as a whole as against party leaders and political organizations.

Here was a critical point in popular government; for in practice it was almost impossible to elect a candidate unless he was on some party ticket. A small group of men, politely called the "organization," or more harshly the "bosses," in many states and cities had control of the machinery of the nominating conventions. Where they could not dictate a candidate, they could usually defeat the selection of any man whom they disliked or distrusted. Their power extended to national nominating conventions, particularly in the Republican party, because the Republican delegates from southern states, which almost always voted Democratic, were elected to national conventions by a handful of Federal office-holders and other professional politicians. Complaints were abundant everywhere of "hand-picked conventions," of delegates who sat silently in their seats until informed by their "organization" for what men they must vote. The solidifying principle was that the bosses' candidate could usually count upon the steady, regular members of the party.

A method of selecting candidates long practised in some parts of the country now spread rapidly through the Union; this was the primary, under which candidates were selected for each party by the ballots of the members of the party. The primary under-

mined the convention system, which in some states was even prohibited. From nominations for local officers it spread by 1911 to state officers in two-thirds of the states; and after 1910 began to be applied to the choice of delegates to the national conventions. For a time the system seemed a great success; it opened opportunities to enter public life, and killed off unpopular leaders. An unforeseen effect was that the official ballots were made upon the basis of party nominations, with an opportunity for independent voting. The primary was therefore a public and effective election, which practically brought the party system into the domain of public law, as a part of the Government.

The distrust of conventions and controlled elections extended to the numerous and powerful bosses in city and state Legislatures. Three new devices were set at work to curb them and to interest the electors in public measures. The first of these, the referendum, was by 1909 spreading rapidly through the western states. It was a means of checking legislative action contrary to public sentiment. The system, both in local and state government, can be traced from colonial times; and most 19th century state constitutions were submitted to a popular vote, and also many statutes, if the Legislatures so directed. The referendum system furnished a mechanism, usually imbedded in state constitutions, by which a statute on the demand of a sufficient number of voters could be held back from effect until submitted to a vote of the electors. The state of Oregon was one of the earliest and most thorough-going in this reform.

What was to be done if the Legislature refused to enact a statute demanded by the people? How could this negative force be overcome? By the initiative, through which a designated number of voters could unite on a measure, which must then be submitted to the electors for their suffrages. Both the initiative and referendum were attacked on the ground that they were contrary to republican government, inasmuch as they substituted direct action for representation. The referendum had been so long and widely used that it was hard to make out a case against it. The initiative was based on the general principle that the ultimate source of authority is not the Legislature or any public officer, but the people at large. In a test case (Feb. 1912) the Federal Supreme Court declined to rule that the initiative and referendum were contrary to a "republican form of government"; and no further attempts were made to upset them on constitutional grounds.

A third branch of this system of appeal to the people was the recall, under which a public officer chosen by popular vote, and in a few cases those who were appointed in some other way, could be subjected to an election; and, if the majority decided against them, they would be thereby removed from office. The system began in the far western states and never spread so widely as the other two methods mentioned. In 1911-2 the recall came before Congress in connexion with the proposed constitution of the new state of Arizona, which included a provision for the recall of judges. President Taft vetoed the Act of admission because of this provision. The state therefore withdrew the clause, was duly admitted in 1912, and thereupon proceeded to reinsert the recall. In practice, recalls proved to be few, and recalls of judges very few. A still wider application of the principle of responsibility of functionaries to the voters was the recall of judicial decisions, which was advocated by Roosevelt in 1912 and was applied in one state, Colorado.

Popular elections were applied to the choice of Federal senators, first by an indirect method of pledging members of the Legislature, invented in the state of Oregon. The Senate contained some members who could never have passed the ordeal of popular election, yet were frequently re-elected by the Legislature. The result was the 17th Amendment, submitted by Congress June 12 1912, and added to the Constitution May 31 1913, under which all elections to the Senate from that time were to be made by direct popular vote. Another evidence of a rising feeling of responsibility in Congress was a statute (Aug. 7 1911) requiring candidates for the House and Senate to submit statements of the money raised and expended in their behalf and limiting the amount that they might themselves spend. One purpose of both

these measures was to make it difficult for men to purchase their way into the Senate. On July 13 1912 Senator Lorimer of Illinois was practically expelled from the U.S. Senate for buying legislative votes.

Experience has shown that the load of responsibility placed upon the voters by these new measures was sometimes more than they were willing to bear. The scanty primary votes, and the inattention to some of the referendum and initiative questions, put on the ballots, were seized upon as showing that the voter was interested only in men. On the other hand, the ballots of most cities, towns and states were loaded down with long lists of officers to be chosen at each election, so that the "vote for men" was in many cases a vote in the dark. The result was an agitation for the reform commonly known as the "short ballot," by reducing the number of elective officers and increasing the officers to be appointed by the few elective officials. Working difficulties were found in many of these reforms, and it was hard to keep the public keyed up to the necessary pitch of thought and attention at every election. It was evident, however, that the American people intended to free themselves from the shackles of what Elihu Root styled "invisible government."

Social Questions.—The spirit of discontent extended to many questions outside of politics. Throughout Taft's administration there was an increasing pressure for "equal suffrage"—that is, woman suffrage—which was introduced in the territory of Wyoming in 1869, gradually spread among the far western states, and then worked its way eastward. Inasmuch as the voters for the more numerous branch of the state Legislature are also voters for members of Congress and for presidential electors, women began to take part in national affairs, and one of them was a delegate in the Republican National Convention of 1908. As the number of suffrage states increased, it was natural to look forward to a constitutional amendment which would abolish sex distinction for voting and indirectly for office-holding.

Both state and national Governments were compelled to deal with the question of alcoholic beverages. From the earliest times there had been some restriction on liquor selling and liquor sellers as well as punishment for undue use of intoxicants. By 1909 in almost all states there was some form of general legal restriction: prohibition or local option or high licence or a state dispensary system. These laws were enforced more or less strictly within the state or communities to which they applied. The question became national, however, because the liquor trade transported its wares from one state to another; and that brought it within the Interstate Commerce clause of the Constitution and the Interstate Commerce Act. There was a long, running fight between the opponents of the liquor trade, Congress, the state Legislatures, and the Federal courts, which finally passed upon the validity of various Acts passed by the Federal Government regulating transportation. Eventually Congress adopted the policy, by the Original Package Act of 1890, of prohibiting shipments of liquor into prohibition states; and this law sustained the test of the U.S. Supreme Court. Pure food laws in force before 1909 were supplemented by the Drug Label Act (Aug. 23 1912), which greatly aided in preventing the adulteration of drugs.

Many questions arose out of immigration. The laws forbade the entry of labourers under a contract to work in the United States, of convicts, insane persons, and (after 1907) diseased persons; but the execution of such laws was slack. The first statute looking toward decided control of immigration was that of Feb. 1907, which increased the grounds of exclusion, and at the same time provided a plan to help the immigrants to find work. It also created an Immigration Commission, which in 1910 made a report in 41 volumes, strongly recommending the sifting of immigrants by testing their ability to read and write some language; but bills to that effect were twice vetoed by President Taft. Meanwhile, the number of immigrants rose in the decade 1901-10 to an average of a million a year. New machinery for registering departures brought out the fact that from 300,000 to 500,000 annually returned to their old homes, so that the rate of increase of population by immigration was no larger than it

had been for 50 years. The alarming fact was that the immigration from W. Europe fell off, while great numbers of ignorant and unskilled people crowded in from Russia, Austria-Hungary, and other parts of E. Europe. Still, the newcomers found work and their employers found a profit in employing them.

Finances and the Tariff, 1908-13.—Every growing unit in the country—from a small school district to New York State—was harassed by questions of taxation and expenditure. The U.S. Government also searched for new resources, and found them in the income-tax, a method familiar in European countries and open to the individual American states. An income-tax had been levied by Congress during the Civil War, and again in 1884, when it was set aside by the odd decision of the U.S. Supreme Court that it was a direct tax which could be levied among the states only in proportion to their representation in Congress. Successful agitation brought about, July 13 1909, the submission of a 16th Amendment, to remove the restriction, and it was declared adopted by the necessary three-fourths majority of states, Feb. 25 1913.

June 25 1910 a postal deposit Act was passed which created a vast savings bank, of which many post-offices were the local branches. The new form of savings attracted foreigners who were accustomed to a similar system in their own countries; and in 1920 the deposits had risen to \$157,276,322. Another new resource of the Federal Government was a tax upon corporations levied on net income (Aug. 5 1909). The immediate proceeds were small—only about \$30,000,000 a year; but corporations were obliged to file accounts which showed their net income, and thus to give access to facts about their profits and methods. The more important question of reorganizing the national banking system so as to furnish a strong national institution was debated from 1908 to 1912, and was the subject of an elaborate report by a National Monetary Commission; but no action was taken at that time. The net Federal debt was \$1,000,000,000, which was only about \$11 per head of the population.

A financial resource as to which Congress had sole authority was the tariff. Under strong pressure from members of the party to carry out the promises of the Republican Convention of 1908, President Taft, a few days after his inauguration, summoned Congress to meet in special session, for a "revision." As usual there was a long controversy which resulted, Aug. 5 1909, in the Payne-Aldrich Tariff Act. The administrative features were good. The act created a permanent court of customs appeals, with power to determine finally all questions as to the value of imports; and also a Tariff Board, expected to make investigations and recommend specific measures which Congress would adopt. As to rates, the Act was not very different from its predecessor, except for a decided increase of duties on cotton and silk manufactures. There was a loud outcry that the "revision" called for by the party platform was plainly a revision downward and not upward. President Taft argued against the textile schedules, but signed the bill and in a speech at Winona, Minn., Sept. 17 1909, surprised the country by declaring that it was the "best tariff bill that the Republican party has ever passed." When in the next Congress the Democrats had a majority of the House, they passed a series of bills, covering a farmers' free list, woollens and cottons, which were carried also in the Senate by the aid of low-tariff Republicans; all these were vetoed by President Taft. In the campaign of 1912 the tariff played very little part. It was accepted that a considerable revenue must be raised by import duties; and the large import trade showed that the existing tariff was not prohibitive.

Trusts and Transportation.—During the 20 years ending with 1910 it had become clear that the most difficult question before the U.S. Government was the regulation of the vast aggregates of capital, commonly called trusts, which were combined into corporations and aimed at the control of particular lines of business, and also of the railways, which, as general transportation agencies, were of great importance in connexion with every kind of industry and trade. For many years Congress had been struggling with this question, and the result was two lines of restrictive statutes, headed by the Interstate Commerce Act of 1887 and

the Sherman Anti-Trust Act of 1890. Upon these and the amendments to the Interstate Commerce Act was built a structure of decisions of the U.S. Supreme Court, sometimes annulling provisions of the statutes, more often altering decisions by the Interstate Commerce Commission. Partly to carry out and partly to avoid these decisions, the Mann-Elkins Act of June 18 1910 widely extended the Interstate Commerce Acts by including telephones, telegraphs, express and sleeping-car companies, and setting up a Commerce Court which was to hasten decisions on transportation questions. Armed with these new powers the Commission reduced some freight rates and raised others. December 2 1910, the Supreme Court dissolved the combination of the Union Pacific and Southern Pacific railways as contrary to the laws against mergers. The Commerce Court proved a failure; its decisions were received by the public as an unreasonable attempt to control the Commission; and in 1914 Congress refused appropriations, and the President was obliged to abandon it.

Federal control of railways on the whole worked well. It secured uniform appliances and a system of rates based on successive decisions of the Interstate Commerce Commission. This Commission was a striking example of disregard of the great principle of separation of powers inasmuch as it was a rule-making body, an executive body, and a court which interpreted its own rules, subject as to some questions to appeal to the Federal Courts. The great problem of the trusts was much farther from a solution than that of the railways, because the large corporations were linked together through the holding and manipulation of stocks by capitalists and banks, and through the so-called "interlocking of interests." Furthermore, except for Treasury processes for collecting taxes, there was no public agency other than the Department of Justice to call into action the anti-trust laws in specific cases and exact penalties for their violation.

The process of forming new and powerful corporations, frequently by the union of previous companies or firms, grew more active from year to year. Capital was abundant, vast riches lay in the development of mines and oil-wells and in manufactures and trade. The constant tendency was to combine and systematize so that such large lines of business as the production and manufacture of oil, the mining of iron ore and the manufacture of steel, the weaving of cotton, woollen and other textiles, the manufacture of tobacco, packing of meat, making of cordage, were rolling up into larger and larger corporate units. Above all, the railways which stretched throughout the country and were indispensable to business of every kind had consolidated into great systems which destroyed competition.

The only effective way of dealing with large corporations whose activities extended from state to state was to bring suit against them for monopolizing or conspiring to monopolize in their lines of trade. These were difficult matters to prove against corporations of great resources. Hence it was considered a triumph when, May 9 1911, the U.S. Supreme Court rendered decisions against two of the most powerful trusts, the Standard Oil Co. and the American Tobacco Co., the latter on an issue which had been pending since 1906. The minds of a majority of the Court worked in a roundabout way. It held that the anti-trust legislation must be interpreted by the "standard of reason" namely, that a combination was not unlawful or against the public interest unless it actually caused a restraint of trade and commerce among the Federal states or with foreign nations. Having thus set up a "rule of reason" which Congress had refused to enact, and created an example of judicial legislation, the Court proceeded in both the pending cases to hold that the companies were guilty of attempts to monopolize their lines of trade, and had tried to cloak their monopoly by setting up a variety of intertwined companies, thus concealing their transactions. The Court, therefore, upheld the justice and constitutionality of the Sherman Act, but as to penalties, the Court contented itself with ordering the offenders to disintegrate. The companies reluctantly and slowly went through the process of reorganization, but their stocks immediately rose on the market—a sufficient proof that the court decisions were more favourable than had been expected. Thenceforth the "rule of reason" required

that positive proof must be adduced that a great combination was doing harm before it could be touched; the general danger of vast aggregations of capital was left out of account.

Another form of unlawful behaviour by trusts was their misuse of the patent laws. The question arose whether the maker of a patented device could insist that the purchaser must use also the seller's unpatented appliances in connexion with the materials employed. On this point the Supreme Court went through various stages of opinion. In the *Dick* case (March 1912) it held that such restrictions on the purchaser were legal. About two months later it held, in the "*Bathtub Trust*" case, that there could not be a monopoly of the product of patented machinery.

Labour Questions.—A long time was needed to make the discovery that closely connected with the railway question and the trust question was the legal and economic status of those who labour. Beginning in the 18th century with the English legal principle that a combination of labourers to raise their wages was unlawful, the United States changed its position and early accepted and for many years acted on the counter principle that strikes were lawful. No legal obstacle was put in the way of the organization, first, of local trade unions, then of nation-wide unions for single trades, and finally of national unions combining many trades. To this was slowly added by the unions the principle of the "right to labour," which means both that it is the duty of the community to see that the worker has a job, and also that at least the skilled workers have a kind of title in their employment, so that it is contrary to good morals for a "scab" to take the place of a striker. When the railways came under Federal supervision and control, the railway employees, especially the skilled workers, began to feel that they, as well as the shipping and travelling public, were entitled to protection by the Government. When, during Roosevelt's administration, the President designated an informal commission to negotiate a settlement of a wage dispute in the anthracite coal-mines in Pennsylvania, he made almost the first acknowledgment that such industries as fuel production and steel-making were national in their character and required national regulation.

The legal position of labour unions in these controversies was brought to a head by suits of national importance against unions.

The first test case was that of the *Buck Stove and Range Co.* against the American Federation of Labor, which was really a suit between a national labour union and a national organization of manufacturers. The charge was that the Federation, by posting the Company in its publications as "unfair" to labour, was boycotting and thus infringing legal rights. In its evolution the case turned into long-drawn-out proceedings against Samuel Gompers, president of the Federation, for contempt of court, on the ground that he had refused to obey a court order to abandon the boycott. After seven years of shifting of the case from one court to another, Gompers escaped the 12 months' imprisonment to which he had been sentenced. In 1910 a suit was decided against a union of the Danbury (Conn.) hatters, who had attempted to boycott the products of a local hat manufacturer. The jury found a verdict of \$74,000 damages, part of which was eventually collected from members of the local union who had property, and refunded by the general trades union.

These court trials accentuated the labour controversy and led to violent strikes. In the midst of them sprang up a new labour organization, the Industrial Workers of the World (I.W.W.), which was an attempt on a large scale to organize the unskilled labourers, and also to reach the goal of one big union for all trades. The movement was unwelcome to the unions of skilled labour, because the unskilled were so much more numerous that they could always outvote the skilled, and were sure to insist on an equalization of wages, which would reduce the rates of the highly paid. For several years, strikes were frequent and often accompanied by acts of violence. In several instances labour unions supported their leaders in arson and murder. One such case was the blowing up of the Los Angeles *Times* building in Oct. 1910, for which two brothers named McNamara, one of them secretary of the International Association of Bridge and Construction Workers, were convicted and sentenced.

Another phase of the labour situation was the spread of employers' liability laws through various states, and an Act of Congress of April 22 1908 for the protection of employees of interstate railways. Minimum Wage Acts also were passed in a few states with the purpose of protecting the employees in industries that required chiefly unskilled or slightly skilled women. In June 1912 Congress added to its previous enactment of an eight-hour maximum regular day for public employees, by providing that all contract work for the Federal Government must also be on the eight-hour basis. The effect of these movements was that labour came to be recognized as one of the elements of production that must be considered; as most of the labourers were voters they brought to bear powerful influences on state Legislatures and Congress in favour of labour. On the other hand, the courts, particularly those of the states, were slow to recognize the changes in industrial conditions which made protection of wage earners necessary, and many statutes intended for the betterment of labour conditions were held invalid.

In addition, the courts began to use a system of labour injunctions; workmen, labour unions and members were forbidden to perform acts, which if performed would presumably be a violation of a statute and would therefore lead to prosecution, in which the question of guilt or innocence would be settled by a jury. If the offense were transformed by the injunction into a defiance of the Court, then the Court itself would decide on the responsibility and affix a penalty not specifically laid down in any statute. Labour was opposed to unlimited immigration, and nearly all the measures for restricting immigration were originally proposed by labour unions, particularly the convict and contract labour Acts. For many years there was a Labor or Socialist Labor national party, which regularly nominated a candidate for the presidency and cast a small popular vote. It did not succeed because there was a standing Socialist party which cast from half a million to a million votes and absorbed the Socialist vote; while the labour leaders saw that if they withdrew from the main political parties they would set the farmers and traders and professional men against them. Hence, in all the shifts of politics very few avowed Labour candidates were elected to the state Legislatures or Congress. Labour agents and agitators failed therefore, to influence the public at large—their speeches and literature were little regarded outside their own constituencies. Furthermore, the members of the labour unions, about 5,000,000 all told, were not more than one-eighth of those men and women in the United States who worked with their hands.

Foreign Relations, 1907-13.—In the pressure for action on social and political matters, foreign affairs received even less than the usual meagre attention given them by the American people. The tradition of isolation was a strong force in the public mind, notwithstanding the rapidly growing foreign trade and the influence of the great number of immigrants. The thing that brought the United States closest to European complications was the possession of the Philippine Is., which made the United States an Asiatic power, and compelled it to be interested in the fiscal and territorial conditions of China on the basis of the "open door" system proposed by Secretary Hay in 1901. In the western hemisphere the Americans upheld the Monroe Doctrine as applied by Roosevelt to prevent the use of force by European countries to collect debts and claims from delinquent American powers. Three steps had already been taken in pursuit of the Caribbean policy: the protectorate of Cuba, the Panama Canal undertaking, and the lodgment in San Domingo.

In the Hague conference of 1907 the U.S. delegates urged arbitration; and in accordance with the general principles put forth at that conference, Secretary Root in 1908 secured 25 arbitration treaties with as many countries. The United States and Great Britain arranged (Jan. 27 1909) to refer to the Hague tribunal their long-standing dispute on the Newfoundland fisheries, the first really important case brought before the tribunal. The result was a decision (Sept. 7 1910), which brought to a satisfactory termination the difficulty. President Taft, through Secretary Knox, secured in 1911 arbitration treaties with Great Britain and France. The Senate insisted on inserting in these

documents a reservation of all questions involving what Roosevelt called the "vital interest, the independence or honour of the nation," and in 1912 it refused to approve them. A long-standing difficulty with Russia caused by the refusal of the Russian Government to recognize passports issued to Jews and some other people, was suddenly accentuated when, on Dec. 18 1911, the commercial treaty with Russia was abrogated. Trade relations went on for the time, however, without a treaty.

In 1911 the Republican majority under President Taft's leadership proceeded to a policy of commercial reciprocity with Canada, thus reviving the principle of the treaty of 1854 which went out of effect in 1865. An agreement was made with the Canadian Government by which each side should reduce or abolish duties on certain raw products and manufactures. For the first time in American history such an international arrangement was to be brought about by legislation on both sides, instead of by a formal treaty. With great difficulty the necessary bill was pushed through Congress (July 1911); but two months later the Canadian electors refused to support the Liberal Government which had negotiated the reciprocity agreement, and the plan broke down with the refusal of Canada.

Conditions in the Latin-American states did not remain harmonious. The United States ever since the Spanish war had been gaining territory and power to the southward. The arrangements of 1902 made Cuba practically a dependency; and from 1906 to 1909 it was found necessary to resort to those treaty rights and set up a provisional Government, supported by American troops. The Panama Canal was now approaching completion and the little republic of Panama, which it bisected, nominally an independent state, was in fact under complete American control. President Taft continued the occupation of San Domingo, the consent of the Senate to a treaty to that effect having been obtained in 1907. In 1911 he secured a convention by which Nicaragua ceded certain small islands on its Atlantic and Pacific coasts and gave exclusive canal privileges to the United States. Although the Senate did not ratify the treaty, President Taft practically took possession of Nicaragua and this occupation continued throughout his term. Another foreign question arose out of the possession of the Panama Canal. As the Canal approached completion, an Act of Congress was passed Aug. 27 1912 for laying tolls on shipping, from which American ships engaged in coastwise trade were to be relieved. The British Government lodged a protest (Dec. 9) on the ground that by its treaty with the United States the Canal was to be opened on equal terms to the ships of "all nations"; President Taft, however, stood by the Act, and the question was passed on to the next Administration (*see PANAMA CANAL*).

Still more serious were the relations with Mexico, where, in 1910, a revolution headed by Madero, assailed the presumed solid Government of Dictator Diaz and drove the latter after a few months out of the country. Mexico was thrown into confusion, and President Taft found it necessary to place troops on the border; in 1912 he proclaimed an embargo on the export of arms or military supplies to Mexico. Meanwhile the concessions and property of Americans in Mexico were threatened or destroyed, and there were many cases of robbery, forced loans and murder. The Americans who had interests in Mexico began a steady pressure for intervention by the United States. The nationals of other countries were suffering from the same disorder and violence; but the temper of the United States was strongly against any show of force by other Governments, because it might be a direct or indirect violation of the Monroe Doctrine.

Across the Pacific, clouds rose on the diplomatic horizon. Chinese immigration had long been prohibited, but the commercial treaties with Japan allowed a reciprocal freedom of residence and trade to the nationals of the two countries. The immigration of Japanese was very distasteful to the people of California, who undertook to restrict Japanese children to separate schools. Behind this difficulty was the rising power of the Japanese and their national spirit, greatly enhanced by their victory over the Russians in 1905. In 1908 Roosevelt sent around the world a powerful naval fleet which visited Japan and was received with

elaborate courtesy by a welcoming Japanese squadron exactly equal in number, ship for ship. In the Root-Takahira reciprocal note of Dec. 1 1908 (which was never submitted to the Senate), the United States practically admitted Japan's special interest in Asiatic affairs. In Dec. 1909, Secretary Knox suggested the nationalization of the Manchurian railways by China, which proved to be unacceptable both to Japan and Russia. The Japanese were evidently acquiring a sense of their special and almost exclusive rights to influence on the Asiatic mainland. The question of immigration was settled for the time being by renewal of the commercial treaty, July 24 1911; the previous "gentlemen's agreement" was continued, according to which, while not yielding its claim to a right of immigration into the United States, the Japanese Government pledged itself not to issue passports to labourers. There still seemed to be a feeling in the United States that the Japanese had in mind an imperial policy, and when in 1912 it was rumoured that they were trying to get possession of Magdalena Bay in Mexico, the Senate adopted the Lodge resolution against foreign occupation of territory near by which might be a point of vantage against the United States.

Politics, 1900-12.—In the action of Congress on many important issues as above described no party lines were drawn; though such measures as the tariff and the new taxes were distinctly Republican. As often happens when a party is firmly seated in power, the Republicans began to divide. On the tariff, some members from middle western states, particularly Minnesota, voted against the Payne-Aldrich measure because their constituents could see in it no advantage to themselves. Another influence which tended to divide the Republican party was resentment against the Speaker of the House, Cannon of Illinois, who exercised the powers that had been accumulating in the hands of Speakers for a hundred years. By his control of the proceedings of the House, by his appointments of committees, and by his power to refuse recognition of members who desired to take part in debate or submit proposals, he was practically the legislative premier. Through the combining of these powers the Speaker virtually had a veto on any measure or proceeding which he did not like. This concentration of authority in the Speaker, and a few chairmen of committees whom he designated, in many ways tended to unity and responsibility in legislation; but Cannon kept too tight a hand; hence, March 10 1910, a group of Republican "insurgents" joined hands with the Democrats of the House to reduce his power. By these and later changes in the rules, the power to appoint committees and to direct legislation was taken from the Speaker and never restored. The Speaker became simply a partisan moderator.

A new issue upon which both parties were divided was covered by the general term "conservation." The United States, though most of the arable land had passed out of its possession, was still, as owner of a vast area of public lands, the possessor of great tracts of forest, of mineral lands, and of water power. President Roosevelt became interested in stopping the waste of timber and minerals, in preserving part of the gifts of nature for future generations, and in retaining public ownership of the utilities of the country, particularly the forests and streams. The policy of conservation had hardly gone further than the reservation of large areas of forest land until 1910, when statutes provided for a new classification of land and for the reservation of coal by the Government. Congress in 1902 had provided for a system of irrigation, the cost to be advanced by the Government and repaid in instalments by the users of the water. This statute underwent various amendments so as to give greater encouragement to settlers. In 1910 large areas, previously held as forest lands, were thrown open to settlement. Under a statute of March 1911, considerable areas of mountain land were purchased in the Appalachians on the theory that their control would protect the watersheds of navigable rivers. Congress also reserved forever several scenic areas, particularly Rocky Mountain National Park in Colorado, Glacier Park in Montana, and later the Grand Canyon of the Colorado.

The Progressive Movement.—In the confusion of statutes, executive orders, proceedings of the Interstate Commerce Commis-

sion and Supreme Court decisions, it was difficult to see how far the country was really advancing in its attempt to control capital and satisfy labour. The only clear result was that the Republican party was weakening, and that President Taft's popularity and influence were lessening. The diminution of power vested in the Speaker was an evidence both of discontent and of willingness to disregard party lines; and the State and Congressional elections of 1910 were unfavourable to the Republicans. The insurgents, who soon came to be called Progressives, gained most of the Republican districts in the west; and the Democrats gained about 50 seats in Congress, which transferred to them the control of the House; while in the Senate they had 41 of the 92 members.

The dissatisfied Republicans began to look forward to the presidential election of 1912, and a group of them gathered about Senator La Follette of Wisconsin as a leader and presumptive candidate. Meanwhile the state Legislatures were passing primary laws some of which included the choice of delegates to national nominating conventions. La Follette had broken into the Republican party organization in his own state, secured the governorship, and entered the U.S. Senate, where he violated the traditions of that conservative body by making speeches without waiting the usual length of time. Taft's friends and supporters naturally expected that the President would be renominated.

All these calculations were upset by the greatest personality in the country, Theodore Roosevelt. A few weeks after leaving the White House (1909) he undertook an expedition to Central Africa, and before returning made a series of visits to the countries of W. Europe. He was received as the ex-President of the most important of republics and as a commanding personage; immense crowds greeted him as a world celebrity. He returned to the United States June 18 1910 to find political conditions little to his liking. Most of his friends had disappeared from the Administration; his policies, particularly as to conservation and the more rigorous control of the trusts, seemed to him to have been slighted. Without any open breach of personal friendship Taft did not satisfy the ex-President, and the two drifted apart. On the other hand, the insurgent Republicans included some of Roosevelt's warm friends. It was impossible for him to remain silent, for he was called upon to speak in all parts of the country. Aug. 31 1910 at Osawatimie, Kan., he set forth a programme which he called "the new Nationalism," favouring publicity of the accounts and proceedings of trusts, a tariff commission, a graduated income-tax, a proper army and navy, conservation, protection of labour, and the direct primary with the recall of elective officers. This was a programme which could not be accepted by the conservative or "stand-pat" Republicans, with whom, by this time, President Taft, was included.

Nevertheless, throughout 1911 Roosevelt made no direct movement towards standing for the presidency. He publicly attacked Taft's position on the trusts in the columns of *The Outlook* of which he had become an editor, and openly classed himself as a Progressive. Meanwhile several of the western states, particularly California under the guidance of Gov. Hiram Johnson, had accepted a radical programme of political and social reform. A formal breach with Taft and the open candidacy of Roosevelt seemed inevitable. The crisis came when, Feb. 2 1912, La Follette suffered a physical and mental collapse which put him out of consideration; and on Feb. 12 President Taft in a speech alluded to the Progressives (evidently having Roosevelt in mind) as "Extremists—not Progressives; they are political emotionaries, or neurotics." This was taken as a challenge and a few days later Roosevelt openly declared himself a candidate, adding, "My hat is in the ring." Primaries or conventions had already been held in several states which would have instructed their delegations to support Roosevelt if they had known his purposes; in another large group of states, and those for the most part states that formed the backbone of the party, there was still time to organize and select delegates favouring Roosevelt.

Election of 1912.—As the convention held at Chicago approached, the lines of battle were developed. Behind Taft were Barnes of New York, Penrose of Pennsylvania, Crane of Massachusetts, and other "stand-pat" leaders. Among those in fa-

vour of Roosevelt were Garfield of Ohio, Pinchot of Pennsylvania and a strong body of Republican governors. Roosevelt himself had come to Chicago, established headquarters there, and thrown his immense energy and enthusiasm into the campaign. The convention was a scene of unusual excitement. Out of the 1,076 delegates something near 400 were pledged to Roosevelt, and there seemed a good chance of gaining for him some of the southern delegates, of whom a large number were negroes who recognized Roosevelt as favourable to their race. The decision was not made in open convention, but in the preliminary meetings of the national committee (chosen in 1908), which was strongly "stand-pat"; for that committee had to decide upon the right of claimants to be inscribed in the preliminary roll of delegates. The Roosevelt managers entered contests for many seats and had an especially strong case as to Missouri, Washington and two seats for California. In the end, every contest except that of Missouri was settled in favour of the Taft claimants. Even then the combination was almost broken. Notwithstanding the fact that the temporary organization was in the hands of Roosevelt's enemies, among them Elihu Root, his former Secretary of State, a test vote for temporary chairman showed 558 votes for Root against 502 for the anti-Taft forces. The shifting of 30 delegates from one side to the other in all probability would have brought about a "stampede" to Roosevelt; and those delegates Roosevelt would have had if he had thrown his "hat into the ring" two months earlier.

The conservative Republicans being thus in control, there was nothing for the Roosevelt men to do but to protest to the last. Roosevelt advised his delegates to take no further part in the proceedings. At the final roll-call, June 22, there were 561 votes for Taft, 58 scattering, and 107 for Roosevelt, besides 344 Roosevelt men not voting. In the last issue, therefore, Taft had a majority of 50 votes out of 1,070. Fairbanks of Indiana was nominated for Vice-President. In the minds of the conservative Republicans Roosevelt was extinct. He had entered the convention, been defeated, and he must bow to the will of the majority. In the minds of Roosevelt and most of his followers the nomination was a violation of the principles of popular government. At a great meeting held the same night Roosevelt openly advised a bolt. This was duly accomplished by a formal Progressive Convention which met in Chicago in Aug. and nominated Roosevelt for president and Hiram Johnson, of California, for vice-president.

Meanwhile the Democratic Convention at Baltimore met under the guidance of William J. Bryan, who had no hope of being the candidate himself but proved to be in a position to dictate the choice. He declared open war upon the capitalistic delegates, one of whom was sitting on the platform. The apparently sure candidate was Speaker Champ Clark of Missouri, who received a majority of the votes, but under the rules of the Democratic Convention requiring a two-thirds majority, he was finally defeated by Woodrow Wilson, governor of New Jersey, owing to the vigorous support of Bryan. Gov. Marshall of Indiana was nominated for vice-president. The platforms of the two old parties were of an usual type. The Republicans as usual declared for protective duties. The Democrats stood by their platform of a tariff for revenue only, additional regulation of the railways and presidential preference primaries. The Progressive platform was a general programme of political reform and "an enlarged measure of social and industrial justice."

It was not the platform, however, but men that appealed to the voters. The issue was really Roosevelt, Taft, or Wilson. Not for 50 years had there been so stirring a campaign. All three candidates took the field; and for the first time in presidential campaigns "soap-box" speakers appeared in large numbers on the streets of the cities. From the first it was clear that the real fight was between Roosevelt and Wilson, since Taft had to bear the unpopularity of the Republican party and also the Progressive charge that the Chicago Convention had given him a stolen nomination. The Progressives were well organized and their convention and campaign included many women. The final question was whether Roosevelt could draw to himself a

sufficient number of Democrats to reduce the Democratic vote below the winning point. He was hopeful as to some of the southern states in which he had many warm friends and supporters.

The result in Nov. showed that the voters in the main stood by their regular candidates. The total popular Democratic vote, more than six and a quarter million, was only about 120,000 less than in 1908. The total Taft and Roosevelt vote combined was almost exactly the same as that of the Republicans in 1900. Roosevelt polled about four million popular votes to two and one half millions for Taft; but he carried only six states with 88 electoral votes against 40 states and 435 votes for Wilson. The only Taft states were Utah and Vermont with a total of eight electoral votes. Notwithstanding the ignominious defeat of their candidate, the Republican party was still intact with its "stand-pat" leaders, its "organization," and its control of state and local politics. On the other hand, Roosevelt had built up what seemed to be a new national party controlling four million votes, and he hoped for a continuation of that party as a power in the individual states and in national politics.

Woodrow Wilson.—The centre and soul of the Progressive movement was Theodore Roosevelt because of his ardent habit of mind; he felt intensely; he spoke with tremendous energy and deep conviction; he was accused by his critics of "inventing the Ten Commandments"; he was not only the head of a party, he was the head of a political cult (*see ROOSEVELT, THEODORE*). In that respect he was closely paralleled by Woodrow Wilson, who, on March 4 1913, was inaugurated as President. Wilson's life had been much less adventurous and varied than that of Roosevelt. Born in Staunton, Va., in 1856, of Scotch Presbyterian ancestry, son of a minister, he graduated from Princeton in 1879, essayed the practice of law in which he made no success, then studied political science and was a professor in several colleges, finally returning to Princeton. From 1902 to 1910, he was president of that university. In 1885 he published his first and most remarkable book, *Congressional Government*, which was a searching criticism of the weaknesses of the American legislative committee system and the separation of executive officials from legislation. He was an easy and attractive speaker, and had a remarkable literary style shown in several books on government and in an elaborate history of the United States. He moved much about the world, and mixed freely with people in and out of his profession, in which he was a leading figure. As administrator of a great university he chafed against the conservatism of his colleagues, and found he could not bring himself to share the responsibilities of direction with others (*see WILSON, WOODROW*). In 1910, a favourable year for the Democratic party, of which he had always been a member, he was put forward for the governorship of New Jersey by friends who looked farther than that office, particularly the journalist, George Harvey. New Jersey went Democratic, and during 1911 and 1912 Gov. Wilson had opportunity to show his skill as a party leader and his interest in reform. He made himself responsible for the "seven sisters," a group of measures dealing with direct primaries, corrupt practices, workmen's protection and control of trusts, and especially public service corporations, somewhat on the plan of the Federal Interstate Commerce Commission.

In 1912 when the Democratic party was looking for a candidate, Woodrow Wilson was put forward against Champ Clark, the experienced political chieftain. He was taken up by Bryan who saw in him first of all, an exponent of the political principles for which Bryan had stood for many years. He was wise enough to see that the party needed a leader and a President who could meet the Progressives on their own ground. He persuaded the Democratic Convention to nominate Wilson, who had a special advantage in his southern birth but was little known among the ranks of the party. Bryan also aided him by drafting a platform hardly less progressive than that of the Progressive party. The split in the Republican party rendered Wilson's election inevitable. On the eve of his inauguration he published a collection of his speeches, chiefly delivered in the preceding campaign, under the title of *The New Freedom*. It was in effect a confession of political faith, a forecast of what the President intended, a summing

up of the fundamentals of American government. He protests against the political conditions and methods of the time, finds economic conditions even worse, and points out the baleful influence of corporations and trusts on parties and Governments. The book advocates publicity and action by popular vote as the remedy for the ills which the writer so clearly sees.

On entering office the first duty of the President was to select his Cabinet. It was only reasonable that Bryan, the most prominent man in the party, who had been three times its candidate for presidency, should enter it; but not that he should be made Secretary of State, an office for which he had little training and as little adaptation. A new Cabinet office had just been created by Congress, the secretaryship of the Department of Labor, to which was appointed W.B. Wilson, a former member of Congress and a strict labour organization man. Lindley M. Garrison, Secretary of War, and Franklin K. Lane, Secretary of the Interior, were strong men. Albert S. Bursleson, Postmaster-General, and Josephus Daniels, Secretary of the Navy, had no adequate training for their duties. David F. Houston of Missouri was made Secretary of Agriculture, William G. McAdoo, Secretary of the Treasury, and James C. McReynolds, Attorney-General. Most of the members of the Cabinet were men who could be trusted to follow the President's lead. One remarkable figure, not included in this list, was Col. E. M. House of Texas, who for six years was the President's most trusted counsellor and political friend without holding any political office. The President's judicial appointments were good, including one man, Louis D. Brandeis, as justice of the Supreme Court, against whom a propaganda was raised because he was supposed to be unduly radical and favourable to labour. In the minor civil service Wilson carried out his principles by enlarging the classified list of posts which could be entered only by competitive examinations.

Although a genial man, who could be a delightful companion, full of experience and of Scotch Presbyterian humour, President Wilson from his first day in the White House cut himself off from most of his countrymen. There were none of those receptions open to all, which had delighted President Roosevelt; none of those sessions with newspaper correspondents that Taft had thought not beneath his dignity. The President's theory was that he must husband his time so as to consider his views upon public questions; nor did he expect the members of his Cabinet to act as antennæ for him, to test the currents of public sentiment. He gauged the public mind for himself. He had a powerful mind, an amazing skill of expression, and an intense belief in the power of ideals to arouse and inspire a people. Furthermore, he stood by the political programme indicated in his book *The New Freedom*. He thought he had no need of conferences, of feeling the public pulse, of mixing with members of Congress and party leaders, of personally greeting the average voter who so much appreciates a word from the President.

Finance and Tariff.—The election of 1912 carried with it a safe Democratic majority in the Senate and a two-to-one majority in the House, so that the responsibility for legislation was clear. Champ Clark again had the empty honour of the Speakership. April 8 1913, the President created a surprise by appearing in person to address the two Houses of Congress jointly at the opening of a special session, instead of sending the written message which had been invariable since 1800. This practice he followed throughout his administration, with great effect. It was part of his conception of the presidency. He was not only chief magistrate of the nation, but head of the Democratic party, and practically the premier of the Government from whom ought to proceed plans for important legislation. May 26 1913 he publicly denounced the lobbyists in Congress who he declared, were endeavouring to control tariff legislation; and Congress accepted the rebuke. He disdained the arts of Jefferson or McKinley in soothing individual congressmen; he revived and enlarged Roosevelt's practice of telling the country what Congress ought to do. Furthermore, he had in his mind a sheaf of statutes which he believed the country needed.

The special session was called particularly to frame a tariff Act, the outline of which was contained in his first address. Repre-

sentative Underwood, chairman of the Committee of Ways and Means, gave to the new measure his name and large experience. The purpose of the statute was to enlarge the free list of raw materials, foodstuffs, and some manufactures, to make a moderate reduction of the protective duties, and to correct some of the things which made the Payne-Aldrich Act unpopular. It was with but one exception the first measure for tariff reduction enacted since the Civil War. Included in the statute was an income-tax, at last made possible by the adoption of the 16th Amendment (Feb. 25 1913), which was expected to supply any revenue which might be lost by the reduction of duties (*see INCOME TAX, United States*). The tax was low: 1% on incomes from \$3,000 to \$20,000 a year, and a sliding scale on larger incomes, with 6% as a maximum. A Tariff Commission was created to make researches into the workings of the Act and try to find out what was the actual difference between the cost of labour in the United States and in foreign countries. The Republicans naturally fought the bill throughout, but it became a law, Oct. 3 1913.

The powerful influence of the President was again exerted to secure a systematic banking system, with the result that (Dec. 23 1913) the Owen-Glass Federal Reserve Bank Act was added to the statutes (*see FEDERAL RESERVE BANKING SYSTEM*). The principle was no longer to rely on separate national banks, each chartered as a separate entity and having no official connexion with other banks, but to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington. In these 12 subdivisions clustered such banks, whether national or state-chartered, as chose to accept; but pressure was put upon national banks to go into the new system. The Federal Reserve banks were authorized and expected to rediscount commercial paper discounted by the local banks. The new institution was also to issue a new form of paper money. Federal Reserve banks were authorized to act as depositories and fiscal agents for the Government. It was about a year before the system could be put into operation, but it was from the start recognized as a great improvement and a large national asset. At the same time a Rural Credits Act was passed (July 17 1916), which created a special group of banks to lend money to farmers on the security of their farms. Both banking systems worked smoothly. The Federal Reserve banks greatly increased the elasticity of the currency; the effect of their operations up to 1920 was virtually to add an immense sum to the circulating medium of the country.

Transportation, 1914-6.—Experience showed that it was much easier to secure regulation of the railways than of other corporations. In 1914 the Interstate Commerce Commission began for the first time to sanction small increases in rates. Under a statute of March 1 1913 the Commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit (*see RAILWAYS: United States*). The Supreme Court supported recent legislation by compelling the pipe-lines to accept the status of common carriers, and by breaking up some of the railway combinations, particularly that of the New York, New Haven and Hartford, which had tried to monopolize the steam, trolley, and steamship lines in southern New England. Down to the middle of 1916 the railways were doing well on the prevailing low rates for passengers and freight.

A new transportation problem developed as the Panama Canal approached completion; for this was the first great agency of transportation which was owned and managed by the U.S. Government. President Wilson undid the work of the previous Congress so far as it gave special privileges in the canal to American vessels. He used to the utmost his personal influence in supporting a bill repealing the discrimination in favour of American-owned vessels, of which the British Government had complained; it became an Act, June 15 1914. On Aug. 15 the first steamer passed through the Canal from sea to sea and in a few months the Canal was paying its own way. Temporary slides closed it for a few months; but in 1916 traffic was resumed and by the close of the fiscal year 7,046,407 tons of shipping had made use

of the new international waterway since its completion. The success of the Panama Canal called attention to the possibilities of water transportation. A canal across Cape Cod, constructed by private capital, was opened July 29 1914. The state of New York spent a hundred million dollars in enlarging the Erie Canal which was then allowed to remain almost unused. Various plans were urged for an artificial waterway from the Great Lakes to the Gulf, ignoring the fact that the Ohio and Mississippi rivers had almost ceased to be used for traffic. Internal canals were all subject to the difficulty that they could not compete with the railways which received freight at any place in the United States for delivery at any other place; while in the northern part of the country ice prevented winter traffic on canals.

A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the country, for pleasure, for convenience, for professional work; then, as the motor-truck developed, for general transportation. These machines could not well be operated on the ordinary country roads or on some of the city streets; and the attention of the whole country was called to the absolute necessity of good roads. The old system of privately owned toll roads and bridges had almost disappeared, and the only way to accommodate this new traffic was to build roads at the public expense. Some of the states had for years been aiding the rural localities in this process. As soon as good roads were built, however, the public discovered to its consternation that they would soon wear out unless kept in order at great expense. In 1916 Congress passed an Act appropriating approximately \$85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads.

The Trusts, 1914.—Just before President Wilson took office, an investigation was begun of the so-called shipping trust, composed of some American and various foreign companies, which was charged with a monopoly of a large part of the business of marine transportation by steamers. A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men." The Supreme Court in its decisions followed this spirit of opposition to the growth of combinations. President Wilson urged successfully a radical amendment of the Sherman Act and the result was the Clayton Anti-Trust Act (Oct. 15 1914) against discriminating freight agreements, interlocking directorates and holding corporations. The field of governmental action was thereby very much enlarged. In June 1914 in a suit involving the International Harvester Company, one of the largest of the manufacturing corporations, the U.S. Supreme Court upheld state anti-trust laws. The ring of law and justice seemed to be drawing closer round the great offenders; yet these offenders still flourished, and huge corporations, such as the U.S. Steel Corp., paid dividends on thousands of millions in stock and bonds.

Another branch of the same attack on the money power was the Federal Trade Commission, created Sept. 26 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers. It received large powers of investigation, and the very important authority to institute hearings as a preliminary to suits. In the same direction were the "blue sky laws" passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere. By these statutes and active prosecutions the Democratic party was put on record as the enemy of the enemies of the people. Unfortunately, the more the laws, the more the need for laws; while there was still what Roosevelt called the "twilight zone" of business action, an area in which neither state nor national laws were operative.

Labour 1913-7.—The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour, which during this period took the field most successfully. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations; it did not undertake to call strikes, though it was likely to support

them. Its agitation and its publications were lively; and it had great effect in bringing about combined and simultaneous demands for the various items in the labour programme. The leaders fixed upon an eight-hour day (commonly interpreted as 48 hours a week) as the basic working time; by which they meant that any work beyond the eight hours was overtime, to be paid for at extra rates. The eventual demand was for a "time and a half" rate (each hour to be counted as an hour and a half) for ordinary overtime, and "double time" for Sundays and holidays. The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour, since it tended to end the employment of feeble and old persons who could not earn even the minimum wage. Another demand was that American citizens should have the preference over aliens in employment. The Supreme Court set aside an Arizona statute in that direction, and affirmed a somewhat similar New York statute. Labour in general was unfriendly to child labour and was, therefore, interested in a Federal statute of Sept. 1 1916. Since Congress had no right to regulate child labour directly, it stretched the Interstate Commerce clause of the Constitution to cover the prohibition of the transport of products made by child labour under specified conditions. This Act was afterwards set aside by the Supreme Court. Some of the states set up public employment bureaux. Many labour acts were contested and nullified by the state courts; but there was an unmistakable gain in public sentiment favouring protection of labour.

As the labour unions gained in numbers and strength they used their energies in favour of the "closed shop," that is, a system by which union men refused to work in any establishment where men not members of the union were also employed. Their object was to bring everybody in that particular trade into the union so as to form a firm front. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle or use or transport products of non-union labour. Thus a factory employing a thousand hands might be compelled to stop work because it directed two or three non-union men to clean a truck, or because it bought machinery built by non-union labour—hence boycotts and perhaps ruin for employers who had no difficulty or quarrel with their own workmen.

Never in the history of the United States had there been so many and so violent strikes as from 1913 to 1917. In New York 150,000 garment workers were unionized and they struck. In May 1916 nearly a million men in various states were out of work because they or some other union had struck. The I.W.W. organized long and tumultuous strikes among the silk weavers of Paterson, N.J., and the textile workers of Lawrence, Mass. More than half of these strikes were attempts to get higher wages; many of them aimed at new working conditions, and very often sought working rules which would add to the wages without increasing the service. In the trying years of 1916-7 there were violent strikes directed not only against non-striking workmen, but against the public peace—for instance, among the Michigan ironworkers and the Spokane lumbermen. In 1913 there were armed conflicts in Colorado. In July 1917 at Bisbee, Ariz., the tables were turned. A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends. When after many months a trial was obtained in the state courts for those responsible for this illegal action, it was found that no jury would convict.

The most serious of all these labour struggles was the threatened strike in 1916 of the large and very powerful unions of railway employees. A day was set for a general strike all over the country. The companies refused to make further concessions, believing that a few days of strike would bring the public to their side. President Wilson intervened and all but compelled Congress to pass (Sept. 3 1916) the Adamson Act by which a basic eight-hour day was secured with *pro-rata* for overtime. This turned out to be in effect a large increase of wages. The Supreme Court upheld this statute, which went to the furthest verge of the Federal Government's authority over labour matters, and formed a basis for the increases of following years.

Social Movements, 1913-7.—These struggles between the railways and the courts, between the trusts and Congress, between labour and state Governments, between strikers and the President of the United States, are part of American history, because they were vital to the welfare of the country. Combinations, both of capital and labour, were too large to be dealt with by any kind of private organization, or by the local and state Governments. Neither the capitalist nor the labourer respected the restraint of state legislation. It was apparent that in the long run the country would go back to the "might makes right" of the middle ages, unless some peaceful settlement could be made by a force that must be respected. Yet the ordinary plain citizen was not much disturbed by these contests, unless he held stock in a trust or his son was a member of a trade union. The first concern of most people is their bread-getting, and the greater part of the population was earning its bread daily. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products, and they resented the trusts which they believed raised prices. The storm centre was in Washington, where President Wilson stood intent on finding the remedy for these difficulties.

The anti-liquor forces steadily developed strength. They urged out-and-out prohibition and secured it in more than half the states. At the end of 1917 war prohibition was enacted by the Federal Government and also prohibition in the district of Columbia. December 19 1917 a two-thirds majority was secured in Congress for a prohibition constitutional amendment—the 18th amendment—which was at once submitted to the states. Woman suffrage also advanced steadily. When it appeared in 1915 that a third of the male voters in the conservative eastern states of Pennsylvania, New Jersey, New York and Massachusetts favoured woman suffrage, the result was beyond doubt. Congress submitted an amendment in 1919. Thus changes that had been 50 years on the way finally were brought about by the force of public opinion.

A change was also visible in the attitude of the country toward immigration which Congress was determined to reduce by an intelligence qualification. Wilson followed the example of Taft by vetoing the new bill not once but twice; yet on Feb. 5 1917 it was passed over his veto. Besides a literacy test it raised the head-tax to \$8 and excluded oriental labourers coming from certain geographical areas which did not include Japan but did apply to Hindus and Malays. Causes connected with the World War at the same time brought about a reduction in the number of immigrants.

Educational Progress, 1900-21.—The decade following 1900 was marked by a new sense of the possibility of general education, and the responsibility of the various governments within the United States for a more direct, searching and practical type of education. The country was accustomed to a system of graded public schools, offering the "common school education," and leading up to the few surviving endowed academies, and the thousands of public high schools, which were expected to "prepare" the small proportion of young men who went on to institutions of higher education. This system had been enriched in various ways.

By 1910 girls were given about an equal chance in the public elementary and secondary schools, and in a large number of co-educational colleges and universities, besides a small group of high-class colleges open to women only. Secondary education was subdivided into literary, commercial and industrial schools. The institutions of higher learning set up new professional departments including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools. The prestige of the classics and of the so-called culture courses was declining; and the most conservative universities moderated their requirements for entrance and offered degrees to men and women on a variety of specialized and technical courses. The number of students in the higher institutions increased to 355,131 in 1918.

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community in which the children were to pass their later lives. It was a common experience that the numerous boys and girls who left school at from 12 to 16 years of

sentative Underwood, chairman of the Committee of Ways and Means, gave to the new measure his name and large experience. The purpose of the statute was to enlarge the free list of raw materials, foodstuffs, and some manufactures, to make a moderate reduction of the protective duties, and to correct some of the things which made the Payne-Aldrich Act unpopular. It was with but one exception the first measure for tariff reduction enacted since the Civil War. Included in the statute was an income-tax, at last made possible by the adoption of the 16th Amendment (Feb. 25 1913), which was expected to supply any revenue which might be lost by the reduction of duties (*see INCOME TAX, United States*). The tax was low: 1% on incomes from \$3,000 to \$20,000 a year, and a sliding scale on larger incomes, with 6% as a maximum. A Tariff Commission was created to make researches into the workings of the Act and try to find out what was the actual difference between the cost of labour in the United States and in foreign countries. The Republicans naturally fought the bill throughout, but it became a law, Oct. 3 1913.

The powerful influence of the President was again exerted to secure a systematic banking system, with the result that (Dec. 23 1913) the Owen-Glass Federal Reserve Bank Act was added to the statutes (*see FEDERAL RESERVE BANKING SYSTEM*). The principle was no longer to rely on separate national banks, each chartered as a separate entity and having no official connexion with other banks, but to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington. In these 12 subdivisions clustered such banks, whether national or state-chartered, as chose to accept; but pressure was put upon national banks to go into the new system. The Federal Reserve banks were authorized and expected to rediscount commercial paper discounted by the local banks. The new institution was also to issue a new form of paper money. Federal Reserve banks were authorized to act as depositories and fiscal agents for the Government. It was about a year before the system could be put into operation, but it was from the start recognized as a great improvement and a large national asset. At the same time a Rural Credits Act was passed (July 17 1916), which created a special group of banks to lend money to farmers on the security of their farms. Both banking systems worked smoothly. The Federal Reserve banks greatly increased the elasticity of the currency; the effect of their operations up to 1920 was virtually to add an immense sum to the circulating medium of the country.

Transportation, 1914-6.—Experience showed that it was much easier to secure regulation of the railways than of other corporations. In 1914 the Interstate Commerce Commission began for the first time to sanction small increases in rates. Under a statute of March 1 1913 the Commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit (*see RAILWAYS: United States*). The Supreme Court supported recent legislation by compelling the pipe-lines to accept the status of common carriers, and by breaking up some of the railway combinations, particularly that of the New York, New Haven and Hartford, which had tried to monopolize the steam, trolley, and steamship lines in southern New England. Down to the middle of 1916 the railways were doing well on the prevailing low rates for passengers and freight.

A new transportation problem developed as the Panama Canal approached completion; for this was the first great agency of transportation which was owned and managed by the U.S. Government. President Wilson undid the work of the previous Congress so far as it gave special privileges in the canal to American vessels. He used to the utmost his personal influence in supporting a bill repealing the discrimination in favour of American-owned vessels, of which the British Government had complained; it became an Act, June 15 1914. On Aug. 15 the first steamer passed through the Canal from sea to sea and in a few months the Canal was paying its own way. Temporary slides closed it for a few months; but in 1916 traffic was resumed and by the close of the fiscal year 7,046,407 tons of shipping had made use

of the new international waterway since its completion. The success of the Panama Canal called attention to the possibilities of water transportation. A canal across Cape Cod, constructed by private capital, was opened July 29 1914. The state of New York spent a hundred million dollars in enlarging the Erie Canal which was then allowed to remain almost unused. Various plans were urged for an artificial waterway from the Great Lakes to the Gulf, ignoring the fact that the Ohio and Mississippi rivers had almost ceased to be used for traffic. Internal canals were all subject to the difficulty that they could not compete with the railways which received freight at any place in the United States for delivery at any other place; while in the northern part of the country ice prevented winter traffic on canals.

A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the country, for pleasure, for convenience, for professional work; then, as the motor-truck developed, for general transportation. These machines could not well be operated on the ordinary country roads or on some of the city streets; and the attention of the whole country was called to the absolute necessity of good roads. The old system of privately owned toll roads and bridges had almost disappeared, and the only way to accommodate this new traffic was to build roads at the public expense. Some of the states had for years been aiding the rural localities in this process. As soon as good roads were built, however, the public discovered to its consternation that they would soon wear out unless kept in order at great expense. In 1916 Congress passed an Act appropriating approximately \$85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads.

The Trusts, 1914.—Just before President Wilson took office, an investigation was begun of the so-called shipping trust, composed of some American and various foreign companies, which was charged with a monopoly of a large part of the business of marine transportation by steamers. A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men." The Supreme Court in its decisions followed this spirit of opposition to the growth of combinations. President Wilson urged successfully a radical amendment of the Sherman Act and the result was the Clayton Anti-Trust Act (Oct. 15 1914) against discriminating freight agreements, interlocking directorates and holding corporations. The field of governmental action was thereby very much enlarged. In June 1914 in a suit involving the International Harvester Company, one of the largest of the manufacturing corporations, the U.S. Supreme Court upheld state anti-trust laws. The ring of law and justice seemed to be drawing closer round the great offenders; yet these offenders still flourished, and huge corporations, such as the U.S. Steel Corp., paid dividends on thousands of millions in stock and bonds.

Another branch of the same attack on the money power was the Federal Trade Commission, created Sept. 26 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers. It received large powers of investigation, and the very important authority to institute hearings as a preliminary to suits. In the same direction were the "blue sky laws" passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere. By these statutes and active prosecutions the Democratic party was put on record as the enemy of the enemies of the people. Unfortunately, the more the laws, the more the need for laws; while there was still what Roosevelt called the "twilight zone" of business action, an area in which neither state nor national laws were operative.

Labour 1913-7.—The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour, which during this period took the field most successfully. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations; it did not undertake to call strikes, though it was likely to support

them. Its agitation and its publications were lively; and it had great effect in bringing about combined and simultaneous demands for the various items in the labour programme. The leaders fixed upon an eight-hour day (commonly interpreted as 48 hours a week) as the basic working time; by which they meant that any work beyond the eight hours was overtime, to be paid for at extra rates. The eventual demand was for a "time and a half" rate (each hour to be counted as an hour and a half) for ordinary overtime, and "double time" for Sundays and holidays. The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour, since it tended to end the employment of feeble and old persons who could not earn even the minimum wage. Another demand was that American citizens should have the preference over aliens in employment. The Supreme Court set aside an Arizona statute in that direction, and affirmed a somewhat similar New York statute. Labour in general was unfriendly to child labour and was, therefore, interested in a Federal statute of Sept. 1 1916. Since Congress had no right to regulate child labour directly, it stretched the Interstate Commerce clause of the Constitution to cover the prohibition of the transport of products made by child labour under specified conditions. This Act was afterwards set aside by the Supreme Court. Some of the states set up public employment bureaux. Many labour acts were contested and nullified by the state courts; but there was an unmistakable gain in public sentiment favouring protection of labour.

As the labour unions gained in numbers and strength they used their energies in favour of the "closed shop," that is, a system by which union men refused to work in any establishment where men not members of the union were also employed. Their object was to bring everybody in that particular trade into the union so as to form a firm front. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle or use or transport products of non-union labour. Thus a factory employing a thousand hands might be compelled to stop work because it directed two or three non-union men to clean a truck, or because it bought machinery built by non-union labour—hence boycotts and perhaps ruin for employers who had no difficulty or quarrel with their own workmen.

Never in the history of the United States had there been so many and so violent strikes as from 1913 to 1917. In New York 150,000 garment workers were unionized and they struck. In May 1916 nearly a million men in various states were out of work because they or some other union had struck. The I.W.W. organized long and tumultuous strikes among the silk weavers of Paterson, N.J., and the textile workers of Lawrence, Mass. More than half of these strikes were attempts to get higher wages; many of them aimed at new working conditions, and very often sought working rules which would add to the wages without increasing the service. In the trying years of 1916-7 there were violent strikes directed not only against non-striking workmen, but against the public peace—for instance, among the Michigan ironworkers and the Spokane lumbermen. In 1913 there were armed conflicts in Colorado. In July 1917 at Bisbee, Ariz., the tables were turned. A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends. When after many months a trial was obtained in the state courts for those responsible for this illegal action, it was found that no jury would convict.

The most serious of all these labour struggles was the threatened strike in 1916 of the large and very powerful unions of railway employees. A day was set for a general strike all over the country. The companies refused to make further concessions, believing that a few days of strike would bring the public to their side. President Wilson intervened and all but compelled Congress to pass (Sept. 3 1916) the Adamson Act by which a basic eight-hour day was secured with *pro-rata* for overtime. This turned out to be in effect a large increase of wages. The Supreme Court upheld this statute, which went to the furthest verge of the Federal Government's authority over labour matters, and formed a basis for the increases of following years.

Social Movements, 1913-7.—These struggles between the railways and the courts, between the trusts and Congress, between labour and state Governments, between strikers and the President of the United States, are part of American history, because they were vital to the welfare of the country. Combinations, both of capital and labour, were too large to be dealt with by any kind of private organization, or by the local and state Governments. Neither the capitalist nor the labourer respected the restraint of state legislation. It was apparent that in the long run the country would go back to the "might makes right" of the middle ages, unless some peaceful settlement could be made by a force that must be respected. Yet the ordinary plain citizen was not much disturbed by these contests, unless he held stock in a trust or his son was a member of a trade union. The first concern of most people is their bread-getting, and the greater part of the population was earning its bread daily. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products, and they resented the trusts which they believed raised prices. The storm centre was in Washington, where President Wilson stood intent on finding the remedy for these difficulties.

The anti-liquor forces steadily developed strength. They urged out-and-out prohibition and secured it in more than half the states. At the end of 1917 war prohibition was enacted by the Federal Government and also prohibition in the district of Columbia. December 19 1917 a two-thirds majority was secured in Congress for a prohibition constitutional amendment—the 18th amendment—which was at once submitted to the states. Woman suffrage also advanced steadily. When it appeared in 1915 that a third of the male voters in the conservative eastern states of Pennsylvania, New Jersey, New York and Massachusetts favoured woman suffrage, the result was beyond doubt. Congress submitted an amendment in 1919. Thus changes that had been 50 years on the way finally were brought about by the force of public opinion.

A change was also visible in the attitude of the country toward immigration which Congress was determined to reduce by an intelligence qualification. Wilson followed the example of Taft by vetoing the new bill not once but twice; yet on Feb. 5 1917 it was passed over his veto. Besides a literacy test it raised the head-tax to \$8 and excluded oriental labourers coming from certain geographical areas which did not include Japan but did apply to Hindus and Malays. Causes connected with the World War at the same time brought about a reduction in the number of immigrants.

Educational Progress, 1900-21.—The decade following 1900 was marked by a new sense of the possibility of general education, and the responsibility of the various governments within the United States for a more direct, searching and practical type of education. The country was accustomed to a system of graded public schools, offering the "common school education," and leading up to the few surviving endowed academies, and the thousands of public high schools, which were expected to "prepare" the small proportion of young men who went on to institutions of higher education. This system had been enriched in various ways.

By 1910 girls were given about an equal chance in the public elementary and secondary schools, and in a large number of co-educational colleges and universities, besides a small group of high-class colleges open to women only. Secondary education was subdivided into literary, commercial and industrial schools. The institutions of higher learning set up new professional departments including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools. The prestige of the classics and of the so-called culture courses was declining; and the most conservative universities moderated their requirements for entrance and offered degrees to men and women on a variety of specialized and technical courses. The number of students in the higher institutions increased to 355,131 in 1918.

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community in which the children were to pass their later lives. It was a common experience that the numerous boys and girls who left school at from 12 to 16 years of

sentative Underwood, chairman of the Committee of Ways and Means, gave to the new measure his name and large experience. The purpose of the statute was to enlarge the free list of raw materials, foodstuffs, and some manufactures, to make a moderate reduction of the protective duties, and to correct some of the things which made the Payne-Aldrich Act unpopular. It was with but one exception the first measure for tariff reduction enacted since the Civil War. Included in the statute was an income-tax, at last made possible by the adoption of the 16th Amendment (Feb. 25 1913), which was expected to supply any revenue which might be lost by the reduction of duties (*see INCOME TAX, United States*). The tax was low: 1% on incomes from \$3,000 to \$20,000 a year, and a sliding scale on larger incomes, with 6% as a maximum. A Tariff Commission was created to make researches into the workings of the Act and try to find out what was the actual difference between the cost of labour in the United States and in foreign countries. The Republicans naturally fought the bill throughout, but it became a law, Oct. 3 1913.

The powerful influence of the President was again exerted to secure a systematic banking system, with the result that (Dec. 23 1913) the Owen-Glass Federal Reserve Bank Act was added to the statutes (*see FEDERAL RESERVE BANKING SYSTEM*). The principle was no longer to rely on separate national banks, each chartered as a separate entity and having no official connexion with other banks, but to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington. In these 12 subdivisions clustered such banks, whether national or state-chartered, as chose to accept; but pressure was put upon national banks to go into the new system. The Federal Reserve banks were authorized and expected to rediscount commercial paper discounted by the local banks. The new institution was also to issue a new form of paper money. Federal Reserve banks were authorized to act as depositories and fiscal agents for the Government. It was about a year before the system could be put into operation, but it was from the start recognized as a great improvement and a large national asset. At the same time a Rural Credits Act was passed (July 17 1916), which created a special group of banks to lend money to farmers on the security of their farms. Both banking systems worked smoothly. The Federal Reserve banks greatly increased the elasticity of the currency; the effect of their operations up to 1920 was virtually to add an immense sum to the circulating medium of the country.

Transportation, 1914-6.—Experience showed that it was much easier to secure regulation of the railways than of other corporations. In 1914 the Interstate Commerce Commission began for the first time to sanction small increases in rates. Under a statute of March 1 1913 the Commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit (*see RAILWAYS: United States*). The Supreme Court supported recent legislation by compelling the pipe-lines to accept the status of common carriers, and by breaking up some of the railway combinations, particularly that of the New York, New Haven and Hartford, which had tried to monopolize the steam, trolley, and steamship lines in southern New England. Down to the middle of 1916 the railways were doing well on the prevailing low rates for passengers and freight.

A new transportation problem developed as the Panama Canal approached completion; for this was the first great agency of transportation which was owned and managed by the U.S. Government. President Wilson undid the work of the previous Congress so far as it gave special privileges in the canal to American vessels. He used to the utmost his personal influence in supporting a bill repealing the discrimination in favour of American-owned vessels, of which the British Government had complained; it became an Act, June 15 1914. On Aug. 15 the first steamer passed through the Canal from sea to sea and in a few months the Canal was paying its own way. Temporary slides closed it for a few months; but in 1916 traffic was resumed and by the close of the fiscal year 7,046,407 tons of shipping had made use

of the new international waterway since its completion. The success of the Panama Canal called attention to the possibilities of water transportation. A canal across Cape Cod, constructed by private capital, was opened July 29 1914. The state of New York spent a hundred million dollars in enlarging the Erie Canal which was then allowed to remain almost unused. Various plans were urged for an artificial waterway from the Great Lakes to the Gulf, ignoring the fact that the Ohio and Mississippi rivers had almost ceased to be used for traffic. Internal canals were all subject to the difficulty that they could not compete with the railways which received freight at any place in the United States for delivery at any other place; while in the northern part of the country ice prevented winter traffic on canals.

A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the country, for pleasure, for convenience, for professional work; then, as the motor-truck developed, for general transportation. These machines could not well be operated on the ordinary country roads or on some of the city streets; and the attention of the whole country was called to the absolute necessity of good roads. The old system of privately owned toll roads and bridges had almost disappeared, and the only way to accommodate this new traffic was to build roads at the public expense. Some of the states had for years been aiding the rural localities in this process. As soon as good roads were built, however, the public discovered to its consternation that they would soon wear out unless kept in order at great expense. In 1916 Congress passed an Act appropriating approximately \$85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads.

The Trusts, 1914.—Just before President Wilson took office, an investigation was begun of the so-called shipping trust, composed of some American and various foreign companies, which was charged with a monopoly of a large part of the business of marine transportation by steamers. A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men." The Supreme Court in its decisions followed this spirit of opposition to the growth of combinations. President Wilson urged successfully a radical amendment of the Sherman Act and the result was the Clayton Anti-Trust Act (Oct. 15 1914) against discriminating freight agreements, interlocking directorates and holding corporations. The field of governmental action was thereby very much enlarged. In June 1914 in a suit involving the International Harvester Company, one of the largest of the manufacturing corporations, the U.S. Supreme Court upheld state anti-trust laws. The ring of law and justice seemed to be drawing closer round the great offenders; yet these offenders still flourished, and huge corporations, such as the U.S. Steel Corp., paid dividends on thousands of millions in stock and bonds.

Another branch of the same attack on the money power was the Federal Trade Commission, created Sept. 26 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers. It received large powers of investigation, and the very important authority to institute hearings as a preliminary to suits. In the same direction were the "blue sky laws" passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere. By these statutes and active prosecutions the Democratic party was put on record as the enemy of the enemies of the people. Unfortunately, the more the laws, the more the need for laws; while there was still what Roosevelt called the "twilight zone" of business action, an area in which neither state nor national laws were operative.

Labour 1913-7.—The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour, which during this period took the field most successfully. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations; it did not undertake to call strikes, though it was likely to support

the unexpected effects of the war was a great change in immigration. Hundreds of thousands of men left the United States for Europe to join the various armies; and the countries at war were not likely to allow anybody to evade military service by going to America. Net immigration fell from 1,218,480 in 1914 to 208,826 in 1916.

Election of 1916.—In the midst of the turmoil and confusion of business and public policy caused by the war came the preliminaries of the Presidential election of 1916. The sharp difference of opinion as to the responsibility for, and the conduct of, the war was reflected in Congress, which included many ardent friends of the western Allies, others without a doubt pro-Germans, and a much larger number who desired to keep the United States out of war, no matter what happened overseas. President Wilson, though of Scotch-Irish descent and much inspired by English law and history, carefully abstained from taking sides; but the aggressive submarine policy of Germany made necessary a much sharper tone toward, and much more direct and insistent demands on, the Germans than in the case of the English. He was not only President with complete control of all diplomatic negotiations, he was the acknowledged head of the Democratic party; he was also commander-in-chief of the army and navy of the United States. He felt the need of caution, particularly because a growing group of men inside and outside Congress, among them Roosevelt, were coming to the conclusion that eventually the United States would have to go into the war.

During the early part of 1916 the President was studiously neutral and careful. In April the little force under Pershing was withdrawn from Mexico. May 4 the President succeeded in securing from Germany the promise to refrain from submarine warfare on neutrals. In June the great national nominating conventions met, in which the attitudes of the President and his opponents upon the war were issues. As usual the Republican Convention came first, and was called in Chicago for June 7. A strong effort was made by those friends of Roosevelt who had returned to their relations with the Republican party to make him the Republican candidate. One result of the complaints regarding the Convention of 1912 was that the Republican National Committee recommended a change in the basis of representation in the Convention, which reduced the representation of those southern states in which the Republican vote was very small. Such a reduction, if made four years earlier, would have brought about Roosevelt's nomination. Nevertheless, in most of the states the "stand-pat" Republicans had control of the party machinery including the primaries, and Roosevelt showed little strength in the Convention. The Progressives, who in Nov. 1914 had cast 1,800,000 votes for Congressional and state candidates, met in convention in Chicago side by side with the Republicans. Their purpose was to make such a demonstration of strength as would compel the Republicans to nominate Roosevelt as the only means of healing the breach. That effort failed because it became evident that a large number of the Progressives throughout the country would vote for any candidate nominated by the Republican Convention who seemed likely to carry out the Progressive principles, and they gave up all hope of electing Roosevelt on a third-party ticket. The Republicans nominated Justice Hughes of the Supreme Court who had been a reform governor of New York State. No course was left to Roosevelt but to refuse the nomination offered by the Progressive Convention. The days of the Progressive party were numbered.

In the Democratic Convention, June 14, there was practically no opposition to Wilson and his running-mate Marshall. The platform in many respects was similar to that of the Republicans. Both favoured woman suffrage, conservation of national resources, and national enforcement of child-labour laws; both approved the Monroe Doctrine. But in opposition to the Republicans the Democrats upheld tariff for revenue only; they endorsed the promise of ultimate independence to the Filipinos; they commended the establishment of a Federal trade commission; and they approved a merchant marine owned and operated by the Federal Government. In the campaign Roosevelt publicly

supported Hughes, though he felt no enthusiasm for him. He was more interested in questions of neutrality and in the moral support of the hard-pressed Allies than in the election. Hughes and Wilson, especially the former, canvassed the country, which was not interested in the questions of tariff and immigration but was eager to know what would be the effect of the victory of one party or another on foreign relations. The only "slogan" that caught the public ear was favourable to Wilson: "He kept us out of war." The result was the reelection of Wilson, who received about 9,000,000 popular votes against 8,500,000 for Hughes. The electoral vote, however, was very close and was finally decided by majorities of a few hundred in New Hampshire, Minnesota and especially California.

Peace or War, 1917.—Although the election had been so close, President Wilson stood in a very strong position in the United States and in the world. He was reelected. His policy, whatever it was, was approved. He felt that he had the nation politically united. The Administration soon began to take a firmer tone in protesting against the Allied system of neutral blockade. Meanwhile the Allies were hard pressed. During the summer of 1916 the Russians made their last aggressive campaign against Austria-Hungary. Rumania entered the contest Aug. 28 1916 but was defeated by the Germans by the close of the year. England, France and Italy were holding the western lines with difficulty. It seemed to President Wilson that only the one great neutral nation could bring about peace. Dec. 18 1916, six weeks after the election, he sent an appeal to the warring Powers to take some steps to come to an understanding of each other's demands. In a later document, Jan. 27 1917, he suggested a "peace without victory," which should give the right of self-determination to the different national units. The western Allies responded courteously. The practical German answer was a brief note communicated by Ambassador Bernstorff to Secretary Lansing Jan. 31 1917, announcing that the Germans would shortly resume submarine warfare without mercy. High military authority in Germany had decreed that this was the way to win. They were convinced that the Americans would never sacrifice the large profits of export trade and incur the huge expenses of war merely for the sake of a question of neutral maritime rights.

Nevertheless it was announced Feb. 4 that the United States was using its influence to persuade other neutrals to sever diplomatic relations with Germany, and immediate steps were taken to make the navy ready for war. Unfortunately, the United States at that moment was not in a position to assemble even so small a land force as 30,000 men and send it abroad. It had no organized transport service to carry numbers of troops or their supplies. For a time the President dallied with a plan of maintaining official neutrality while arming merchant ships and authorizing them to defend themselves. This measure, proposed to Congress Feb. 26, certainly would have brought about war in a few days, by an engagement between some American merchant ships and a submarine. Although Congress was ready to grant to the President almost any power, this armed ship bill was killed by a filibuster in the Senate, which the President characterized as the act of "a little group of wilful men representing no opinion but their own." The Administration then took steps to arm merchant ships without Congressional authority. One result of the controversy was the adoption by the Senate March 8 of a mild and cumbersome method of cutting short debate by closure.

During Feb. and March 1917 a few American vessels and one belligerent vessel having Americans on board were torpedoed by German submarines. It was apparent, therefore, that Germany would not desist from these atrocities, and that the United States must resort to war. The President called Congress in special session for April 2. Congress, elected the previous Nov., contained a small Democratic majority in both Houses and welcomed the first woman representative in the person of Miss Jeannette Rankin of Montana. On Feb. 8 the Government published an intercepted German despatch to the Mexican Government asking the Mexicans to join in the war, promising them the "former Mexican provinces," long incorporated in the

United States. This so-called "Zimmerman Note" further suggested that Mexico induce Japan to desert the Allies and join her in war on America. The participation of the United States in the war was now inevitable. A formal declaration signed by the President April 6 after a House vote of 373 to 50 and a Senate vote of 82 to 6, stated that war had been already begun by Germany. Relations with Austria and Turkey were at once broken off, but the declaration of war with Austria was delayed until Dec. 17 and no declaration was ever made against Turkey.

Though the breach with Germany was initiated by a Democratic President and passed by a Congress in which the Democrats had a small majority, it was a spontaneous national action representing the practically universal belief that the United States could no longer live in peace with such a nation as Germany had become. In a succession of brilliant speeches President Wilson had developed the idea that it was the duty of the American people to make the world "safe for democracy." Moreover, there was widespread sympathy with the three western Powers closest to the United States in their political principles and system of government. Righteous wrath was aroused by the German treatment of the people of Belgium and other conquered countries. In some minds existed a genuine and well-grounded fear of a future attack upon the United States by Germany if the resistance of the Allies should be destroyed. Amid all the motives for the war, the one thing clear was that the American people recognized Germany as an enemy, and the enemies of Germany as natural friends and partners in the great enterprise of subduing "the Hun." (See also WORLD WAR.)

War Measures.—Passionate national spirit, patriotism, and urgent reasons for war were all useless unless the United States could enroll, train, equip, convey, and continuously supply an immense army. By improved methods of coping with submarines the British were giving such protection to their merchantmen as to keep up their connexions with the centres of food, raw materials and munitions. The American navy, though the vessels were good and the crews skilled and well commanded, was in no position to give direct aid in the process of destroying the German army and still less the German navy. The main service to be rendered by the United States must clearly be to raise and convey to the fighting front a large force of American troops. Under the Act of 1916 nothing had been done toward organizing an efficient expeditionary force—a real army was still to be made.

One saving service the United States was able to do at once: it could help the western Allies in their pressing financial difficulties. Besides the immense industrial production of military and other supplies, the country was blessed with an abundant surplus of foodstuffs. The main crops of 1915 and 1916 were large and prices high. The U.S. Treasury and banks were holding about \$3,000,000,000 in gold, which was one-third of the world's supply. Federal taxes were low and little felt. The new income-tax was just beginning to be significant. The total Government income for the fiscal year 1916-7 was \$1,118,182,978.

Soon after the declaration of war by the United States, missions from the various Allied countries were sent to America to suggest from their experience plans for coöperation. The British Mission, headed by Arthur Balfour, British Foreign Secretary, and including military and naval officers as well as financiers, reached Halifax April 20 and proceeded to Washington. The French Mission, headed by René Viviani, the former Premier, and including Marshal Joffre, landed at Hampton Roads April 24. Other missions came from Italy, Belgium, Russia, Rumania and Japan. Conferences were held with officials of the U.S. army and navy departments with regard to the prosecution of the war. Afterwards the French Mission travelled through the eastern and middle western states, visiting Chicago, Kansas City, St. Louis, Springfield (Ill.), Philadelphia, New York, and Boston; it was everywhere welcomed with enthusiasm, Marshal Joffre being hailed as a hero. With the Japanese Mission an important agreement was signed (the so-called Lansing-Ishii Agreement), which recognized Japan's special interests in China, but provided for a continuance of the "open door" policy for commerce in that country. The commissioners from the European Allies

asked for immediate financial assistance. Under Acts of Congress beginning Oct. 17 1917, the Allies received credits which amounted eventually to \$9,500,000,000: this was supplied to take up the floating debts held in the United States and to purchase more supplies. This material support, backed by the moral support given by America, was a great encouragement to the Allies through the winter campaign of 1917-8.

These enormous payments were among the results of the so-called Liberty loans. April 24 1917 was passed the first loan Act, under which some 4,000,000 people joined in offering in June \$3,000,000,000 to the Government. Three later issues of Liberty bonds followed, and in 1919 an issue of Victory notes. The result was an increase of the interest-bearing debt from \$972,469,290 on Dec. 31 1916 to \$25,234,496,000 in 1919. These loans were supplemented by the War Revenue Act of Oct. 17 1917, which laid a variety of new taxes, increased the income-tax heavily, and combined with it an excess-profits tax, the purpose of which was to bring into the Treasury unreasonable profits likely to be made in the war industries.

All limitations on raising an army were discarded. Volunteers were authorized as in previous wars. Ex-President Roosevelt asked permission to raise a division of which he might take command, and Congress gave its authority for such a special force, but the President refused him a commission. It was soon seen, however, that the only fair and helpful method was to call out all able-bodied men within certain ages. May 18 the Selective Service Act was passed, which provided for raising the regular army and National Guard to authorized strength, and also the enlistment of 1,000,000 men by "selective draft." There was abundant raw material, but it took time and energy to make it available. A system was provided for registering all men of military age. When they were compelled to appear for physical and mental examination the astounding facts were revealed that one-fourth were illiterate, one-fifth were physically unfit for military service, and another fifth defective but not enough so to prevent their serving. (See the table below.) When called up, the men had to be clothed, housed, fed and drilled. Thousands of officers were necessary, and training camps, both for men and officers, were established on a vast scale. Eventually about 4,000,000 men out of 11,000,000 registrants were inducted into the service.

Table Showing Rejections of Draftees for Physical Defects by Local and Camp Boards, Compiled by Maj. Albert G. Love, Office of the Surgeon-General.

	Local Boards	Camp Boards	Total
1. Infectious diseases (excluding tuberculous and venereal)	1,415	351	1,766
2. Tuberculous	69,935	15,446	85,381
3. Venereal	5,796	9,342	15,138
4. General	31,772	13,878	45,650

Nothing could conceal the hard fact that no considerable force could be made ready in less than about a year from the declaration of war. In May 1917 a few American destroyers reached England. June 8 Gen. Pershing, who had been selected as commander-in-chief, arrived in England. June 26 a small detachment of U.S. troops reached France. From that time contingents continued to arrive, thus giving to the Allies the assurance that succour on a vast scale was being organized. New branches of military service were established, among them the Chemical Warfare Service which provided materials for lethal gases and for gas-masks and other means of resisting the enemy attacks. Congress, July 24, appropriated \$640,000,000 for aviation. The whole land was full of unwonted and startling preparations. By Aug. about 700,000 men were enrolled in the army and 230,000 in the navy. Nevertheless, on Dec. 31 1917 the total number of troops in France was only 176,665.

Control of Industry and Transportation.—The establishment of huge war industries for making guns, munitions, clothing, and the varied supplies for a vast army put a great strain on the industry and transportation of the United States. The country was called upon to feed its own people, the army that was preparing to go abroad and, in considerable part, the Allied armies. Aug. 10 1917 a Food Control Act gave the President powers never before conferred with regard to food and fuel (*see FOOD SUPPLY*). Herbert C. Hoover, of California, who had distinguished himself in the management of the Red Cross in Europe and especially in Belgium, was made Food Administrator with large powers. Before the war ended he had established "meatless days," "wheatless days," and "porkless days"; the price of grain was fixed; eventually the farmers were assured \$2.20 a bushel for their wheat crops, which was more than twice what had been considered a good price before the war. The winter of 1917-8 was very severe and coal shipments were delayed both by storms and by pressure of war industries; so that even New York City was for a few days almost without fuel. The warming of buildings and houses was cut to the lowest point. Dr. Harry A. Garfield, president of Williams College, was made Fuel Administrator, and carried through drastic measures for stimulating production, regulating shipments and distributing the supply.

During 1918 these sweeping war powers were rigorously applied. In the food bill was a provision against the use of grain for the manufacture of liquor. Later, manufacture for sale was entirely prohibited by Congress as a war measure. On March 10 1918 Congress passed a Daylight Saving law, for putting the clocks one hour ahead of Standard time from March to October. On March 21 the Federal Control Act placed the management of all the railways in the country in the hands of the Government during the war, and for a period after its close (*see RAILWAYS*). Secretary of the Treasury McAdoo was made director-general of the railways; later Walker D. Hines, an experienced railwayman, succeeded him. President Wilson declared all telephone and telegraph wires to be under the control of the Government and appointed Postmaster-General Burleson to take charge.

One of the most serious needs of the time was a fleet adequate to carry across the Atlantic the army and its supplies and then keep up the shipments of reserves and munitions. The merchant marine of the United States registered for foreign trade was in 1914 only 1,066,288 gross tons. Most of the food and munition tonnage, which was immense, was carried up to 1917 in British or neutral ships, some in French and Italian. The Government then undertook the great task of improvising a merchant fleet (*see SHIPPING*). After a contest between those who insisted on steel ships and those who thought they could be supplemented by wooden vessels, construction was authorized in both materials. But the war was over before any considerable number of new ships were completed, and the wooden ones were a failure.

The Army and Navy at the Front.—The sea duty was strenuous but less dangerous than army service at the front. Beginning with patrol work on the American coast as soon as war was declared, the activities of the U.S. navy extended to coöperation with the British and French in the hunting down of submarines and the protection of convoys. No German fleet gained access

to the high seas, but in 1918 one or two commerce destroyers succeeded in doing a little damage to Allied commerce. In the laying of the North Sea mine barrage, extending from the Orkneys to Norway and completed by July 20 1918, the U.S. mine-layers placed 56,611 out of a total of 70,263 mines. The American navy had some part in blockading the Austrian coast of the Adriatic, and participated in maintaining that Allied command of the sea which in the end was fatal to Germany. One of the most remarkable feats accomplished by the United States during the war was the development of a convoy system whereby over 2,000,000 troops were carried safely 3,000 m. overseas to France. In this work the utmost secrecy was necessary and there was little to appeal to the public mind. On entering the war the United States was wholly unprepared to transport a large expeditionary force; but in June 1917 a few cruisers and transports were provided and the first troops sent across. This convoy was attacked by submarines, but no boat was damaged and no lives were lost. The convoy system was generally adopted. At intervals vessels assembled and sailed on definite routes under the protection of destroyers. Under Rear-Adml. Albert Gleaves the cruiser and transport service was rapidly increased, eventually comprising 24 cruisers and 42 transports, besides 4 French men-of-war and 13 foreign merchant vessels, manned by 3,000 officers and 41,000 men. By a system of zigzag courses, camouflage and protection by swift destroyers the German submarines were rendered almost powerless. Of the escort protecting the convoys up to the Armistice the United States furnished about 83% (Great Britain 14% and France 3%). Of American troops, according to the report of the Secretary of the Navy (1920), 911,047, or 43.75%, were carried on U.S. navy transports, and 41,534, or 2.5% on other U.S. ships. The rest were carried chiefly in British ships. The peak of movement for any one day was reached on July 9 1918 when 75 transports, carrying 171,630 men, were on the high seas. The record month also was that of July, during which 306,350 troops were embarked. So successful was the convoy system that not one east-bound American transport was torpedoed by the German submarines; only three were sunk on their return voyage—the "Antilles" (Oct. 17 1917, 70 lives lost), the "President Lincoln" (May 31 1918, 26 lives lost), and the "Covington" (July 1 1918, 6 lives lost). The "Mount Vernon," returning from France, was torpedoed Sept. 5 1918, but made port; 36 lives were lost. Only three fighting ships were destroyed by the enemy—the patrol-boat "Alcedo," a converted yacht (Nov. 5 1917, off the French coast, 20 lives lost), the torpedo-boat destroyer "Jacob Jones" (Dec. 6 1917, off the British coast, 62 lives lost), and the cruiser "San Diego" (July 19 1918, sunk by a mine off the New York coast, 6 lives lost). Interned German vessels were used as transports, the "Leviathan" alone (the former "Vaterland") making ten voyages to France and carrying almost 100,000 troops. Other large U.S. transports were the "President Grant," 9 voyages, carrying all told about 80,000 men; the "George Washington," 9 voyages, about 46,000 men; the "America," 9 voyages, about 37,000 men; the "Agamemnon," 10 voyages, about 35,000 men.

The first notable appearance of American troops was at Cantigny May 28 1918. On June 6 there was a fierce engagement between the Americans and the Germans at Belleau Wood. During July 15-18 American troops, posted at Château-Thierry, desperately and successfully held the German forward movement. By Aug. about 1,500,000 soldiers had reached France. During Sept. 11-13 the Americans were given the task of clearing the Germans out of the St. Mihiel salient, their first independent action. From Sept. 26 to Nov. 11 the American army was engaged in the sanguinary Meuse-Argonne campaign, finally capturing Sedan and breaking the German lines. In these brief and territorially limited operations the American army, of which not more than 600,000 actually came within reach of the enemy, lost through casualties about one-third of those engaged.

The work of frenzied preparation and the steady drives on land and sea would have been impossible but for a new kind of organization of the War Department and other parts of the Government machinery at Washington. Under the Overman

Act of May 20 1918 the President was authorized to rearrange the departmental work and to transfer bureaux according to his discretion. Large numbers of civilian men and women were brought into the War, Navy and other departments, some on salaries, others as "dollar-a-year men"—that is, men who for one reason or another could not enter the army but desired to serve their country at their own cost. The pace was severe, the administration complicated. The main object was to start things moving, without due regard, at times, to immediate results or costs. Plans were made with a view to a prolonged war. The sudden cessation of hostilities found the Government in possession of vast stores of supplies, now unneeded and inviting waste. There was a large accumulation of raw materials but comparatively little of finished product. The most glaring contrast between expenditures and results was in the construction of aircraft. In April 1918 Gutzon Borglum, the distinguished sculptor, and other civilians charged that the aircraft production was extravagant and inefficient. Charles E. Hughes was appointed by the President to make an investigation; he later reported that waste and confusion and inefficiency existed but that there was no wilful plunder of the Government on the part of anyone. Notwithstanding such errors large armies were speedily raised, dispatched and reached the front in time to give decisive aid to the Allies.

During the campaign of 1918 efforts were made to extend the possible field of enlistment by the passage of the Man Power bill of Aug. 27. All men between 18 and 45 were required to register with a view to service if needed, and 11,000,000 were registered. On Aug. 17 it was reported that some 3,000,000 men were with the colours at home and abroad. By a statute of Oct. 6 1917 provision was made for a system of military and naval insurance available for all men in the service. General Pershing officially reported that at the date of the Armistice, Nov. 11 1918, there were in Europe 2,071,463 American officers and men (approximately 82,000 officers). Only about 15,000 soldiers had returned to the United States. On the same date, according to figures compiled by the War Department, the number of troops encamped in the United States was 1,634,499, including 104,155 officers. The casualties up to Nov. 18 1918 were: killed in action, 35,556; died of battle wounds, 15,130; died of other wounds, 5,669; died of disease, 24,786; total deaths, 81,141; wounded 179,625; missing, 1,160; prisoners, 2,163; total casualties, 264,089.

War Activities at Home.—Immediately after the declaration of war the American people through official and unofficial channels made preparations to give support by civilian service and money contribution. One of the first war measures of President Wilson was to designate, April 14 1917, a Committee on Public Information, composed of the Secretaries of State, War and Navy, and one civilian, George Creel, journalist, as chairman. It was designed to be the official source of news relating to Allied war activities and issued a daily *Bulletin*, widely distributed for the special use of the press. Newspapers were requested to coöperate and to refrain from publishing unauthorized war news. The Committee kept up a lively system of publicity throughout the war, and at times was accused of providing favourable information even when things did not go altogether well. Its publicity work was aided by the National Board for Historical Service, created April 28 1918 at a conference of historians at Washington. Numerous pamphlets, maps and moving pictures were prepared and a nation-wide organization effected for furnishing a patriotic speaking service of "four-minute men," who by arrangement with the purveyors of public amusements made brief talks before their audiences. By an executive Act of Oct. 12 1917 a Censorship Board was established for censoring all communications—mail, cable, radio—passing between the United States and foreign countries. Its members consisted of representatives of the Secretary of War, Secretary of the Navy, Postmaster-General, War Trade Board, and the chairman of the Committee on Public Information. Control of all radio stations within the jurisdiction of the United States had been placed under the Secretary of the Navy April 6 1917; on April 28 the transmission of cable messages between the United States and foreign countries had been

placed under the same supervision and international telephone and telegraph messages under the Secretary of War; censorship of the mails began Nov. 2, under the direction of the Post Office Department. This last provision was of great service in enforcing the Trading with the Enemy Act, in suppressing enemy propaganda, and in preventing the disclosure of military information to the enemy.

As early as Aug. 29 1916 a Council of National Defense, created by Act of Congress, had been approved and on March 3 1917 was fully organized. Its duty was the "coördination of industries and resources for the national security and welfare" and the "creation of relations which render possible in time of need the immediate concentration and utilization of the resources of the nation." Composed of the Secretaries of War, Navy, Interior, Agriculture, Commerce and Labor, it utilized the counsel of an Advisory Commission of seven persons, each one a specialist in one branch of industry. After America entered the war this Council devised the ways and means for efficient production and transportation of the essentials of war. Under it were later created several special organizations such as the War Industries Board (succeeding the earlier General Munitions Board), created July 28 1917, for assuring the prompt equipping and arming, with the least possible disadjustment of normal industrial conditions, of whatsoever forces might be called into the service of the country; the Purchasing Commission, formed Aug. 28 1917, for coördinating the purchases in America of supplies for the Allies; the Emergency Fleet Corp. of the Shipping Board, incorporated April 16 1917 for the purchase, construction, equipment, lease, charter, maintenance, and operation of merchant vessels in the commerce of the United States (see MUNITIONS). Early steps were taken also to conserve the supply of food and fuel. At the request of the Secretary of War (April 9 1917) the various states also organized State Councils of Defense, which supervised such matters as the conservation of food, sale of Liberty bonds and draft registration.

On April 21 1917 the Council of National Defense appointed a Woman's Committee, with Dr. Anna Howard Shaw as chairman, to coördinate the patriotic work of the women throughout the country. Divisions were organized in every state, and within a year four-fifths of all counties had subdivisions. Through these organizations the country's needs were promptly reported and all households mobilized for thrift. On April 2 1917 a General Medical Board was established under the Council. Through its aid medical officers were recruited, various committees were appointed and advice given in the interest of camp sanitation and health of the soldiers.

Hardly less important than production was transportation. The Advisory Commission of the Council of National Defense created a Committee on Transportation and Communication, with Daniel Willard, president of the Baltimore & Ohio railway, as chairman. Already in Feb. 1917 a Special Committee on National Defense had been appointed by the American Railway Association. Railways were requested to adopt measures for the most efficient handling of freight. At a meeting of the presidents of the important railways, held in Washington, April 11, plans were made for organizing an executive committee, composed of the presidents of five railways and of two *ex-officio* members one each from the Council of National Defense and the Interstate Commerce Commission, with Fairfax Harrison as chairman. This Committee, popularly known as the Railroad War Board, undertook to secure unity of operation among all railways, to subordinate private interests, and to eliminate competition. It continued to work until Dec. 28 1917, when the President placed all railways under Government control. William G. McAdoo, Secretary of the Treasury, was named as Director-General of Railroads, and under him was organized the U.S. Railroad Administration. By an Act approved March 21 1918 each railway, during the period of Federal control, was allowed compensation equivalent to its average income during the year ending June 30 1917; it was further provided that the roads should be kept in good repair and with equipment equal to that assumed by the Government. It was an emergency war measure

and Federal control was not to last longer than 21 months after the end of the war. The country was divided into regions, each under a regional director, and methods were devised for rapid transportation of troops and supplies. The roads were returned to private ownership on March 1 1920. On April 11 1918 the important coastwise steamship lines also were placed under control of the Director-General of Railroads. At the latter's suggestion the four large express companies had combined in May 1918 under the name American Railway Express Co. which on Nov. 16 was placed wholly under control of the Railroad Administration.

Authorized by a joint resolution of Congress, dated July 19 1918, the Government assumed control of telegraph, telephone and marine cable systems, under the U.S. Telegraph and Telephone Administration, directed by Postmaster-General Albert S. Burleson. Radio control was already under the Navy Department. The telegraphs and telephones were taken over Aug. 1 1918. Contracts as to compensation were made with various companies, including the American Telephone and Telegraph Co., and the Western Union Telegraph Company. The Postal Telegraph-Cable Co. refused to enter into a contract, but was given compensation. There was considerable opposition to the taking over of the wires, due to the fact that the Postmaster-General was an avowed advocate of Government ownership, and it was surmised that he would use his influence for permanent Federal control. The cables were not taken over until Nov. 16 1918, five days after the signing of the Armistice, an action which aroused much criticism. They were returned to their owners May 3 1919. The telegraphs and telephones were returned Aug. 1 1919.

On Oct. 6 1915 a Naval Consulting Board had been organized, with Thomas A. Edison as president, and after the outbreak of the war it was associated with the Council of National Defense. Through various committees it studied such questions as those connected with life-saving appliances, explosives, mines and torpedos. At the same time many scientists were engaged in research throughout the country under the National Research Council, organized by the National Academy of Sciences with the support of President Wilson.

In order that available capital might be turned into channels contributing to the successful prosecution of the war, two agencies were devised. In Jan. 1918 the Secretary of the Treasury asked the Federal Reserve Board to pass upon all proposed issues of securities that should be referred to it. The Board formed a Capital Issues Committee for this purpose, and all banking institutions were asked to refrain from assisting in the floating of new securities until passed upon by the Committee. In general, approval was given only to such issues as contributed to the winning of the war or to the promoting of national welfare. This committee, however, had no legal status. Accordingly by Act of Congress, April 5 1918, there was created a Capital Issues Committee of the same nature, with authority to investigate and pass upon all issues, with certain specified exceptions, of securities of \$100,000 or more. However, it was not empowered to require the submission of such securities to its investigation or to impose acceptance of its decision. The production of non-essentials was discouraged and many doubtful enterprises were repressed. The committee became inactive after Dec. 31 1918. It had investigated issues totalling about \$3,800,000,000, of which amount about \$900,000,000 had been disapproved. The same Act that created the Capital Issues Committee also created the War Finance Corp., the purpose of which was to encourage production of war essentials by providing funds for approved enterprises. With authorized capital of \$500,000,000 furnished by the Government, it was placed under the direction of the Secretary of the Treasury and four associates. Up to Oct. 31 1918, requests for loans had been made amounting to \$323,320,000 and loans amounting to \$67,716,000 granted. At that time the net earnings of the Corporation had reached \$2,169,000. A special War Credits Board was created Nov. 20 1917 for supplying loans to producers of munitions of war, its policy being to supply funds when not available elsewhere. Up to May 1919 loans of about \$248,000,000 had been made, of which sum \$163,000,000 had been repaid.

xxxii.—29

By the Espionage Act of June 15 1917 the President was empowered to control exports. A Bureau of Export Licenses was created through which were issued permits for shipments to foreign countries. The object was to prevent, so far as possible, American goods from reaching the enemy. Later this Bureau was placed under the Exports Administrative Board, created Aug. 21 1917. After the passage of the Trading with the Enemy Act of Oct. 6 1917 this Board in turn was merged with the War Trade Board, organized by executive order of Oct. 12 1917, and consisting of representatives of the Departments of State, Treasury, Agriculture, and Commerce; the Shipping Board, and the Food Administration, with Vance McCormick as chairman. The War Trade Board undertook the control of imports as well as exports, and aimed to strengthen the blockade and to injure Germany's trade. With the aid of a Bureau of Enemy Trade a list was prepared of firms throughout the world with whom Americans should not trade. This Enemy Trading List was distributed for guidance among Americans engaged in foreign trade. Trade agreements were made with neutral countries, allowing them to receive American goods under conditions intended to prevent their reexport to the enemy.

The importance of securing the coöperation of labour was recognized from the first. One of the six members appointed on the Advisory Commission of the Council of National Defense was Samuel Gompers, president of the American Federation of Labor. On April 2 1917 Gompers called a conference at Washington, which was attended by representatives of labour, employers, and social workers. The result was the organization of a Committee on Labor of the Council of National Defense, designed to advise as to the relations between labour and employers during the war. Suggestions were issued through the Council of National Defense and requests made that no changes in existing standards be made without the Council's approval. Labour conditions were investigated, information published, and efforts made to settle disputes without interruption of work. During the summer of 1917 serious labour trouble arose in the west in connexion with the production of such important war materials as copper, lumber, and oil. A special commission, popularly known as the President's Mediation Commission, was appointed by the President, Sept. 19 1917, with William B. Wilson, Secretary of Labor, as chairman, and Prof. Felix Frankfurter, of the Harvard Law School, as secretary and counsel. A thorough study of labour conditions was made and many disputes settled. A report made Jan. 9 1918 formed the basis of all subsequent labour adjustments. In Jan. 1919 the Secretary of Labor called a conference, inviting employers and labour to send five representatives, each side to choose a chairman to preside on alternate days. Plans were formulated for governing relations between employers and employees, recommending, among other things, that the right of collective bargaining should be conceded on both sides; that no change should be made in existing conditions as to the "open" and "closed" shop; that women replacing men should be paid on an equal basis; and that the minimum wage should insure reasonable comfort for the worker's family.

Following a suggestion of the conference there was created, April 9 1918, a National War Labor Board, whose membership, chosen by the Secretary of Labor, was identical with that of the labour conference, and consisted of 12 members. It acted throughout the war as a "supreme court" in settling labour disputes. To supplement the work of this Board there was appointed, May 13 1918, a War Labor Policies Board, intended to be representative of all the Governmental producing agencies, for the purpose of standardizing wages, hours of labour, housing conditions, draft exemption, and employment of women.

A matter of great importance was the recruiting of labour and its directing into necessary industries. After America's entrance into the war several existing services under the Department of Labor were enlarged and new ones created. The U.S. Employment Service, under the Bureau of Immigration, with offices throughout the country, assumed Aug. 1 1917 the task of recruiting unskilled labour for all war industries, excepting farms and railways. Private employment bureaux were closed. Much

skilled labour, also, was secured for shipyards and camp construction. From Jan. 1 1918 up to the signing of the Armistice, about 2,400,000 workers had been placed in essential industries. Later this Service undertook to find employment for ex-service men; and from Dec. 1 1918 to Sept. 27 1919 out of 758,474 registrants, 474,085 were duly placed (see DEMOBILIZATION AND RESETTLEMENT). The influx of labour in the industrial centres created a serious housing problem. In Feb. 1918 in the Department of Labor there was organized a Bureau of Industrial Housing and Transportation. On May 16 Congress appropriated \$60,000,000 (later increased to \$100,000,000) for providing adequate housing facilities for labourers and their families. By Act of June 4 1918 the President was authorized to form a corporation for carrying on this work. Accordingly, on July 10 1918 the U.S. Housing Corporation was incorporated under the laws of New York. The personnel was the same as that of the Bureau of Industrial Housing and Transportation. Elaborate preparations were made for erecting dwellings, dormitories, and cafeterias, but actual construction had not proceeded far before the Armistice.

In addition to these and other official organizations several private agencies were established which had the goodwill and aid of the authorities and raised large sums for the comfort and health of the soldiers in the service, the care of the sick and wounded and aid to refugees and non-combatants in the war zones. Chief among these was the American National Red Cross, which during a single drive raised \$100,000,000 and was to be found wherever there was fighting, sickness, suffering, or starvation. At the date of the Armistice its total membership was 10,028,022; the number of women giving their services in Red Cross workrooms was 8,000,000; supplies had been furnished to the amount of almost \$76,000,000. Special attention to the social welfare of soldiers in camps both in America and overseas was given by the Y.M.C.A., Y.W.C.A., Knights of Columbus, Salvation Army, Jewish Welfare Board, American Library Association, and War Camp Community Service. An attempt was made to coördinate the work of these various organizations through the War Department Commission on Training Camp Activities, which also acted in an advisory capacity in connexion with the prevention of the sale of intoxicating liquor and the discouragement of brothels near the camps.

The Government formally took charge of all foreign trade Feb. 15 1918, and seized not only all German ships interned in U.S. ports since the war broke out, but also ships under the Dutch and other neutral flags, and impressed them into war service. Under the Webb Act of April 10 1918 the Government went to the extent of permitting combinations for foreign trade, which would otherwise have been in violation of the anti-trust Acts.

Enemies in the United States.—While the people of the United States were practically a unit in favour of a vigorous prosecution of the war, there were a few, chiefly foreign-born or sons of foreign-born, who were opposed to the war or more often to the nations in concert with which and partly for whose salvation the United States was fighting. Ever since 1914 the country had been irritated and aroused by a series of illegal, violent and often murderous acts which were traced to German and Austrian agents. For example, determined efforts were made to blow up the international bridge at Vassalboro, Me., and the locks of the Welland Canal, by men acting within the boundaries of the United States. Bopp, German consul-general at San Francisco, was convicted and imprisoned for aiding German vessels in the Pacific in defiance of neutrality laws. Rintelen (after the war specially rewarded by the German Government) was sent to the Federal prison at Atlanta for aiding in placing bombs on outgoing vessels with intent to destroy them. In 1910 Eugene V. Debs, Presidential candidate four times of the Socialist party, was sentenced to ten years' imprisonment for advising men not to enlist in the army. Victor Berger, member of Congress from Wisconsin, was convicted and sentenced for disloyalty, then reelected to Congress, which refused to seat him.

The I.W.W. took advantage of the general confusion to engage in a campaign of disturbance and violence in the west; as many as 97 leaders of that order, including William Haywood, were

convicted of disloyal conduct by one court at one time. These prosecutions were supported by the Trading with the Enemy Act of Oct. 6 1917, the Espionage Act of June 15 1917, and the Act of April 18 1918 as to alien enemies. Several thousand German and Austrian citizens who were believed to be dangerous were interned. On Dec. 19 1918 two pro-German editors were punished for disloyal utterances in a German-American paper. These prosecutions against American-born citizens, naturalized citizens and unnaturalized foreigners continued for two years after the end of hostilities. The authorities were particularly incensed by an open propaganda carried on by Russians and others in favour of Bolshevism as a principle of Government and a substitute for the institutions of the United States. In Dec. 1919 some 250 alien anarchists were placed on a Government transport and taken to Russia. On Dec. 25 1921 President Harding commuted the sentences of Debs and 23 others who had been convicted under the Espionage Act, but a number of persons remained in jail under sentences for disloyal action.

The Armistice and the 1918 Elections.—All at once this tremendous energy, these costly preparations, this enrolling of millions of men, this unceasing action of the great national relief societies, were interrupted by the end of the war in western Europe. The fierce campaign of 1918 was the final effort of the Germans. For the second time in the war they came almost within striking distance of Paris, but were repelled by the bravery of the French and British combined with the new armies from America. No one can say positively that the American army in the field was the chief element that insured victory; but there is not a doubt that the triumphant success in raising, drilling and transporting incessantly provisions and supplies, was to the German mind convincing and disheartening evidence that the Government and the people of the United States, with all their power and potentiality, would stand by the Allies indefinitely. November 11 1918, by the Armistice in which the American armies shared, the Germans admitted their defeat and at once began to evacuate the occupied regions and also portions of their own national territory.

This climax came a few days after the state and Congressional elections of the autumn of 1918. The war was a national war. Enlistments, whether volunteer or by draft, had no relation to politics. Nobody paid any attention to the party affiliations of officers or men or civilian administrators and aids. Nevertheless, Oct. 15, a few days before the elections, President Wilson took the strange course of issuing a circular letter urging the voters to return a Democratic majority to the Senate and the House, because, if the Republicans were successful, it would be considered an imputation upon the President. The warning was in vain; in fact, it probably helped the Republicans materially. The result of the election made the new House decidedly Republican and the Senate Republican by two votes. It was apparent, therefore, that the Administration in making the necessary adjustments after the war must take into account the preponderance of the opposition in both Houses of Congress. Several changes came about in the Cabinet at the end of 1918. McAdoo resigned and was followed in the Treasury by Carter Glass, a representative from Virginia, who gave way in turn to Houston, transferred from the Department of Agriculture, where he was succeeded by Meredith. February 13 1920 Secretary Lansing was practically removed by President Wilson for "insubordination," and was succeeded in the State Department by Bainbridge Colby.

Throughout the year 1918 the influence of Theodore Roosevelt was steadily growing. He was by his whole nature a supporter of the war. He and his four sons volunteered for service, though, as he put it with plaintive humour: "Wilson has kept me out of the war." He was recognized as a Republican and the most powerful Republican. Even his strongest political enemies admitted that the party must reckon with him. As the months passed it became clear that he would be nominated by the Republican Convention of 1920 and in all probability would be elected President. But he died suddenly, Jan. 6 1919, leaving behind him a long roll of achievements and a place among the greatest of American statesmen and world figures.

Peace and the Treaty.—Two great tasks remained when active war ceased. The first was to secure a settlement and register it in a treaty or series of treaties, thus returning so far as possible to normal international relations. The second was to reconstitute the world and to protect it, if possible, against future wars. A third task for the United States was its internal reconstruction by putting an end to the special war laws and conditions and by readjusting business, transportation and labour.

The first two of these tasks are described in detail elsewhere (see PEACE CONFERENCE and LEAGUE OF NATIONS). In addition to the suggestions made in the winter of 1916-7 President Wilson put forward on Jan. 9 1918, during the height of the war, "fourteen points" (see WILSON, WOODROW) which he considered a necessary basis for the peace of the nations and a subsequent world agreement. These points he enlarged in later addresses to twenty-seven. The Germans afterwards asserted that the points were an essential part of the Armistice. One week after the signature of that document President Wilson decided that he would attend the necessary Peace Conference in person. As soon as Congress assembled he announced that purpose and designated as peace commissioners with himself four others—Secretary Lansing, Col. House of Texas, his most intimate friend and political adviser, Gen. Bliss of the army, and Mr. White, formerly minister to France. These commissioners were not passed upon by the Senate, only one of them was a Republican, and not one was a member of either the Senate or the House. To Republicans it seemed that the President meant it to be a Democratic peace as well as a Democratic war. In the Peace Conference President Wilson, as representative of the richest and most powerful nation in the world, became one of the four representatives of the four Great Powers—Great Britain, France, Italy and the United States—who engineered the Treaty.

President Wilson was deeply interested in the League of Nations; and, when he found that the French were not ready to adopt such a plan without some guarantee of protection, he signed a treaty of alliance between the United States, France and Great Britain pledging the United States to join in war in case of the invasion of France by Germany. No one familiar with the temper of Congress and of the American people should have supposed that such a treaty would be ratified. President Wilson returned home for a short stay (Feb. 24-March 4), defending the general terms of the Treaty and the Covenant of the League of Nations, of which he was the most significant draftsman. He returned to Paris and on June 28 1919, he and the four commissioners signed for the United States the formal Treaty of Versailles, including the Covenant of the League of Nations, which was interwoven into the text of the Treaty. Upon one of the subjects covered by the territorial adjustments of the Treaty in which the people of the United States felt a deep national interest—the continued occupation of Shantung by the Japanese—the President reluctantly gave way and consented to its retention by the Japanese, in spite of the general adverse opinion in the United States.

The Treaty had many powerful supporters in the United States among all parties, particularly ex-President Taft, the League of Free Nations and the League to Enforce Peace, in which A. Lawrence Lowell, president of Harvard University, was the leading spirit. The Senate, which had the constitutional right to pass upon the Treaty by a two-thirds majority, was divided into strongly opposed groups. Most of the Democrats, under the lead of Senator Hitchcock, followed the President in favouring the Treaty with the Covenant as it stood. A group of Republicans, headed by Senator Lodge of Massachusetts, favoured "amendments" to the Treaty and "reservations" as to the League which would have maimed but not killed the two projects. The contest ostensibly centred about Art. X. of the Treaty, under which the members of the League undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League," and agreed that in case of need the Council should "advise upon the means by which this obligation shall be fulfilled." This group expressed fear lest the United

States be drawn into foreign wars and insisted that "no American soldiers or sailors must be sent to fight in other lands at the bidding of the League of Nations." The President, on the other hand, regarded Art. X. as the heart of the whole Treaty. Another group wished reservations that would practically destroy the document. A small but implacable junto, headed by Borah of Idaho and Johnson of California, were against both the Treaty and the Covenant in any form or with any reservations.

The President declined at the critical moment to accept either amendments or reservations, except certain minor alterations approved by himself. Senator Knox of Pennsylvania proposed a resolution intended to put an end to the fictitious state of war with Germany. It was passed by both Houses, but was vetoed by the President (May 27 1920). After strenuous debate and by a test vote, Nov. 19 1919, the Senate refused to ratify the Peace Treaty with reservations—the vote being 55 to 39 in favour, but not the necessary two-thirds. Thus after five months' discussion the Treaty was rejected, and the United States was left in the absurd situation of remaining at war with Germany and Austria though all hostilities had ceased a year before.

President Wilson until the last moment believed that he could force ratification of the Treaty by his logic and influence. September 26, while on a speaking trip through the country in favour of the Treaty, he was struck down by paralysis; when he rallied sufficiently to think of public business he continued to hope that he would recover. His Cabinet and closest friends joined in an attempt to minimize the extent of the President's illness, though for months he was unable to see even members of his Cabinet. Had he possessed his usual mental force, the result would probably have been the same. The difficulty with the Treaty and the League was that both were signed by a body of so-called commissioners who represented no lawful authority except that of the President. The only one who held public office or responsibility was Lansing, who by his own account fundamentally differed from the President at Paris but always surrendered his convictions. Whether President Wilson, or the statesmen who opposed him in the Senate, had the clearer view of the state of the world and the duties of the United States, whether the opposition could have been avoided by taking counsel with a larger group of competent men, cannot now be decided. The fundamental fact is that the opposition to the Covenant was strong enough to prevent the ratification of the Treaty even with serious reservations: the representatives of the United States at Paris were out of accord with the constitutional treaty-making power of the nation. Since the President had the last word in framing treaties, nothing could be done.

Rehabilitation.—The task of *post bellum* economic adjustment was entirely within the control of the people of the United States, except so far as foreign trade was involved. The census of 1920 showed a pop. of 105,000,000 in the continental area and 12,000,000 more in the dependencies. At the end of the war the Federal Government by war statutes was controlling the food supply and its distribution, manufactures, the coal supply and shipments, railways, telegraphs and telephones, foreign commerce and shipping, the care of the property of aliens through an Alien Property Custodian, as well as the conditions of interstate labour and of labour in other fields, through a War Labor Administrator, and a National War Labor Board. For foreign commerce there was still a Shipping Board, an Emergency Fleet Board, a War Trade Board and a War Finance Board. Two million American soldiers were overseas and wanted to come home as soon as possible. The average cost of living was about 80% higher than in 1914. The United States had spent on the war about \$35,500,000,000, including \$5,500,000,000 loaned to the Allies. Congress was willing enough to impose high taxes, and the people were ready to pay them; but expenditures after peace came continued on a scale far beyond any previous experience of the country. This complicated condition was to be readjusted by a Government made up of a President physically unable to perform his duties, a Senate and a House opposed to him in politics, and a group of abnormal war agencies. No swift or judicious result could be expected.

In the course of six months after the Armistice, about two-thirds of the troops were brought back, leaving behind them enormous stores, large parts of which were sold at heavy discounts to European Governments. General Pershing, the only military man of high rank whose achievements caught the public eye, received the reward of the permanent rank of general. By 1920 the only American troops left in Europe were an Army of Occupation of about 17,000. In Sept. 1919 the American Legion incorporated by Act of Congress was formed to look after the interests of the ex-soldiers.

Two constitutional amendments crystallized some of the results of the war. The various prohibition measures passed by Congress, on the ground that the use of liquor impeded the success of the war, were powerful aids to the general arguments against liquor. Many of the states had absolutely prohibited the sale of liquor and on Jan. 16 1919 the 18th Amendment, prohibiting the manufacture, sale, transportation or gift of intoxicants (submitted in 1917) was ratified by 36 states (eventually 45 states). It went into final effect Jan. 15 1920, enforced by the Volstead Act (passed Oct. 28 1919, over the President's veto), which declared all liquors containing more than one-half of 1% of alcohol to be intoxicating and therefore prohibited (*see PROHIBITION*).

The active war patriotism and service of women, together with the votes they already enjoyed, caused Congress June 1919 to submit the 19th Constitutional Amendment, annulling all sex restrictions of suffrage. It was warmly supported by the former Progressives and by President Wilson, received its 36th ratification Aug. 24 1920, and went into force August 26.

Railways and telephones were restored to their owners. Federal control over fuel stopped; but the abnormal number of executives and clerks in Washington and elsewhere remained under pay. Congress provided for the men disabled in the war by establishing hospitals and by giving to the weak and maimed an opportunity to acquire some trade or calling by which they could make a living. This system enlarged the functions of the Federal Vocation Board created by the Vocational Education Act of Feb. 23 1917. Trade and overseas transportation were discouraged by the financial conditions of the European nations that had been accustomed to trade with the United States. All the war countries in Europe except Great Britain were on a paper-money basis, and a dollar in gold in Oct. 1920 would buy 15 French francs, 26 Italian lire or 71 German marks; even the English sovereign was as compared with the dollar at a discount of 25%. These conditions demoralized international exchange. Transportation in the United States was much disturbed because of the great increase in the money cost of labour and supplies. Feb. 28 1920 Congress passed the Esch-Cummins Transportation Act for the return of the railways to their owners, with certain guarantees of compensation for a period of six months and a stipulation directing the Interstate Commerce Commission to make rates yielding a return of 5½% to 6% for a period of two years. Sea traffic was confused, and in 1921 became almost profitless because of the increased number of ships which were competing for a decreasing amount of business.

The most serious trouble was with labour. Railwaymen and many other skilled employees received wages amounting in some cases to more than double the figures of 1914, and naturally were unwilling to relinquish their advantages. Whenever there was an attempt to reduce wages there was a strike. New York and other ports were several times almost paralysed by strikes of longshoremen or officers and crews of ships. In Aug. 1919, under President Wilson's direction, the Government threatened to use military force to break a railway strike. The police force of Boston struck Sept. 9 1919 as a protest against an order not to join the American Federation of Labor. The strikers stood by and saw without protest scenes of riot and pillage. They were all dismissed and Governor Coolidge of Massachusetts, in replying to a telegram from Samuel Gompers, declared that "there is no right to strike against the public safety by anybody, anywhere, any time." In 1916 there was a strike of 600,000 bituminous coal-miners in the west. Notwithstanding conferences and

boards and mutual understanding there was no national or state machinery that could effectively deal with these troubles.

Political Overturn of 1920.—As the months passed, dissatisfaction grew. The soldiers received in many states a money bonus varying in amount, and demanded a similar bonus from Congress. The general public complained bitterly against the "high cost of living," while many corporations continued to make war profits in time of peace. Salaried men, people living on investments, holders of life-insurance policies and depositors in savings banks, saw their incomes and expectations reduced by the fall in the purchasing power of the dollar. The Democratic party was paralysed by internal difficulties over the Peace Treaty and by lack of the trusted leadership of the President. The Republicans had broken the foreign policy of the Administration and were in possession of a majority of both Houses, but had no fixed policy of foreign relations or reconstruction.

In the winter and spring of 1920 Presidential candidates began to develop. General Leonard Wood, formerly chief-of-staff of the army, who had been refused a foreign command during the war, was put forward by a large group of Republicans. Governor Lowden of Illinois had a considerable following. A movement was made in favour of Hoover, well known for his services on the Commission for Relief in Belgium and other relief agencies and also as Federal Food Administrator. When the Convention assembled at Chicago June 9 1920, it proved to be impossible to nominate any of the three, and Senator Harding of Ohio received the nomination backed by a strong group of stand-patters to whom, however, he seems to have made no pledges as to policy or appointment. Governor Coolidge of Massachusetts was put on the ticket as vice-president.

The Democratic Convention held at San Francisco was confronted with a similar difficulty. Woodrow Wilson had already served two terms and was known to be physically unable to perform the duties of the office. The leading candidates were McAdoo of New York, formerly Secretary of the Treasury, and Attorney-General Palmer of Pennsylvania; but after many ballots the nomination went to Governor Cox of Ohio, a man little known in national affairs, with Franklin D. Roosevelt, a cousin of the former president, as vice-president. The Republicans had the lead in the campaign, in which for the first time women were eligible to vote in every state. The result was a complete triumph for the Republicans, who elected Harding by a popular majority of about seven million and an electoral majority of 404 against 127 for Cox, besides securing solid majorities in both Houses of Congress.

March 4 1921 Woodrow Wilson accompanied the President-Elect to the Capitol as the last act of his official life. He had been president for eight years, during six of which he was the undisputed leader of his party and of the nation. Except for a few not very important measures passed over his veto, up to the summer of 1919 he had his way with Congress and with the people. He was responsible for a group of important revenue, banking and labour laws. He had a great hold on the affections and opinions of millions of his fellow citizens, and maintained the country's dignity in war and peace. He had the people behind him in entering the war. He stood behind the measures for organizing and transporting millions of American soldiers. For a time in Paris he was the foremost man in the world, and he succeeded in inducing foreign statesmen, not much interested in, and at heart disliking, the project, to accept a League of Nations. At the height of his career he suddenly lost control as war president of the whole country, was no longer accepted as unquestioned head of his party, and ceased to be the one man who could appeal from Congress to the people. Before illness disabled him, he had already lost his hold upon the minds of the majority of his fellow countrymen.

His work was transferred to a new man less experienced in politics, for a short time a quiet member of the U.S. Senate, whose task it was to take over the discordant elements and build out of them a national policy. President Harding accepted this new responsibility and began his administration under favouring auspices. An excellent impression was created through-

out the country by his choice of a Cabinet above the average, several members being chosen in the face of strong opposition from the professional politicians. The members were: Charles E. Hughes, State; Andrew W. Mellon, Treasury; John W. Weeks, War; Harry M. Daugherty, Attorney-General; Will H. Hays, Postmaster-General; Edwin Denby, Navy; Albert B. Fall, Interior; Henry C. Wallace, Agriculture; Herbert C. Hoover, Commerce; James J. Davis, Labor. The new President early showed tact and ability in leading his party in favour of constructive action. Within four months the epoch-making bill providing for a Federal budget system was passed by Congress and approved (June 9 1921). This was in line with the President's constant appeal for economy, which led him also to urge postponement of legislation for the grant of a Federal bonus to ex-service men in view of the existing burden of taxation. He displayed keen interest in all attempts to restore business to a sound basis and urged prompt action in the assistance of the railways. By nature conservative, he laboured to bring the country back to a state of "normalcy," to use a favourite word of his own. Treaties of peace negotiated with Germany, Austria and Hungary were ratified by the U.S. Senate Oct. 18 1921.

Of world-wide importance was his call for a conference of the different Powers bordering on and interested in the Pacific Ocean, to be held in Washington and to discuss both Pacific questions and the question of limitation of armament.

The conference assembled Nov. 11 1921, "Armistice Day," and closed Feb. 6 1922. The participants were the United States, Great Britain, France, Italy, Holland, Belgium, Portugal, China and Japan. Important agreements were signed:—to limit construction of capital warships; against improper use of submarines, and against gas warfare; for maintenance of Pacific insular possessions; and on other questions involving relations with Japan and China (see WASHINGTON CONFERENCE).

UNITED STATES NAVAL ACADEMY (see 27.736).—The expansion of the Naval Academy in the period 1910-20 began before the entry of America into the World War. In 1912 the six-year course (including two years at sea as "midshipmen") was discontinued, and midshipmen were commissioned ensigns immediately upon graduation from the Academy. By Acts of Congress in 1916 and 1917, the number of annual appointments to the Academy allowed to each senator, representative, and delegate in Congress was increased from two to five; presidential appointments from 10 to 15, and appointments of qualified enlisted men from 15 to 100. Thus the total number of authorized appointments reached 3,126; and the number of midshipmen increased from 758 in 1910 to 1,230 in 1916, and in 1920 to about 2,200. Since 1920, physically qualified candidates have been allowed to enter either by examination or by certificate from a recognized school.

As a war measure, the class of 1917 was graduated in March of that year, and the class of 1918, after a period of intensive study, in the following June. The course was reduced to three years; but by cutting down examination periods, holidays, and reviews, and increasing the academic year to nine months, practically the same work was covered. In 1919 the four-year course was resumed. Between Sept. 1917 and Jan. 1919, five reserve officer classes, composed chiefly of former enlisted men who were graduates of technical schools, were quartered at the Academy for periods of about three months' training. In this way 1,622 officers were added to the service as temporary ensigns. The post-graduate school for officers, established in 1912 in the former marine barracks near the Academy, was suspended during the World War, but reopened in 1919 with about 50 student-officers. These spend a half-year or year at the post-graduate school before continuing their studies in civilian technical institutions. To provide for increased attendance, in 1918 two wings accommodating 1,100 additional midshipmen were added to Bancroft Hall, an extension to the Marine Engineering Building was completed in 1919, and a new Seanship Building in 1920. In this period, the discipline and the course of studies were modified progressively to meet changed requirements. In 1919 the civilian corps of instructors was reorganized with increased pay and systematic promotion. The staff of the Academy increased from 146 officers and civilian instructors in 1910 to nearly 300 in 1921. (A. H. S.)

UNTERMYER, SAMUEL (1858-), American lawyer, was born at Lynchburg, Va., March 2 1858. He was educated at the College of the City of New York and at the Columbia Law School (LL.B. 1876). He was admitted to the bar in 1879 and practised thereafter in New York City. Between that time and the end of 1921 he was counsel in many celebrated cases covering almost every phase of corporate, civil, criminal and international law. As counsel for H. Clay Pierce he prevented the Standard Oil Co., after its dissolution in 1910, from dominating

the Waters-Pierce Co. In the same year he effected the merger of the Utah Copper Co. with the Boston Consolidated and the Nevada Consolidated Co.'s involving more than \$100,000,000. In 1912, as counsel to the Kaliwerke Aschersleben and the Disconto Gesellschaft in the controversy arising out of the control of the potash industry by the German Government, he assisted in bringing about a settlement. In 1903 he undertook the first judicial exposure of "high finance" in connexion with the failure of the U.S. Shipbuilding Co., organized only a year before as a consolidation of the larger shipbuilding companies in America including that subsequently known as the Bethlehem Steel Co. As a result of the sensational exposures connected with that company a reorganization was effected under the name of the Bethlehem Steel Co., in which Mr. Untermeyer became a large shareholder. After this he conducted a number of similar exposures. In 1911 he delivered an address, entitled, "Is There a Money Trust?" which led the following year to an investigation in which he appeared as counsel, by the Committee on Banking and Currency of the Federal House of Representatives. This so-called Pujo Money Trust Investigation resulted in the passage of a mass of remedial legislation. Mr. Untermeyer for years agitated before Congress and state Legislatures such measures as the compulsory regulation of stock exchanges. He for many years conducted agitations and wrote magazine articles dealing with reforms in the criminal laws, the regulation of trusts and combinations and other economic subjects. He was counsel for many reorganization committees, including those of the Seaboard Air Line, the Rock Island railway, the Central Fuel Oil Co., and the Southern Iron and Steel Co. In 1915 he acted as one of the counsel for the U.S. Government in the suit brought against the Secretary of the Treasury and the Comptroller of the Currency by the Riggs National Bank of Washington, D.C., which charged there was a conspiracy to wreck it; the defendants were cleared. He took an active part in preparing the Federal Reserve Bank law, the Clayton bill, the Federal Trade Commission bill, and other legislation curbing trusts. He was a delegate to the Democratic National Convention in 1904, 1908, 1912, and delegate-at-large for the state of New York in 1916. He was a strong supporter of President Wilson's administration. After America entered the World War he was adviser to the Treasury Department regarding the interpretation of the income tax and the excess profits tax laws. He was appointed by President Wilson to serve on the U.S. section of the International High Commission, which sat at Buenos Aires, in 1916, for the purpose of framing uniform laws for the Pan-American countries. In 1920-1 he was counsel for the Lockwood Committee, appointed by the state Legislature to investigate an alleged conspiracy among the building trades of New York City. It was charged that labour leaders were using their power by extorting bribes for the prevention of strikes, by preventing independent bids and by forcing building awards to favourites. Many illegal acts were disclosed and numerous convictions secured. Robert P. Brindell, who was at the head of the labour council of the building trades with a membership of 115,000 was prosecuted by Mr. Untermeyer, who conducted the case in person as a special attorney-general, and convicted of extortion and sentenced to from five to ten years in state prison. At the end of 1921, when the prosecutions were being continued, more than 600 indictments had been found as a result of the investigation and many more were said to be impending. There were more than 200 convictions including pleas of guilty by employers, labour leaders and others and over \$500,000 had been collected in fines. In connexion with the exposure of abuses and acts of illegality among the labour unions, all unions in the state were required, under the threat of criminal prosecution and of submitting to incorporation, to amend their constitutions and by-laws by eliminating these abuses; this they all agreed to do. It was shown that in many of the building trades both manufacturers and dealers, often with the collusive aid of labour leaders, had organized to fix prices and prevent competition. Subsequent prosecutions established the fact that these and other unfair practices were an important element in preventing build-

ing operations and increasing rental charges for dwelling property. Public opinion, especially in view of the housing shortage, reacted sharply to these revelations, and it was felt that Mr. Untermeyer's work in this connexion had been performed with admirable public spirit, energy and courage. It was generally believed, moreover, that the evils brought to light by the committee were not confined to New York, and a demand for similar investigations arose in other parts of the country.

Mr. Untermeyer was an ardent believer in the Zionist movement and was President of the Koren Hayesod, the agency through which the movement was conducted in America.

UNWIN, RAYMOND (1863-), English architect, was born at Rotherham, Yorks, in 1863, and educated at Magdalen College school, Oxford. He received his earlier training in an engineer's office and later as an architect. He was for many years associated in practice with Barry Parker in Buxton. Interesting himself more particularly in housing as a social question he acquired a reputation as an authority on the laying-out and designing of "Garden-Cities," being responsible for the first English example at Letchworth. The planning of many other garden suburbs, villages and estates was carried out from his designs. Amongst them are the layout and buildings at New Earswick, Yorks, for the Joseph Rowntree Village Trust, and the Hampstead Garden Suburb in the N.W. district of London. In 1914 he was appointed the first chief town-planning inspector to the Local Government Board, and, immediately on the outbreak of the World War, director of the housing branch under the Ministry of Munitions. Here he was responsible for the layout of many buildings for the new township of Gretna, and for Mancot Village, Queensferry, and much other work. He also during the war served on departmental committees dealing with small holding buildings, building by-laws, and building materials research. After the war he was appointed chief architect dealing with site planning, and, subsequently, deputy director of housing, under the Ministry of Health. He published *Town-planning in Practice* (translated into French and German), and (with Barry Parker) *The Art of Building a House*.

URUGUAY (see 27.805).—The pop. at the end of 1918, the latest figure available, was 1,429,585. This represented a growth of 34% since 1908. The average density increased from 12.9 per sq. m. in 1908 to 19.2 in 1918, the latter being greater than that of any other S. American country.

The administration of President Claudio Williman (1907-11) marked a definite period of progress and stabilization. Since no serious armed attempt was made to overthrow the Government, its efforts could be largely concentrated on educational progress and internal development. The first child-labour legislation was adopted, the death penalty abolished and a model penitentiary and a tuberculosis sanitarium were established. The Agronomical Institute of the university of Montevideo, which was opened on Sept. 15 1906, developed into a National Agricultural College modelled on the best European and U.S. institutions, and distracted the attention of the rising generation from revolution as a profession. The first chilled meat plant was opened in 1907, and a large and thoroughly modern packing and freezing plant at Montevideo in 1912. In 1920 Uruguay had two freezing plants, 13 salting plants, three canning and three tongue-preserving factories and a large factory for liquid extract of meat. Through rail communication between Montevideo and Rio de Janeiro was completed in 1911 by the connexion of various railways in southern Brazil, and so increased the points of contact between Brazil and Uruguay.

The social and educational progress of the country continued during the second administration of José Battle y Ordóñez (1911-15), who succeeded Williman. Hours of labour were further regulated, a National Insurance Bank was established and many experts were brought from the United States and Europe to advance various phases of education, particularly industrial and agricultural. The first S. American International Conference of Agricultural Defence was held at Montevideo on May 2 1913, and \$200,000 annually was appropriated for free seeds for farmers. A law of July 12 1911 set aside \$100,000

Uruguayan gold for encouraging immigration. While only 262 immigrants arrived in 1908, the number reached 2,455 in 1910 and 5,358 in 1913, a tribute to the continued stability and prosperity of the country.

In May 1910 ratifications were exchanged of the boundary treaty concluded in Oct. 1900 between Uruguay and Brazil; this settled several minor but long-pending questions in a satisfactory manner. A subsequent treaty of May 7 1913, since carried out, provided for delimiting and marking the boundary. Brazil ceded to Uruguay "the waters and navigation" of Lake Mirim and the Yaguaron river, and the contracting parties agreed not to fortify their new frontiers.

Uruguay continued to prosper under her next president, Feliciano Vieira (1915-9), who surrounded himself with able advisers of the young and progressive group which continued to dominate Uruguayan affairs. Most of them had studied or travelled abroad. Baltasar Brum, Vieira's successor in the presidency, had been Minister of Foreign Affairs in the latter part of Vieira's administration, when the growing pro-Allied sympathies of Uruguay were crystallized by the entry of the United States into the World War.

The Uruguayan Government, which had been pro-Ally, did not hesitate to express its sympathy with the action of the United States in declaring war, acting on the principle that "any act perpetrated against one of the countries of America in violation of the precepts of international law as universally recognized shall constitute an offence against all of them and consequently cause a common reaction in all," a statement largely inspired by dislike of Germany's submarine policy. On June 19 1917 President Vieira issued a proclamation stating that Uruguay would not regard as subject to the restrictions applicable to a belligerent any American nation which, in defence of its own rights, finds itself at war with nations of other continents. A month later a U.S. squadron under Adml. Caperton visited Montevideo and was received with great popular enthusiasm and pro-Ally demonstrations; while the Luxburg disclosures and the Argentine Congress's vote in Sept. (see ARGENTINA) for a rupture of diplomatic relations with Germany further stirred Uruguay. Finally, on Oct. 6 1917 President Vieira formally broke diplomatic relations with Germany, having been authorized to do so by a Congressional vote of 74 to 23, and on Oct. 15 a presidential decree stated that the rules of neutrality would not be applied to the Entente Allies. July 4 and 14 were proclaimed national holidays, in recognition of the national holidays in the United States and in France, and although no military or naval aid was sent to the Allies, Uruguay's sympathies continued with them until the end of the war. On Nov. 9 1917 the eight German merchant vessels in Montevideo harbour were seized by the Uruguayan Government and were chartered by the U.S. Emergency Fleet Corp. A credit of 15,000,000 pesos (approximately £3,000,000 at normal exchange) was advanced to England by the Uruguayan Government at 5%, to be used for the purchase of supplies in Uruguay, and a visiting British warship was most cordially welcomed. No less than five new branches of foreign banks were opened at Montevideo between 1915 and 1921, one of them from the United States and one from Canada. Uruguayan trade with the United States greatly increased during this period.

For some time Battle y Ordóñez and his followers had been urging a new constitution to replace that promulgated on July 18 1830, and in 1916 a Constitutional Convention met to discuss one which had largely been composed and influenced by Battle himself. The convention concluded its task in Oct. 1917, and the new constitution came into effect March 1 1919. The most important change in it was the definite separation of Church and State, making all religions free. The Roman Catholic Church, though no longer recognized as the state religion, was given control of such places of worship as had been already wholly or partly constructed by funds from the national treasury. Members of the clergy may be chosen as representatives or senators. Decentralization of the formerly strongly centralized Federal Government was brought about by the installation of popularly

elected assemblies and autonomous councils of administration to regulate the local affairs of the departments, with control over the municipalities. The chief-of-police in each department, however, is paid by the national treasury and is directly subordinate to the president of the republic, who appoints and removes him. For the first time in the history of American constitutions the executive power is divided. It is shared between the president (elected by direct vote for four years) and an administrative board composed of nine members elected by a popular vote for a six-year term, one-third of its members retiring every two years. The president coöperates with this board, which directs the affairs of the departments of Finance, Public Instruction and Public Works, the president controlling those of the Interior, Foreign Relations, War and Marine. Minority representation is protected by a system of plural voting, and for the first time in S. American constitutions the adoption of woman suffrage is sanctioned for national or local elections, but a two-thirds majority of all the members in each chamber of the Legislature is required for its adoption. The General Assembly, composed of two Houses, is charged with the interpretation of the constitution, and also elects the justices of the Supreme Court. Perhaps the fact that Uruguay spends more money on education than on her combined army and navy (in 1915 there was one school in Uruguay for every 900 inhabitants, 63% of the children of school age attending school), best illustrates her prospects of progress under this new and liberal constitution.

Uruguay's youngest president, Baltasar Brum, took office on March 1 1919, shortly after travelling, while Minister of Foreign Affairs, in the United States and throughout S. America. He had developed a strongly pro-Ally and pan-American policy while Minister of Foreign Affairs, and he surrounded himself with an able and progressive cabinet. The visit of Mr. Bainbridge Colby, U.S. Secretary of State, to Montevideo in Dec. 1920, to return President Brum's visit to the United States two years before, caused renewed expressions of pan-American solidarity, which were intensified by the continued numbers of young men and women sent to the United States to study and the reduction of the average passenger voyage from New York to Montevideo from 24 to 17 days. Uruguay ratified the Peace of Versailles in 1919, and also concluded obligatory arbitration treaties with Great Britain and Italy in that year.

Economics.—The public debt of Uruguay was \$129,774,119 in 1900 and \$154,733,367 in 1916, which shows a very small relative increase. Agricultural development favoured the increase of small holdings and of peasant proprietors. In 1908 there were 43,874 rural holdings and in 1916 57,974. In 1916 there were 11,472,852 sheep, 7,802,442 meat cattle, 567,154 horses, 303,958 swine, 16,663 mules and asses, and 12,218 goats. The accompanying table, given in U.S. dollars, contains the latest available statistics of foreign commerce:—

Imports into, and Exports from, Uruguay.

From or to	Imports		Exports	
	1907	1917	1907	1917
United States	\$3,556,336	\$11,009,259	\$2,415,632	\$26,218,746
Great Britain (United Kingdom)	11,965,605	6,054,393	3,089,343	19,358,161
Argentina	2,650,335	8,421,124	8,419,392	12,376,146
Brazil	1,813,018	6,677,020	6,346,753	1,299,622
France	4,057,487	1,429,274	7,961,725	16,180,680

The trade with Spain was not important. In 1907 Germany stood second among the countries supplying Uruguay's imports. In 1917 she only supplied Uruguay with \$106,733 worth of merchandise.

(C. L. C.)

UTAH (see 27.813).—The pop. of Utah in 1920 was 449,396, an increase over 1910 of 76,045 or 20.4%, a rate of increase 5.5% greater than that of the United States as a whole. The density of pop. increased from 4.5 persons per sq. m. in 1910 to 5.5 in 1920. The urban pop. increased from 46.3% in 1910 to 48% in 1920.

Before 1891 the two political organizations in the state were known as People's party and Liberal party, closely corresponding to Mormon and anti-Mormon. These old names ceased to be used in the decade 1910-20; there was an evident desire to

forget the old feuds between Mormons and non-Mormons who alike composed the Republican and Democratic parties, and political divisions were no longer on religious lines. Utah has been Republican since its admission as a state in 1896, excepting in 1896, when the electoral vote was cast for Bryan, and in 1916, when the presidential vote was for Wilson and a Democratic governor and other state officers were elected.

Recent governors have been William Spry (Republican), 1909-17; Simon Bamberger (Democrat), 1917-21; Charles R. Mabey (Republican), 1921-. Bamberger, the only governor of Utah not connected with the Mormon Church, was born in Germany of Jewish parents. Joseph Fielding Smith, president of the Church of Latter Day Saints from 1901, died in Nov. 1918. He was a nephew of Joseph Smith, founder of the Mormon Church. His successor was Heber J. Grant.

The state's most important irrigation enterprise, the Strawberry Project, begun in 1906, was practically completed in 1918. By means of a tunnel 4 m. long through the Wasatch Mts., water is brought from a drainage basin on the E. side of the mountains into the Utah valley, 45 m. away. The reservoir in Strawberry valley, covering 8,100 ac., 7,600 ft. above sea-level, has a capacity of 280,000 ac. ft., of which only 75,000 are to be used annually until the project is enlarged. Use was begun Sept. 1913, and in 1920 70,000 ac. were irrigated from it. The state's irrigated acreage in 1909 was 458,273; in 1919 722,772; and works existed capable of irrigating 944,727 acres. Two canyons, Brice's and Little Zion, are reserved as national parks.

In Aug. 1909 Earl Douglass, a geologist, while conducting an expedition sent out by the Carnegie Museum of Pittsburgh, discovered in Uinta county the first complete skeleton of a dinosaur. Excavations for its removal revealed a deposit, the most extensive yet found, of fossil remains of extinct animals. The spot, embracing 80 ac., was set aside in 1915 by the U.S. Government and named Dinosaur National Monument.

Amendments to Constitution.—Section 3 of Article 10 was amended Nov. 8 1910 to provide that funds from the state tax for high schools be apportioned among cities and school districts according to attendance at high schools, so long as the schools are maintained at a standard fixed by the state Board of Education. Section 4 of Article 13 was amended to provide that after Jan. 1 1919 metaliferous mines and mining claims be assessed at \$5 per ac. and in addition thereto at a value based on some multiple or submultiple of net annual proceeds. All other mines or mining claims and other valuable mineral deposits, including coal or hydrocarbons, are assessed at full value, as are also machinery and surface improvements. Article 22, Miscellaneous, was amended by adding Section 3 prohibiting after Jan. 1 1919 the manufacture and sale of intoxicating liquor containing in excess of one-half of 1% of alcohol. Amendment to Section 7, Article 13, approved by referendum Nov. 1920, provided for a minimum appropriation for school purposes from state funds, of \$25 for each child of school age. Amendment to Section 5, Article 16, gave the Legislature power to make recovery in fatal cases definite, thereby eliminating long suits, enabling dependents to obtain definite amounts without expense, and protecting them against settlements at less than the law provides.

Government.—By an Act of the Legislature, passed in 1911 to take effect in 1912, government by a board of five commissioners was made mandatory in all cities of the 1st class; and in cities of the 2nd class by a board of three commissioners; cities of the 3rd class remained under mayor and councilmen. An Act of 1919 authorized levying of taxes for libraries and gymnasiums in cities of the 3rd class and in unincorporated towns.

Education.—In 1919 Utah enacted much legislation extending the educational work of the state. Among things provided for were the establishment of standard high schools in voting precincts having 1,200 or more school population; vocational education; part-time schools for those excused for necessary employment; health education supervisors and school nurses; care for physical welfare of children of pre-school age; free dispensaries and clinics; Americanization by requiring persons not speaking English to attend evening schools; county public libraries; libraries and gymnasiums in cities of the 3rd class and unincorporated towns. By 1920 legal provisions had been made for public schooling, including kindergartens, for all children from 4 to 18 years old, and for supervision of the activities of all children of school age for 12 months in the year. Class-room instruction was not extended over the usual vacation periods, but each student was to enroll for "out-of-school" activities in which he and his parents might be directly interested. Credit for such work systematically done was to be given on the school records. Improvement of equipment and teaching staff resulted from consolidation of many rural schools. While in 1909 685 public schools were reported

and in 1920 only 683, increase of enrolled pupils from 84,804 to 117,406 reflected the increased provision for public education. The average attendance in 1920 was 97,008. The total expenditures of 1919-20 were \$8,353,133. The total number of teachers in 1909 was 2,255 (1,645 women) and in 1920 3,739 (2,824 women). The average salary of high-school principals in Salt Lake City in 1920 was \$3,750; the lowest salary paid any teachers in the rural schools was \$502. The Branch Normal School at Cedar City, formerly connected with the university of Utah, was transferred to the supervision of the Agricultural College. There were in 1920 46 tax-supported libraries, 22 of the buildings being Carnegie gifts.

Agriculture.—The number of farms in Utah in 1920 was 25,662, an increase of 18.4% over 1909. The farm acreage was 5,050,410, of which 1,715,380 ac. or 34% were improved. The value of lands and buildings in 1920 was \$243,751,758; of implements and machinery \$13,514,787; of live stock \$54,008,183; showing respectively an increase over 1910 of 107.4%; 202.5% and 87.6%. The average value of land and buildings per farm was in 1920 \$9,499 as compared with \$5,423 in 1910. Of all farms operated by owners in 1920, 47.6% were mortgaged as compared with 28.9% in 1910. Of the 25,248 white farmers, 21,276 were native and 3,972 foreign-born. Of native white farmers 18,683 were owners, 268 managers, and 2,320 tenants. Of foreign-born white farmers, 3,652 were owners, 25 managers, and 295 tenants. The 414 coloured farmers comprised 239 owners, 3 managers, and 172 tenants. There were 627 women farmers, including 609 owners, 1 manager and 17 tenants.

Crops.—The total value of crops in 1919 was \$58,067,067, an increase of 219% over 1910. In order of value the chief crops were hay and forage; cereals; sugar beets; potatoes and other vegetables; fruits and nuts; clover and alfalfa seed. As compared with that of 1909 the acreage of oats, 61,825, showed 23.5% decrease; wheat 208,457, increase of 50.5%; barley, 15,938, decrease of 40.4%. The average yield of oats per ac. in 1919 was 27.9 bus.; of wheat 15.3 bus.; barley 22.9 bus. The total acreage of hay and forage in 1919 was 549,967 with a total production of 1,031,609 tons. There were 12,047 ac. in potatoes, a decrease of 15.2% as compared with 1909; the average yield per ac. was 136.8 bus. as against 169.5 in 1909. The production of strawberries in 1919 was 484,792 qt.; raspberries 363,801 qt.; apples 759,696 bus.; peaches 883,950 bus.; cherries 123,477 bus. The acreage of sugar beets in 1919 was 93,359 as compared with 27,442 in 1909, an increase of 240 per cent. In beet production (1,338,000 tons) Utah ranked next to Colorado in 1920. In that year there were sugar factories in 18 towns, and their product totalled 153,200 tons. The value of the sugar production in 1920 was approximately \$30,000,000.

Live Stock.—On Jan. 1 1920 the number of beef cattle was 397,563; dairy cattle 108,015; value of beef cattle \$16,806,429; dairy cattle \$5,821,441. The number of horses was 125,471 valued at \$9,642,418; of sheep 1,691,795 valued at \$18,881,529; of goats 29,512 valued at \$253,100; of swine 99,361 valued at \$1,551,880.

Industries.—Important industries in 1920 were meat-packing; creameries and condenseries; canneries; flour and cereals; candy; salt; metal and sheet iron; cement and lime. The following table, from the U.S. census of 1920, gives a comparative summary of manufactures for 1919 and 1909:—

	1919	1909
Number of establishments	1,160	749
Wage-earners	18,868	11,785
Capital	\$140,785,034	\$52,626,640
Cost of materials	\$110,154,349	\$41,265,661
Value of products	\$156,933,071	\$61,989,277

Mining.—The production of gold in Utah has been decreasing steadily since 1908. In 1920 the value was \$1,949,000. More than half the gold of 1920 was from the Bingham district, about 30% from the Tintic district, and the rest from Park City and other camps. Most of the gold was produced from silicious, copper, and lead ores treated at smelting plants. The largest producers of gold were the Utah Copper Co., U.S. Mining Co., Deer Trail, Chief Consolidated, Utah Consolidated, and Grand Central mines. The value of silver output in 1908 was \$4,479,209 and in 1920 \$12,664,000, the latter a slight decrease from 1919. The Chief Consolidated Mine at Eureka continued to be the largest producer of silver in the state, and the Tintic Standard followed closely. Although production of copper in 1920 was somewhat less than in 1919, it was considerably greater than a decade before. In 1908 the copper output was valued at \$12,851,377 and in 1920 \$19,991,000. The Utah Copper Co. at Bingham produced nearly 9,000,000 lb. a month throughout the year. In 1908 lead mined in Utah was valued at \$3,728,655; in 1919 \$6,562,940; in 1920 \$10,939,000. The largest producers of lead were the Utah Apex, U.S. Mining Co., Tintic Standard, Chief Consolidated, Utah Consolidated, Silver King Coalition, Daily Judge, Ophir Hill, and Eagle and Blue mines. The largest increases were those of Chief Consolidated and Tintic Standard in the Tintic district. The zinc product increased from \$68,646 in 1908 to \$323,465 in 1919 and \$487,000 in 1920. In 1908 the production of coal was 1,846,792 tons; in 1918 the output of Carbon county alone was 4,607,192 tons; and in 1920 the total state production was 6,125,000 tons. (G. E. F.)

VACCINE THERAPY.—Since the discoveries of Pasteur it has become recognized that a very large number of the diseases from which human beings suffer are due to infection of the tissues by living micro-organisms, most of which belong to the simpler forms of plant life.

Immunity from such infections may be natural or may be acquired. By natural immunity we understand a natural resistance to infection by certain micro-organisms which are known to have pathogenic properties for other species of animals. It is known, for instance, that microbes which produce a rapidly fatal disease in one kind of animal are quite innocuous when introduced even in enormous numbers into another kind.

As an example of an acquired immunity may be taken the immunity conferred as a rule for a lifetime by an attack of measles or chicken-pox. The individual who has once overcome such an infection is usually immune from a further attack, even though exposed to infection.

It is this fact which led Jenner to try to confer immunity against smallpox by producing a modified mild "attack" by vaccination with calf lymph. It is now admitted that such vaccination does confer immunity, and that even should infection occur the disease runs a mild course.

Since the discovery of bacteria as causative agents of disease, much study has been devoted to the part played by the cells and fluids of the tissues in recovering from bacterial infections. Evidence has been sought for response on the part of the body to the bacterial invasion. It is to Metchnikoff that we owe the knowledge that the white blood corpuscles and other cells of the body react to the introduction of bacteria into the tissues. Enormous numbers of these cells congregate at the site of invasion and engulf the microbes (phagocytosis). As Sir John Burdon Sanderson aptly put it, the white blood corpuscles act as the policemen of the body.

It was soon learnt, however, that this is not the only way in which the body reacts to microbic infection. Buchner was able to show that the tissue fluids and the blood serum in particular acquire new properties as a result of bacterial infection, properties which render them highly injurious to the invading microbes. It was shown, for instance, that if actively mobile typhoid bacilli are brought into contact with the blood serum of a normal individual the bacilli are but little affected by the serum. On the contrary, if the bacilli are brought into contact with the serum of an individual convalescent from typhoid fever their mobility ceases, they are massed into clumps (agglutination) and finally killed (bactericidal action) and dissolved (bacteriolytic action). Sir Almroth Wright was able to demonstrate that a further property is acquired by the serum, namely an increased power to render the bacteria more readily ingestible by the phagocytic cells (opsonic action). Exactly how and where these new properties are acquired is not yet known, but one of the most striking facts emerging from the study of these reactions is that they are directed against the particular micro-organism which has invaded the tissues; the reactions are said to be specific. Thus the blood serum of a patient convalescent from typhoid fever, which is strongly bactericidal for the typhoid bacillus, behaves like a normal serum when brought into contact with any other kind of bacteria. Similarly, while an attack of typhoid fever confers immunity against a second infection by the typhoid bacillus, it confers no immunity from infection by other bacteria, even those so closely related as the para-typhoid bacilli.

It must be admitted that recent work goes to confirm the opinion that there is a concomitant non-specific response common to the reaction against all microbic infections, but this does not detract from the importance of recognizing the highly specific nature of these immunity reactions.

A very important step forward was taken when it was demonstrated that the body responds to the introduction into the tissues of dead bacteria in the same way as it does when living

bacteria invade the tissues, for this made possible artificial immunization. To attempt to confer immunity against any microbic disease by the introduction of very small numbers of even attenuated living bacteria is fraught with manifest dangers, for the bacteria are capable of multiplication in the tissues and are no longer under control. To attempt to confer immunity against disease by the introduction of dead microbes into the tissues is a different matter, for the dosage can be regulated and the bacteria cannot multiply in the tissues.

Thus it was that Sir Almroth Wright proposed to confer immunity from typhoid infection by inoculation into the healthy tissues of a standardized suspension of dead typhoid bacilli in physiological salt solution (typhoid vaccine). The immense benefit derived from such inoculations was fully demonstrated during the World War 1914-8. Wright's studies in immunization had demonstrated that it was possible to confer immunity against microbic infections by the inoculation of bacterial vaccines into healthy individuals. It seemed at first that nothing but harm could result from the inoculation of such vaccines once the tissues had become infected. It appeared, indeed, as if to do so were merely to add more poison to a system already being poisoned. Such, however, is not the case. Pasteur was the first to show, in connexion with rabies, that beneficial results could be obtained by inoculating vaccine during the incubation period of the disease. But it was the discovery by Wright that the rapidity with which a specific response to the inoculation of a vaccine occurs depends on the dose of vaccine given, and that this response occurs very rapidly if the dose is an appropriate one, which opened up the whole field of vaccine therapy. Wright showed that the inoculation of too large a dose of vaccine can lead to a state of lessened resistance to infection and that no immunizing response follows. But this so-called negative phase can be modified as regards severity and duration by the adjustment of the dose, even to the point of its virtual disappearance, and nevertheless a good immunizing response follows. And such a satisfactory response occurs when vaccines are inoculated into an already infected individual. This means that, if the gravest generalized infections be excepted, there is not in microbic diseases a wholesale poisoning of the tissues of the body. There is infection of certain tissues and others remain healthy or, at all events, capable of an immunizing response. And it is the power of these healthy tissues to respond that we turn in vaccine therapy. Just as the tissues of a healthy individual inoculated with an appropriate vaccine respond by elaborating protective substances against the microbe or microbes contained in that vaccine, and such response confers immunity on the individual, so do the healthy tissues of an infected individual respond to a vaccine containing the infecting microbe, and such a response raises the resisting power of the individual to the infection.

Now infections by microbes can broadly be divided into two classes: (a) generalized, and (b) localized. By a generalized infection we mean that the microbes and their products have ready access to the blood and lymph stream, and thus exert their baneful influence not only locally but at a distance on various tissues of the body. In a localized infection, on the other hand, the microbes affect a particular region of the body only and the remaining regions are not at all or only quite secondarily affected. From what has been said before, it is obvious that in the first class vaccine therapy has but a limited sphere of application; in the second class it has a very wide one. For it is on the satisfactory response of the tissues that the success of vaccine therapy depends and this will bear definite relationship to the healthiness of the tissues; further, the gravity of the infection must necessarily enter into account, just as a small war calls for but a small effort, whilst a great war, in which the life of a nation is at stake, calls for a maximal and sustained effort.

When it is borne in mind that the substances elaborated in response to the inoculation of a vaccine are largely carried to the

site of infection by the blood stream, it will be realized that the success or failure of vaccine therapy depends largely on the blood supply of the affected area. So long as the newly elaborated antibacterial substances can come into contact with the bacteria, success may be anticipated, but when barriers to their arrival exist, success is limited or denied by the extent or completeness of the barriers. Thus in acute lobar pneumonia the affected area of the lung is occupied by an impenetrable clot of blood; little good can therefore be expected from vaccine therapy once this clot has formed and as long as it remains. But this does not preclude the exploitation of vaccine therapy in pneumonia in the earliest stages of the disease or after resorption of the clot has begun. Fortunately, in the majority of infections there is no such general disturbance of the blood supply to the infected area; in such case it surely follows that a supply of blood rich in protective substances must constitute an advantage, as against a supply of blood poorer in such substances. It will be realized from these remarks that the utmost care is needed in the accurate bacteriological diagnosis of each infection before vaccine therapy is employed, and the vaccine must be prepared with care as to sterility and specificity.

The administration of the vaccine needs the knowledge not only of general medicine but of bacteriology and the principles of active immunization against microbic infections.

The Vaccine.—For practical purposes bacterial vaccine may be defined as sterilized and enumerated suspensions of bacteria, the liquid medium being either physiological salt solution or dilute nutrient broth. The bacteria must be isolated in pure culture and strictly identified by the usual tests. The microbes thus identified are usually inoculated on to the surface of a solid medium (e.g. agar-agar) and, after growth has occurred, the bacterial colonies are floated off into sterile physiological salt solution. The suspension thus obtained is placed in a hermetically sealed tube and thoroughly shaken, if necessary by mechanical means, so as to break up the colonies and obtain an even suspension. A small sample of the suspension is then removed for enumeration, the tube once more hermetically sealed and the whole placed in a water bath at 60° C. for one hour. This temperature has been found to be sufficient to kill most of the pathogenic bacteria without profoundly altering their chemical composition. Sterility of the vaccine is not, however, presumed and each one is subjected to cultural control before being certified sterile.

The enumeration of the suspension may be carried out in various ways. The original method of Wright is as follows:

It has been the practice for some 25 years to enumerate the corpuscles of the blood in a counting chamber of known depth and ruled with squares of known size. Wright, therefore, mixes an equal quantity of blood and the bacterial suspension. Films of the mixture are made and appropriately stained for microscopic examination. An adequate number, about 500 usually suffices, of red blood corpuscles are counted in a series of fields of the microscope and at the same time the number of bacteria seen is noted. The number of red blood corpuscles per cub. mm. has previously been determined in a counting chamber, so that all that remains to be done is to work out the proportion of bacteria to red cells and so to arrive at the number of bacteria per cub. mm. or cm. of the suspension. There are technical difficulties in the way of enumerating certain bacteria, e.g. the tubercle bacilli; in these cases the bacterial growth is weighed, and the dosage, instead of being expressed in millions of microbes per cub. cm., is given in milligrammes or their fractions, e.g. a usual dose of a staphylococcus vaccine will be 250,000,000 cocci, whilst that of a tubercle vaccine would be 0.0001 milligrammes.

A vaccine made from cultures obtained directly from the patient to be treated is said to be an autogenous vaccine. A vaccine made not directly from cultures obtained from the patient but from cultures of the same species of microbe as that which is infecting him is termed a stock vaccine. In general it may be affirmed that autogenous vaccines are nearly invariably to be preferred to stock vaccines, whilst in the case of certain microbes they are indispensable. Stock vaccines, however, are usually effective, save time and expense and have very wide application. Latterly attempts have been made to reduce the toxic action of the bacterial suspensions and so-called sensitized and detoxicated vaccines have been recommended, but it is doubtful whether these procedures constitute a useful advance.

The accompanying table gives a summary of the microbes from which vaccines are commonly prepared, together with the minimal and maximal effective doses in which they are administered.

Vaccines are administered by hypodermic injection and the inoculations are painless.

Where the minimal effective dose is employed the inoculation is not followed by any local or constitutional disturbance. If there is any sensible constitutional change, that change is in the direction of increased well-being. When a medium dose is inoculated there may

	Autogenous vaccine advisable	Stock vaccine adequate	Effective doses	
			Min-imal	Max-imal
			million	million
Acne bacillus . . .	In some cases	Generally	5	5000
Staphylococcus	Generally	50	1000
Streptococcus . . .	In most cases	..	1	50
Pneumococcus . . .	Generally	..	5	50
Influenza bac. . .	Generally	If polyvalent	10	500
B. of Friedlander . .	Generally	..	5	100
B. coli . . .	Generally	..	1	100
M. catarrhalis . . .	Generally	..	5	100
Bordet's bac.	Generally	50	500
Diphtheria bac. . .	Often	..	10	50
Gonococcus	Generally	1	50
Actinomycetes	Generally	1	25
Meningococcus	Polyvalent	50	1000
M. melitensis	Generally	30	100
B. typhosus	Yes	10	100
B. paratyphosus A	Yes	10	100
B. paratyphosus B	Yes	10	100
Tubercle bac. . .	(?)	Nearly always used	1/100,000 mg.	1/1000 mg.

be a small amount of local tenderness and a transient aggravation of the patient's symptoms, or slight constitutional disturbance malaise, headache and possibly a slight rise in temperature. But none of these negative phase effects are at all marked except when an excessive dose has been employed.

It is outside the sphere of this article to enumerate the various diseases in which vaccine therapy finds application, but a few in which vaccines have proved of exceptional value may be mentioned.

Boils, carbuncles and other staphylococcal infections usually yield readily to treatment by staphylococcus vaccine. Erysipelas, puerperal septicæmia, acute surgical septicæmia and septic wounds are conditions benefited by treatment with a streptococcus vaccine. Certain forms of rheumatism, arthritis and fibrositis are relieved and the progress of the disease is arrested by treatment with an appropriate vaccine, and the same may be said in the case of certain cases of bronchial asthma, chronic bronchitis and recurrent colds.

The distressing symptoms of inflammation of the bladder due to infection by the bacillus coli are relieved and may entirely disappear under treatment with an autogenous vaccine.

Tuberculous disease of the glands, skin and joints is amenable to treatment with a tubercle vaccine, and in rigidly selected cases the same holds good for tuberculosis of the lung.

It may be confidently asserted that, with increasing knowledge vaccine therapy will find wider application and will become recognized as a valuable weapon in the combating of microbic diseases.

(A. C. L.)

VACHELL, HORACE ANNESLEY (1861—), English novelist and playwright, was born at Sydenham, Kent, Oct. 30 1861. Educated at Harrow and the Royal Military College, Sandhurst he received a commission in the Rifle Brigade in 1883. In 1894 he published his first novel, and in 1897 the first to make its mark, viz. *A Drama in Sunshine*. Subsequent novels included *John Charity* (1900); *Brothers* (1904) and *The Hill* (1905), both Harrow school stories; *The Waters of Jordan* (1908) and *The Fourth Dimension* (1920). He is the author of many plays, some such as *Searchlights* (1915) and *The Case of Lady Camber* (1915) original; others, such as *Her Son* (1907) and *Quinney's* (1915) dramatizations of his own novels, or like *Fishpingle* (1916) afterwards issued as novels; whilst others again, e.g. *Who is He?* (1915) and *The House of Peril* (1919), were dramatized versions of novels by other authors.

VAIL, THEODORE NEWTON (1845–1920), American capitalist was born on a farm in Carroll county, O., July 16 1845. When a child, he moved with his parents to New Jersey, studied at the Morristown Academy, and for two years studied medicine with an uncle. Meanwhile he had become interested in telegraphy. In 1866 he went with his parents to a farm in Iowa, but two years later became station agent and telegraph operator on the Union Pacific at Pine Bluffs, Wyo. Then he was appointed clerk in the railway mail service and his efficiency led to his being called to Washington, D.C., in 1873, where he was made assistant-superintendent of railway mail service, rising in 1875 to general superintendent. In 1878 he was made general manager of the American Bell Telephone Co., and for the next seven years was actively engaged in the development of the telephone business, for which he foresaw a great future. In 1885 he resigned from the Bell Co., and was elected president of the newly organized American

Telephone and Telegraph Co., which in 1900 acquired the American Bell Telephone Co. In 1887 because of ill health Vail retired and spent the next nine years in travel and on his farm at Lyndonville, Vt. During a visit to S. America he became interested in traction problems and in 1896 installed an electric railway system in Buenos Ayres, and later introduced telephone systems in many S. American cities, enlisting British capital for these enterprises. In 1904 he retired to his farm but in 1907 was again induced to accept the presidency of the American Telephone and Telegraph Co. When this company in 1910 bought control of the Western Union Telegraph Co., Vail was made president of the latter also, and introduced many changes, including "night letters" at reduced rates. When in 1914, as the result of a threatened suit by the Government, the Western Union was again segregated, Vail remained president of his old company. After the taking over of the wires in Aug. 1918 by the Government as a war measure, he was appointed adviser by the Postmaster-General and urged unified control of all cables, telegraphs and telephones. When the wires were returned in 1919 to private ownership he was elected chairman of the board of directors of the American Telephone and Telegraph Co. In 1920 the gross earnings of the company were \$103,946,988, net earnings \$70,686,004, number of miles of wire owned 25,377,404. Vail died in Baltimore April 16 1920. The value of his estate was estimated at about \$2,000,000. He left \$100,000 each to Princeton and Dartmouth, and \$200,000 to be divided equally among Phillips Exeter Academy, Middlebury College, Harvard, and the Massachusetts Institute of Technology. To the last named he left also his large collection of books on electricity.

See A. B. Paine, *In One Man's Life* (1921).

VAMBÉRY, ARMINIUS (1832-1913), Hungarian Orientalist and traveller (see 27.876*), died at Budapest Sept. 4 1913.

VANBRUGH, IRENE (1872-), and **VIOLET** (1867-), English actresses, youngest and eldest daughters respectively of the Rev. R. N. Barnes, Prebendary of Exeter cathedral.

VIOLET VANBRUGH was born at Exeter June 11 1867, and married Mr. Arthur Bouchier, the actor, in 1894, their marriage being dissolved in 1918. She first appeared in London at the Criterion theatre in 1886, and later toured with Toole. In 1889 she was with the Kendalls both in London and in America, and in 1892 played Anne Bolcyn at the Lyceum in Henry Irving's production of *Henry VIII*. After her marriage she played leading parts in many of her husband's productions, both in Shakespearean and modern drama. Amongst her rôles may be mentioned Queen Katherine, Portia, Lady Macbeth (which she also played in 1911 at His Majesty's theatre), Yanetta in *The Arm of the Law*, and the heroines of many modern comedies by Sutro, Henry Arthur Jones and others.

IRENE VANBRUGH was born at Exeter Dec. 2 1872 and married Mr. Dion Boucicault (b. 1859), the actor, in 1901. She first appeared in London at the Globe theatre in *Alice in Wonderland*. Like her sister she played with Toole, remaining with him for four years and touring with him in Australia. Subsequently she acted with George Alexander at the St. James's theatre, with Arthur Bouchier at the Royalty and with Charles Wyndham at the Criterion in Jones's play *The Liars*. Her first notable successes were as Sophy Fullgarney in Pinero's *The Gay Lord Quex* (1899), Letty Shell in his *Letty* (1904) and Nina Jesson in *His House in Order* (1906). She also appeared with distinction in various short plays by Barric, especially *Rosalind* and *The Twelve Pound Look*, and in other modern dramas.

VANCOUVER (see 27.883), in British Columbia, the chief Pacific port of the Dominion of Canada, was estimated to have a population of nearly 200,000 (the suburbs of North Vancouver, South Vancouver and Point Grey included) at the end of 1920. Vancouver proper had a population of 100,400 in 1911. As the natural western outlet for the Prairie Provinces, Vancouver had expected to gain materially by the opening of the Panama Canal. Not until the spring of 1921 was the first cargo of wheat carried to England by sea direct from Vancouver, but the success of that experiment made probable a speedy development of a new trade for the British Columbian port.

With one of the finest natural harbours in the world Vancouver has grown in importance as a port during recent years. Already the terminal point for British, Australasian and Asiatic terminal lines, Vancouver was the prospective terminal in 1921 for a new Pacific line to be inaugurated by the Canadian National Railways. Government contracts had then been let for further improvements on Burrard Inlet (the chief of Vancouver's three harbours) for greater dockage and for a system of car ferries crossing the Inlet to carry freight from the city to North Vancouver without transfer. In 1920-1 the Canadian Pacific railway built a pier of concrete and steel, equipped with all modern freight-handling devices, at a cost of \$1,500,000.

The Dominion Government in recent years has erected a grain elevator with a capacity of 1,250,000 bushels. Shipbuilding became a prominent industry during the years of the World War and as many as 5,000 men were at one time employed in the shipbuilding yards. In 1920 Vancouver had approximately 543 industries employing 28,800 people. They included lumber and shingle mills, pulp and paper mills, salmon, halibut and herring fisheries, foundries and structural steel works, sugar refineries, shipyards, etc. The output in 1917 was \$57,172,309. Clearing-house returns for Vancouver in 1919 were \$577,670,063. In that year 108,111,090 ft. of lumber were exported by sea. The customs revenue in 1920 amounted to \$9,202,940. Exports in that year were \$39,535,283, and imports \$49,256,913. Shipping passing through the port in 1919 was approximately 23,000 vessels of 10,691,411 tons register. Building was quiescent for several years preceding 1919. In that year the building permits amounted to \$2,271,411. Shaughnessy Heights is a wealthy suburb developed since 1911 by the Canadian Pacific railway.

The foundation of the university of British Columbia brought about a closing down of the British Columbia branch of McGill University and a transfer of the staff, equipment, etc., of the latter to the new college. The newly founded university made use at first of temporary buildings in the city, but just before the war secured extensive grounds for a campus and buildings at Port Grey. Construction was delayed by the war but was begun in 1921.

Granville I., a large block of reclaimed land near the retail business district, has of late years been providing excellent sites for industries, such sites being served with truckage, wharfage, electric power, etc.

VANDERLIP, FRANK ARTHUR (1864-), American banker, was born at Aurora, Ill., Nov. 17 1864. After leaving the public schools he studied for a time at the university of Illinois and at the old university of Chicago. In 1889 he became a reporter on the *Chicago Tribune* and in 1890 was made its financial editor, but resigned in 1894 to accept the associate editorship of the *Economist*, a paper published weekly in Chicago. His contributions to it attracted wide attention and he was frequently called upon to deliver addresses. On March 4 1897 he became private secretary to the U.S. Secretary of the Treasury, Lyman J. Gage, and four months later was appointed by President McKinley assistant Secretary of the Treasury. On resigning in 1901 he was elected vice-president of the National City Bank, of New York City, and in 1909 president, serving in the latter capacity for ten years. Before taking up his work in 1901 he spent a year in Europe studying financial and industrial conditions. When the War Savings Committee was appointed by Secretary of the Treasury McAdoo, to promote the sale of War Savings Certificates during the World War, he was made chairman, serving from Sept. 1917 to Sept. 1918. He was chairman of the board of directors of the American Industrial Corporation and director in many organizations, including the Haskell & Barker Car Co., the Midvale Steel & Ordnance Co., and the Union Pacific R.R. Co. He was a trustee of the Carnegie Foundation for the Advancement of Teaching. He was the author of *The American Commercial Invasion of Europe* (1902, the result of his studies in Europe); *Business and Education* (1907); *Modern Banking* (1911) and *What Happened to Europe* (1919).

VAN DYKE, HENRY (1852-), American writer, was born at Germantown, Pa., Nov. 10 1852. He studied at the Brooklyn Polytechnic Institute, and after graduating from Princeton in 1873 and from the Princeton Theological School in 1877, he spent two years at the university of Berlin. In 1879 he was ordained a Presbyterian minister, was for three years stationed at Newport, R.I., and from 1883 to 1900 was pastor of the Brick Presbyterian Church, New York City. In this capacity his preaching gave him a national reputation. From 1900 he was professor of English literature at Princeton. During 1902-3

* These figures indicate the volume and page number of the previous article.

he was moderator of the Presbyterian Church in the United States. In 1908 he was appointed American lecturer at the Sorbonne. He was a member of the American Academy of Arts and Letters, and in 1909 was elected president of the National Institute. In 1913 he was appointed by President Wilson minister to Holland and Luxemburg, but resigned in 1917. When after the fall of Liège in 1914 von Jagow handed to Mr. Gerard, the American ambassador in Berlin, the note to Belgium, offering full reparation for damages, in case free passage to France were granted German troops, Van Dyke flatly refused to act as intermediary. From the first he championed the cause of the Allies in the World War, and after America's entrance into the war he served as a naval chaplain. Dr. Van Dyke was an eloquent speaker. His books, both prose and in verse, give him a high place in modern American literature. Among his best works are his "outdoor essays," especially *Little Rivers* (1895) and *Fisherman's Luck* (1899). His publications include *The Reality of Religion* (1884); *The Poetry of Tennyson* (1889); *The Other Wise Man* (1896); *Ships and Havens* (1897); *The Taming of Felix, and Other Poems* (1900); *The Poetry of the Psalms* (1900); *The Blue Flower* (1902); *Days Off* (1907); *The House of Rimmon* (1908); *Out-of-Doors in the Holy Land* (1908); *Collected Poems* (1911); *The Bad Shepherd* (1911); *The Unknown Quantity* (1912); *The Lost Boy* (1914); *Fighting for Peace* (1917); *The Valley of Vision* (1919); and *Golden Stars* (1919).

VAN HORNE, SIR WILLIAM CORNELIUS (1843-1915), Canadian financier (see 27.894), died at Montreal Sept. 11 1915.

VAN'T HOFF, JACOBUS HENDRICUS (1852-1911), Dutch chemist and physicist (see 27.896), died at Steglitz, near Berlin, March 1 1911.

VASSAR COLLEGE (see 27.946).—During the period 1910-20 the endowment of Vassar College grew from about \$1,500,000 to \$3,218,904.40 with 800 ac. in campus and farm. Student enrolment is limited to 1,000, the number that may be housed on the campus; but the pressure for admittance and the difficulty of estimating withdrawals make it impossible to maintain this limit with exactness, and the enrolment for 1921 was 1,106, the faculty numbering 142. The funds available for student aid in one form or another amounted in 1921 to \$456,371.55. Students are admitted on passing the examinations set by the college entrance examination board, or by an examination covering three years of preparation in four selected subjects; this latter method takes the place of entrance by certificate from approved schools. The physical equipment of the college, exclusive of faculty residences, includes 27 buildings, seven of them dormitories, and a farm of 675 ac., with vegetable gardens and a model dairy.

Student self-government is in effective operation, the students themselves assuming responsibility for most of the regulations governing attendance and conduct, and for the management of the Students' Building and the Good Fellowship Club House, and for all extra curriculum activities, including the providing of various money-making occupations for self-supporting students. The facts that the price for rooms and board is the same for every student, the rooms being selected by lot, that there are no sororities or other clubs to which membership is not absolutely open, and that no admission fee may be charged to any campus meeting, all help to maintain a democratic spirit.

Among the notable war-time services of Vassar were the farm unit, the reconstruction units, and the training camp for nurses. In the summer of 1917 Vassar undertook the experiment of student labour on the college farm. Its success led to many similar enterprises throughout the country. Volunteers were accepted for the summer of 1918 to work in two shifts of six weeks each. They were housed in one of the campus buildings, paying their board out of their wages, working eight hours a day, and undertaking every form of farm work, as well as work in the model dairy, and drying, canning and preserving in the college kitchens. The Vassar units for service abroad, one under the American Red Cross, and a canteen unit under the Y.M.C.A., were financed by alumnae and undergraduates, with assistance from the Red Cross, and served in France. The Red Cross reconstruction unit included trained nurses, a dietitian, a doctor and social workers. Much of the rehabilitation work at Verdun was in their charge. The summer training camp for nurses was organized under the direction of the Red Cross and the National Council of Defense. Five hundred graduates of colleges for women entered upon a course of training for three months at Vassar and two years in a hospital, leading to the degree of registered nurse. One hundred and ten colleges were represented in this training camp,

the probationary nurses coming from 46 different states of the Union and three British colonies. (B. J. *)

VAUGHAN WILLIAMS, RALPH (1872-), English musical composer, was born at Down Ampney, Oct. 12 1872. He was educated at Charterhouse and Trinity College, Cambridge, where he took the degree of Mus. Bac. in 1894. He studied further at the Royal College of Music, and also at Paris and Berlin. He took the degree of Mus. Doc. at Cambridge in 1901, and in 1919 received an hon. musical degree from the university of Oxford. His works include *Toward the Unknown Region* (1907); *Willow-wood* (1909); *Sea Symphony* (1910); *On Wenlock Edge* (1911); *London Symphony* (1914); Carnegie award 1917 and many fine songs, including arrangements of traditional melodies.

VAUGHAN WILLIAMS, SIR ROLAND LOMAX BOWDLER (1838-1916), English judge, was born in London Dec. 31 1838, the fifth son of the Rt. Hon. Sir Edward Vaughan Williams. He was educated at Westminster and Christ Church, Oxford, where he took his degree in 1860. He was called to the bar in 1861, and was made a Q.C. in 1889. In 1890 he was raised to the bench of the Queen's Bench division, in 1891 was transferred to the Bankruptcy division, and in 1897 became a lord justice of appeal. In 1906 Vaughan Williams was appointed chairman of the royal commission on the disestablishment of the Church in Wales. He retired from the bench in 1914, and died at Abinger, Dorking, Dec. 8 1916. His book *The Law and Practice of Bankruptcy* (1870; latest ed. 1915) is a leading authority.

VAZOV, IVAN (1850-1921), Bulgarian poet and writer, was born at Sopot in Bulgaria in 1850, and received his first education in the Sopot village school. Later on, he went to Russia to continue his studies. His first literary efforts took the form of essays and songs describing the sorrows of the Bulgars under Turkish rule, their hopes for a free united Bulgaria, their disappointment when the Treaty of Berlin divided the Bulgarian people once again. His most important work is the novel *Pod Igolo* (Under the Yoke), which has been translated into many European languages. *Pod Igolo* gives a simple and convincing picture of village life in Turkish times and of the heroes of the struggle for freedom. Among Vazov's other works are *The New Graves of Slivnitsa* (Serbo-Bulgarian War of 1885-6); *The Kazanlarska Czaritsa*; *Borislav* and *Towards the Abyss*, two of his best plays. Vazov, who identified himself with the sufferings and joys of the people, is honoured throughout the country as the national poet and as a true patriot. His jubilee was officially celebrated in 1920 and he was awarded a pension from the State. He was the first Bulgarian writer whose works had been read outside Bulgaria. He died at Sofia Sept. 22 1921.

VENEREAL DISEASES (see 27.983).—There are three distinct diseases included under the term "venereal"—gonorrhoea, syphilis, and soft chancre, of which the first two are of primary importance in relation to public health. The advance in our knowledge of venereal disease, its prevention and curative treatment, during 1910-21, may be regarded as the outcome of experience upon a large scale based upon the following discoveries:—(1) the specific organism of syphilis by Schaudinn; (2) the inoculation of monkeys by Metchnikoff and protection therefrom by the application of a 33% calomel cream ointment; (3) the application by Wassermann of the Bordet haemolytic test to syphilis; and (4) the discovery by Ehrlich of "606" (salvarsan) as a rapid curative agent of syphilis. All four discoveries may be said to have laid the foundation of all modern methods of medically dealing with this disease.

The discussion of the whole subject at the International Medical Congress held in London in 1912, and the change in the attitude of a large section of the public and the press, eventually led up to the appointment of a British Royal Commission in 1913. The report of the Commission, published in 1916, was strongly supported by a National Council for Combating Venereal Disease, and ultimately an Act of Parliament was passed which made provision for the carrying out of its recommendations.

Scientific Advances.—During 1910-20 the so-called parasymphilitic diseases, general paralysis of the insane, and tabes dorsalis (locomotor ataxia), were proved to be the direct result of

active proliferation of the *spirochaeta pallida*, in the brain and spinal cord respectively, of these two diseases. This knowledge was due to the discovery by Noguchi and Moore of spirochaetes in the brains of 12 out of 70 brains of persons dying of general paralysis. Confirmation of this was soon at hand in all civilized countries where these diseases occur. Mott was able to find the spirochaete pallida in the brains of 66 out of 100 successive fatal cases. Inasmuch as the cerebro-spinal fluid invariably gives a positive Wassermann reaction in general paralysis, it may be inferred that the spirochaete is always present. A large experience in the services during the World War has shown that in spite of modern energetic treatment a certain proportion of cases give a positive reaction of the cerebro-spinal fluid, and there is evidence to show that when generalization of the organism takes place in the secondary stage, its implantation in the substance of the central nervous system may occur; and it is these cases which subsequently develop this fatal and incurable disease, general paralysis; incurable because neither the mercury nor the arsenobenzol compounds are able to enter the substance of the nervous system and destroy the specific organism. This is a practical point of the greatest significance, for it shows that the only way to avoid this and other fatal incurable diseases is the adoption of curative treatment in the primary stage, as emphasized in the report of the Royal Commission. But even better is the adoption of prophylactic measures, by which the organism is killed while it is still on the surface of the body; for many persons may not know that they have been infected owing to the fact that the sore is not of a typical nature and in a number of cases is therefore regarded by the doctor or patient as a soft sore or chancreoid; consequently only local treatment is adopted; or it may be that the sore causing little pain or discomfort leads to the patient neglecting treatment until it is too late.

A. Marie and Levaditi have recently put forward the view that there are two forms of specific organism—a neurotropic spirochaete, which seeks the nervous system, and a dermatotropic one which seeks the skin. Although there are no morphological differences discoverable in the organisms, yet certain clinical epidemiological and experimental facts support this argument.

Prevalence.—The returns of the Registrar General in England, as was shown in the report of the Royal Commission, are liable to many fallacies, which invalidate the accuracy of any deductions that could be made from them. The returns of deaths, which may unquestionably be assumed to be due to syphilis with the exception of general paralysis and aneurism, are very limited; yet we know that a large proportion of the deaths from organic brain and spinal cord diseases is due to this cause, likewise a large proportion of valvular and other diseases of the heart. Evidence was given at the Royal Commission showing that 5% of syphilitics subsequently developed general paralysis, also that 10 years is the average time for the brain symptoms to develop and several years then elapse before a fatal termination. It follows that the prevalence of syphilis in a community 12 to 13 years previously may be gauged by the percentage of deaths from general paralysis in any given year. Possibly this would be a more accurate method of estimating, to some extent, the prevalence of syphilis in a community than even the statistics afforded by the early treatment centres, for a large number of people suffering with the disease, even now, do not come under observation on account of avoiding the social stigma.

Death from general paralysis is about four times as great in men as in women; it may be assumed therefore that syphilitic infection is four times as frequent in men as in women. The incidence of general paralysis is about the same in all classes but it diminishes as we rise in the social scale in women. The inference is obvious as regards venereal disease and the social status of women. In the juvenile form due to congenital syphilis it occurs equally in the two sexes. Gonorrhoea, not being a direct cause of death, although of many chronic and even fatal diseases especially in women, rarely enters into the returns.

An attempt was made by the Royal Commission to estimate by the application of the blood test the prevalence of syphilis. Thus the present writer tested the specimens of blood withdrawn

from a vein by Sir John Collie from 500 apparently healthy men applying for service in the L.C.C., and found that 9.2% gave a positive reaction. These, and many other statistics from various sources, notably hospitals, poor-law infirmaries, asylums for lunatics, idiots and imbeciles, and institutions for the blind and the deaf, published in the report, showed that a large percentage of the population had been infected with syphilis, and that a very large proportion of these people were suffering from a disease or disability directly or indirectly due to infection.

From the mass of evidence collected it was roughly calculated by the Royal Commission that probably 10% of the population had been infected with syphilis. This corresponds with the statistics of the United States:—

"The results of a survey by the Wassermann test of adults admitted to hospitals (apart from venereal clinics) in five large cities of the United States showed 9.5% positives out of a total of 15,264. Vedder obtained 13% positive reactions in 11,933 recruits for the U.S. army in 1916, 15% of 856 candidates for the police force, and 5% of 3,203 candidates for commissions in the army. It is worthy of note that in the same locality that gave 5.8% positive Wassermanns, Warthin found evidence of syphilis in 30% of post-mortem examinations. Hence Jeans concludes that the minimum of syphilis in the United States is 10%, and the probable percentage twenty."¹

It was assumed from the evidence before the Royal Commission that a much larger percentage of the people had suffered with gonorrhoea; inasmuch as one attack of this disease does not give immunity and relapses of an apparently cured infection frequently occur, it follows that reliable statistics of admissions for gonorrhoea are difficult to ascertain by the rate of admissions. Altogether it would not be an unfair estimate to assume that 20% to 30% of the population prior to the World War had suffered with venereal diseases.

The Annual Report of the Chief Medical Officer of the Ministry of Health for 1920 stated that the Ministry had based its policy upon the recommendations of the Royal Commission on Venereal Disease, 1916. The principal recommendations were thus summarized:—(a) Confidential registration of cause of death. (b) Extension of facilities for diagnosis. (c) Organization by the local authority of means of free treatment for all classes at convenient hours and under suitable conditions. (d) Improved professional and public education. (e) A grant-in-aid of 75% of total cost incurred in approved schemes. (f) Treatment in army and navy, poor-law institutions, prisons, etc. (g) Prohibition of all advertisements of remedies and unqualified practice. (h) Recognition by the Government of the National Council for Combating Venereal Diseases.

The Commission recommended that "no system of notification of venereal diseases should be put in force at the present time," and they condemned "unqualified practice" by chemists, herbalists and others as "disastrous" and "one of the principal hindrances to the eradication of those diseases," and they stated that "the most urgent requirement is to secure to every patient the freest and earliest possible access to medical assistance when there is suspicion of venereal disease. This implies, *inter alia*, that all temptation for the patient to have resort to an unqualified person shall be removed."

The National Council for Combating Venereal Diseases was established to promote and assist by propaganda and lectures the programme of the Royal Commission; it had the approval and support of the Local Government Board and of the Ministry of Health. Still, in spite of moral teaching, lectures, propaganda and early treatment centres, an alarming incidence of venereal disease occurred in the British armies and in those of the Dominions during the World War. Some idea of the prevalence of these diseases may be gained by reference to a statement by the late Sir William Osler (*Lancet*, May 26 1917):—

"The last quoted figures for the British army at home are (Hansard, April 23): 71,000 cases of gonorrhoea, 21,000 cases of syphilis, and 6,000 cases of soft chancre. In the Canadian army to March 31 1917, there have been 18,335 cases of venereal disease—figures which have stirred public opinion in the Dominions to boiling point."

¹ Medical Science Abstracts and Reviews. Published for the Medical Research Committee, vol. i., 1919-20, p. 397.

There are many facts which show that there has been, in consequence of the war, and in spite of the application of the measures recommended by the Royal Commission, a very considerable increase in the prevalence of venereal diseases in the United Kingdom (see evidence by Dr. Sequeira, Miss Ettie Rout and others in the report of the Committee of the Birth-Rate Commission).

Table 1, taken from the Annual Report of the Chief Medical Officer of the Ministry of Health for 1920, indicates the extent to which the clinics were utilized in 1920. From this table it

TABLE 1.—Experience of British Clinics, 1920.

England and Wales	Number of persons dealt with for the first time.						Total Number of Attendances	Number of Clinics at end of year
	Syphilis	Soft Chancres	Gonorrhoea	Total V. D.	Other than V. D.	Total new cases		
1917	29,036	204,692	113
1918	26,912	806	17,635	45,353	6,622	51,975	488,137	134
1919	42,134	2,164	38,499	82,797	15,447	98,244	1,002,791	160
1920	42,805	2,442	40,284	85,531	19,654	105,185	1,488,514	190

appears:—(a) that in the fourth year of the scheme there were approximately 85,000 cases of venereal disease and 19,000 cases which proved not to be venereal disease, the total number of new cases being 105,000 and the attendances 1,488,000; (b) that there was a rapid increase of "new" cases of venereal disease in 1918 and 1919 and a stationary position in 1920. The term "new cases" can only be relative, and does not afford a basis for calculations of incidence; (c) that if the army estimate of the relative frequency of gonorrhoea and other venereal diseases ($2\frac{1}{2}$ to 1) be correct for the civil community, only a small proportion of the cases of gonorrhoea in the country came under treatment at the clinics; (d) that the total attendances (and the ratio of attendances to patients) had increased greatly, and that the number of persons who were apprehensive of their condition and who came to the clinics for diagnosis had increased—two facts which suggest that the clinics were better appreciated.

The total expenditure of British local authorities was £116,000 in 1917-8, £214,000 in 1918-9, £287,000 in 1919-20; towards which the Ministry of Health provided grants of £84,000, £145,232, and £224,716.

Owing probably to financial reasons and inefficiency of some of the clinics there were indications of a change of policy by the Ministry of Health, for in the above-mentioned report it was stated:—

"It cannot be too clearly understood that the best way of dealing with most cases of these diseases is through the skilful private practitioner. For a substantial portion of this problem the public clinic should be looked upon as a temporary organization pending the time when the practitioner is ready, available, competent, and properly equipped to undertake effective treatment. Certain patients require hospital treatment, but the authority should not needlessly establish institutions if and when the ordinary channels of medical practice are available and reliable, or can be made so."

"I am bound to advise that if the work of these clinics is not properly done—if it is casual, superficial or perfunctory—they should be disapproved by the Ministry. It is better to have only a few clinics well-organized and scientifically controlled than a large number which are not thus administered. These statements indicative of a change of policy in the future may find an explanation in a study of the statistics (see Table 2) relating to the number of patients discharged from venereal disease centres as having completed treatment. This table shows that 29% of syphilitics and 33% of persons suffering from gonorrhoea ceased to attend before completing a course of treatment. Nearly three times as many as those who were discharged after completion of treatment and observation and accordingly can be definitely tabulated as cured and non-infective. These facts seem to show the necessity of adopting some disciplinary measures to combat the evil, such as exist in the United States."

Prevention.—Sir Archdall Reid, in his work on the prevention of venereal disease, complains that no reference was made in the report of the Royal Commission of the value of Metchnikoff's discovery. The National Council strenuously opposed what they termed "the packet system" but the facts had to be faced.

TABLE 2.—Patients at British Treatment-Centres.

	Syphilis	Gonorrhoea	Total
(1) Number of persons dealt with during 1919 and 1920	105,619	87,792	193,411
(2) Number of persons who ceased to attend:—			
(a) before completing a course of treatment	30,459	28,869	59,328
(b) after completion of a course of treatment, but before final tests as to cure	9,350	6,481	15,831
(3) Number of persons discharged after completion of treatment and observation	8,240	13,300	21,540
(4) Number of persons who on the 1st of Jan. 1921 were under treatment or observation	47,894	28,822	76,716

Early curative treatment and moral suasion by propaganda and lectures had not effected the purpose which most of the members of the Royal Commission believed and desired they would. Sir Bryan Donkin, in a letter to *The Times* in Jan. 1917, first called attention to the necessity of the adoption of immediate self-disinfection in accordance with the discovery of Metchnikoff. He cited the remarkable success attending the simple measures of immediate self-disinfection adopted at Portsmouth by Sir Archdall Reid. Reid states in his book that one in 1,000 solution of permanganate of potash, carried in a flat screw-stoppered bottle with a swab of cotton wool, proved a simple and cheap means by which he obtained successful results. The directions were that the soldier should immediately after exposure to infection thoroughly swab the exposed surfaces with the fluid; and he states on p. 130:—"Immediately venereal disease vanished from my units. For six months not a single case occurred. In two years and four months, during which quite 20,000 men must have passed through my hands, only seven men were infected. Of the seven cases, six of gonorrhoea and one of syphilis, all could be accounted for by drink or negligence."

A controversy as to the right or wrong of such treatment thus arose which eventuated in a number of eminent medical men leaving the National Council for Combating Venereal Diseases to form the Society for the Prevention of Venereal Disease by immediate self-disinfection. While not discouraging continuance of efforts by moral persuasion, athletics, education and early curative treatment, this Society realized that immediate self-disinfection either by calomel cream or permanganate solution, was essential supplement to the before-mentioned measures; recognizing as the members of this Society do, that a large proportion of the adult population are not, and in our present social conditions, cannot or will not remain continent. It may be assumed that both the societies are animated with the same desire, and it was hoped that by the establishment of a special committee of the Birth-Rate Commission in June 1920, in order to take expert evidence on the value of the various measures for the prevention of venereal diseases, unanimity on the part of the two societies might arise. A report on "The prevention of venereal disease" by this Committee was issued in Feb. 1921. The report states (p. 21):—"The Committee is of opinion that any administrative or legal difficulties that may at present prevent individuals, who desire to do so, from purchasing such disinfectants from chemists, on their own initiative as a protection against venereal disease should be removed; and that the section of the Act dealing with this matter should be rendered more explicit and amended if necessary;" but up to June 1921 no result had been achieved as regards action by the Government or by way of settling the essential point of difference between the two societies.

The supporters of the S.P.V.D. maintain that if 183 curative treatment centres (which cost the State £300,000 in 1920) are necessary, a similar number of prophylactic centres are more necessary. Now the National Council advised the Government to establish what they call Early Ablution Centres where skilled but delayed disinfection would be carried out. There are so many obvious defects in this system when applied to the civil

population, together with the enormous cost which would be thrown upon the present overburdened ratepayers, that even in June 1921 there was only one in operation (in Manchester), and only four other possible prospective centres. The London County Council and many boroughs had refused to adopt this method of dealing with these diseases, and most thinking people are of opinion that the onus of keeping clean and thus avoiding the spread of infection should be thrown on the individual who lays himself open to infection by promiscuous intercourse. In respect to prophylaxis therefore the policy of the National Council had entirely failed to deal with the problem, and it was the contention of the S.P.V.D. that the only practical preventive measure is, "immediate self-disinfection" and that all hindrance to facilities, such as the law forbidding chemists in England to sell prophylactics for the specific purpose of rendering an individual safe, when contemplating promiscuous sexual intercourse, should be abolished.

The National Council and its supporters could not deny the fact that immediate self-disinfection, if properly carried out, was an efficient method of prophylaxis; but on moral grounds they strongly objected to its employment, as condoning promiscuous sexual intercourse and thereby leading to increased risk of infection and a false security, because it could never be carried out efficiently by the civil population. Colonel Harrison, adviser to the Ministry of Health, who was responsible for its application in the army, supported the National Council in this contention. He stated that his experience showed that he was wrong in his estimation of the value of self-disinfection as a means of prevention of venereal disease in the army, and that it did not meet with the success that he anticipated. On the other hand there is the experience of Sir Archdall Reid, and the equally successful results obtained in the navy by Commander Boyden (see p. 227, Report of Birth-Rate Committee, and Archdall Reid's *Prevention of Venereal Diseases*, appendix pp. 437-442). Also Capt. Walker's results: "During Aug. and Sept. 1917 (64 days) a little over 5,000 officers and men came on leave to Paris, of whom 1,038 developed venereal disease or about 20 per cent. This closed the leave to Paris. Leave was reopened on Nov. 8 1917. . . ."

"The actual results from Nov. 8 1917 to March 31 1918 was stated by Capt. Walker to be only 3% of infections among the men on leave to Paris." This great reduction was the result of prophylactic measures (*Public Health*, Sept. 1918). Although on a small scale compared with those of Col. Harrison, these results tended to prove that the personal equation plays an all-important part not only in respect to the faith, intelligence and desire of the man who employs self-disinfection as a means of prevention, but in the faith, intelligence and desire of the commanding officers and medical officers whose duty it is to see that the excellent army instructions, which were promulgated, were enforced and the necessary disinfectants provided. Indeed, had disciplinary measures been adopted and applied both to the individuals who became infected and to the medical officer in charge if carelessness or negligence in carrying out the instructions had been proved, far better results would no doubt have been obtained. Moreover, early detection of the practice of men seeking infection in order to escape service at the front, which became so prevalent as to necessitate classification as "self-inflicted wound," would have been easy and the practice prevented. Again, it is argued against chemists being allowed to sell specific prophylactics that it would lead to increase of venereal disease by the assumption of the purchaser that they might serve as a curative agent. Perhaps the strongest argument in favour of the efficacy of the adoption of immediate self-disinfection as the best means of prevention of venereal disease is the fact that at Portsmouth, where Sir Archdall Reid carried on his work, the Medical Officer of Health, Dr. Mearns Fraser, overcame the opposition of clergy and others to this mode of treatment, and advice and information on immediate self-disinfection was in 1921 given there by posters and on application to the Health Department at the town hall.

The policy of the Ministry of Health was thus stated by the Chief Medical Officer of the Ministry of Health:—

Facilities are now being provided for disinfection, as well as irrigation and other intermediate treatment, at the various kinds of treatment centres approved by the Ministry and elsewhere under medical supervision (Annual Report, 1920, p. 122).

The experience of the American army, with State control in the United States, supports the view that, to make any system efficient, disciplinary measures and notifications are desirable, but this can only be done when all obstacles to prevention are removed. Ignorance, prejudice and false sentiment must be banished and the public educated to regard venereal disease like any other infective disease:—

"Prophylactic treatment stations were established during the war in all the camps and in towns in the vicinity of camps in the United States and in France. These stations were under the supervision of American officers and in charge of carefully trained non-commissioned officers. Soldiers were not only instructed in the course of their training that prophylactic treatment does, in many cases, prevent the development of venereal disease but they were also under orders to apply for treatment after having exposed themselves. If a soldier developed venereal disease his record was examined to ascertain whether prophylactic treatment had been taken and if this duty had been omitted, the soldier was subjected to trial by court-martial to ascertain why preventive measures had not been undertaken and to undergo punishment in case neglect became evident. Inquiry into the effectiveness of this system establishes the fact that under favourable conditions, prophylactic treatment was effective in over 90% of the cases received. It was found that apparent failures resulted from four causes:—(a) delay in seeking treatment; (b) incompetence on the part of the attendant giving the treatment; (c) previous history of venereal disease indicating a recurrent attack; (d) false statements on the part of the soldier." ("Combating Venereal Disease in Armies," *International Journal of Public Health*, published by the League of Red Cross Societies, Jan.-Feb. 1921, vol. ii., No. 1.)

State Control.—The measures adopted in the United States to control venereal disease are described in the reports of the Public Health Service. These measures are as follows:—(1) Notification of cases of venereal disease to the health authorities, the records to be secret; (2) isolation and treatment in detention hospitals of infected persons who are unable or unwilling to take measures to prevent their becoming a menace against others; also measures for the suppression of prostitution; (3) educational measures, including information of the general public concerning the nature and manner of spreading of venereal diseases and the steps to combat them; (4) extension of facilities for early diagnosis and treatment; (5) prohibition of prescribing by druggists. These principles have been carried into effect in many of the states by rendering persons who are a danger to the public health on account of venereal disease subject to quarantine, and certain standards are laid down which have to be followed before discharging patients as non-infectious.

In Pennsylvania the following measures have been adopted. The work of the Department has been divided into three parts: medical, educational, and law enforcement. There are certain measures concerning the Medical Department, making for economy and efficiency, which are at variance with those adopted by the British Ministry of Health. These are as follows:—

There are 30 public clinics for the treatment of venereal disease, over which the Department of Health has entire supervision and for which it assumes all financial responsibility. In these clinics free treatment is given to those patients whose economic condition will not permit treatment either by private physicians or by clinics charging a fee. Upon entrance to clinics, patients are questioned as to their ability to pay for services. Those able to pay a private physician are referred to outside doctors who are registered with the clinics. If in position to pay only a small sum, they are referred to hospital clinics which charge a nominal fee. Indigent patients are treated free in the state clinics.

Continuance of treatment of a patient is insured by sending a notice to return for treatment. If this does not effect a return, the clinic makes use of the legal machinery at the disposal of the Department of Health.

Through an Act of the State Legislature passed in 1921, there has been placed at the disposal of the Department of Health a modern 400-bed hospital for the care and treatment of syphilitic patients who are menaces to the public health.

Immediate treatment (venereal prophylaxis) for those exposed to disease has been approved by the Pennsylvania State Department of Health. Prophylaxis as used in the army by means of stations is impractical in civilian life. Tubes containing material for self-disinfection are given the Department's approval, after

being tested. The material usually employed is after the formula of Metchnikoff. The tubes are on sale in drug stores.

Self-disinfection in Women.—All authorities are agreed that self-disinfection in women under most circumstances is not likely to be attended by the same satisfactory results as in men, on account of the different anatomical construction of the genital organs. Dr. Morna Rawlins and Lady Barrett, in giving evidence before the Birth-Rate Commission in England, said that they would not recommend its use for several reasons. It would be employed for contraconception, and if the permanganate solution were used it might lead to the spread of the infection to the uterus. Sir Archdall Reid in his book discusses the subject, and refers to the opinion of Miss Ettie Rout, who was for years in France with the New Zealand and Australian forces. Although Miss Rout was not a doctor she had an extraordinary experience and knowledge of the subject. She points out that there is far more danger to women in outdoor relationships than in indoor relationships, and she supports this statement by the fact that the weekly average of soldiers infected was doubled and afterwards still further increased when the licensed houses in Havre were put out of bounds in April 1918, simply because immediate self-disinfection was not available to the women (or to the men) and they were not under medical supervision. Similarly in Amiens, Abbeville and other places, the amount of disease increased for the same reason. In her evidence before the Committee of the Birth-Rate Commission she stated that a weak permanganate solution was in use at the St. Louis Hospital, Paris.

Syphilis and Pregnancy.—Dr. Amand Routh, who has made a special study of this subject, estimates that at least 20% of the ante-natal and neo-natal deaths are due to congenital syphilis. Experience shows that treatment of the mother is very satisfactory, for she can be cured and the offspring prevented from becoming congenital syphilitics.

Modern Curative Treatment.—Sufficient time has now elapsed since Ehrlich's great discovery of the arseno-benzol compound known as salvarsan or "606" to appraise the value of this drug or its equivalents in the treatment of syphilis. It was at first believed that it would entirely replace the old mercurial treatment, but the greatest success has been attended by a combination of the two. Numerous other arseno-benzol compounds of a similar nature to the original "606" have since been introduced, and, although it is generally considered that they have not such a powerful influence on the disease, yet neo-salvarsan or its equivalent preparations are now almost universally employed, because the technique of administration is so much simpler. When salvarsan was introduced, a misapprehension of its curative effect arose in the mind of the public and many members of the profession; for it was believed that a few intravenous injections of the drug would suffice to effect a cure, and this might seem probable if, in conjunction with the patient showing no active symptoms, the blood previously positive in its reaction became negative. Under such circumstances the patient believed, and sometimes was led to believe, that no further treatment was necessary. Experience has shown that not infrequently serious consequences were the result. Therefore most authorities recommend what is termed "intensive treatment," namely a course of intravenous and intramuscular injection of an arseno-benzol compound combined with mercury in the form of intramuscular injections or inunctions. Periodic courses extending over two years are required. The Wassermann reaction of the blood is taken before treatment is commenced and the strength of complement fixation estimated before and after each course of treatment. The curative effects of the drug can thus in a measure be estimated. For ill-effects of salvarsan treatment and standards of cure, see pp. 114-5, *Annual Report of the Chief Medical Officer of Ministry of Health, 1920*. It will be observed that of 193,411 persons dealt with during 1919-20 there were 59,328 who ceased to attend before completing a course of treatment. Many of these were still infective.

Evidence given before the British Royal Commission showed that energetic "intensive treatment" employed in the primary stage before the Wassermann reaction was positive and there-

fore the spirochaete had become generalized in the body, had led to a complete cure in a number of cases. This was shown by the fact that although the spirochaete of syphilis had been found in the sore yet the Wassermann reaction was negative and remained so. A still more convincing proof of cure, in such cases, was the fact that re-infection has been known to occur. It is necessary to state that, owing to faulty technique and short cuts in performing the Wassermann reaction, cases have been reported as negative by one observer and positive by another. In some of these cases the patients were obviously suffering from disease, the result of a previous infection, in others there was no clinical sign. The Commission rightly laid stress upon the necessity of employing a standardized method to avoid error and thus avert very serious consequences, medical and medicolegal. Most authorities lay more stress upon the examination of the cerebro-spinal fluid than the blood in diseases of the nervous system, presumably of syphilitic origin, as a means of diagnosis. Experience shows that many persons may be in good health or at any rate not suffering from any obvious clinical syphilitic disease, and yet give a positive Wassermann reaction of the blood, for the organism may be locked up in some functionally indifferent tissue, but a positive reaction of the fluid shows that the spirochaete is in the central nervous system and if it is not causing any clinically recognizable symptoms there is a positive danger that it may at any time do so. When once the cerebro-spinal fluid is found to give a positive Wassermann reaction it is doubtful whether any treatment will make it negative. This fact shows how extremely difficult it is for the drug to attack the organism when once it has gained access to the substance of the central nervous system. It was for this reason that Swift and Ellis introduced the treatment of general paralysis and tabes by spinal intrathecal injections of salvarsanized serum; but it was found to have no advantages over the usual methods of treatment, and only a few authorities now employ it and claim successful results.

All those who have had experience in the prevention and treatment of venereal disease consider gonorrhoea and its complications the most difficult to deal with. It is not implied therefore that the effects of gonorrhoea are so serious as syphilis, but owing to the fact that the organism when it has invaded the deeper structures is not easily eradicated, a patient thinking himself cured, because he suffers no pain, may unwittingly infect his wife or other women. As there are immense numbers of these carriers it is easily seen how difficult is the problem of prevention of gonorrhoea; and this difficulty is greatly increased by the fact that this disease is not looked upon as serious; whereas all the evidence given before the Royal Commission showed that many serious diseases especially affecting women were due to gonorrhoeal infection. It is a frequent cause of disease of the reproductive organs, and sterility is a result. Its ill-effect upon the health and happiness of the nation is far greater than is generally imagined. If the complex medical and social problem involved in venereal infection is to be dealt with nationally on sound lines it is essential that the full confidence and support of the public must be obtained. This can only be done by getting the people, as the late Sir William Osler said: "to realize that it is a great communicable disease, many of whose victims are innocent."

The following works may be consulted for further information:—*System of Syphilis* (Oxford Press); The Report of the Royal Commission on Venereal Disease with appendices (1916); Report on the Prevention of Venereal Disease by the Special Committee of the Birth-Rate Commission; *Manual of Military Urology* (American Red Cross Association); *Medical Science*, abstracts and reviews, published by the Council of Medical Research (vols. i. and ii.); Sir William Osler, "The Campaign against Syphilis," *Lancet* May 26 1917; Sir Archdall Reid, *The Prevention of Venereal Disease*; Reports of the Public Health Service, U.S.A., 1920; Report of the Chief Medical Officer of the Ministry of Health, 1920. (F. W. Mo.)

VENEZUELA (see 27.988).—The permanent additions made to the population of Venezuela by immigration during 1910-20 were slight. The official year book for 1912 stated that the total number of persons arriving at Venezuelan ports in that year was 9,615, while the total departures were 7,981. It gave the approximate pop. of the republic as 2,632,754.

Venezuela's constitution of 1909 declared that the republic be composed of 20 states, 2 territories, and a federal district. These states made provisions regarding their boundaries and territorial divisions by laws passed prior to March 16 1912. In Oct. 1912, the Federal district was made up of two departments, Libertador and Vargas, which were subdivided into 20 parishes or municipalities. The states had been divided into 147 districts and these subdivided into 597 municipalities. The territories had been organized into 10 municipalities. The Venezuelan constitution of 1914 allowed the main territorial divisions to remain as they were when established under the constitution of 1909. On June 14 1916, Congress enacted an organic law for the Government of the Federal territory of Delta Amacuro, which divided it into four municipalities and vested its government in the president of Venezuela according to certain prescriptions.

Communications.—Twelve railroads of some importance were operating in Venezuela in 1920 with a total mileage of about 600 m., and an invested capital of some 200,000,000 bolívares. Steamships plied up the Orinoco river to Ciudad Bolívar and thence to ports in the interior. Some ocean vessels entered Lake Maracaibo. La Guaira and Puerto Cabello were ports of call for important American and European steamship lines. During the rule of President Gómez, beginning in 1908, considerable attention was given to interior communications. Shortly after becoming president he conceived the idea that the construction, improvement, and repair of important Venezuelan roads was a most urgent public work. From Dec. 1908 to Dec. 1913, the construction or repair of several highways was undertaken by the national Government. Among these were the roads from La Guaira to Caracas, from Caracas to Guatire, and from Rubio to Uraguá, which was macadamized. In some years the expenses for highway construction and maintenance constituted the major portion of the expenditures of the Department of Public Works. Plans were made for a comprehensive system of roads. On Aug. 11 1916, a presidential decree provided for the construction of the great western highway from Caracas to San Cristóbal through the states of Miranda, Aragua, Carabobo, Cojedes, Portuguesa, Zámora, and Táchira. On Dec. 19 1915, another decree provided for the construction of the great eastern highway from Caracas through the states of Miranda, Anzoátegui, and Bolívar to the interior of Guiana.

Foreign Commerce.—According to official statistics in 1913 the total imports of Venezuela amounted to 93,420,225.90 bolívares. (Nominal value \$.193 or 9.4d.) The imports from the leading countries were as follows: 35,979,980.03 bolívares from the United States; 22,260,593.57 from the British Empire; 13,404,073.91 from Germany; 8,218,680.19 from Holland; 5,666,611.43 from France; 3,744,276.53 from Spain; 2,878,928.50 from Italy; 1,184,266.30 from Belgium; and 66,575.84 from Colombia. In 1913 the total exports of Venezuela amounted to 152,765,749.04 bolívares. The countries taking the largest shares were: France, 51,751,523.27 bolívares; the United States, 43,914,670.33; Germany, 28,827,814.24; England, 11,394,058.90; Holland, 3,675,353.30; Colombia 2,151,434; Austria-Hungary, 2,051,273 and Italy, 1,308,325. According to statistics compiled by the Pan-American Union, the chief imports into Venezuela in 1918, exclusive of parcel post shipments, were as follows: cotton textiles, 16,709,753 bolívares; drugs and medicines, 4,242,157; machinery, 3,190,315; flour, 3,039,409; automobiles and accessories, 1,562,495; leather and leather goods, 1,135,198; paraffin, 1,625,949; wines, 1,303,388; stearin, 975,865; and soda, 921,384. The total imports in 1918, according to official statistics, amounted to 77,244,950.23 bolívares. Imports from the chief countries were as follows: United States, 46,564,983.71 bolívares; England, 22,396,903.23; Colombia, 2,264,753.23; Spain, 2,240,538.71; France, 1,770,621.41; Italy, 920,720.50 and Holland, 759,104.55. The chief articles exported in 1918, according to figures compiled by the Pan-American Union, were as follows: coffee, 38,568,176 bolívares; cacao, 19,798,054; rubber, 6,947,320; sugar, 5,481,139; corn, 3,987,698; cattle and hides, 3,249,060; tobacco, 3,179,902; gold, 2,348,914; frozen beef, 2,545,935; asphalt, 1,560,193; and petroleum, 1,041,742. According to official statistics, the total exports of Venezuela in 1918 came to 102,659,153.74 bolívares. The countries taking the largest quota were: United States, 46,382,272.70 bolívares; Holland, 17,640,887.74; England, 17,098,261.82; France, 10,068,966.33; Spain, 8,913,919.10; Italy, 1,142,422; Cuba, 719,151.05; and Colombia, 612,203. During the World War the trade of Venezuela with the Central Empires altogether ceased, while her commerce with the Allies and with neutral Powers much increased, the United States securing a large part of the trade.

Government.—On May 18 1914, a Congress of Deputies from the Venezuelan states adopted a new constitution for their union. That constitution declared that the Venezuelan states reciprocally recognized their autonomy and equality, and that they retained all sovereignty which was not delegated to the central Government by the constitution. The states agreed to promul-

gate constitutions that would harmonize with the fundamental law and agreed to see that the national constitution, laws, and orders were obeyed. Early in June assemblies at the capitals of the respective states ratified the new form of Government, which was accordingly proclaimed in force June 13 1914. This constitution provided that the right of suffrage was to be exercised by male citizens 21 years of age or over. Foreigners who took part in political controversies (*contendidas*) could be arrested, confined, or expelled by order of the president. Executive power was vested in a president and a cabinet of ministers appointed by him. The president was to be elected for a seven-year term by the secret vote of Congress. During the temporary absence of the president from the capital his functions were to be exercised by a minister whom he designated. Among the extensive powers vested in the chief executive were the following: to administer the Federal district and the two Federal territories; to issue decrees and regulations for the better execution of the laws; to negotiate loans as provided by Congress; to grant certificates of naturalization; to appoint national officials whose appointment was not otherwise provided for; to convoke an extraordinary session of Congress; to declare war when authorized by Congress; to negotiate treaties with foreign nations; and to proclaim martial law throughout the republic. Article 137 of the constitution stipulated that the provisional president and vice-presidents of the republic should hold office until the new constitutional functionaries were inaugurated. Article 138 stipulated that the commander-in-chief of the national army should exercise his functions until the inauguration of the constitutional president of the republic. Legislative authority was granted to a Congress composed of a Senate and a Chamber of Deputies. The Senate was to be composed of two Senators from each state chosen by its Legislative Assembly for three years. The Chamber of Deputies was to be composed of members chosen from every state and from the Federal district by popular vote for three years at the ratio of one deputy to every 35,000 inhabitants. Congress was to meet annually on April 10 at the capital for a session of 70 days. Judicial authority was vested in a Supreme Court designated by law. The Federal Supreme Court was to be composed of seven judges who were to be elected by Congress for a term of seven years. Clauses defining powers of this court provided that it should take cognizance of accusations against the president and other high officials. It was given jurisdiction over cases involving claims against the nation, cases relating to foreign diplomatic agents in Venezuela, cases arising from contracts made by the president, and cases involving conflicts between laws or decrees, State or Federal.

Army and Navy.—In 1912 Venezuela purchased a vessel of about 1,000 tons from the United States, which was re-christened the "Mariscal Sucre" and made the flagship of the navy. About 1915 the Venezuelan navy was composed of two cruisers, three gunboats and two transports with a personnel of a few hundred men. The standing army was composed of some 9,000 infantry, artillery and cavalry. In addition there was a reserve which was estimated to consist of about 100,000 men. By a law published in June 1919, military service was made compulsory for all adult male citizens, with certain exceptions. Every man was obliged to serve in the army or navy for two years in peace-time and during war at the president's pleasure. Until they became 45 years of age those soldiers were to compose part of the reserve. A decree of April 17 1920 provided for a military aviation school at Maracay.

Education.—According to the official year book for 1912 there were in that year in the republic 1,408 elementary schools attended by 45,515 children. There were in attendance at 52 graded schools 4,853 pupils. On Dec. 19 1914 a fundamental law concerning education was enacted. This law provided that primary instruction should be compulsory and free for all children from 7 to 14 years of age. Secondary education, furnished in *lyceos* and *colegios*, should comprehend two successive courses: one of a general character, and another of a special type giving training in philosophy and letters, in physical and natural science, or in physical and mathematical science. A decree of March 1915 provided that the national Government should maintain a school of fine arts, furnishing instruction in music, declamation and the plastic arts; commercial schools at Caracas, Maracaibo, and Ciudad Bolívar; a school of arts and crafts for males and another for females; and a training school for nurses. In 1916 decrees were issued which founded at Caracas a number of institutions for higher education, such as a school of political

science, a school of pharmacy, and a school of dentistry. Decrees were issued in the following year which established in that city a museum of natural history and an institute of fine arts. Besides the facilities furnished by various educational institutions in the capital city, there is the *Universidad de los Andes* at Mérida.

Finances.—The financial condition of Venezuela has improved in recent years. On Dec. 31 1913, the total indebtedness of the Venezuelan Government amounted to 176,460,251.14 bolívares. Of this 61,607,179.53 bolívares was domestic, while the balance was foreign debt. The domestic debt was thus classified:—

	Bolívares
National domestic debt, consolidated at 6%	54,699.59
Script at 1%	38,165.62
National domestic debt, consolidated at 3%	59,960,572.36
National domestic debt, consolidated without interest	1,204,639.83
Current indebtedness	349,102.13
Total	61,607,179.53

The foreign debt was as follows:

	Bolívares
National debt at 3% by diplomatic conventions	9,843,791.61
Provisional script (Spanish)	1,600.00
Diplomatic debt at 3%, issue of 1905	105,007,680.00
Total	114,853,071.61

In Aug. 1914 the Government of Venezuela issued a decree ordering a reduction in the number of offices and a decrease of 25% in official salaries. This was followed by other economies. Claims of French citizens against Venezuela amounting to 13,000,000 bolívares were adjudged by a protocol of Jan. 14 1915, at 3,000,000 bolívares. For the satisfaction of this obligation a non-interest bearing debt was provided, the arrangement being that it was to be cancelled by the payment by Venezuela of 57,692.31 bolívares monthly. The national revenue for the fiscal year 1917-8 amounted to 53,253,686.06 bolívares; while the expenditures came to 52,948,924.48 bolívares, leaving a surplus of 304,761.78. Revenues for that year were derived from the following sources:—

	Bolívares
Customs duties, consular fees, etc.	24,544,127.42
Cigarette tax	6,317,345.85
Liquor tax	7,437,183.09
Salt monopoly	6,725,814.75
Stamps	4,295,891.95
Stamped paper	177,520.90
Inheritance taxes	179,965.92
Other sources	3,575,836.18
Total	53,253,686.06

On July 13 1919, the national domestic debt of Venezuela was as follows:—

	Bolívares
National domestic debt, consolidated at 3%	46,623,077.29
Script	2,098,652.50
Treasury bonds	349,102.13
Total	49,070,831.92

Upon the same date the national foreign debt was as follows:—

	Bolívares
National debt at 3% by diplomatic conventions	9,208,291.61
Provisional script (Spanish)	1,600.00
Diplomatic debt at 3%, issue of 1905	84,511,750.00
Non-interest bearing diplomatic debt as arranged in 1915	230,769.12
Total	93,952,410.73

The total indebtedness of the Venezuelan Government on July 13 1919 thus amounted to 143,023,242.65 bolívares. The bolívar was relatively stable during the World War. The exchange value of the U.S. dollar measured in bolívares at different dates was as follows: July 1914, 5.30; April 1917, 5.14; April 1918, 4.32; Jan. 1919, 4.25; and Dec. 1919, 5.16. An official estimate in 1919 stated that there were in circulation some 25,000,000 bolívares of bank-notes; 49,000,000 in silver coin; while the gold in circulation and in reserve came to 62,000,000 bolívares. In July 1920 eight companies had banks in Caracas. Two indigenous institutions were the *Banco de Venezuela* with a capital of 24,000,000 bolívares and with more than a score of agencies, and the *Banco Caracas* with a capital of 6,000,000. The Royal Bank of Canada had a bank in Caracas and four branches in other cities. The National City Bank of New York had a bank in Caracas and four branches in other cities and towns. The *Hollandische Bank voor West-Indië* had a bank in the capital city. The Mercantile Bank of the Americas of New York City had established a central bank in Caracas with branches at La Guaira, Puerto Cabello, and Maracaibo. The Commercial Bank of Spanish America Limited—affiliated with the Anglo-South American Bank Limited—with a capital and reserves of 200,000,000 bolívares, had banks in Caracas and Puerto Cabello. The Deschanel International Corporation of Venezuela, affiliated with a corporation of that name

in New York City, with a capital of some 1,260,000 bolívares, had established banks in Caracas and La Guaira. Another important institution of Venezuela was the *Banco de Maracaibo*, with a capital of 937,500 bolívares.

History.—When in Nov. 1908, President Castro left Venezuela to visit Europe, the first vice-president, Juan Vicente Gómez, a wealthy land-owner and an efficient military leader, was given the presidential power. In decrees of Nov. 23 1908, Gómez appointed a general secretary and confirmed the existing Cabinet appointments. On May 3 1909 he issued a decree announcing that he was exercising the powers of President of Venezuela, and after suppressing opposition to his rule in certain quarters, he was acclaimed President Dec. 19 1909. Under the constitution of 1909, on Aug. 27 1910, Congress elected Gómez constitutional President for four years. In June and July 1911, Venezuela celebrated with appropriate ceremonies the centenary of her declaration of independence. During the rule of Gómez diplomatic relations with foreign nations that had been ruptured were resumed, and Venezuela undertook to pay her obligations to foreign nations upon which payments had lapsed. Upon an attempt of ex-President Castro to regain his power, President Gómez issued a proclamation on Aug. 3 1913, announcing that as the peace of the republic had been disturbed by Castro, he (Gómez) was leaving the capital to undertake a campaign for the restoration of public order. Upon the following day he entrusted his authority to José Gil Fortoul, president of the council of government. On Jan. 1 1914, he reentered Caracas at the head of his army and at once reassumed the powers of President.

According to the constitution the term of office of President Gómez ended on April 19 1914. Upon that day a Congress of Deputies from the Venezuelan states adopted a provisional constitutional statute for the Union. That statute declared that all laws not inconsistent therewith should remain in force. It further provided that this Congress should elect a commander-in-chief of the national army at the same time that it elected a provisional president of republic. Congress was also to frame a new pact of union for Venezuela, which should be submitted to the assemblies of the states for approval. The period of provisional rule should last until the new constitution had been ratified by the states and until the constitutional functionaries had taken their posts. On the same day Congress elected Victorino Márquez Bustillos, who had been Minister of War and the Navy, provisional president. By a decree of the same day Provisional President Márquez Bustillos appointed his ministers of state, making César Zumeta Minister of the Interior. Congress elected General Gómez commander-in-chief of the national army. On May 3 1915, the Congress chosen under the constitution of 1914 unanimously elected Gen. Gómez President of the republic for the term ending April 19 1922. However, the President-elect did not assume the presidency. The provisional president continued to exercise the president's authority while Gen. Gómez remained commander-in-chief of the army with the title President-elect of the republic. Among the members of the first Cabinet of Provisional President Márquez Bustillos were C. Zumeta, Minister of the Interior; M. Díaz Rodríguez, Minister of Foreign Affairs; Román Cardenas, Minister of Finance, and Felipe Guevara Rojas, Minister of Public Instruction.

Boundary Disputes.—Protocols signed in Caracas in 1905 between Brazil and Venezuela acknowledged those portions of the Brazilian-Venezuelan boundary which had been surveyed by their commissioners as the true boundary line. In Feb. 1912, these nations agreed to select commissioners to determine their boundary between Cucuy and the Salto de Hua. In 1914 those commissioners proceeded to mark that part of the boundary line exactly. By a treaty signed in 1881 Venezuela and Colombia agreed to submit their long-standing boundary dispute to the arbitration of the King of Spain, who was to fix the line which in 1810 separated the captaincy-general of Venezuela from the viceroyalty of New Granada (Colombia). The award of the Spanish monarch was given on March 16 1891. Subsequently, however, a heated correspondence took place between Colombia and Venezuela about this line, mixed commissions delimited a part of it, and Colombia proceeded to take possession of regions which clearly belonged to her. Venezuela objected to this action and at times war seemed imminent. By a treaty signed at Bogotá on Nov. 3 1916, the contending nations agreed to submit to an arbiter the question whether or not Colombia had the right to

enter upon the possession of territory that belonged to her by the award or whether she should postpone such occupation until the boundary line had been fully drawn. The parties agreed that both states should remain, for the time being, in the possession of territories which they held at the date of the treaty. As arbiter they selected the President of Switzerland, who, after pronouncing his decision, was to appoint Swiss engineers to demarcate exactly the boundary where it had not been surveyed. In July 1917, when ratifications of that treaty were exchanged the parties changed the arbiter to the Swiss Federal Council. On June 24 1918, that council made known the regulations which should be followed in the arbitral procedure. Both parties presented their last arguments to the arbiter and a decision was pending at the close of 1920.

International Relations.—Although Venezuela did not publish a proclamation of neutrality upon the outbreak of the World War, yet on Aug. 12 1914, the Minister of the Interior sent instructions to officers of custom houses directing them to maintain neutrality in the conflict. Seven days later, at the instance of the Minister of Foreign Relations, the Minister of the Interior addressed to the chief executives of the states, the territories, and the Federal district, circulars informing them that the Venezuelan Government would maintain the strictest neutrality and directing them to prevent individuals from aiding any of the belligerent nations. Upon being informed by the U.S. minister of the rupture of diplomatic relations with Germany, on Feb. 23 1917, Ignacio Andrade, Venezuela's Minister of Foreign Relations, informed the envoy of the United States at Caracas that his country would fulfill all her duties as a neutral and would not relinquish any of her rights: "She wishes to preserve her relations of peace and friendship with all of the belligerent nations and to maintain the most perfect neutrality." Although the sympathies of many of her intellectual leaders were with the United States, yet Venezuela maintained her neutral policy throughout the struggle. In March 1920, Venezuela's minister at Paris filed his Government's adhesion to the League of Nations.

(W. S. Ro.)

VENIZELOS, ELEUTHERIOS (1864–), Greek statesman, was born at Mourniés, in the island of Crete, on Aug. 23 1864, of a family that emigrated from Mistra (near Sparta) to Crete in 1770. His father, a merchant of Canea, took an active part in the Cretan patriotic movement and was therefore exiled by the Turks in 1866, but returned to the island in 1872. Young Eleutherios was educated in the schools of Syra and Athens, and then studied law at the university of Athens, taking his degree in 1887. Returning to Canea, he took up the practice of law, but, like most Cretan lawyers of that day, he soon was drawn into political life. In the insurrection of 1889 he was compelled to fly from the island and take refuge in Greece; after tranquillity was restored, he returned and was elected a member for Canea to the Cretan Assembly. It was not till 1897 that Venizelos came into prominence as one of the leaders of the Cretan uprising of that year, which culminated in the removal of Turkish rule from Crete (1898). Venizelos was in command of the insurgents' camp on Akrotiri, which was shelled by the united European squadrons on Feb. 21 1897. A few days later, he received at this camp the British, French and Italian admirals, who came under a flag of truce to negotiate a settlement between the insurgents and the Turks. These two incidents form the first occasion when Venizelos came into official contact with the Great Powers.

In 1898 Prince George of Greece landed in Crete as High Commissioner of the Great Powers, and a few months later, upon Sphakianakis' retirement, Venizelos became the head of the Cretan executive. He soon found himself at variance with

the Prince, who inaugurated in Crete very much the same autocratic policy that his elder brother, King Constantine, subsequently adopted in Greece in 1915-7. Finally, a complete rupture took place in 1904 between the Prince and Venizelos; the Venizelist party were defeated at the polls by the personal canvassing of the Prince and the united efforts of the other Cretan party leaders, already jealous of Venizelos' rising star. Venizelos then organized a revolt at Therisso, which was partially successful but which died out after a few months, yet not until it had made the Prince's position in the island untenable. In 1905 the Prince departed, resigning his office as High Commissioner, in which he was succeeded by M. Alex. Zaimis. From 1905 to 1909 Venizelos' activities alternated between those of chief of the Cretan executive and those of leader of the Opposition. More than once during this period the Cretans came into sharp conflict with the four Great Powers; but Venizelos' wisdom and moderation prevented any rupture and maintained friendly relations with the Powers.

In 1909 the Military League at Athens, which headed a bloodless revolution against the existing political corruption and Court favouritism in Greece, found itself in need of a sound political adviser. As such, Venizelos went over to Athens at the invitation of the League three times within four months. He persuaded both the League and King George of the necessity of convening a National Assembly for the revision of the Constitution, as the only safe and satisfactory way out of the dangerous situation. The elections for this Assembly were held in the summer of 1910, and Venizelos himself (who had never ceased to retain his Greek citizenship, while in Cretan political life) headed the poll at Athens. His arrival at the Greek capital in Sept. was greeted with tremendous popular enthusiasm. Such was his unlimited mastery over Greek public opinion at that time, that at a nod from him the Royal family would have been expelled ignominiously. But Venizelos had come to Greece to establish reform and pacific progress; and little as he respected any member of the Royal family, he was fully conscious of the set-back that Greece's internal tranquillity and foreign relations would receive by a fresh change of dynasty or by the doubtful experiment of a republic. His first great work in Greece was the revision of the Greek Constitution, which was successfully accomplished in 1911. Simultaneously, he was busily reorganizing the public services, especially the army and navy, the former through a French, the latter through a British, mission. Within the short space of a year and a half he prepared the ground for the Balkan League, which had hitherto been universally looked upon as a Utopian project. By May 1912, the League was practically an accomplished fact, but a fact so successfully dissimulated that the outside world knew nothing of the League's existence. Only Russia, as the traditional protectress of the Southern Slavs, was in the secret. Other Greek statesmen, and notably Tricoupis, had worked for a Balkan League but failed, partly, no doubt, owing to adverse circumstances, but partly also because of Greek unpreparedness for war and of the inflexibility of the Greek claims. Venizelos was, it is true, favoured by circumstances—the Balkan races just then had been drawn together in self-defence against the newly fledged tyranny of the Young Turks in Macedonia and Thrace, while the military revolt of 1909 had swept the Greek political stage clear of nearly all the corrupt parties, that hitherto had blocked the wheels of the nation's progress. But even so, the Balkan League would never have sprung into being but for Venizelos' higher vision, and his supreme courage in consenting to an alliance with Bulgaria, without a preliminary agreement as to the division of the Turkish spoils in case of victory.

When the World War broke out, Venizelos hastened, in the dark days which preceded the first battle of the Marne, to offer Greece's aid and adhesion to the Entente. This courageous offer, made at a time when the situation in France was so menacing, was never forgotten by the Allies, though declined for the moment on purely military grounds. A few months later (Jan. 1915) the Allies themselves asked for the coöperation of Greece in their plans for the Dardanelles expedition, and promised Greece, in exchange, extensive territory in Asia Minor. But

Venizelos' decision to accept this offer was incontinently vetoed by King Constantine; and Venizelos was forced to resign, though supported by a strong parliamentary majority and an all but unanimous public opinion. In the general election which followed (June 13 1915), despite the desperate efforts of the King and his party, the Venizelist party were returned with a large majority. But, contrary to all constitutional requirements, three full months were allowed to pass before Venizelos was summoned to resume office, the King's illness being made an excuse. When finally Venizelos formed his new Cabinet, the Dardanelles expedition had already failed, and another crisis was at hand. In the preceding spring Serbia had driven back the Austrian armies out of her territory; but now a fresh Austrian invasion was imminent, and Bulgaria was plainly bent on revenging herself for her disasters of 1913 by preparing to attack Serbia in the flank. According to the terms of the Greco-Serbian Treaty of 1913, Greece would, in that case, be bound to come to Serbia's aid. Bulgaria mobilized her army in Sept. 1915, and on the following day Venizelos obtained the King's signature to the decree mobilizing the Greek army. Two days later, Venizelos made an important statement in the Greek Chamber, declaring that, if Bulgaria attacked Serbia, she would have to face the Greek army as well. This declaration was received by the Chamber with loud cheers. King Constantine thereupon sent for Venizelos, and, after telling him that he would never consent to Greece drawing the sword against the allies of Germany, asked for his resignation. To the Premier's remonstrance that, after the recent verdict of the general election in favour of his policy, the Crown was not entitled to refuse its sanction, Constantine replied that in matters of foreign policy he did not consider himself bound to follow the national will, feeling himself "personally responsible to God alone." In the face of this attitude, Venizelos thought it best to resign once more (Oct. 1915); and after a Zaimis Cabinet had vainly endeavoured to obtain the support of the Venizelist majority in the Chamber, the latter was dissolved (for the second time within six months) and a new election ordered for Dec. 19 1915. This time Venizelos, as a protest against the King's unconstitutional proceedings, called upon his party to abstain from the polls; and as a result, only 230,000 votes were cast, as against 720,000 in the previous election. In consequence of this abstention of the Venizelist electors, no Venizelist was elected, and the new Chamber consisted almost exclusively of the old politicians, whom the military revolt of 1909 had swept out of politics.

Venizelos spent that winter and spring (1915-6) in endeavouring, through the press (he founded a newspaper called the *Keryx*), and by public mass meetings, to force the King to see the folly of his course. But after the surrender of Eastern Macedonia to the Bulgarians (Aug. 1916) he gave up all hope of converting Constantine to his views. On Sept. 25 1916 he took ship with his leading partisans for Crete, whence he sent out his proclamation to the Greek people, calling upon all true patriots to disavow Constantine and his fatal policy and to flock to the standard of the Entente. Proceeding on to Salonika, he established there a "Provisional Government of National Defence," which was in Dec. 1916 duly recognized by England, France and Russia, though not by Italy. His call for volunteers was responded to with enthusiasm by all parts of Greece not held by Constantine's troops, and 60,000 men were soon gathered at Salonika.

When at last England and France proceeded to dethrone King Constantine, Venizelos returned to Athens a few days after his removal (June 27 1917) and took over the government of the whole of Greece. His first measure was to convoke the Chamber elected in June 1915, whose dissolution by Constantine in Nov. of the same year was considered as a violation of the spirit, if not of the strict letter, of the Constitution. Venizelos then ordered a general mobilization of the Greek army and formally declared war against Germany and her allies. His path was beset by many serious difficulties. The German propaganda had done its work so thoroughly that a large section of the community were now entirely out of sympathy with Venizelos' war policy. Nearly one-half of the officers of the army and navy

were against him and the Entente. These were given their choice between adherence to the new regime and dismissal from the service. The large majority chose the latter; and thus 1,800 officers were retired on small pensions, and became a dangerous leaven for all subversive activities against the Government. Three distinct mutinies broke out while the newly mobilized reserves were being moved to the front. A large proportion of the public officials and judiciary were also disaffected; their removal from their posts was a matter of elementary prudence for a Government engaged in a war of such magnitude.

After the Armistice of Nov. 11 1918, and the assembling of the Peace Conference at Paris, Venizelos took up the diplomatic struggle for the rights of Greece. Between Nov. 1918 and Aug. 1920 he and his colleagues of the Greek delegation were almost continuously absent in Paris or London. He returned a few times for a brief sojourn to attend the meetings of the Greek Chamber; but there could be no rest for him until the Treaties of Neuilly and of Sèvres were finally signed. Never before had a Greek statesman achieved such magnificent results for his country. Never before had a representative of a small nation won such admiration or played such a brilliant part in a great international gathering. Yet no sooner was his triumph complete, than an attempt was made upon his life by a couple of young Greek naval officers (Tserépes and Kyriakos); and three months later, the Greek elections gave a crushing majority to his political opponents. Greek history is indeed full of such acts of popular ingratitude to public men, from Aristides the Just down to Charilaos Tricoupis.

Many explanations have been given of Venizelos' amazing overthrow in the hour of his greatest triumph. He himself attributed it to the war-weariness of the Greek people, that had been under arms with almost no intermission since 1912. His political enemies ascribed it to the determination of the Greek people to "regain their liberties" and to punish his "tyranny." It is, no doubt, the fact that a large section of the Greek people had been led to regard the situation in this light. The wildest stories were circulated in the press about the oppressive character of the Venizelist regime of 1917-20. Venizelos was accused of having cast 80,000 people into prison, shot several thousands of his political enemies, and dismissed 20,000 public servants. As a matter of fact, the aggregate number of persons imprisoned or interned or placed under police surveillance never exceeded 1,600. The only executions were those of military ringleaders of mutinies or military spies, after due public trial and conviction by courts-martial; the total number of these executions was 63. There were also some 9,000 dismissals of public servants for political reasons; but nearly all of these men were subsequently reinstated by the Venizelist Government itself, after they had sworn allegiance to the new order of things. When Venizelos' successors came into office in Nov. 1920 there were not more than 300 or 400 of these dismissed public officials still out of service by their own choice. There were, nevertheless, numerous acts of petty tyranny and injustice, that could be laid at the door of the Venizelist administration, during Venizelos' prolonged absence at the Peace Conference. Some of his lieutenants abused their power or failed to prevent such abuse by others. Many notorious bad characters had managed to creep into posts of influence and used their position to wreak personal vengeance or to enrich themselves at the expense of the public or the public treasury. But it may be doubted if, even so, the elections would have gone against Venizelos, had it not been for two other factors. One was the sudden death of the young King Alexander a bare fortnight before the election. This reopened the question of the succession to the throne; and although Venizelos, as a desperate makeshift, proposed Prince Paul, Constantine's youngest son, as King, the utter insignificance of this boy candidate only threw Constantine's own claim to restoration into stronger relief and gave a fresh impetus to the efforts of his party. Had Alexander lived until after the election, Constantine would hardly have succeeded in making his return good. The other factor in Venizelos' defeat was the blind over-confidence of his partisans; many Venizelists in Athens and the larger cities neglected to vote.

The total vote polled by the Venizelist party throughout Greece was actually 436,781 as against 525,642 cast for all the other parties. Venizelos himself received a huge majority in Athens and Piræus, but was defeated by the vote of the rural population of Attica. It is evident therefore that the large majority of anti-Venizelist deputies returned to the Chamber (256 out of 369) did not in any way correspond to a real anti-Venizelist majority in the electorate at large. After the election, and Constantine's return to Athens as King, a noticeable revulsion of feeling set in, especially in provinces where the anti-Venizelist vote had been strong. But up to Sept. 1921, when the great Greek statesman was occupied in cementing his domestic happiness by a second marriage in England, and the Greek army in Asia Minor was engaged in costly military operations against Turkey by way of making up for the loss of his powerful diplomacy, Venizelos himself had taken no further steps towards a restoration of his active influence in the national politics. He had been left a widower in 1895, with two sons, Kyriakos (b. 1893) and Sophocles (b. 1895); and his second wife, to whom he became engaged in Paris in the summer of 1921, the wedding being celebrated on Sept. 15 in London, was Miss Helena Schilizzi, heiress of a Greek Chiot family established in England.

See C. Kerofilas, *Eleutherios Venizelos* (1915); S. B. Chester, *Life of Venizelos* (1921).

VERDUN, BATTLES OF (1916-7).—On Dec. 6, 7 and 8 1915, the commanders-in-chief of the Allied armies on the western front, Sir Douglas Haig (Great Britain), Gen. Alexieff (Russia) and Gen. Cadorna (Italy), met together at Chantilly for a conference presided over by Gen. Joffre (France). The question to be considered was the best method of applying the suggestion of M. Briand, who had been president of the council of French ministers since Oct. 20 1915, for united action on an united front. It was decided to start a general offensive simultaneously on all fronts as soon as the British army had been able to obtain and train the expected reinforcements, and as soon as the Russian army, which had been severely tried by the 1915 campaign, had been reorganized as to men and war material, and the French army had its full complement of heavy artillery, trench mortars and ammunition reserves. Until the fulfilment of these necessary conditions it was impossible to fix a date for the offensive; it was, however, to take place as soon as possible. In the event of the enemy foreseeing the Allied attack and attacking one part of the front first the defender should be assisted by his Allies to their utmost powers.

On Feb. 18 Gen. Joffre chose the Somme as the theatre of the Franco-British offensive, and wrote to Sir Douglas Haig that the attack should take place about July 1. But the German High Command had decided upon a winter offensive. Maj.-Gen. Erich von Falkenhayn, who had relieved Gen. von Moltke as commander-in-chief of the armies in the field, was in reality generalissimo of the Central Powers; the Austrian High Command had suggested to him that nearly the whole of the Austrian forces should be directed against Italy, and that nine new German divisions should be sent as reinforcements to the Russian front. When once Italy was put out of action 400,000 Austrians would then be available to take part in the battle against France. Falkenhayn, however, rejected this proposal because he did not believe that a defeat upon a frontier of such extent would cause Italy to lay down her arms.

At the end of Dec., in a memorandum to the Kaiser, Falkenhayn reviewed the situation to the following effect. England, he said, was the soul of the Entente and the implacable enemy of Germany; she was exhibiting to-day the same tenacity that she showed in her historical struggles against the Low Countries, Spain, France and Napoleon. But in order to exhaust the resources of Germany she could hardly count on anything but a war of attrition; and Falkenhayn recognized that in reality time was on the side of the Entente. It was then necessary to strike a blow at England. But where? It was not possible to bring about a decision in the East; any success would be purely of a local nature, without influence on the course of the war. In France the marshy soil of Flanders was an obstacle up to the middle of

the spring; and as regards the British positions farther south, the objectives were too distant and their conquest would necessitate the employment of 30 divisions at least, which in point of fact the German army did not possess, and experienced officers were lacking to form the nucleus for new formations. Since England was out of reach, it was necessary to deprive her of her weapons, which were the Allied armies, and to give up the idea of a direct attack against the British armies. "Obviously this is a pity from the point of view of what our feelings are towards our chief enemy in this war," said Falkenhayn, "but it is necessary to accept the situation. Above all the enemy must be struck at through submarine warfare carried out to its limit. There was no sort of imprudence in risking the hostility of America. Because of the strong current of political opinion which is favourable to Germany it is doubtful whether the United States could decide to take any active measures on the European continent. It is still more doubtful whether they would be able to intervene in time with sufficiently strong forces. In order to destroy the tools of England on the Continent, Austria-Hungary has demanded that Italy should be attacked. This scheme, however, must be discarded: its realization would have as its only result the securing of future advantages for Austria-Hungary, but it would not have any immediate influence on the war taken as a whole. Even if Italy abandoned the Entente (and this is difficult to admit) her defection would not have an appreciable effect on England. The military aid of Italy is so little, and Italy in any case is so much under the thumb of England that it would be strange to make any mistake in this appreciation of the situation. Interior troubles which may be expected in Italy at no long date will paralyze the power to fight in that country.

"The same thing," continued Falkenhayn, "applies to Russia. Her internal distress will soon oblige her to change her tune. An offensive on a grand scale is impossible for her in winter. In addition strategic objectives are not to be found: the capture of St. Petersburg would much complicate the question of supply; an advance against Moscow would lead us into the desert; the Ukraine is a granary, but we must wait for the settlement of the Rumanian question before pursuing the occupation of it. All the Allies then have been successively eliminated: only France remains. France," Falkenhayn repeats, "has almost arrived at the end of her military effort, with a devotion that has been after all admirable. If her people can be made to understand clearly that there is nothing more to be hoped for from a military point of view, the worst will be over and England will find herself without her best sword. A break-through carried out in mass, an operation which is doubtful and beyond the power of our forces, is not necessary in order to reach this end. Even by the employment of limited effectives our aim can probably be reached. Behind the French line on the western front there are objectives which are within accessible range, and for which the French Command would have to fight to the last man."

Falkenhayn saw then the solution in a terrible conflict of attrition fought out on a limited front against the French army by the German army; the latter holding the initiative in attack could manipulate it according to circumstances and limit itself in effort and in losses. Two objectives presented themselves, Belfort and Verdun. The capture of either would have an enormous moral effect in France. Between these two Falkenhayn chose Verdun, for the following military reasons. "The French lines here are still at a distance of about 20 km. from the German lines of communication. Verdun is always the most powerful *point d'appui* for every attempt of the enemy to make untenable the German position in France and Belgium by the employment of relatively weak effectives."

This noteworthy report by Falkenhayn is full of the most detailed comments on the general situation of the Central Powers and on the conduct of the war as seen at that time by the German High Command. It displays naively his hate for England and contempt for the United States. It should be compared with William II.'s speech on June 15 1918 to the Great General Staff, on the occasion of the anniversary of his coronation, when after three victorious offensives he was persuaded of certain victory

Venizelos' decision to accept this offer was incontinently vetoed by King Constantine; and Venizelos was forced to resign, though supported by a strong parliamentary majority and an all but unanimous public opinion. In the general election which followed (June 13 1915), despite the desperate efforts of the King and his party, the Venizelist party were returned with a large majority. But, contrary to all constitutional requirements, three full months were allowed to pass before Venizelos was summoned to resume office, the King's illness being made an excuse. When finally Venizelos formed his new Cabinet, the Dardanelles expedition had already failed, and another crisis was at hand. In the preceding spring Serbia had driven back the Austrian armies out of her territory; but now a fresh Austrian invasion was imminent, and Bulgaria was plainly bent on revenging herself for her disasters of 1913 by preparing to attack Serbia in the flank. According to the terms of the Greco-Serbian Treaty of 1913, Greece would, in that case, be bound to come to Serbia's aid. Bulgaria mobilized her army in Sept. 1915, and on the following day Venizelos obtained the King's signature to the decree mobilizing the Greek army. Two days later, Venizelos made an important statement in the Greek Chamber, declaring that, if Bulgaria attacked Serbia, she would have to face the Greek army as well. This declaration was received by the Chamber with loud cheers. King Constantine thereupon sent for Venizelos, and, after telling him that he would never consent to Greece drawing the sword against the allies of Germany, asked for his resignation. To the Premier's remonstrance that, after the recent verdict of the general election in favour of his policy, the Crown was not entitled to refuse its sanction, Constantine replied that in matters of foreign policy he did not consider himself bound to follow the national will, feeling himself "personally responsible to God alone." In the face of this attitude, Venizelos thought it best to resign once more (Oct. 1915); and after a Zaimis Cabinet had vainly endeavoured to obtain the support of the Venizelist majority in the Chamber, the latter was dissolved (for the second time within six months) and a new election ordered for Dec. 19 1915. This time Venizelos, as a protest against the King's unconstitutional proceedings, called upon his party to abstain from the polls; and as a result, only 230,000 votes were cast, as against 720,000 in the previous election. In consequence of this abstention of the Venizelist electors, no Venizelist was elected, and the new Chamber consisted almost exclusively of the old politicians, whom the military revolt of 1909 had swept out of politics.

Venizelos spent that winter and spring (1915-6) in endeavouring, through the press (he founded a newspaper called the *Keryx*), and by public mass meetings, to force the King to see the folly of his course. But after the surrender of Eastern Macedonia to the Bulgarians (Aug. 1916) he gave up all hope of converting Constantine to his views. On Sept. 25 1916 he took ship with his leading partisans for Crete, whence he sent out his proclamation to the Greek people, calling upon all true patriots to disavow Constantine and his fatal policy and to flock to the standard of the Entente. Proceeding on to Salonika, he established there a "Provisional Government of National Defence," which was in Dec. 1916 duly recognized by England, France and Russia, though not by Italy. His call for volunteers was responded to with enthusiasm by all parts of Greece not held by Constantine's troops, and 60,000 men were soon gathered at Salonika.

When at last England and France proceeded to dethrone King Constantine, Venizelos returned to Athens a few days after his removal (June 27 1917) and took over the government of the whole of Greece. His first measure was to convoke the Chamber elected in June 1915, whose dissolution by Constantine in Nov. of the same year was considered as a violation of the spirit, if not of the strict letter, of the Constitution. Venizelos then ordered a general mobilization of the Greek army and formally declared war against Germany and her allies. His path was beset by many serious difficulties. The German propaganda had done its work so thoroughly that a large section of the community were now entirely out of sympathy with Venizelos' war policy. Nearly one-half of the officers of the army and navy

were against him and the Entente. These were given their choice between adherence to the new regime and dismissal from the service. The large majority chose the latter; and thus 1,800 officers were retired on small pensions, and became a dangerous leaven for all subversive activities against the Government. Three distinct mutinies broke out while the newly mobilized reserves were being moved to the front. A large proportion of the public officials and judiciary were also disaffected; their removal from their posts was a matter of elementary prudence for a Government engaged in a war of such magnitude.

After the Armistice of Nov. 11 1918, and the assembling of the Peace Conference at Paris, Venizelos took up the diplomatic struggle for the rights of Greece. Between Nov. 1918 and Aug. 1920 he and his colleagues of the Greek delegation were almost continuously absent in Paris or London. He returned a few times for a brief sojourn to attend the meetings of the Greek Chamber; but there could be no rest for him until the Treaties of Neuilly and of Sèvres were finally signed. Never before had a Greek statesman achieved such magnificent results for his country. Never before had a representative of a small nation won such admiration or played such a brilliant part in a great international gathering. Yet no sooner was his triumph complete, than an attempt was made upon his life by a couple of young Greek naval officers (Tserépes and Kyriakos); and three months later, the Greek elections gave a crushing majority to his political opponents. Greek history is indeed full of such acts of popular ingratitude to public men, from Aristides the Just down to Charilaos Tricoupis.

Many explanations have been given of Venizelos' amazing overthrow in the hour of his greatest triumph. He himself attributed it to the war-weariness of the Greek people, that had been under arms with almost no intermission since 1912. His political enemies ascribed it to the determination of the Greek people to "regain their liberties" and to punish his "tyranny." It is, no doubt, the fact that a large section of the Greek people had been led to regard the situation in this light. The wildest stories were circulated in the press about the oppressive character of the Venizelist regime of 1917-20. Venizelos was accused of having cast 80,000 people into prison, shot several thousands of his political enemies, and dismissed 20,000 public servants. As a matter of fact, the aggregate number of persons imprisoned or interned or placed under police surveillance never exceeded 1,600. The only executions were those of military ringleaders of mutinies or military spies, after due public trial and conviction by courts-martial; the total number of these executions was 63. There were also some 9,000 dismissals of public servants for political reasons; but nearly all of these men were subsequently reinstated by the Venizelist Government itself, after they had sworn allegiance to the new order of things. When Venizelos' successors came into office in Nov. 1920 there were not more than 300 or 400 of these dismissed public officials still out of service by their own choice. There were, nevertheless, numerous acts of petty tyranny and injustice, that could be laid at the door of the Venizelist administration, during Venizelos' prolonged absence at the Peace Conference. Some of his lieutenants abused their power or failed to prevent such abuse by others. Many notorious bad characters had managed to creep into posts of influence and used their position to wreak personal vengeance or to enrich themselves at the expense of the public or the public treasury. But it may be doubted if, even so, the elections would have gone against Venizelos, had it not been for two other factors. One was the sudden death of the young King Alexander a bare fortnight before the election. This reopened the question of the succession to the throne; and although Venizelos, as a desperate makeshift, proposed Prince Paul, Constantine's youngest son, as King, the utter insignificance of this boy candidate only threw Constantine's own claim to restoration into stronger relief and gave a fresh impetus to the efforts of his party. Had Alexander lived until after the election, Constantine would hardly have succeeded in making his return good. The other factor in Venizelos' defeat was the blind over-confidence of his partisans; many Venizelists in Athens and the larger cities neglected to vote.

VERDUN, BATTLES OF (1916-17)

noticed the Bavarian troops among their enemies, whose blood was shed unsparingly by the Prussian command.

General Joffre thought that he had won the first trick in this terrible game. In historic words he thanked the soldiers of Verdun. "Germany hoped," he told them, "that the capture of Verdun would strengthen the courage of her allies and would convince neutral countries of her superiority. She had not reckoned with you . . . the struggle is not over, because the Germans must have a victory. You will take it out of their hands. Of you it will be said: they barred to the Germans the way to Verdun."

The generalissimo dared then to tell his soldiers that the battle would continue; he took up the challenge of the enemy, who attached a moral importance to the capture of Verdun, for want of a strategic importance which it had not. The Germans had not obtained the rapid "break-through" which they had hoped for, and their objective was limited to the capture of forts on the right bank of the Meuse, purely a local rectification of front. They were reduced to give this objective an importance purely fictitious—"Verdun, the chief stronghold of our chief enemy, the head and heart of France," etc., etc.

General Joffre's victory was enhanced by these same declarations of the enemy. He frequently visited the front, for two or three days at a time. He kept Gen. Pétain's second army under his own immediate command, thus relieving of responsibility the intermediary "group of armies," a formation often useless, sometimes harmful, always heavy and slow, unless under the command of a striking personality; as long as Verdun was to be the sole theatre of operations Gen. Joffre was to exert there his direct personal action. He was thus able to calculate exactly what forces he could employ there, because he had to keep in reserve effectives necessary for the French offensive which was being prepared on the Somme, according to the plan of operations decided upon in Dec. 1915, and the execution of which he was following through imperturbably. Sir Douglas Haig had been quite willing to extend his front so as to free the N. French Army, which force could then be employed as reinforcements for Verdun; the British general offered to contribute directly to the battle that was being fought; but Gen. Joffre declined his offer as he wished the whole of the British forces to be available for the forthcoming offensive.

On March 12 and 13 the German bombardment was renewed on both banks of the Meuse with great violence; on the 14th a small advance brought the attack line nearer to the Mort Homme, but it was stopped by some successful counter-attacks.

On the 16th the village and fort of Vaux successfully resisted violent assaults repeated five times. On the 20th, however, after a furious artillery bombardment, the Germans seized the Avocourt wood, poorly defended by troops, who apparently allowed themselves to be unduly influenced by jets of burning liquid used in great quantities. However, on the following days, the attackers attempted to debouch from the wood in vain; well-directed artillery fire stopped any advance.

Prepared at leisure, a French counter-attack retook this wood on the 29th; it created a salient in the lines and might serve as a base for an advance which would embarrass the whole position. A violent struggle lasted four days for the possession of this ground, which finally remained in the hands of the French.

But against this the whole Malancourt salient fell into German hands; the French were obliged to evacuate Bethincourt and to fall back on the S. bank of the Forges stream; they even lost the summit of Mort Homme.

On the right bank the end of March witnessed the gradual advance of the Germans, slightly going beyond the village of Vaux. On April 2, descending the slopes of Douaumont, they seized the Caillette wood and crossed the Baril ravine; no defensive line, nor any reserve troops, separated them any longer from Fort Souville. They had even gone beyond the barrage fire of the French artillery.

At this moment the 5th Div. under Gen. Mangin came into line, and forestalling the hour for relief hurled in its first regiment to counter-attack. Uncertainty concerning the ground given

up deprived the artillery of all accuracy in its fire, which was not able to support the counter-attacking line, but this uncertainty was the same for both sides. It was above all necessary to stop the enemy where he was, and then to drive him back. All arrangements were made during the night, and the fight was resumed on the 3rd with a first success of good omen.

On the following days the artillery was able to regulate its fire, the Caillette wood was recaptured completely, all the approaches to Souville and to the N. of Vaux were largely freed, in spite of German reinforcements. It was noticeable that this division had lost fewer men in recapturing the ground than the former division in losing it. The idea gained ground of continuing with the same troops so as to retake Douaumont.

The 5th Div. was sent back to rest, and the plan of attack, which anticipated an advance on the part of the division on its left, was drawn up. That division, however, lost ground instead of gaining it, and the objective now to be reached was altogether *en jcteur*; as the adjoining divisions were not considered to be in a state to take part in the operation, the base of the attack became too narrow. Nevertheless it was launched on the 22nd about midday. After a fairly satisfactory artillery preparation, with magnificent dash it reached the fort in 11 minutes and occupied the superstructure with the exception of the northwestern angle.

To right and left the objectives laid down were reached almost entirely. The enemy, however, held on to the interior of the fort, and the outside was soon swept by his artillery fire; the machine-guns, in turrets which had not been knocked out, were soon augmented by others brought gradually into action.

The German reinforcements came up after the 23rd, because they were ready for this attack; the French reinforcements were too far back, and the officer in control of the attack did not have them under his orders. The struggle lasted two days, but the fort was lost again on the 28th.

Then the struggle broke out anew round Fort Vaux. The bombardment increased in intensity each day at the end of May; Damloup was taken on June 2 and the fort surrounded on three sides. The Germans finally occupied the superstructure, but Maj. Raynal continued the defence with steadfast heroism.

The fort fell on June 7. Its fall uncovered Fort Souville, already threatened by the German advance down the slopes from Douaumont; Thiaumont farm fell, the Caillette wood was retaken; and it seemed as if the heroism of the French soldiers was to be powerless in face of this advance, which appeared to be in some way mechanical.

General Pétain had taken over command of the group of French armies in the centre, and Gen. Nivelle of the Verdun army. General Pétain had already drawn the attention of Gen. Joffre to the gravity of the situation in May. He referred to it again on June 11, and insisted that the offensive to be undertaken on the Somme should take place as soon as possible. General Joffre replied the following day that he had made all his dispositions with this end in view, but that it was necessary to continue the struggle at all costs on the right bank, and even to risk the loss of batteries which could hardly be withdrawn.

The German advance, however, continued on the right bank, in spite of the energy of Gen. Nivelle, who repeatedly ordered counter-attacks, both immediate and instinctive.

The whole effort of the attacker was concentrated on this ground, an effort which amounted to a major operation having as its first objectives the work of Froide Terre, the village of Fleury and Fort Souville. Once that line was reached the old forts on the height St. Michel-Belleville would be easily seized, and the French would be hemmed in against the Meuse with its bridges under German artillery fire. Nineteen regiments belonging to seven different divisions were to be engaged; the reinforcements and reserves were brought up close to the front line in order to take advantage of the first successes, and to insure the strength and continuity of the effort. It was the most important and heaviest attack that Verdun had ever had to bear.

The artillery had been strongly reinforced, and began its preparation from June 20 with an intensity hitherto unheard of. On the morning of the 23rd the first-line trenches were literally

VERDUN, BATTLES OF

ploughed up, and the German infantry hardly found a single defender at the beginning of the attack, which reached the Baril ravine, Fleury, the Thiaumont work, and even penetrated the moats or ditches of the Froide Terre work, where the advanced elements had been taken prisoner. The French counter-attacks, however, stopped the German attack. General Mangin, who commanded this section of defence, launched unceasing counter-attacks. They hurled themselves against the German attacks but their advance at first was very slow; however, that of the enemy was stopped and his will was soon to be conquered. The stubbornness of the two adversaries was equal, and the course of the battle reached a dead-lock, but it was felt that the battle had already assumed another aspect.

However, on the evening of the 23rd the situation was serious, as the German wave was very near to beating against the Belleville height, the last stronghold to keep it from Verdun.

It reached the head of the ravines coming down from Froide Terre towards the Meuse, and the Poivre height was in danger of being submerged and its defenders taken in rear. General Nivelle, commanding the army, conferred with Gen. Mangin. Both were in agreement in thinking that it was necessary to counter-attack to the utmost; the threatened front was in a position of unstable equilibrium, and its only salvation was to be found in a movement forwards; Gen. Nivelle approved the orders issued in consequence. On his return to his headquarters he found Gen. Pétain, who satisfied himself that all measures were ready for the evacuation of the right bank, prepared down to the last detail. The positions for withdrawal by echelons were fixed in advance, in such a way that this masterly retreat would not leave a single trophy of war to the enemy. There was to be found in Gen. Pétain an admirable steadfastness of soul. With the exception of Gen. Nivelle not one of his subordinates suspected his fears. When he asked that opinion should be prepared for the retreat to the left bank he was thinking of those at home; to his soldiers and their officers he continued to show an impassive countenance, and he kept on saying, "We shall have them!"

For the third time Gen. Pétain pointed out the gravity of the situation to the commander-in-chief. A third of the French artillery was on the right bank and would be lost in case of a reverse if it was not withdrawn before the German artillery could fire on the bridges over the Meuse, and three days were needed to carry out this withdrawal; it would be wise to begin it.

General Joffre, however, was imperturbable. He replied on the 26th that the preparation for the Franco-British offensive had commenced, and repeated that Verdun should be defended on the right bank; should there be a loss of material as a result of this decision the commander-in-chief would assume the entire responsibility for it. When the telegram that he had ordered to be written to the above effect was handed to him by his chief-of-staff, the latter drew his attention to this decision and to the responsibility which he was assuming thereby. "I have taken many others," said placidly the general as he signed. He explained the general situation to the Minister for War, who had invited him to hurry on the Franco-British attack; the launching of the offensive had been subordinated to the reinforcement of the British and Russian armies in men and material; the hour had struck, and the guns on the Somme made their thunder heard. The offensive, previously fixed for June 29, was postponed till July 1 on account of bad weather, which hampered the artillery preparation. But it was on that date that it had been fixed by Gen. Joffre on Feb. 18, three days before the attack on Verdun, which had not succeeded in advancing or delaying it a single day.

The French Counter-offensive.—The end of June had witnessed the arrest of the German advance by French counter-attacks. The ground, which had been won at one blow on the 23rd, was regained step by step; on the edges of the Thiaumont work the conflict always remained fierce enough; vibrations on the front decreased in magnitude, but its general tendency was towards the N. and to the detriment of the assailant. The work—or rather the small protuberance which marked the site of the work—was taken and retaken to such a degree that it changed hands 16 times during the summer; the slight advances which had carried

the German line beyond the craters were gradually reduced, and from this side the initiative in attack belonged to the French.

On the other hand the German offensive continued to progress slightly in the direction of Fleury-Souville. The French had been almost completely thrown out of the village, which they had partly retaken on June 27.

The Crown Prince carried out anew a strong attack against Fort Souville. On July 11, after a violent artillery preparation and a storm of asphyxiating shells which enveloped the attack zone, he hurled 13 regiments belonging to 5 different divisions in between the slopes E. of Thiaumont up to the Vaux-Chapitre wood. The attack made a little progress on the 11th, very little on the 12th; a small detachment, however, was taken prisoner on the superstructure of Fort Souville. Certain counter-attacks organized unexpectedly had limited the gain of this strong offensive, very costly as it was in men, to a depth of 400 metres to the S. of Fleury on a front of 800 metres. By sheer tenacity a well-organized counter-attack led to the recapture of all the ground lost, resulting in the capture of many prisoners. After July 20 it was the French who attacked, in front of Souville as well as round Thiaumont. After the 11th Mangin's command was increased on this sector, and this unity made possible the powerful concentrations of artillery fire. Local attacks could be preceded by preparation on a large front, and thus leave the enemy uncertain as to the precise point where the action would unfold itself. Often several attacks would be carried out at the same time several kilometres distant from one another.

These minor operations were organized in detail, and numerous prisoners were taken along the whole front. This had its influence on the strength of the German troops, on their moral and physical condition, and on the march of reliefs and bringing up of supplies, which presented targets to the harassing fire carried out at night. The trenches to be attacked were covered by the fire of the 75's, which put up a barrage behind and prevented the escape of the defenders; at the same time the heavy artillery pounded them, either killing or burying the defenders; before the attack it often happened that whole detachments came out and surrendered themselves, declaring the position to be untenable. The advance of the attack was preceded by artillery fire from field guns which moved on at the same pace as the attacking infantry; this was the "creeping barrage," which made its appearance after the end of June. The French thus obtained the maximum results with the minimum losses. During the months of July and Aug. they took 3,500 prisoners, and their advance was continued.

The village of Fleury, retaken and lost again at the beginning of Aug., remained in the hands of the French from Aug. 17 onwards. The whole of the Fleury-Thiaumont crater was French, and the outskirts of Souville were well cleared on the north-east. But the enemy now attacked Souville on the E., issuing from Fort Vaux. He gained about 1,200 metres, and the pressure was disturbing. The unity of command then made itself felt between the Meuse and the Woevre, and produced its full results; at the beginning of Sept. the enemy was thrown back from the positions which he had just taken, and confined to the outskirts of Fort Vaux, from the other side of a crater whose inner slopes provided a good position for the defence of Souville.

The French losses had been heavier than the German during the first period, but the proportion was now reversed.

Hindenburg, who had just assumed command, proposed to the Kaiser that the attacks should be discontinued, and explained this decision as follows: "The battles which were fought in this region exhausted our strength as does a wound that will not heal. It was evident that this adventure did not leave us the least hope from whatever point of view, and its continuation cost us much more men than it did our enemy. Our advanced positions were exposed everywhere to the enemy's flanking fire; liaison with the front line was exceedingly difficult. The battlefield was a veritable hell, and the troops considered it rightly as such. To-day, after a retrospective study, I do not hesitate to say that from the purely military point of view, it would have been more to our advantage to improve our position in front of

Verdun by voluntarily giving up the greater part of the ground taken. However, in the autumn of 1916, I thought it necessary to postpone that decision: we have sacrificed in this affair a great part of our best troops, and up to that time we allowed our people to hope that the struggle would terminate gloriously for us. Further, if we had withdrawn at that moment, it might have made the too facile impression that all our sacrifices had been in vain. I wished to avoid that strain on the *moral* of our population, which was already highly tried. In suspending our attacks on Verdun we counted on our adversaries themselves adopting, in this region, a purely defensive attitude; our hope was not realized. At the end of Oct. the French launched a counter-attack on a large scale on the right bank of the Meuse; it was boldly carried out and overwhelmed us. We lost Douaumont and we had not the troops to retake this monument of German heroism."

The conditions under which that action unfolded itself were as follows: In front of Souville and of the line of forts a stout barrier had been formed, which included several well-organized positions; the battle had died down on the right bank, and the French renewed the offensive from the Meuse to the Woëvre, and regained their superiority over the enemy. On Sept. 13 the President of the French Republic came to bring to the martyr town the cross of the Legion of Honour and the decorations which the sovereigns of Allied countries had conferred upon it. From the casemates of the citadel, during a ceremony of moving simplicity, he pronounced an eloquent speech which consecrated the victory. But he had to keep all his fascination for the word which was at last to be spoken. Events had proved that every well-organized attack always commenced with success, and that it was exceedingly difficult to limit a victorious advance.

Now above all was it necessary to throw back the enemy from that barrier which had at last been remade. The hour had passed for those little attacks which aimed at the recapture of a few hundred metres; they had enabled them to get rid of successively the small or large pockets which the German line had dug into the French, but it was only by carrying the whole line forward at one bound that ground could be gained to advantage. An operation on a grand scale was called for.

General Nivelle entrusted Gen. Mangin with the study of this task. The latter considered the recapture of Douaumont as a possible consequence of success; this scheme was adopted after discussion, and the fort did not come into it except as one of the objectives of the attack. The same applied to Fort Vaux. The main object thus became the reconstitution in its integrity of the barrier of forts round Verdun.

General Mangin had all the necessary means at his disposal to bring this operation to a successful issue. He had a very powerful mass of artillery—280 field and mountain guns (calibre 65 to 96 mm.) and 314 heavy guns (100 to 400 mm.); 3 divisions in the front line, with 2 Senegalese battalions and 1 Somali battalion; 3 divisions under his immediate orders in the second line; while the adjoining divisions on the front of attack each placed a regiment in the line. The enemy opposed him with 7 divisions but they were very dispersed in depth: 16 battalions were in the first line; 6 in immediate support and in the zone to be taken; 11 in near support, which were all to be engaged on the evening of the attack; 25 in reserve, who would later come up to fill in the gaps. The French had located 200 German batteries (about 800 guns) capable of coming into action when the offensive began. After three days of destructive bombardment they feigned a general attack. The ruse was completely successful, and 158 batteries were disclosed; these were under counter-battery fire the next day, the day of the attack, to such effect that only 90 batteries opened fire that day, and then only under unfavourable conditions. The initial artillery superiority of the Germans had then disappeared. This was foreseen in the scheme of attack; the French commander knew that the means at his disposal would be inferior at the beginning to those of the defence, but would become superior during the action.

The infantry strengths were almost equal on both sides. The disposal of the German divisions on very narrow fronts, and some-

what hemmed in, lent itself less to manœuvre than did that of the French divisions, whose front was quite double, but above everything else the experience of former actions had shown the efficacy of the methods employed in this zone; a barrage of field guns falling behind the trenches nailed the defenders to them whilst the heavy artillery and the trench mortars made them indisposed for the fight. At the same time the fire of other heavy guns filled up the openings of the deep shelters, which in times of quiet served as strongholds for the defence; when the assault waves started, preceded by the creeping barrage from 70 to 80 metres in advance, they would not find more than rare local resistance, and would advance up to the deep shelters whose occupants would be taken prisoner. General Mangin was able to inform Gen. Joffre and Gen. Nivelle that two hours before the attack 22 German battalions had been almost completely wiped out. As far as the forts were concerned they were laid open; it was impossible to determine their capture with the same degree of certainty as that of the conquest of ground, but the occupation of the superstructure was certain and the capture of the whole appeared to be a matter of two to three days at the most.

If a success of this nature could be foreseen with such certainty, it was not due to an accumulation of material of war, since, at the beginning of the struggle the German artillery was undeniably much superior in numbers, in range, in rapidity of fire, and even in calibre (with the exception of a few French guns of 400 and 370 mm., whose fire was solely directed against the forts); nor was it due to the employment of masses of infantry which would overwhelm the enemy by sheer weight of numbers, since the density of the attack was thin so as not to expose more men to loss than those actually required to obtain the desired result. It was due to the use of logical methods, of well thought-out artillery bombardments, which gave them a superiority over the enemy and which compensated in large measure for inferiority in numbers and material; it was due, too, to the dash of the French troops and their confidence in their leaders. It was, however, further due to a perfect understanding in the command. The army commander provided his subordinate, who was in charge of the attack, with all the means at his disposal, and if they were not available he could ask for them from headquarters. Another factor was a thorough knowledge of the particular zone, and the experiences gained in this zone by the same leaders and the same staffs, who had been on the spot during a bitter struggle that had lasted several months. The result was assisted by the mistakes of the enemy, who had practically everywhere only one line of defence, in front of which he had been able to set up only elementary obstacles. These conditions were to be found again on the same field of battle two months later; but they were exceptional and weighed very heavily in favour of the French.

The artillery preparation, which commenced on the 20th and continued to the 24th with increasing intensity, produced its usual effects. The Germans gave themselves up singly or in little groups; a strayed carrier-pigeon brought in a message of distress from a battalion commander, who said that his troops were not in a state to fight. Finally, at 11.40, the artillery lengthened its fire and the French infantry left their assault trenches. A dense fog hid their advance from the enemy, who did not open fire till 12 minutes after zero time, when the two front waves had crossed his first trenches. The objective was reached in an hour, and it was consolidated very rapidly. In the first instructions the pause was to have been for half-an-hour; the commander of the groups of armies, considering it advisable to consolidate the position, the conquest of which was practically certain, had insisted that it should be much longer, and after discussion had finally fixed the pause for two hours. The bombardment, however, had been most thorough; a 420-mm. shell had brought about an explosion which was followed by a fire; one would have thought that it would have been a great advantage to hurry on and to profit by the confusion. Gen. Mangin, too, had fixed the time for consolidation as one hour.

The 38th Div. under Guyot de Salins formed the left wing. His colonial Moroccan regiment penetrated into Douaumont fort, which the Germans had evacuated the day before owing to

the threat of explosion but were occupying again. They were putting their machine-guns into position, but the rising tide of the assailants overwhelmed them.

In the centre the dash of the 133rd Div., known as "La Gauloise," under Passaga, had overcome all obstacles; and it had established itself in the angle N.E. of Douaumont and by the pool at Vaux. On the right, in front of the 74th Div. under Lardemelle, the artillery preparation had been insufficient against some centres of resistance, and the advance had been more difficult. More powerful artillery, which had become available, smashed the framework of the fort; long-range guns enfiladed the casemates (the surface which faced Verdun was covered with only ordinary masonry instead of being concreted); and finally the advance in the direction of Douaumont enabled field guns to be brought into action on the only position from which they could fire on the very steep slopes to the E. of the fort, whose communications were thus cut. The pressure of the infantry continued after the 9th Div. under Audlauer had relieved Lardemelle's division; the enemy evacuated the fort and Gen. Audlauer installed himself there on the 3rd. He occupied the villages of Vaux and Damloup.

The recapture of the Douaumont and Vaux forts was an important event, which consecrated the victory of Verdun in the eyes of the whole world; 6,000 prisoners emphasized it. This great success, however, called for its complement.

On Oct. 21 Gen. Mangin had pointed out to Gen. Nivelle the necessity which obtruded itself, after the capture of the objectives assigned for the operation on the 24th, of seizing the crater Douaumont-Hardoumont and the Poivre height, both of which had direct observation into the positions which were to be conquered, and of clearing the way round Fort Douaumont. General Nivelle then considered a combined operation, but he was very limited by the means at his disposal. The front of attack must not be beyond that of one for three divisions, but it might be possible to have a break of continuity in the centre. The ammunition would be only that which could be economized out of the daily allowances. General Mangin, however, insisted on the advantages of an attack from the Meuse to the Woevre, even should it be necessary to wait for the necessary troops and munitions. It was this scheme which the command finally agreed to. Before Mangin's group the German front was held by five divisions in the front line and by four in the second; the latter could intervene in one night, 247 batteries having been identified (960 guns approximately).

The French attack had 4 divisions available in the first line, 4 in the second, and 740 guns. It was, accordingly, inferior to the defence, but it could count on the results obtained on Oct. 24. The artillery in actual fact rapidly established a superiority over the German artillery, thanks to deeper penetration; 13 German artillery officers were captured, whose evidence confirmed in detail this undoubted superiority. As far as the infantry is concerned the smashing in of the front trenches led to the complete destruction of the 13 battalions defending them, and to the partial destruction of the 13 battalions in support in the zone to be conquered, so that the attack could then meet the slight initial numerical inequality.

The enemy, forewarned by the experience of Oct. 24, had organized three lines of resistance defended by a network of barbed wire; further the distance of the final objective introduced a greater element of chance; it was, accordingly, necessary to have more elasticity in the mechanism of the creeping barrage and to vary its application. It was laid down in the attack orders of Mangin's group that: "Each objective must be seized at the first onset and with one bound—the pace to be 100 metres in four minutes. The infantry to be preceded at a distance of 70 to 80 metres by percussion shell and at 150 metres by shrapnel, time and percussion. Further, when circumstances demand it and when it is possible, owing to long-range observation, artillery fire will be carried out in conjunction with the advance of the infantry; general officers commanding divisions will organize, with this end in view, the closest possible liaison between infantry and artillery."

The great obstacle to the organization of the attack was the state of the ground, which was frightfully cut up by 10 months of repeated fighting; in the slushy clay, where the water oozes out at any altitude, the shellholes, nearly touching one another, were at this time covered with ice. Without a complete fitting up of the ground every attack would come to grief in the mud. It was necessary to construct 25 km. of roads, several of which were planked with wood, 10 km. of Dreauville line, and a very great number of telephone systems. Everywhere supply and ammunition dumps had to be made and camouflaged battery emplacements; water tanks and pipes had to be fitted up, etc., etc. The inclemency of the weather, very severe on the Meuse heights, made these works particularly arduous. All the soldiers, however, realized their necessity, and they were completed in five weeks with wholehearted self-denial and with great spirit by the divisions who succeeded one another in this zone, right up to the time when the attack divisions went into line.

On Dec. 15, about 10.00 hours, the French regiments, after as complete an artillery preparation as was possible, issued from their trenches and attacked from the Meuse to the Woevre. On the left, the 126th Div. under Muteau seized Vacherauville and the Poivre height, where it established itself; the 38th, under Guyot de Salins, once again on the ground of its former exploits, seized Louvemont; the 37th under Garnier-Duplessis advanced as far as the Caurières wood, fighting step by step; the 133rd ("La Gauloise") under Passaga captured the Hardoumont work and the village of Bezonvaux. The advance, which had slowed down at certain points, carried the attack on the 18th to the second objective. At the same time, after the 15th, offensive reconnaissances had gone right beyond their objectives, and, protected by their creeping barrage, destroyed guns and captured prisoners to the number of 11,387, including 284 officers. By adding the number of killed and seriously wounded the total losses of the enemy could not be estimated at less than 25,000, on a front of 10 kilometres. One hundred and fifteen guns were taken and destroyed, and the defence of Verdun was now established on the narrowest part of the Meuse heights and in an excellent position.

The moral effect of this victory was great on both sides. Ludendorff speaks of it in the following terms: "The blow which we then received was a particularly hard one. We suffered great losses and also lost important positions. The effort exerted during the year had been too great. The elasticity of our troops had been weakened by the immobility of the defence, by the powerful artillery of the enemy, and in consequence of our own losses. On the western front we were completely exhausted."

The Germans drew many useful conclusions from these events, and recognized noticeably the impossibility of reducing the defence to lines of regular trenches, too visible targets for the opposing artillery. The French learnt from them the brilliant confirmation of the methods employed on Oct. 24. Without in any way decrying this success, it should be remarked that the most distant objectives (3 km.), which according to the fixed time-table should have been reached in a few hours, had been conquered only on the fourth day. Indeed, this was not the condemnation of the methods used, nor of the time-table fixed in advance in particular; but it went to show the necessity of foreseeing that this time-table could not be followed, and that it was necessary to manoeuvre, because the advance does not always develop with mechanical precision. On Dec. 12 Germany, for the first time, made overtures for peace, overtures which appeared to slacken the energies of the Government, of the armies and of the peoples of the Entente.

In thanking his victorious troops Gen. Mangin enumerated the results obtained, and the hopes that they could picture in the future. He added these words: "Admitting themselves incapable of conquering us on the field of battle, our savage aggressors dare to hold out to us a clumsy snare in the shape of a premature peace. While still picking up new arms they cry 'Kamerad.' You know that gesture. Our fathers of the Revolution refused to treat with the enemy as long as he was soiling the sacred

ground of our country, as long as he was within our natural frontiers, as long as the triumph of right and of liberty over the tyrants was not assured. And we will never treat with that perjured Government to whom treaties are but a scrap of paper, with assassins and butchers of women and children. After the final victory, which will render them incapable of doing hurt, we will dictate to them our will. To their hypocritical overtures France has replied through the muzzle of your guns and by the points of your bayonets. You have been good ambassadors for the Republic; she thanks you."

Capture of Mort Homme, Height 304 and Chaume Wood.—The Verdun front remained comparatively quiet until the middle of the summer of 1917, when it was livened up in Aug. with a brilliant stroke by the II. French Army under Guillaumat. The French command had provisionally given up the offensive on a large scale having as its object the break-through, whether immediate or as a consequence to the slow using-up of the enemy. It contented itself with attacks with limited objectives, having as their aim the improvement of part of the front whilst inflicting on the enemy losses more considerable than their own. The French command was able to carry through these local actions with extremely powerful forces, and thus assured their success. The operations on Aug. 20 had as its object the improvement of the French positions between Avocourt and Bezouvaux.

From the 13th onward artillery preparation was begun; 2,400 guns, 1,100 of which were large-calibre guns, were employed. On a front of approximately 20 km. on the Meuse four army corps were deployed, two on each bank, each having two divisions in the first line and two in the second. The army kept two divisions in reserve. To meet this attack, so long and carefully prepared, the Germans had six divisions in the front line, three on each bank. The front held by a division was 3 km. on the left bank and 2,800 metres on the right. Behind them were five so-called "divisions of intervention," two on the right and three on the left bank, with one division in army reserve in the vicinity of Montmédy. The defence had 380 batteries (about 1,500 guns).

The French artillery, which thundered for eight days, accelerated its fire on the 20th at 04.00 hours. At 04.40 it lengthened and the infantry assaulted, preceded by their creeping barrage. The enemy did not start his counter-barrage until 12 minutes afterwards. On the left bank the XIII. Corps seized all its objectives in the Avocourt wood and to the E. of Height 304, which fell after open fighting. The XVI. Corps captured Mort Homme and made numerous prisoners in its deep tunnels; the Moroccan division under Degoutte took Cumieres, the Corbeaux wood and the Oie height. On the right bank the XV. Corps captured the Talon height after daybreak and the important position of Height 344, then advanced in the bend of the Meuse as far as Champ and Champneville. The XXXII. Corps under Passaga captured the German positions to the S. of Beaumont Fosse wood and the outskirts of the Chaume wood.

The rapidity of the advance had disconcerted the enemy; the counter-attacks prepared in advance could not materialize, and the "intervention" divisions contented themselves by remaining where they were. During the night, however, the Germans attempted to react, without success.

On the 21st the French XV. Corps took Samogneux and the XVI. Corps the Oie height and Régneville.

On the 24th the famous position Height 304 fell. All the French objectives were reached. Seven new German divisions were hastily called up to hold the front, which became definitely stabilized on the left bank on the 24th. On the right bank the XXXII. Corps improved its positions in the direction of Beaumont and the Chaume wood on Aug. 26 and Sept. 8. On Sept. 9 a violent attack against Height 344 was repulsed. The captures amounted to 9,100 prisoners, 30 guns and 22 mine-throwers. Verdun was to a great extent cleared by this very successful operation. (C. M. E. M.)

VERDY DU VERNONIS, JULIUS VON (1832-1910), German general and military writer (see 27.1019), died Sept. 30 1910.

VERGA, GIOVANNI (1840-1922), Italian novelist (see 27.1021), died at Rome, Jan. 27 1922.

VERHAEREN, EMILE (1855-1916), Belgian poet (see 27.1023), produced in 1912 a tragedy, *Hélène de Sparte*, which was performed in German and Russian, besides French. His later poems include *Les Rythmes souverains* (1910); *Les Villes & pignons* (1910); *Les Fleurs du Soir* (1911); *Les Plaines* (1911) and *Les Blés Mouvanis* (1912). On the outbreak of the World War Verhaeren came to England, where he received hon. degrees from various universities. During his exile he published *Les Ailes rouges de la Guerre*. He was killed at Rouen while attempting to enter a moving train, Nov. 27 1916.

VERMONT (see 27.1025).—The pop. of the state was 352,428 in 1920 as compared with 355,936 in 1910, a loss of 3,528 or 1%. This was the first time that the pop. had been less than in the preceding decade, though several times the gain had been very slight. The movement within the state was distinctly toward the urban districts. Of the total pop. of 1900 22% lived in cities and villages of 2,500 and over, in 1920 27.8%, and in 1920 31.2%. Of the 14 counties only six show an increase in population. The number of towns showing a decrease was 186 in a total of 248. There is no radical change in the character of the population, the proportions of native and foreign remaining about the same, with a tendency toward increase of Canadian immigrants. The following are the cities having a pop. of 5,000 or over and the percentage of increase for the decade:—

	1920	1910	Percentage increase
Burlington	22,779	20,468	11.3
Rutland	14,954	13,546	10.4
Barre	10,008	10,734	-6.8
St. Albans	7,588	6,381	18.9
Montpelier	7,125	7,856	-9.3

Agriculture.—The number of farms in Vermont in 1920 was 29,075 as against 32,709 in 1910, a decrease of 3,634 or 11.1%, but the acreage of improved land increased from 1,633,965 in 1910 to 1,691,595, a gain of 3.5%. The value of all farm property was \$222,736,620, an increase over the 1910 figures (\$145,399,728) of 53.2%. Of this value \$82,938,253 was in land and \$76,178,906 in buildings. The average value per farm was \$7,661, with \$2,853 in land and \$2,620 in buildings, respective increases of 72.4%, 59.8% and 58.1% over the 1910 figures, which were \$4,445 for all property, \$1,785 for land and \$1,657 for buildings.

In 1919 the leading crops with their yields and values were as follows:—

Crops	Acreage	Quantity	Value
Cereals, total	133,621	3,916,959 bus.	\$5,171,758
Corn	21,186	937,375 "	1,687,275
Oats	83,097	2,396,349 "	2,396,349
Hay and forage	991,757	1,748,358 tons	29,581,464
Vegetables	7,387,254
Miscellaneous crops	3,622,443
Fruits	1,957,515

The total number of cattle in 1920 was 435,480, including 14,200 beef cattle and 421,280 dairy cattle. Dairy cows numbered 290,122. The value was \$28,502,803 for all cattle, and \$23,027,209 for dairy cows. The production of milk for 1919 was 122,095,734 gallons. The total value of all dairy products, excluding home use of milk and cream, was \$27,207,813. For 1917 the reports show a value of dairy products handled in factories of \$13,372,838. Vigorous efforts were being made to develop cooperative marketing, especially of dairy products. A decision of the Interstate Commerce Commission in 1916 abolished the leased-car system of shipping milk, and made possible the open-car system. This made it practicable to ship in smaller quantities. A state law was passed providing that any corporation using the word "cooperative" in its business name must provide (1) that voting shall be based on the number of shareholders and not of shares held; (2) that interest or dividends on paid-up capital shall be limited to 6%; (3) that a reserve fund shall be set aside, not less than 10% of the net profits annually, until the fund amounts to not less than 30% of the paid-up capital stock; (4) that the remainder of the earnings shall be distributed by uniform dividend on the basis of purchase and sale through the corporation by shareholders or the amount of raw material furnished; and (5) that not more than 10% of the capital stock shall be owned by any one member. Under this law there were, in 1920, 29 cooperative dairy plants incorporated, of which 27 had already begun business. The Commissioner of Agriculture estimated in that year that one-third of the entire dairy products of the state was being marketed through these plants. In addition to this movement there was being organized, in 1920, the Vermont Cooperative Creameries, Inc., a federation of cooperative enterprises for the purpose of securing col-

lectively certain services beyond the reach of the separate plants, such as the buying of supplies, the selling of products, and standardized accounting.

Manufacture.—The reports for the five-year period 1914-9 show a substantial increase in the manufacturing activities of the state, due in large measure to demands of the World War. The number of establishments increased from 1,772 to 1,790, or 1%; persons engaged from 37,217 to 38,845, or 4.4%; salaried employees from 2,726 to 3,550, or 30.2%; wage earners from 32,794 to 33,491, or 2.4%; capital increased from \$79,847,000 to \$134,314,391, or 68.2%; value of products from \$76,990,974 to \$168,108,072, or 118.3%; value added by manufacture from \$34,285,254 to \$72,935,491, or 112.7%. In 1919 Vermont had 15 manufacturing industries the value of whose products were over \$1,000,000 each, namely: marble and stone; woollen and worsted goods; paper and wood pulp; lumber and timber products; machine tools; butter; condensed milk; flour-mill and grist-mill products; other food preparations; knit goods; foundry and machine cars; general ship construction and repairs by steam railway; furniture planing-mill products; bakery products.

History.—In 1915 a workmen's compensation law was enacted, denying common-law defences to those employers who did not elect to operate under the provisions of the law. The statute covers all public and industrial employment except domestic service and cases where 10 or less are employed. Beginning in 1912 a series of Acts was passed leading to the organization of a state Board of Charities and Probation and more systematic provisions for the care of dependent, neglected and delinquent children. This movement has been extended to include widows' pensions in certain cases. In 1917 an important step was taken in the direction of coordinating the work of some of the many state departments, commissions, and boards. A state Board of Control was established by law, composed of the governor of the state, the state treasurer, the auditor of accounts, the director of state institutions, and a fifth person to be appointed biennially by the governor and Senate. This Board of Control meets regularly once a month. All state boards, institutions, commissions, officers and departments, other than judicial officers, must make monthly reports to the Board of Control. The Board has general supervisory powers over the various state activities, and may investigate any phase of their work. The Board makes its report biennially to the state Legislature.

Following an extensive educational survey, the public-school system of the state was radically reorganized in 1915, making the seventh form of administration that has been tried since 1845. Under the system adopted the office of state superintendent was abolished. In its place was established a State Board of Education consisting of five members appointed by the governor, one each year for a five-year term. This Board has general powers of supervision and management of the public educational system, and employs as state commissioner of education a trained and experienced educator, whose term of office is indefinite, being removable by a majority vote of the Board. The Board also appoints a number of superintendents with powers of supervision, and the state commissioner has power to appoint a suitable number of state supervisors when approved by the Board. The supervisors cooperate with the superintendents and supplement their work.

In 1919 the Legislature authorized the state Board of Health to divide the state into 10 sanitary districts, and to appoint for each a district health officer in place of the town health officers. This Act entirely reorganized the public health work of the state. The district officers are full-time officers and serve under the pay of the state. The public health work is much more effectively carried on than before, being after 1919 under five separate divisions, each under the direction of an expert supervisor.

Up to the signing of the Armistice Vermont had supplied for the World War over 15,000 men. Some of this number had gone across the line and enlisted with the Canadian forces before the spring of 1917. Of those in service more than one-half were sent over-seas. The deaths were: killed in action, 119; died of wounds, 47; total deaths, 613. The total wounded were 778. Total casualties recorded were 1,390.

The state has remained consistently Republican in politics since 1836, not excepting 1912, the year of the Progressive party campaign. The recent governors of the state, all Republican, have been: John A. Mead, 1910-2; Allen M. Fletcher, 1912-5; Charles W. Gates, 1915-7; Horace F. Graham, 1917-9; Percival W. Clement, 1919-21; James A. Hartness, 1921-

(G. G. G.)

VERRALL, ARTHUR WOOLGAR (1851-1912), English classical scholar, was born at Brighton Feb. 5 1851. He was the son of a solicitor, and was educated at Wellington and at Trinity College, Cambridge, where he graduated as second classic in 1873, becoming fellow and tutor of his college. He published editions of many classical plays, especially the *Medea*, *Agamemnon* and *Choephoree*. In 1895 appeared *Euripides the Rationalist*, followed in 1905 and 1910 by editions of most of Euripides' plays. He was an original critic, with views of his own, often expounded in the *Classical Review* and other journals. In February 1911 he was appointed to fill the new King Edward VII. professorship of Literature at Cambridge, which had been endowed by Sir Harold Harmsworth, later Viscount Rothermere. He died at Cambridge June 18 1912.

VICTOR EMMANUEL III. (1869-), King of Italy (see 28.28). When in 1915 Italy declared war on Austria, the King at once went to the war zone, remaining there until the Armistice, appointing his uncle Ferdinand, duke of Genoa, Royal *Luogotenente* of the kingdom to act in his stead. At the front he lived in a most unassuming manner at the "Villa Italia" near Udine, and after Caporetto near Padua, constantly visiting the trenches and the most exposed positions, as well as the military hospitals. He took the deepest interest in everything concerning the army and the welfare of the troops; but, although nominally commander-in-chief, he never interfered with the conduct of the operations nor in the matter of appointments, and he allowed himself only the same amount of leave as any other soldier. After the conclusion of the Armistice he returned to Rome on Nov. 14 1918 and had a triumphant reception. He visited Paris and the French front with the Crown Prince (Dec. 19-21), and subsequently London.

After the birth of his son and heir Umberto, Prince of Piedmont (Sept. 15 1904), the King's family was increased by two more daughters, Giovanna, born Nov. 13 1907, and Maria, born Dec. 26 1914. He was devoted to his wife and children, and to study; and he took a special interest in numismatics, having in 1910 and 1913 already published two volumes of his monumental work on the coins of Italy, the *Corpus nummorum italicorum*. After the war he made over to the nation a large number of royal residences in various parts of Italy, a heritage of the days when Italy was divided into a number of separate states, each with one or more royal or ducal palaces and villas. Among the most famous of these are the Pitti Palace in Florence, the villas of Castello, La Petraia and Poggio a Cajano in the neighbourhood of that town, the royal palaces of Milan, Venice, Genoa, Naples, the villa Capodimonte near Naples and the "Neapolitan Versailles" at Caserta. Some of these buildings were turned into hospitals and homes for war victims, and others into museums.

VIENNA (see 28.50), the capital of the Austrian Republic, is situated in Lower Austria, but under the Constitution has in all matters which concern itself the status of an independent Territory. Under these special conditions, the *Gemeinderat* (or city council) exercises the rights of a *Diet* (or states assembly). In 1910, Vienna had a pop. of 2,031,408, but in 1920 only 1,842,003. In 1910 86.9% of the inhabitants were Roman Catholics; 3.7% Evangelicals; 8.6% Jews and 0.7% of other faiths. The proportion of males to females was in 1910 1,000 to 1,086; in 1920, 1,000 to 1,163. The non-German minority shown by the census of 1910 (98,430 Czechs and 8,954 others) greatly decreased after 1918.

VILLA, FRANCISCO (1872-), Mexican bandit and revolutionary, was born Dec. 4 1872 at Las Nieves, Zacatecas. He was outlawed for murder, and a price was put on his head by President Díaz. He joined Madero in 1910 for the sake of immunity, served under Huerta, and in 1914 joined Carranza, but quarrelled with him over military jealousies and presidential aspirations. He opposed Carranza in the Convention at Aguascalientes, led a campaign against him and occupied Mexico City in April and again in Nov. 1915, but was defeated by Obregon and driven to the border, where surrender under guarantee was denied him. On Jan. 12 1916 he led the *Santa Ysabel massacre*, in which a special train carrying a party of American mining

men was held up and 19 of the number shot, and also the raid on Columbus, Tex., in March 1916, when the city was fired and 17 of the inhabitants killed. A punitive expedition under Gen. Pershing crossed the border March 16, and operated in the border states for 11 months, but did not succeed in capturing Villa. After Obregon's seizure of the presidential power in 1920 Villa was eliminated from political and military activity, and settled in the *hacienda* La Canutilla, Durango. (H. I. P.)

VILLARI, PASQUALE (1827-1917), Italian historian and statesman (see 28.76), was invested in 1910 with the order of the Annunziata. He died at Florence Dec. 5 1917.

VINCENT, GEORGE EDGAR (1864-), American educationist, was born at Rockford, Ill., March 21 1864. He was a son of John Heyl Vincent (d. 1920), a bishop of the Methodist Episcopal Church and one of the founders of the Chautauqua Assembly in 1874 (see 6.19). After graduating from Yale in 1885 he began editorial work and in 1886 was made literary editor of the Chautauqua Press. Henceforth he was active in the work at Chautauqua, was president of the Chautauqua Institution from 1907 to 1915 and thereafter honorary president. In 1892 he was appointed fellow at the university of Chicago, receiving his Ph.D. in 1896. He taught at Chicago as instructor, assistant professor, associate professor, and from 1904 to 1911 as professor of sociology. He was dean of the junior colleges from 1900 to 1907 and then for four years was dean of the faculties of arts, literature and sciences. From 1911 to 1917 he was president of the university of Minnesota. In 1917 he was chosen president of the Rockefeller Foundation in New York City; he had been a member of the General Education Board since 1914. He was author of *An Introduction to the Study of Society* (1895, with Albion W. Small) and *The Social Mind and Education* (1897).

VINOGRADOFF, SIR PAUL (1854-), Anglo-Russian jurist (see 28.100), was knighted in 1917. His more recent works include *Common Sense in Law* (Home University Library, 1914), *Self-Government in Russia* (1915), and editions of various works for the British Academy and Selden Society. During the World War he gave valuable assistance to the British Foreign Office in connexion with Russian affairs.

VINTON, FREDERIC PORTER (1846-1911), American portrait painter (see 28.101), died in Boston, Mass., May 19 1911.

VIRGINIA (see 28.117).—The pop. in 1920 was 2,300,187; an increase since 1910 of 247,575, or 12%, as against an increase for the decade 1900-10 of 207,428, or 11.2%. Negroes numbered 600,017, as compared with 671,006 in 1910. The urban pop. (in places having more than 2,500 inhabitants) was in 1920 29.2% and in 1910 23.1% of the whole.

The pop. of the principal cities and its increase were:—

	1920	1910	Percentage Increase
Richmond	171,667	127,628	34.5
Norfolk	115,777	67,452	71.6
Portsmouth	54,387	33,190	63.9
Roanoke	50,842	34,874	45.8
Newport News	35,596	20,205	76.2
Petersburg	31,012	24,127	28.5
Lynchburg	30,070	29,494	2.0
Danville	21,539	19,020	13.2
Alexandria	18,060	15,329	17.8

The great increase in Newport News, Norfolk and Portsmouth was largely due to industries related to the World War.

Agriculture.—In 1920 Virginia ranked as twenty-third state in value of agricultural products, \$187,038,000 as compared with \$100,531,000 in 1908. The production of the staple crops was:—

	1920	1909
Corn (bus.)	50,100,000	38,295,141
Wheat "	11,425,000	8,076,989
Oats "	4,818,000	2,284,495
Rye "	864,000	438,345
Barley "	405,000	253,049
Buckwheat (bus.)	540,000	332,222
Tobacco (lb.)	177,390,000	132,979,390
Hay (tons)	1,235,000	823,383
Peanuts (bus.)	4,416,000	4,284,340
Potatoes "	13,608,000	8,770,778
Cotton (bales)	19,000	10,480

An important element was the increased activity of the State Department of Agriculture. In addition to seed testing and the inspection of fertilizers a division of markets was established and plants were opened to supply lime to farmers at cost. Fruit crops in 1920 were large, the production of apples being 15,210,000 bus., peaches 1,470,000 and pears 296,000.

Minerals.—The mining and quarrying industry in 1919 showed a considerable increase since 1909 in the number of enterprises, a slight increase in the capital invested, and a large increase in the value of products. But there was a decrease in the number of individual mines and quarries and a slight decrease in the number of persons engaged in the industry. The statistics were:—

	1919	1909	Per cent Increase
Enterprises	202	150	34.7
Mines and quarries	216	244	-11.5
Persons engaged	15,537	15,960	-2.7
Wage earners	14,547	15,257	-4.7
Capital	\$57,035,775	\$55,992,693	1.9
Value of products	29,363,449	8,795,646	233.8

Virginia in 1920 was the leading state in the production of iron pyrites and soapstone, third in the production of lime and manganese, and sixth in mineral waters. The figures for mining and mineral water industries in 1919 were as follows:—

	Establs.	Capital	Product
Coal	109	\$48,978,261	9,111,454 tons
Iron	14	895,555	308,000 "
Manganese	47	2,489,400	13,665 "
Mineral waters	18	848,283	1,745,105 gal.
Pyrites	5	2,550,854	143,427 tons (1918)
Soapstone	4	617,887	\$527,524
Millstones, and sand and gravel	6	522,152	\$733,074
Slate		3,654,000	\$264,275
Miscellaneous ores		1,587,491	1,313,439 tons
Lime			26,700 "

Manufactures.—Manufacturing industries made less progress than agriculture between 1910 and 1920. The following statistics for 1919 are the preliminary figures of the 14th Census; those for 1909 from the 13th Census:—

	1919	1909
Establishments	5,603	5,685
Capital invested	\$464,517,000	\$216,392,000
Materials	372,041,000	155,320,000
Value of products	641,810,000	219,794,000
Value added by manufacture	269,769,000	108,719,000
Wage earners (average)	119,368	105,676

Government.—Between 1910 and 1920 10 amendments to the state constitution were adopted. Local government was the subject of four amendments. In 1910 the state constitution was amended to permit the re-election of county treasurers and commissioners of revenue, and in 1912 another amendment permitted the re-election of city treasurers and commissioners of revenue. In 1912 the Legislature was empowered to classify cities according to population and to provide forms of city and town government, but cities with over 50,000 pop. were permitted to have special forms of government. Under this amendment the Legislature provided for general charters under the commission, or manager, form, but in 1920 another amendment was ratified which permitted Legislature to provide special forms of government for any city on condition that the sections of the constitution regarding franchises, changes in city boundaries, public debts and the assessment of property were not violated. In 1920 another amendment removed the requirement of residence within the municipality as qualification for appointment to office in a city government when technical training was requisite. In 1920, also, the construction of roads was made a proper subject for state debt, and other amendments bearing on education were adopted.

Finance.—The valuation of property assessed for taxation in 1910 was \$756,194,480; in 1920 it was \$1,459,762,653. In 1910 the public debt was \$24,956,959; in 1919 it was \$23,561,823. In 1910 the state's income and disbursements combined were \$11,333,490; in 1920 they were \$18,442,324. The long-standing controversy between Virginia and West Virginia concerning the division of the state debt as it existed in 1860 was finally settled in 1915 by the Supreme Court of the United States. The amount to be assumed by the state of West Virginia was fixed at \$12,393,929 (see WEST VIRGINIA). Between 1910 and 1920 notable reforms were made in taxation and financial administration. A special tax commission was appointed in 1910 to recommend measures for the segregation of property for taxation. In 1912 the commission recommended the establishment of a permanent tax commission with power to investigate and to submit plans. A second special commission was then appointed; in 1915 a majority report recommended a revision of assessments

under a permanent tax commission, and a minority report favoured immediate measures for segregation. The minority report was adopted, and the tax laws were revised as follows: the state levy on real estate and tangible property was restricted to educational purposes, and state and local levies on intangible property were apportioned at 65c and 30c per \$100 respectively; a permanent tax board was created consisting of the governor, the auditor, and the chairman of the State Corporation Commission, with power to employ assistants, whose duties are to collect information relating to taxation, to make recommendations to the Legislature, and to supervise the work of local tax boards. In 1918 local governments were denied the right to levy income taxes, and in the same year a special tax of eight cents per \$100 was levied, four-eighths of which was to be applied to state elementary schools, three-eighths to the construction of roads, and one-eighth to the eradication of tuberculosis. In 1919 an additional tax of seven cents was levied for roads. In 1916 a commission on efficiency was constituted to recommend more efficient methods of state and local financial administration, and in response to its recommendations a state budget law was enacted in 1918 which gave the governor large powers over appropriations from the state treasury.

Education.—The school revenue, which in 1910 was \$4,407,853, amounted in 1920 to \$13,791,864, the expenditure *per capita* of attendance increasing from \$14.77 to \$39.48 and the length of the school term from 140 to 147 days. In this period the number of state high schools of all grades increased from 360 to 394. In 1912 an additional state normal school for the training of teachers was established at Radford. In 1918 a general property tax was added to the existing sources of school revenue which yielded approximately \$600,000. In 1918 school attendance of all children between the ages of 8 and 12 for 16 weeks was required. Teachers' pensions have been provided for, and the pensions disbursed in 1920 amounted to \$10,000. In 1918 the Legislature provided for an Educational Commission to make a survey of the educational laws and conditions and to make recommendations for reform and improvements. Its report was made in 1920, and in accord with its recommendations the Legislature in that year submitted for ratification the following amendments to the constitution: legalizing the membership of women on school boards, removing the limitation on county and district school tax rates and all limitation on the Legislature in enacting compulsory attendance laws, and giving the Legislature the power to fix the duties of the State Board of Education. Among statutes enacted in 1920 looking to the improvement of the school system were laws encouraging a nine months' term in rural communities, making the school age 7 to 20 years, provision for a school census, encouragement of rural high schools, conferring on the state superintendent the right to nominate candidates for positions as teachers, provision for physical education and medical inspection, and placing the state institutions of higher education on an all-year basis of operation.

History.—In 1912 the work of children under 12 years of age in coal mines was prohibited and the 10-hour day for children in factories was extended to workshops and mercantile establishments, with the exception of packing and fruit industries between July 1 and Nov. 1, mercantile establishments in towns of less than 2,000 pop., and Saturday work in mercantile establishments. In 1918 the minimum age for employment was raised to 16 years. In 1914 the commitment of insane criminals to asylums by judicial investigation and order before trial for the crime committed was provided for, and in 1916 the State Board of Charities and Correction was required to register all the feeble-minded in the state, to take measures for their commitment to asylums, and to instruct parents in the care of feeble-minded children; it was also authorized to supervise private institutions for the feeble-minded. Two institutions for the feeble-minded are supported by the state, one for white patients near Lynchburg and one for negroes near Petersburg. In 1916 the office of public defender for cities of 50,000 or more pop., with the duty of defending the poor in lawsuits, and state compensation was authorized for attorneys appointed by courts to that duty. In 1918 a Mothers' Pension law was enacted which allowed city and county governments to make payments to widows with children under 16 years of age. In the same year the principle of the uniform Family Desertion Acts was adopted, and an Industrial Commission was provided to administer a workmen's compensation system.

Three sanatoria for the treatment of tuberculosis have been established, the Catawba Sanatorium in Roanoke county (1909), Blue Ridge Sanatorium near Charlottesville (1920), and Piedmont Sanatorium for negro patients near Burkville (1918). In 1918 a state orthopaedic hospital was established at Richmond. In 1914 the Virginia Home and Industrial School for Girls, a

private institution, became the property of the state, and since then three other reformatories have been taken over. In 1919 the State Prison Board was reorganized and reforms in prison management were adopted, notably better medical care of prisoners, investigation of their mental condition, provision for recreation, and elementary and industrial education. In 1914 a State Forestry Commission was established. In 1916 the State Board of Health was given control over all water supplies which might endanger public health. A state art commission was constituted in the same year.

In the World War Virginia supplied 81,140 men to the army, navy and marine corps and subscribed \$263,948,400 to the Liberty and Victory loans.

In every state and national election between 1910 and 1920 the Democratic party had a majority. In 1909 William Hodges Mann (Dem.) was elected governor, his term being from 1910-4; he was succeeded by Henry Carter Stuart (Dem. 1914-8, and in 1917 Westmoreland Davis (Dem.) was elected, his term of service beginning in 1918. (W. K. B.)

VIRGIN ISLANDS (see 28.126).—The group of the Virgin Is. formerly known as the Danish West Indies was purchased by the United States from Denmark in 1917 for \$25,000,000, the formal transfer taking place March 31 of that year. This group consists of the islands St. Croix, St. Thomas and St. John, together with about 50 smaller ones, most of them unnamed and uninhabited. These and the islands Vieques and Culebra ceded to the United States by Spain in 1898 now compose the Virgin Is. of the United States. The language of the people is English, although the islands had been under the Danish flag for 245 years. The total area of the three principal islands is about 132 sq. m.; St. Croix, the largest, had, according to the U.S. census of 1917, a pop. of 14,901; St. Thomas had 10,191; and St. John, 959, a total of 26,051, of which 7.4% were white, about 80% negroes and the remainder of mixed races. Illiterates constituted 24.9% of the pop. 10 years of age and over. The largest city in the islands, Charlotte Amalie, on the island St. Thomas, had in 1917 a pop. of 7,747. The other towns, Christiansted and Fredericksted on the island of St. Croix, had pop. of 4,574 and 3,144 respectively; these three towns embrace approximately 60% of the total population.

The principal industry, the production of sugar, rum and molasses, is confined to St. Croix. The importance of St. Thomas is due to its magnificent harbour, where the repairing and provisioning of vessels constitute practically the sole industry. In 1920 the U.S. Shipping Board completed an oil-fuelling station here with a capacity of 110,000 bar. St. John and St. Thomas produce the finest bay oil and bay rum in the world. In 1918 exports of bay rum amounted to 26,531 gal. valued at \$29,101, and in 1919 these returns were more than doubled. There were, in 1917, 430 farms containing an area of 69,892 ac., which was 82.4% of the total land area. There were 6,084 persons, or 41.6% of the working population engaged in agriculture and animal husbandry, and 380 persons in fishing.

The total trade of the islands in 1919 was valued at \$4,196,037, compared with \$3,141,775 in 1918. Exports advanced from \$1,249,346 in 1918 to \$1,919,525 in 1919, while imports increased from \$1,892,429 to \$2,276,512. The major portion of this commerce was with the United States, being in 1918 more than seven times as great as with all foreign countries, and in 1919 about four times as great. The total exports of the islands to the United States in 1918 were valued at \$1,137,501, 82% being sugar, compared with \$1,593,130 in 1919, of which sugar constituted 88%. Of the other exports to the United States the chief were rum, hides and skins, and cabinet woods. Of exports to foreign countries in 1919, spirituous liquors to Denmark constituted about 44% and bay rum about 18%. The principal imports from the United States are breadstuffs, meat and dairy products, iron and steel products, cotton manufactures and coal. Since 1918 fuel oil from Mexico has constituted a large proportion of the imports. Many of the provisions imported are resold as ships' stores, while nearly all of the coal and fuel oil imported are used for bunkering ships at St. Thomas.

Since the transfer of the islands from Denmark, their administration has been under the U.S. Navy Department. The first governor was Rear-Adml. James H. Oliver, who was relieved April 8 1919 by Rear-Adml. Joseph W. Oman, U.S. navy. The latter was succeeded in April 1921 by Capt. Sumner E. W. Kittelle. When the United States took over the islands educational facilities were limited, but steps have been taken to improve conditions. Improvements have been made also in the municipal hospitals and along sanitary lines generally, especial attention having been paid to infant welfare work. (W. R. MA.)

VISCONTI-VENOSTA, EMILIO, MARQUIS (1829-1914). Italian statesman and diplomat (see 28.129). After representing Italy at the Algieras Conference the Marquis Visconti-Venosta retired into private life, but on account of his great experience, profound legal and political culture and sound judgment, he was often consulted by his Government, especially on questions of foreign affairs. He explicitly approved of Italy's declaration of neutrality on the outbreak of the World War. He died in Rome Nov. 28 1914.

VISTULA-SAN, BATTLES OF THE.—In the Austro-German autumn campaign of 1914 against Russia (see EASTERN EUROPEAN FRONT CAMPAIGNS; also Map, PLATE I., under same heading), the battles of the Vistula and the fighting on the San, with the battle of Chyrow, from Sept. 9 to Nov. 5, form a series of operations which are described below.

The retreat of the Austro-Hungarian armies in the middle of Sept. to the San and the area around and S. of Przemyśl had hardly been completed when the Russian forces made ready to cross the San at its mouth with a view to enveloping Dankl's army, both at that point and on the left bank of the Vistula.

After the recent heavy fighting, in which Austria-Hungary had drawn upon herself alone the whole weight of the superior force of Russia, her army was exhausted and anything but fit to hold the San against the on-coming, steadily increasing mass of Russians. And yet if they were allowed to advance any further, not only would the Austro-Hungarian army be shattered but one of the main German industrial areas—Upper Silesia—would be in danger. For the protection of this area and the support of her ally, it was necessary for Germany to send immediate reinforcements. Negotiations to this end began between the two army commands by the middle of September.

Considerable portions of the German VIII. Army had been sent free after the successful battles on the Masurian lakes. While the Austro-Hungarian armies were shaking off the enemy, a IX. German army under the command of Gen. von Hindenburg had been constituted in S. Poland and Upper Silesia out of the German XI., XVII. and XX. Corps, the Guard Res. Corps and a combined Corps, together with the 8th Cav. Division. This army was drawn up for deployment along the line Przynów-Lelów-Wolbrom-Cracow by the end of September.

On Sept. 16, protected by the Przemyśl fortress, which was left to its fate, and the bridgeheads of Sieniawa and Jarosław, evacuated on Sept. 18 and 20 respectively, the Austro-Hungarian armies resumed the retreat which led them back to the line of the Dunajec, the Biala, and the farther side of the Carpathian ridge, by the end of the month. The Russians attempted no real pursuit, but sent only weak forces after them to beyond the Wisłok. They regarded the Austro-Hungarian army as worn-out, and turned their attention to preparing a powerful push through Poland into the heart of Germany.

The Austro-Hungarian armies, after re-establishment, were to join the German IX. Army in a new offensive which aimed at beating the Russians and relieving Przemyśl.

The Austro-German Advance on the San-Vistula Line (Oct. 9 1914).—The idea underlying the new offensive was as follows: Hindenburg's army was to advance on the stretch of the Vistula between Zawichost and Ivangorod and envelope the Russians from the north. The Austro-Hungarian armies were to advance with a small group on the N. bank of the Vistula, but with their main forces to the S. of the river by way of Rzeszów and Krosno to the San and on Przemyśl, while the II. Army moved forward correspondingly in the region S. of Przemyśl.

The Russians were well aware of these measures, and as soon as the advance of the Allies began they abandoned the siege of Przemyśl and withdrew their forces remaining in Galicia to the San and to the E. and S. of Przemyśl, where they fortified their positions. Their main strength they concentrated in the first instance at Ivangorod, and later at Warsaw, in order to fall on Hindenburg's northern flank and thus compel the Allies to retire. As early as Sept. 22 the latter received the first news of the formation of a Russian IX. Army in the region round Ivangorod, and from this time reports kept pouring in of the shifting of

strong Russian forces northward. It therefore became incumbent upon the Austro-Hungarian army to make a vigorous onslaught on the Russians, in order to contain as large a number of their forces as possible. The demand thus made upon it that army was in a position to meet only conditionally owing to the superiority of the Russians, who had meanwhile been reinforced by Siberian and Caucasian troops.

While on Oct. 4 the main forces of the Austro-Hungarian armies were advancing eastward S. of the Vistula, the German XI. Corps at Opatów and the Austro-Hungarian 3rd and 7th Cav. Divs. at Klimontów on the N. of that river came upon the enemy and drove him behind the stretch of the San between Sandomierz and Zawichost by Oct. 5. The Austro-Hungarian main forces in the area S. of the Vistula encountered at first only Russian cavalry. Until the San was reached only comparatively slight resistance was offered by the Russians. Only the IV. Army, of which the command had been taken over by the Archduke Joseph Ferdinand in the beginning of Oct., and the N. wing of the III. Army had to battle with and overcome strong Russian forces round Rzeszów, Lancut, and Barycz on Oct. 7 and 8. The I. Army, after some brief combats, was able to drive over the San the portions of the Russian V. Army which had remained in the angle of the San and Vistula. By Oct. 10 the Russians were over the San and behind Przemyśl, with the exception of parts of the Russian III. Army, which held out until Oct. 12 at Jarosław on the W. bank of the San.

While the advance was still in progress news came of a northward diversion of the Russian V. Army. Large Russian forces were also debouching from Ivangorod and Warsaw. All the indications pointed to the fact that the Russians had transferred their centre of gravity to the Warsaw-Ivangorod stretch of the Vistula. The original plan of forcing the Vistula with Hindenburg's army between Zawichost and Ivangorod could not now be carried out. Instead, while the Austrian I. Army advanced gradually down the Vistula to the mouth of the Kamienna, Hindenburg was to cross the Vistula below Ivangorod, having first driven the Russian forces from Warsaw and Ivangorod back across the Vistula. The Austro-Hungarian main army was to make a vigorous effort to force the San and once more push on toward Lublin and Chełm.

Battles of Warsaw and Ivangorod (Oct. 10-Nov. 5).—The advancing corps of Hindenburg's army came into contact with large Russian forces to the S. of Ivangorod and Kalwarija and at Mszczonów-Grojec, and these they drove back on Oct. 10. South of Warsaw, where the resistance offered was only slight, the German corps gained ground, taking Blonie; but at Ivangorod and Alexandrya the attacks of the III. Caucasian Corps made things very uncomfortable for them.

The Russian offensive advance across the Vistula below Zawichost seemed to be getting well under way. The German IX. Army was reinforced without delay by two divisions on its right wing, and three more divisions of the I. Army were pushed forward into the Radom-Ilzanka area. To Hindenburg's left wing were sent two Landwehr Brigades and the Austro-Hungarian 7th Cav. Div., which, with the German 8th Cav. Div. was formed into a Cav. Corps under Gen. von Korda.

The fighting persisted stubbornly on both sides. In view of the constant Russian reinforcements, Hindenburg could achieve a decisive success neither at Warsaw nor at Kalwarija or Ivangorod. When, on Oct. 15, his left wing was forced back at Blonie-Grodzisk, the Allied Army Commands were more and more inclined to think that the Russian main attack was about to be launched from Warsaw with two armies, the II. and V. Armies. The Allies decided to meet this attack by the German IX. Army on the line Łowicz-Skierniewice-Rawa-Nowemiasto-Radom. The Austro-Hungarian I. Army meanwhile was to concentrate seven divisions in the Radom-Ilzanka sector in readiness for an attack on Ivangorod. This concentration of the I. Army was completed by Oct. 21. The IX. Army held its ground against the numerical superiority of the Russians until Oct. 20, when, after Korda's Cav. Corps had dispersed a Russian Cav. Corps near Sochaczew, it retired to the above line.

Simultaneous attempts to force the San were made by those portions of the Austro-Hungarian I. and IV. Armies posted on the lower San, but though partial successes were achieved, no tangible results were possible in view of the Russians' powerful counter-attacks, particularly as the Russians had succeeded in taking the W. bank of the San at Biellny, Zarzecze and Monasterz. For this brought the X. Corps of the Austro-Hungarian I. Army over to the W. bank of the Vistula, and the IV. Army had to take over the defence of the whole line of the San. To the W. of Warsaw the Russians were extending still further westward, and bringing up forces to the Lower Bzura, where the Russian I. Army was being formed.

On Oct. 21 Hindenburg and Dankl were grouped for attack in the order arranged, and on the 22nd Dankl advanced to the assault. In the battle of Ivangorod which followed (Oct. 22-7), some fine initial successes were obtained by the I. Army and the German Guard Res. Corps fighting on its left wing, but the 37th Honved Div., fighting on the right wing, was placed in a very critical position by the extremely violent attacks of the Russian XXV. and XIV. Corps. Embittered fighting persisted for the next few days on the I. Army's front. On Oct. 24, Hindenburg was attacked along the whole of the front by the Russian II. and V. Armies, but was able to repulse all their assaults. On Oct. 26 the Russians drove their right wing forward through Gadin, Osmolin and Lowicz. Here four Russian Corps forced back two German Landwehr Bdes., Korda's Cav. Corps and some German Landsturm. Hindenburg's main force, four Corps strong, was opposed by six Russian Corps, and the seven Austro-Hungarian Divs. posted in the direction of Ivangorod had to cope with double their own numbers.

As there was no prospect of a successful issue, and as an enforced retreat had in places already set in, the battle was broken off on Oct. 27. Leaving Dankl's army to put up an obstinate resistance along the line Kielce-Gura-Opuczna-Opatow-Sandomierz, Hindenburg led his army back to the line Sieradz-Jedrzejów. The Guard Res. Corps was to remain on the left wing of the I. Army, while Field-marshal Lt. Freiherr von Haner's Cav. Corps, newly formed out of the 2nd, 3rd and 9th Cav. Divs., was to constitute a liaison between the two armies.

Battle of the Opatowka (Oct. 31-Nov. 2).—The Russians pursued the Austro-Hungarian I. Army with their IX. and IV. Armies, the German IX. with their V. and II. Armies. Meanwhile the newly formed I. Army on the Russian right wing advanced on Kutno. By Oct. 30 the Austro-Hungarian I. Army had reached its position and strengthened it technically against all emergencies. On Oct. 31 the columns of the Russian IX. Army appeared at Opatow and proceeded to attack violently both there and on the Opatowka. At Kielce the fighting was of secondary importance, but E. of Opatow the Russians were aiming at a breakthrough. On Nov. 2 Dankl's right wing retired behind the Koprzywianka, exposing the flank of the Austro-Hungarian IV. Army fighting on the far side of the Vistula.

In view of the vigorous Russian pursuit and the impossibility of holding the Koprzywianka any longer with troops that were already greatly exhausted, the Austro-Hungarian higher command agreed to the retreat behind the Nida proposed by the I. Army command. On Nov. 3 the I. Army with the Guard Res. Corps, reached the area W. of the Czarna and Czarna Nida and on the 4th shook off the Russian IX. Army completely. On Nov. 5 the army crossed the Nida and on the 6th continued its march into the area round Cracow.

The German IX. Army, which remained practically unmolested during the whole retreat, commenced its further retirement to the Silesian frontier in the night of Nov. 3 and 4, arriving there on the 5th.

Battle of Chyrow (Oct. 13-Nov. 2).—The Austro-Hungarian II. Army had advanced to the S. of the III. Army, without encountering enemy opposition, but under the most unfavourable conditions imaginable. The leading division reached Krosienko on Oct. 9, only to find the Chyrow defile, through which the advance to the area E. of Przemyśl was to be made, blocked by the Russian XXIV. Corps. Gen. von Tersztyánszky's column

(the IV. Corps), which had pushed on further to the E., reached Turka after taking the Uszok pass by hard fighting.

The II. Army came up against strong enemy forces, firmly established in well-prepared positions on the heights S. of Stary Sambor, and on those opposite the S. wing of Boroewić's army. With its main force, the VII. and XII. Corps, the II. Army attacked the enemy's position S. of Czystski, on both sides of the Blozewka hollow and at Starasol. Tersztyánszky's group, coming from the S. was to take the heights S. of Stary Sambor and push forward with one column (the 38th Honved Inf. Div. and 5th and 8th Cav. Divs.) through the Bystrzyca valley to Sambor. Working in harmony with this attack, the S. wing of the III. Army, which was opposed by numerically superior Russian forces, was also to push forward. Gen. von Boroewić reinforced this wing by bringing up the III. Corps and the 23rd Honved Inf. Div. from the area N. of Przemyśl, where they had just driven the Russians across the San. The II. Army aimed at forcing a decision with Tersztyánszky's group. But while the preliminary battles were being successfully conducted there, a heavy Russian counter-attack set in in front of the left army wing. This led to very heavy fighting on the heights S. of Stary Sambor, at Slochynia, Blozew Gorna and Towarnia, and necessitated the putting in of all available reserves. The right army wing was able to achieve some successes in fighting down the Russian opposition, but an advance on the left wing by the XII. Corps was quite impossible, for there the Russians were doing their utmost to break through to Chyrow and Dobromil. The 20th Honved Inf. Div. and 34th Inf. Div. fighting on that wing had to be withdrawn to the area E. of Towarnia and toward Blozew Gorna, and from Grodowice to Slochynia, and even after the 17th Inf. Div. came on the field they could not stand against the overwhelming onslaught. Just when the situation looked most threatening, the 12th Inf. Bde. of the III. Corps arrived on the battlefield, and although not able to turn the scale it relieved the pressure on the Honved Inf. Div., which was the most exhausted.

On the morning of Oct. 16, the Russians were resuming their attacks, when the III. Corps made its counter-attack directed against the heights of Czystski, Guty and Wegrzeliska. But though the coming into action of the III. Corps brought some relief to the fighting divisions, no success could be expected in view of the continuous vehement Russian attacks, and more especially, the devastating flank fire from the Czystski and Magiera heights. To conquer these heights Boroewić now brought up the XI. Corps also to the area S. of Przemyśl. But in the night of Oct. 17-8, the Russians once more pushed forward with strong forces into the Blozewka hollow, and threw back the 22nd Inf. Div. onto the heights E. of Nowemiasz. The 34th Inf. Div. was likewise forced to give ground, and Blozew Gorna was given up to the enemy. On Oct. 19, the XI. Corps, advancing through Stroniowice and Tyszkowice on Mizyniec and Chodnowice, flung themselves into the battle, and drove the Russians back. Close by, a little further S., the 44th Inf. Div. stormed the Magiera height, and the advance of the III. Corps was made considerably easier. When the 23rd Honved Inf. Div. attacked from Byblo, it carried the whole front with it. The 22nd Inf. Div. recaptured Sanoczany, the 6th Inf. Div. seized Blozew Gorna, and the 28th Inf. Div. worked its way through to the edge of a wood opposite the Wegrzeliska height. The danger of a break-through now seemed to be finally averted.

Meanwhile Tersztyánszky's group on the right wing of the II. Army had also had some hard battles. In the Bystrzyca valley the 38th Honved Inf. Div. column, which had gone on ahead, succeeded in beating back through Zalokiec, Podbuz and Uroz the Cossacks who had been pushed forward to protect the Russian left wing. But on Oct. 18 the Russians brought up new forces through Boryslaw with which to attack this column in flank, whereupon the column had to be taken back to the heights W. of Zalokiec and Podbuz. In the meantime Gen. Hofmann's Corps, destined for the defence of the Carpathians, which had advanced over the Beskid Pass on Oct. 8, had taken Stryj and despatched a group to Drohobycz. This group came up in front of Drohobycz on Oct. 27, but the Russians in the meantime had

attacked Gen. Hofmann with greatly superior forces, so that the detachment sent to Drohobycz had to intervene at Stryj. It was therefore unable to procure any relief for the II. Army particularly as Gen. Hofmann had also been forced to retreat.

Simultaneously with this, the attack along the whole front of the II. and III. Armies was continued. In the case of the III. Army this culminated in the attempt to capture the Czyski heights and in the defence of the Magiera height against the Russians who were longing to regain it, while the II. Army aimed at relieving the enemy pressure on the right wing. But by Oct. 23 the great numerical superiority of the Russians at this point had become evident, and the II. Army command found it necessary to bring back the IV. Corps—consisting of the 38th Honved Inf. Div., the 31st Inf. Div. and the 1st, 5th and 8th Cav. Divs.—without delay to the heights N.E. of Turka. The XII. Corps was to remain on the heights W. of Sary Sambor, and the IV. Corps was brought up from the III. Army to fill the gap between the two. The Russians kept touch with the retreating divisions but for the moment attempted no sort of pursuit.

The III. Army, stricken with cholera and short of munitions, had not been able to achieve any real success up to Oct. 26. On the afternoon of that day a general attack was delivered by the III. Army with the object of relieving the II. Army, but as this also failed almost completely the front was technically strengthened and the reserves were taken out of it and placed at the disposal of the II. Army.

Meanwhile the Russians had not molested the II. Army's right wing to any extent, but directed their energies toward the gap between the IV. and XII. Corps, where they hoped to break through. Their attack on Oct. 26 across the Holownia height had begun to look like a break-through, when Field-marshal St. Krautwald's group of the III. Army, together with two newly arrived Landsturm territorial brigades and a few march battalions, came to the rescue. The IV. Corps, as soon as it had recovered a little from the recent heavy fighting, went over to the attack, and took the Bzeniec, Podzemen and Zwiwonka heights.

The attack by Krautwald's group and the IV. Corps had good results. By Oct. 31 the Russian VII. Corps had been driven from the stubbornly defended Holownia height. As this attack progressed, the XII. Corps and, shortly after, the III. Army joined in. On the morning of Nov. 2, the whole of the II. Army was engaged in the attack. Hofmann's Corps, which had retired on Skole after the abortive advance on Drohobycz, also joined in the renewed attack on Stryj. The XII. Corps came up close to Sary Sambor and up to the Kundieska height. The IV. Corps approached the strong Russian position Lisij height—Zalarski height and the heights E. of Podbuz.

Just as the battle at Chyrów seemed at last to be taking a favourable turn, after the II. Army had received reinforcements, and the reconstruction of the railways leading to Chyrów and Przemyśl promised a considerable improvement in the service of munitions and supplies, there came the order to retire, an order totally unexpected by the troops of the II. and III. Army engaged in the attack.

The army higher command had already informed the army commands on Oct. 27 of the unfavourable situation in the bend of the Vistula, and announced the possibility of the breaking off of the battle. The position of the armies fighting on the San, at Przemyśl and at Chyrów, had been made untenable by the withdrawal of the German IX. Army and the Austro-Hungarian I. Army from the line Sieradz-Kielce, and from the Opatówka to behind the Nida—practically to the Silesian frontier. In spite of the successes just achieved on the S. wing, therefore, the Austro-Hungarian armies had again to be led back, in view of the general situation. In Upper Silesia, in the Cracow area and in Western Galicia, a new grouping of the Austro-Hungarian armies was to be undertaken, under the protection of the Carpathian ridge, in readiness for a new offensive in better circumstances in conjunction with the German IX. Army—which was also to be reorganized.

The retreat was begun in the night of Nov. 2-3, by the left wing of the Austro-Hungarian IV. Army, and by the right wing,

now amalgamated with the III. Army. Both these and the II. Army broke contact with the enemy in the night of Nov. 4-5. (E. J.)

VITAMINE, the term now employed to designate certain substances contained in foods. The exact nature of these substances is not known, but they have been shown to be necessary to the normal development of young animals (including children) as well as to the maintenance of health and well-being in adults. They are very labile substances which, existing abundantly in raw foods, especially in uncooked fruits and vegetables, become seriously attenuated or altogether destroyed by cooking, desiccation, decortication and other refining processes. There are probably a great many vitamins in natural foods—live or quick foods, as they are called—but up to the time of writing three only have been isolated. These are (1) the anti-scorbutic factor; (2) the water-soluble B.; (3) the fat-soluble A.

The Anti-Scorbutic Factor.—As long ago as 1734 J. E. Bachstrom observed that the disease known as scorbutus or scurvy appeared to be related to the ingestion of salted, preserved and dried foods. The disease in question was alarmingly prevalent among mariners on long distance sailing vessels, and the British navy was annually decimated by this scourge. The introduction of fresh vegetables and fruits into the dietary of the sailors was found to afford them complete protection against the disease, but the knowledge thus empirically gained was not followed by any scientific investigation, and though the door was thus widely opened to the discovery of vitamins, these important substances were destined to lie *perdu* for nearly 200 years. This anti-scorbutic factor is the most fragile of the three which have so far been isolated. It is present in large quantities in all uncooked fruits and vegetables, and it is interesting to note that the popular idea that foods which have been kissed by the sun have a greater value than those which have not, finds some justification in the fact that vegetables grown above ground are much richer in the anti-scorbutic factor than root vegetables. This factor is well represented in fresh milk, but boiling, pasteurization, or evaporation completely destroys it. The activity of the anti-scorbutic factor is much increased by germination; thus, beans, peas, or the grains of wheat or barley in the ordinary dry quiescent state contain no anti-scorbutic factor, but if they be placed in water and allowed to germinate, they immediately acquire this vitamin in large quantities. There is a practical application of this interesting fact which should not be lost sight of by travellers in inaccessible regions.

The Water-Soluble B.—Prof. Gowland Hopkins of Cambridge published in 1912 an article entitled "Feeding Experiments Illustrating the Importance of Accessory Factors in Normal Diets,"¹ in which he called attention to the serious effects upon the health of animals which resulted from the absence from their food of certain hitherto unrecognized principles. In the following year Casimir Funk² claimed to have isolated a "Factor X" which corresponded to the absent principles described by Hopkins to which he gave the name of Vitamine, in the mistaken belief that the factor in question contained an amino-acid. In spite of its faulty derivation the name caught on, and the word vitamine is now employed to include any of those essential substances which Hopkins unfortunately described under the term "accessory." The experiments of these two observers showed that the absence of the factor now known as the Water-Soluble B. was the cause of the disease known as beriberi, which a Dutch physician, Dr. C. Eykman, had in 1867 associated with the custom of eating polished or decorticated rice by the natives, to the exclusion of all other foods. Beriberi is a disease of the nerves, and it was found that other similar affections of the nerves, pellagra for example, could be experimentally produced by withholding this vitamin, and cured by reinstating it in the dietary; hence the term "anti neuritic" by which it is sometimes known. This factor is essential to the normal growth, development and well-being of young animals. It is present in great

² *Ueber die physiologische Bedeutung gewisser bisher unbekannten Nahrungbestandteile der Vitamine.* *Ergeb. Phys.* (1913), 13, p. 125.

abundance in all quick or natural foods, in grains and eggs. It is also present in the brain, liver, sweetbread and kidneys of animals, whereas from muscle or ordinary meat it is relatively absent. Yeast contains this vitamine in large quantities. In the vegetable kingdom, the leguminosae afford it, uniformly distributed throughout their substance; whereas in cereals it is confined to the outside covering; hence the importance of unpolished rice and whole meal bread. It is soluble in water, especially in slightly acidulated water, and in alcohol, but not in fats. It resists a relatively high temperature; it is present for example after boiling for a short period, but is destroyed at 120° C.

This vitamine, as indeed the whole conception of vitamines in general, was first described in 1901 by Dr. Eugene Wildiers of Antwerp (1878-1908) under the name of Bios.¹ In a paper which appeared in *La Cellule* (Louvain) on April 2 1901 entitled "Nouvelle substance indispensable au développement de la levure," this young Belgian observer set forth a good deal of the knowledge which we now possess, but no notice was taken of his work, and his conclusions were arrived at independently by a different route about 12 years later.

The Fat-Soluble A.—In the year 1913 the third vitamine was described by McCollum and Davis.² Its absence was shown to provoke a disease of the eyes, characterized by oedema of the lids, ulceration of the cornea, blindness and ultimately death. These lesions, even when in an advanced state, were cured by the exhibition of the vitamine. The absence in some degree of this factor is held responsible by some for the disease known as rickets. Its presence is certainly necessary to the growth and normal development of young animals. It is found (a) in certain animal fats, i.e. milk, butter and glandular tissue; (b) in the green leaves of edible plants. It is thus interesting to note that though present in essential organs or so-called "noble" tissues, it is absent from connective tissue and reserve tissue, such as lard or the subcutaneous animal fats. Olive oil and other vegetable oils do not contain this vitamine, whereas cod-liver oil contains it in large quantities. Fat-Soluble A. is soluble in oil, but not in water. It resists high temperature better than the other two.

Such was the state of our precise knowledge in 1921 concerning these elusive substances. If only from the confused and cacophonous nomenclature, it is evident that this knowledge was still in a very embryonic state. That there is, in this matter, a very wide field of interesting and fruitful research awaiting us is obvious from the fact that the discovery of the vitamines has entirely altered our conceptions of the causes and origins of disease. Until lately disease was regarded as a sin of commission by some unseen and subtle agency; the vitamines are teaching us to regard it in some degree at any rate as a sin of omission on the part of civilized or hypercivilized man. By our habit of riveting our attention upon microbes and their toxins we had sadly neglected the side of the question which concerns itself with our own defences. We sterilized our children's milk against the bacillus, and in so doing we deprived it of its vitamines and thus lowered the resisting power of the victim, not to one microbe only, but to all. The importance of vitamines has taught us that the naturally nourished child is practically immune from the majority of the diseases which in spite of our bacteriological and hygienic knowledge have been raising the infant death-rate to a figure which was as surprising as it was appalling. But it is to be remembered that in order to attain to this immunity a child must be born healthy; it must have been suitably nourished during its intra-uterine life, and this can only be attained by feeding the prospective mother upon foods which contain the necessary vitamines in such an abundance as will satisfy the physiological needs of two. The gross diseases due to absence of vitamines, such as scurvy, beriberi, pellagra and xerophthalmia, called the "deficiency diseases" (*maladies de carence*) are characterized by symptoms which are acute and unmistakable, but it is certain that long before these acute symptoms appear there will have been

a general ill-defined departure from normal health, called by the French *carence fruste* or *hypo-carence*, and the condition may never pass beyond this stage. It is thus not only futile but actually dangerous to seek to estimate, as has often been done, the minimum amount of vitamine which will insure protection from obvious disease. What is required is not the minimum but the optimum. Amongst these conditions of *hypo-carence* may be mentioned the majority of the maladies due to the deficient action of the internal secretory or endocrine glands, such as the thyroid, thymus, supra-renals, pituitary, gonads and others, which have already been shown to suffer severely from deprivation of vitaminous foods. In the same category of *hypo-carence* are also to be placed many of the so-called metabolic diseases such as gout, arthritis, diabetes and others. These may be occasioned directly by the vitamine deficiency, or indirectly by starving one or more of the endocrine glands of the all-essential principles. As might easily be supposed, this relative lack of vitamines is peculiarly liable to show itself in the gastro-intestinal tract. Digestive difficulties and intestinal inertia, appendicitis and colitis have been shown in a great number of cases to have been due to a lack of vitamines in the ordinary foods, a fact of which anyone may convince himself in the matter of the widely distributed disease known as intestinal stasis or chronic constipation. It has often been remarked that dental caries or defective teeth is an evil which has seemed to be very much on the increase during the last 20 years; the period, that is, during which all fresh and unsterilized foods have been withheld from the young in order that they may be fed on devitalized pap which, in addition to requiring no mastication, is, by boiling and other culinary processes, completely deprived of the vitamine content so necessary to the proper development and eruption of the teeth themselves. Vitamines have already revolutionized our ideas on dietetics. The erstwhile stereotyped proportions of the proximate principles, proteins, carbohydrates, fats and salts which were considered essential to bodily health have been so altered by the discovery of the vitamines that the whole question will have to be investigated and studied afresh, and the ineffable theory of calories which was based on the curious assumption that the behaviour of food in the human body was identical with its behaviour in a test-tube, will retire to the limbo of things well forgotten. The discovery of the vitamines presents would-be scientists with a much-needed lesson in humility. It reminds us that, in evolving man, Nature provided him with the foods necessary to his growth, development and well-being, and that in interfering with these natural foods by cooking, sterilizing and refining, he has sacrificed their efficacy, sometimes to his greed, but more often to his arrogant assumption of superior knowledge, with the result that he has not only promoted the prevalence of preventable disease, but has actually created others which but for his misdirected energy would have had no existence.

VOGÜE, EUGÈNE MELCHIOR, COMTE DE (1848-1914), French author (see 28.172), died in Paris in 1914.

VOLUNTEERS (see 28.208).—The reorganization of the Volunteer Force in Great Britain, founded in 1859, as a Territorial Force fully constituted with staffs, troops and services, took place in 1908; and when this was completed, no units of the Volunteers continued in existence as such, except a few companies in the Isle of Man. The Volunteer Act, however, was not repealed.

At the outbreak of the World War, the existing organization of the British army, consisting of Regulars, Special Reserve, and Territorial Force, filled up its establishments generally, and the Territorial Force formed duplicate units, while the depots and surplus resources of the Regular army and Special Reserve formed the nucleus of the "New Armies." But over and above these, which were normal, or derived from normal organizations, there began in Aug. 1914 a widespread effort throughout Great Britain to prepare for the contingency of invasion by voluntary

military training. Everywhere local units sprang up. These had no official status, all expenses being privately borne; and the organization and administration were vested in local committees.

In Nov. 1914, the British Government, realizing the necessity for making every provision for a possible invasion, granted recognition to these voluntary formations under the title of Volunteer Training Corps. They were affiliated to a body in London called the Central Association Volunteer Training Corps, which was made responsible by the War Office for their training and administration. A uniform enrolment form was prescribed, and the following conditions of service were imposed by the Army Council:—(1) that only those should be enrolled who, through age, were not eligible to serve in the Regular or Territorial armies, or were unable to do so for some genuine reason, and in the latter event agreed to enlist if called upon to do so later; (2) that it should be open to army recruiting officers to visit the corps at any time, and to recruit any eligible members whose presence in the corps could not be justified; (3) that no form of attestation involving an oath should be permitted. Clothing, equipment, arms and financial assistance were not provided by the Government; local appeals for funds were issued, and met with considerable success, many municipalities making generous grants. Whenever they were available, exempted men with military experience were appointed instructors. Buildings for drill purposes were hired where they were not lent by Territorial Force associations, and miniature rifle ranges were constructed. Some corps, owing to the patriotic generosity of individuals, were provided with uniforms of green-grey, as well as rifles. Every volunteer was supplied with a red brassard worn on the left arm when he was in plain clothes, inscribed with the letters "G.R.," showing his status as a combatant.

Many feared that this volunteer movement might provide a hiding place for shirkers from military service, but on the contrary, it proved a most powerful recruiting organization; over a million men passed through its ranks into the Regular army, the preliminary training they had received as Volunteers contributing materially to their efficiency. By the end of 1915, some of the corps had attained considerable proficiency in elementary drill, but the shortage of arms, and the inexperience of many of the instructors, militated against a high standard of efficiency.

The Volunteers were eager for the status of soldiers; and in March 1916, the King invited lords-lieutenant of counties to submit offers from corps willing to enroll under the Volunteer Act of 1863. The response was general. In May 1916, regulations for the reconstructed Volunteer Force were issued, which provided for the raising of Volunteer regiments on a county basis under county commandants. Owing to the wide distribution of the personnel of various battalions, a uniform strength could not be insisted on, but minimum and maximum establishments were laid down. The force was to be called out for actual military service only in the event of imminent invasion, as notified by royal proclamation, although at other times voluntary offers of temporary service either by corps or individuals could be accepted. Motor corps, field ambulance sections, and certain specialist units such as signal and electric light companies, were subsequently formed in order to complete the defence schemes for the commands.

The original organization proved unsatisfactory, as it called for no medical examination and imposed no drill obligation. In Jan. 1917, under powers conferred by a Volunteer Act passed in 1916, it was therefore decided to form special sections of the Volunteer Force, with qualifications as follows:—

Section A.—Men over military age, free from organic disease, who were able to stand service conditions in garrisons at home, to march at least 5 m., to see to shoot with the aid of glasses, and to hear well. In addition they had to be free to vacate their civilian employment on the occurrence of a national emergency.

Section B.—Exempted men of military age, with practically the same conditions as Section A.

Section C.—Lads under military age, but of not less than 17 years, of the same physical standard as for A. and B.

Section D.—Men who were not eligible for, or were unwilling to become, members of Sections A., B., or C.

Section P.—Special constables, who, in the opinion of the chief constable of the county could undertake this duty without interfering with the proper performance of their duties as special constables.

Section R.—Men employed in Government departments, on war work, and railway employees.

Officers and men of Sections A., B. and C. were required to sign an agreement to serve for the duration of the war, and to carry out a definite number of drills per month, becoming liable to penalties under the Army Act if they failed to fulfil their obligations. The sum of £2 was granted to the Territorial associations concerned for each Volunteer on his satisfying the prescribed authority that he had attained the requisite standard of efficiency. It was then the duty of the association to provide him, as a first charge on the grant of £2, with uniform, the balance, if any, being available for general administrative purposes.

The retention of Section D. men, who undertook no obligation, was a weakness to the force, and Sections P. and R. were also of little value, as they could not be depended upon to be available when required, and afforded to many a means of avoiding military obligations. Just before the Armistice, War Office instructions were issued ordering the discharge of all Volunteers over 55 years of age, and also of all who refused to agree to serve for the duration of the war. This would have had the effect of reorganizing the force on a really sound basis.

In Sept. 1916, the general administrative control of the reconstituted Volunteer Force was transferred to the director-general of the Territorial and Volunteer Forces at the War Office, the local administration in the counties being undertaken by Territorial Force associations, in consultation with county commandants. The Central Association Volunteer Training Corps then became mainly an advisory body. A senior staff officer for Volunteer services was appointed to each command and was made responsible to the general officer commanding-in-chief.

Voluntary efforts of service by corps or individuals were accepted by general officers commanding-in-chief of commands, and all kinds of pre-emergency duties were undertaken. When so employed, Volunteers were not entitled to army pay and allowances, but received free travelling warrants, and an allowance at the rate of 5d. per head for each complete period of six hours worked; this amount being paid to the corps for the provision of rations. The following were some of the duties thus undertaken. There was a complete scheme for guarding the various lines of communication by Volunteers, and many men carried out this guard duty on a "rota" system, which enabled them to carry on their normal work as well. A large amount of trench digging, principally in connexion with the London defence scheme was also undertaken. Much useful pre-emergency work was performed by the R.A.S.C., M.T. (V), in evacuating ambulance trains, distributing men arriving home on leave from the different theatres of war, conveying wounded to and from hospitals, and in the provision of transport necessary in the training of other branches of the force. The services of the R.G.A. (V) were in some cases utilized, on a "rota" system, in manning the guns of batteries on the coast at night, men attending at 7:30 P.M. and leaving at 5 A.M. the following morning. And Volunteers, especially in London, were employed on anti-aircraft duties.

Service in the Volunteer Force was not allowed to interfere in any way with the operation of the Military Service Acts, which subsequently withdrew a large number of the original Volunteers. These men were replaced by others, who, though fit and capable, were very busily employed on work of national importance, and were not only for the most part lacking in enthusiasm, but had little time for training. The Military Service Act of 1918 made service in the Volunteer Force compulsory for men exempted by military tribunals. This, of course, meant the administration of conscripts into a so-called "Volunteer" Force.

The formation of special service companies of the Volunteer Force for a limited period of whole-time service, replacing personnel of T.F. cyclists battalions on the E. coast, was undertaken in June 1918. In almost every county the Volunteers were most desirous of carrying out this duty. But the minimum period of service was fixed at two months, and strict medical limitations were laid down. Consequently there was difficulty in

obtaining the necessary number. The total so employed was 484 officers and 7,777 other ranks, which was considerably short of requirements.

In Nov. 1918, the Volunteer Force consisted of:—11 companies of R.G.A.; 11 engineer corps; 1 signal and transport column; 63 motor volunteer corps (R.A.S.C., M.T.) (V); 282 infantry battalions; 1 pioneer company, and 22 medical corps; with a total strength of 254,826 all ranks. In Oct. 1920 the War Office issued instructions for the disbandment of the Volunteer Force. These instructions excepted the R.A.S.C., M.T. (V), of which the strength was:—468 heavy sections of transport, 79 light sections of transport, 92 sections of transport for field ambulance, 3 sections of transport for motor air-line sections, and 7 sections of transport for signal companies. These units were required for special transport duties, and were not disbanded till March 31 1921, when they received the special thanks of the Army Council. As a mark of appreciation of the services rendered by the Volunteer Force, the Army Council decided to allow officers to retain honorary rank on retirement, and granted them the right to wear uniform on special occasions. (R. E. G.)

VORARLBERG (see 28.211).—The pop. in 1910 was 145,408; in 1920 only 133,933 (132 per sq. mile). In 1900, 88% of the area was productive, and of this 51.3% was grazing land, 29.4% forest, 15.3% meadow, 0.5% gardens, and 3.45% arable. Vineyards occupied less than 0.1%. The most important towns are Bregenz, the capital (pop. in 1920 12,102, the town itself 7,488); Dornbirn (13,764); Feldkirch (4,503); Bludenz (5,488). Rieden, the suburb of Bregenz, is a manufacturing centre.

VOSGES, BATTLES IN THE, 1914-8.—The Vosges mountains (see 28.214) rise sharply to the N. of Belfort. From the groups of the Ballons, which reaches a height of more than 1,200 metres, the main ridge runs N. by the Drumont, the Grand Ventron (1,300), and the Hohneck (1,366). North of the Bonhomme pass (940) the ridge falls gradually to 558 metres at Saales, near the headwaters of the Bruche, one of the Alsatian tributaries of the Rhine. From the Saales gap the ridge rises to Mont Donon and Prancey, each over 1,000 metres high, and is prolonged through a series of vast forests as far as the Saverne valley. From the Ballon d'Alsace to the Donon, the Vosges form a mass of mountain with steep slopes, narrow deeply cut valleys and swiftly flowing torrents, a terrain always difficult and often impossible of passage away from the roads. The summit of the ridge generally takes the form of a swollen saddle, wooded in places but usually covered with the large grassy swards known as the Chaumes (Calvi Montes). These Chaumes are wind swept all the year round, very hot in summer and very cold in winter, and the snows which cover them completely from Oct. onward only disappear in early June. Both slopes of the ridge are clad with magnificent fir and pine forests, which end just below the crest in a thin ledge of bushes bending before the wind. The fall of these slopes is steeper on the Alsatian side than on the other; immediately below the crest a cliff of granite rocks or sandstone falls almost vertically, often in the southern part of the Vosges, for some 250 metres. From the foot of this wall begins a gentler slope extending all the way to the Rhine valley. On the Lorraine side, however, the mountains descend much less steeply in a series of ridges towards the Moselle and the Meurthe. The points of passage, formed by the roads crossing the ridge, acquire considerable importance owing to the absence of such crossings elsewhere. These points of passage, moreover, are not numerous. In the group of the Ballons the pass of Bursang, with the smaller passes of Oderen and Bramont, lead from the Moselle valley to the Thann valley. At the foot of the Hohneck the pass of the Schlucht leads from Gerardmer to Munster and Colmar; to the N. the Bonhomme and Louchpach join the valleys of the Vologne and the Weiss. The pass of Ste. Marie unites Ste. Marie-aux-Mines and Schlettstadt; the gap of Saales leads from Prerenchères to Schirmeck; and, lastly, a road which passes over the summit of the Donon leads from Celles to Molsheim and Strasbourg. The only railways across the Vosges were the two main lines from Strasbourg to Nancy, by Saverne, and from Mulhouse to Belfort by Dannemarie, together with the narrow gauge railway from

Gerardmer to Munster. On the French side of the Vosges small branch lines ran up into the mountains to St. Dié, Gerardmer, Cornimont and Bursang, and other branch lines on the Alsatian side ran from the Strasbourg-Mulhouse railway to the heads of all the Vosges valleys.

The frontier imposed on France in 1871 by the Treaty of Frankfurt reached the crest of the Vosges, after cutting the gap of Belfort at the Ballon d'Alsace, and followed the watershed as far as the Donon; thence it changed direction from N. to N.W., and following a purely artificial line left all the upper Saar valley to Germany, cut the Seille at two points, and reached the Moselle 2,000 yd. below Pont-à-Mousson. From the military point of view this frontier left French Lorraine in a regular salient. General Séré de Rivières, the far-sighted and skilful creator of the French defensive system, had therefore been compelled to go back to the Moselle to organize the barrier blocking the roads from the frontier. This barrier consisted of the two fortresses of Epinal and Belfort, connected by a line of forts along the upper Moselle. The importance of Belfort lay in the fact that it formed the right flank pivot of the whole defensive system, blocking as it did the gap between the Jura and the Vosges, and commanding the ground as far as the Swiss frontier. On their side the Germans had progressively strengthened the line of the Rhine by constructing the fortress Istein facing Mulhouse, improving the old strongholds on Huningen and Neubrisach, and turning Strasbourg into a great entrenched camp, extending its action by means of the forts of Mutzig and Molsheim as far as the Bruche valley.

The Position in the middle of Sept. 1914.—The work carried on by either side for 40 years had made of the Vosges region a military area in which it was impossible to move without encountering some natural or artificial obstruction, defended on one side or the other by numerous garrisons. It was there, nevertheless, that hostilities between Germany and France actually started in the early days of Aug. 1914. After a few weeks fighting, however, the main offensives had been stopped in one place or another; and the position of the two adversaries towards the middle of Sept. was as follows:

On the western slope of the Vosges the Germans had been checked and obliged to retire on Sept. 7. In the Lunéville area they had maintained their hold on the Parois forest and Badonvillers. North of St. Dié, which they had evacuated on the 11th, they held the Ormont ridge and the vicinity of the Saales gap. On the Vosges crest their occupation of the Violu and the Bernhardstein secured to them the pass of Ste. Marie-aux-Mines; a little further to the S. they held the Tête-de-Faux, commanding the Bonhomme pass. The pass itself was in the hands of the French, who, since the withdrawal of the army of Alsace, held all the crest from there to the south. The German counter-offensive had been stopped on this side facing the Schlucht on the summit of the Luige ridge, commanding the valleys of the Weiss and the Fecht; at Metzeral, blocking the upper Fecht valley, the Grand Ballon de Guebwiller was held by French outposts, and a French division occupied the Thur valley as far as Thann, the gate of the Sundgau. In the Sundgau itself the outpost line of the Belfort garrison had been pushed forward to Lauev, Mortzwiller, Dieffnatten, Traubach, Gommersdorf, Ballersdorf, Saurce, and Réchéczy.

On the French side the forces in the Vosges consisted of three infantry divisions and ten Alpine groups, forming, under the command of Gen. Putz, a "Vosges group" attached to the army of Gen. Dubail. The troops in the gap belonged to the Belfort garrison and were under the governor-general Thévenet. On the German side the troops holding the gap of Saales belonged to von Falkenhausen's army detachment. Those in the Upper Vosges and the Sundgau belonged to the army detachment under von Gaede. Both consisted principally of Ersatz and Landwehr troops, von Gaede's strength being equivalent to five divisions.

From mid-Sept. onward the operations in the Vosges assumed the character of local and disconnected actions, always bloody and often prolonged. These actions may be dealt with here in succession, in each of the secondary theatres—the region of St. Dié, the eastern slope of the High Vosges, and the Sundgau.

The Region of St. Dié.—The Ormont ridge, on which the Germans halted after their retirement, was too close to St. Dié to be left by the French forces in their hands, and on Sept. 17 the 152nd were ordered to drive them from it. The task was no easy one, and for three days the gallant regiment of Gerardmer vainly attempted to maintain their footing on the slopes, which were stubbornly defended and swept by machine-gun fire. On the 20th it delivered a new surprise attack without preliminary bombardment from W. to S. The hostile resistance was as stubborn as ever, but after immense exertions two companies gained a footing on the summit, and despite fierce hand-to-hand fighting and heavy counter-attacks, the mountain remained in French hands at the price of 600 dead.

At the end of Oct. serious fighting took place around the Ste. Marie-aux-Mines pass for the possession of the Tête-de-Violu, commanding the pass to the west. After a series of actions, lasting from Oct. 31 to Nov. 12, the French Alpine troops held the hill, the pass itself remaining in the hands of von Gaede's Landwehr men.

On Dec. 2 Alpine troops stormed the Tête-de-Faux facing the Bonhomme pass on the Alsatian slope, thus securing the pass. On Christmas eve violent hostile attacks, intended to dislodge them, were repulsed by the bayonet and destroyed by the French artillery, and the enemy retired leaving over 500 dead.

The early months of 1915 were passed by both sides in entrenching themselves, but in April violent combats broke out for the possession of the promontory of the Ban-de-Sapt, N. of

St. Dié, between Saales and Moyen Mautiers; the trenches were so close together and so strong that both sides had recourse to underground warfare. German and French mines and counter-mines were exploded one after the other, destroying the defences, and blowing great craters, the possession of which was hotly contested, with bomb and bayonet. After some months of this the French at the end of July had definitely secured possession of the Ban-de-Sapt by their occupation of hill 627, dominating the promontory and the hamlet of Launois in advance of it.

From now onward the positions on both sides were stabilized, and remained so for three years, during which trench mortars and machine-guns were daily in action, and frequent patrol encounters took place, without the fighting ever becoming as intense as during the first year of the war.

In Nov. 1917 the French were relieved by the Americans in the St. Dié sector, where the division under Menohery completed its training and underwent its baptism of fire.

The Eastern Slope of the High Vosges.—On the eastern slope of the High Vosges, between the Schlucht and Cernay, position warfare began in Sept. 1914. Trench systems were gradually dug and often hewn out of the rock. On the crests they were in places so near as to touch each other, and bristled with accessory defences. Elsewhere they were farther apart, separated by valleys and deep ravines. The German positions facing W. were close up against the mountains, but the Alsatian plain behind them facilitated the supply of materials, artillery and reinforcements, and by affording convenient billets rendered easier the task of the command. The French had the advantage of the ground, but there was no inter-communication between the valleys, the heads of which they occupied. The roads leading to the rear were poor, and the supply of ammunition and material of all kinds was proportionately difficult. Bivouacking on the crest was uncomfortable and even impossible in cold weather, while the exercise of command was much impeded by the poverty of communications.

The fighting in this region was necessarily of a local character, and exercised no influence on the general course of the operations; but owing to the stubbornness of the two adversaries its intensity was often such as to involve losses quite disproportionate with any possible results. On the French side the army detachment of the Vosges, under Gen. de Maud'huy, thus became the VII. Army, which included practically all the available Chasseurs Italiens, while on the German side von Gaede's detachment also increased to the size of an army, in which some of the best troops of the German Empire often fought.

These local combats attained their greatest intensity during 1915, and the names of the sectors in which they took place, such as the Fecht and Linge valleys, and Hartmannswillerkopf, appeared in the communiqués for several months.

A severe winter, to which the troops were not yet inured, had for a time suspended operations, but at the end of Feb. 1915 the Germans became active in the Fecht valley, and after several vain attempts to push their line forward in front of Munster they occupied the Reichackerkopf on March 21. On April 17 the French retaliated by occupying the Schnepfenrieth, and a few days later the Sillackerkopf; once in possession of these two heights they drove the Germans from Steinbruck on the Fecht and advanced to the outskirts of Metzeral. During the whole of May fighting went on on both banks of the Fecht, and the French succeeded, after great efforts, in getting up sufficient artillery to render the valley untenable as far as Munster. They then between June 19 and 23 captured Metzeral and Sondernach, and picked up over 700 prisoners in the bottom of the valley. During the course of the following weeks the Germans made several attempts to recapture these villages, but without success, and eventually they turned their attention to the Linge ridge further to the north, activity in the Fecht being henceforward confined to artillery and patrols.

The Linge is a spur, some 3,000 ft. high, situated in front of the main ridge between the Weiss and Fecht valleys. The Germans had occupied it in Sept. 1914, and had constructed a maze of trenches with a thick belt of barbed wire and flanked by

redoubts of machine-guns. Owing to the fact that the Linge hindered inter-communication between the upper Weiss and upper Fecht, the French decided in July 1915 to occupy it. The operation was an extremely difficult one, for it was necessary for them to come down from the heights, pass through a marshy valley, and scale steep rock-strewn slopes under hostile machine-gun fire; moreover the troops and supplies necessary for the operations had to be brought up from the rear by inferior mule tracks. After ten hours' intense bombardment, the assault was delivered on July 20 1915, and the struggle swayed to and fro uninterruptedly until the end of August. On this small peak there fell more than 50,000 shells; 7 German brigades came into action one after the other against 16 French Chasseurs battalions and 2 infantry regiments, and at the end of severe and costly fighting both sides remained face to face on the crest in trenches which were held unchanged until the end of the war.

The Hartmannswillerkopf, or, as the French soldiers soon began to call it, the "Vieil Armand," is a spur 95 metres high, thrown out to the N. of Cernay into the Alsatian plain by the Molkenrain (1,125 metres), itself an offshoot from the Ballon de Guebwiller (1,425 metres), the highest peak in the Vosges. This spur, with its steep slopes, commands the village from which it takes its name, at a distance of some 700 yards. Its sole advantage from the military point of view lies in the fact that it affords good observation over the Alsatian plain, from Isenheim to Mulhouse. The French therefore had advanced their outpost line up the Thann valley by Willer and Goldbach to the summit of the spur. Its possession by the French naturally annoyed the Germans, and on one wintry day in Jan. 1915 they surprised and captured the French post on the summit, and installed themselves there. In a short time they succeeded in transforming the position into a practically impregnable fortress. Trenches and belts of wire were constructed on all the crests, dug-outs were tunnelled out on the steep eastern slopes, a road was constructed to the summit, and aerial cable set up for the transport of supplies, and concrete shelters for troops and munitions erected, while subterranean passages gave access to all the advanced posts.

The loss of the Hartmannswillerkopf caused no apprehension to the French, who still remained in possession of the Grand Ballon and of the Molkenrain, nor could it even be said to cause them any real inconvenience, as they had no intention of taking the offensive in Alsace. Unfortunately pride spoke louder than reason, and a series of useless struggles, which the higher command did not intervene to stop, were undertaken to recover the lost position. The fighting went on for months under very difficult conditions for the French. On the slopes facing Goldbach the heroism and self-sacrifice of the French troops in their hastily dug trenches were unevenly matched against the facilities for defence and attack which had been accumulated by the patient labour of their enemies. Attack and counter-attack alternated during the whole of 1915, and French and Germans alike suffered fearful losses.

Of all these fruitless combats of 1915 the most characteristic were perhaps those which took place at the very end of the year. The 7th, 13th, 27th, and 53rd battalions of Chasseurs and the 152nd Infantry Regt. on the French side were engaged against the German 12th Landwehr Div., the 187th Ersatz brigade and parts of the 19th Reserve Division. On the cold winter morning of Dec. 21 the 152nd dashed forward under a crushing fire from trench mortars and machine-guns. Its waves advanced, broke, reformed, and advanced again, destroying with bombs every obstacle in their path; decimated but triumphant they reached the summit and even passed beyond it in their rush, chasing the routed enemy down the further slopes. At the end of the day the exhausted victors, who had made more than 1,500 prisoners, halted and passed the night where they were, without even being able to reform. The Germans meanwhile were concentrating a powerful artillery and massing their reserves to recover the lost ground. The German counter-attack took place on the morning of the 22nd. The French 152nd, extended in one long, thin line which was outflanked and broken through by the enemy, was exposed on the steep slopes to a hostile bombardment to which

their own guns could not reply; it struggled desperately all the morning, although the men, exhausted by the previous day's fighting, had to make head against the onset of fresh hostile troops thrown in in whole battalions. After eight hours' fighting the heroic regiment was surrounded in the depths of the ravines, and amid the tangle of rocks was entirely overwhelmed. Forty-eight officers and 1,950 men were killed or taken; the rest cut their way out at the point of the bayonet, and rejoined the reinforcements which, though too late to succour their comrades, still held the summit of the "Vieil Armand." The Chasseurs hung on to the crest, and the fierce struggle continued for several more days until the Germans outflanked their position on the north and forced them to retire to their original lines.

A protest was made by the French Parliament against these useless sacrifices of Dec. 1915, and the Minister of War intervened to forbid all local actions not demanded by strategic considerations, and serving no purpose but to increase casualties. This put an end to the fighting which had made the name of the Hartmannswillerkopf famous throughout the world, and from now until the end of the war the two adversaries remained facing each other on the crest, and no further action took place save harmless exchanges of rifle fire. The actions of the Linge and the Hartmannswillerkopf had in this one year of 1915 cost thousands of human lives. Nowhere on the front had there been displayed more courage, more tenacity, more self-sacrifice, but the results had been absolutely *nil*.

From mid-Sept. 1914 onward neither of the two adversaries was in a position to manœuvre offensively in the High Vosges. The strategic defensive was here imposed on both alike by the course of the campaign, and by the local conditions. In the circumstances the task of the commanders was simply to observe the enemy, to strengthen their own positions, and to remain prudently alert without undertaking any local offensives which could only be foredoomed to failure.

The Germans, who disposed of ample resources and good communications in the Rhine valley, should have been content to hold the mouths of the Vosges valleys in strength, while keeping their reserves billeted in the Alsatian plain ready to manœuvre if necessary against any isolated columns which attempted to be debouched from the mountains. The French on their part had an excellent opportunity of applying to the existing situation on the Vosges crest the defensive principles adopted so successfully by Marshal Berwick in the Alps in 1709. A system of solid defences at the heads of the valleys, covered by small advanced posts and supported in rear by well sheltered reserves which could be rapidly moved to any threatened point, would have needed for its successful application a good road running N. and S. on the western slopes of the mountains and connecting up the roads to the various passes. Unfortunately no such lateral road existed, so that the Fecht and Thur valleys were absolutely isolated from each other. This fact explains, though it does not excuse, these attacks on the Linge and the Vieil Armand, which eventually assumed proportions far greater than had been originally intended.

In this respect however the situation began to improve after the spring of 1915. The Governor of Belfort then took in hand the construction of the good and well-concealed road between Massevaux and Willer, connecting the Doller and Thur Valleys. Later the commander of the VII. Army constructed another from the Thur valley road at Kruth along the heights, below the crest which passed behind the Schlucht and extended as far as the Luchpach pass. This new road, together with a few cross tracks, supplied the long-felt need of a lateral line of communication between Massevaux and the Bonhomme pass. It thus became possible to construct strong defensive systems on the heights, and to erect quarters for the reserves and supply parks served by aerial cables further back. A narrow-gauge railway was made from Bursang to Wesserling, so that by 1916 the VII. Army in the Upper Vosges was sufficiently well equipped to be able to fulfil its rôle with complete security. The Germans, on their side, refrained henceforward from partial attacks which could lead to no useful result. The sector thus became one of the

quietest on the western front, and up to the end of the war no further fighting took place apart from artillery activity and patrol encounters. Morton's American division came into line here for the first time in 1918, prior to taking part in the decisive battles in that year on the Meuse.

Operations in the Sundgau in front of Belfort.—The headquarters of the 57th Div. had been transferred to Dannemarie on Sept. 18 1914. When this transfer had been completed, the offensive reconnaissances of the Belfort garrison were pursued with renewed vigour; they were even pushed as far as Altkirch and Waldighoffen, and their advance facilitated the occupation by outposts of the passages of the Largue between St. Ulrich and Seppois and the garrisoning of Pfetterhouse by custom-house officers from Chavannate. Toward the end of Sept. the organization of the Belfort garrison was unexpectedly changed by the departure of the active brigade which the Governor was ordered to despatch to the Meuse within 24 hours, and by the demands on its magazines made by the generalissimo in order to increase the reserves of the armies in the field. Batteries of 155 mm. short guns were formed from the artillery in the fortress; the stocks of 75 mm. ammunition were almost entirely depleted, and the loss of the active troops was not completely compensated for by the insufficiently trained territorial battalions which took their place, though the numbers in either case were about equal. As against this the Germans in the Sundgau were receiving important reinforcements; and the French reconnaissances, in the course of their daily encounters, met with an ever-increasing resistance. In view of these circumstances the Governor of Belfort made a careful calculation of his forces, and toward the end of Oct. proceeded to redistribute the troops which he considered could be allotted to the defence of the forward positions, leaving in the fortress only the minimum consistent with safety.

According to these arrangements the 57th Div. remained between Guvenhatten and Struth as the centre, and, so to speak, the spinal cord of the new disposition. A northern group, equivalent in strength to a mixed brigade, held the interval between Guvenhatten and the Doller on its left, while a similar group was established on its right to occupy the front from Struth to Pfetterhouse. The infantry of these two groups consisted only of territorial battalions, and the artillery of a few 75 mm. guns borrowed from the 57th Div., and some 90 mm. batteries formed from the reserve artillery of the fortress. All units were ordered to fortify their positions and to cover their fronts by means of heavy and medium calibre batteries borrowed from Belfort.

Two divisions of French reservists and territorials were thus in close contact with the enemy on a front of 20 m.—a line which would have been far too thin but for the fact that its flanks rested on the frontier and on the mountains, and its rear on Belfort. But the main strength of the dispositions lay in the fact that Belfort remained, for all the troops drawn from the garrison and operating in front of the forts, a centre of command which unified all their efforts, and a point of support which could sustain or receive them in case of need.

The new distribution of the French forces in the Sundgau marked the opening of a period of activity which was employed in consolidating the ground held, in rectifying the line, and carrying out small and methodical advances as far as the increasing hostile resistance permitted, until the limit of expansion permissible and the limited forces available was reached. The northern group first strengthened its position at Thann, establishing its heavy artillery on the heights of Roderen, and then established itself solidly on the left bank of the Soultzbach. It then swiftly assumed the offensive on Nov. 7; by the 10th it had pushed forward beyond Michelbach and thus rendered it impossible for the enemy to pursue his attacks against Thann, which was now in a pronounced re-entrant and could henceforward only be bombarded. On Dec. 2 Aspach-le-Haut fell to the combined efforts of the troops from Thann and those from Belfort, but the northern group was held up before Aspach-le-Bas and the Kalberg, which the Germans had converted into a regular fortress. It therefore turned its attention to the right bank of the Doller, occupied Pont d'Aspach station, penetrated

on two separate occasions into Burnhaupt-le-Haut, but without being able to remain there, and finally established its right early in Jan. 1915 at the S.E. angle of Langelittenhag wood.

Meanwhile, in a series of successful operations, the 57th Div. had occupied Hecken, Falkwiller, Gildwiller, and penetrated into Buchwald and Keibacker woods. The advance of the northern group to Langelittenhag secured the division's left, and shortly after its front was firmly established on the eastern edge of the forest between the Soultzbach and the Spechbach. Beyond this forest lay the village of Ammertzwiler, which was strongly fortified and held; an attempt to storm it on Jan. 25 1915 failed owing to want of effective artillery support and lack of munitions, and was not repeated, and in front of Dannemarie, the villages of Belschwiller, Ueberkummen and Eglingen were taken and the 57th Div.'s front was pushed forward to the far bank of the Rhine-Rhone canal.

On the right of the 57th Div. the southern group, which was at first almost completely isolated, also set to work to gain ground by small partial offensives; the infantry advanced by slow degrees, consolidating the ground gained at each stage, and thus gradually succeeded in settling and straightening the general line of the front. On the extreme right it was pushed forward to the middle trench of the Largue, below Largin mill. At the same time the position of Pfetterhouse was put in a state of defence, and a 155 mm. battery was placed in position on the slopes S. of the village for counter-battery work against the hostile artillery near Mornach. In front of Seppois the occupation of the Largue valley was completed by the capture of the Entre-Largues salient, which encroached on the heights of Bisel, and further to the N. the southern group's outposts occupied a line in front of and more or less parallel to the Seppois-le-Bas-Largitzen road.

North of Largitzen the line of advanced posts was at first drawn in rear of a group of lakes in the middle of Hirtzbach wood. Later, when the southern group was reinforced, infiltration northward became possible, and the front was pushed forward to the eastern edges of the communal forests facing Carspach and Hirtzbach. Then on Jan. 25 1915, while the 57th Div. attacked Ammertzwiler, the southern group co-operated by advancing S. of the canal, the hostile positions were overrun and our troops crossed the Aspach road, but the check to the 57th Div. leaving them in a salient, they had to be withdrawn, having effected only a small permanent advance in Carspach wood. The action of Jan. 25 1915 was the last effort made to carry out an advance in the Sundgau. The outpost line of the Belfort garrison had then been advanced to a front from N. to S. along the edge of the Brickerwald in front of Michelbach, thence by Pont d'Aspach station, the S.E. corner of the Langelittenhag, the eastern edges of the Buchwald and of Gildwiller wood, Eglingen, the salients of Carspach wood and the communal forests, the crest of the slopes between Seppois and Bisel, the Entre-Largues and Largin mill. To the N. this outpost line joined with that in the Petit Doller, in front of Thann; to the S. it rested on a tongue of Swiss territory known as the Bec-du-Canard, between the Banholtz and Courtavon wood.

The Belfort garrison had employed the offensive-defensive method to the utmost possible limits in carrying on operations for five months, despite the constant depletion of its forces and munitions by the High Command, and in establishing itself firmly between the Petit Doller and the upper Largue; its resources in men, artillery and ammunition were too small to allow of more being done. The objects laid down by the governor in the dark hour at the end of 1914 had, moreover, been practically achieved. The fortress had been made strong enough to inspire a salutary fear in the Germans; the gap was barred and the barrier had been pushed far enough forward to secure Belfort against possible bombardment, save from the ineffective bombs of raiding hostile aircraft. Finally the Belfort troops had set foot as conquerors on the soil of Alsace—that soil whose inhabitants had twice been rendered desperate by the French retirements; they had re-established the prestige of their country at little cost in blood, and had had the honour of restoring to France a portion of her beloved lost provinces.

From Jan. 1915 onwards, only patrol actions, exchanges of rifle fire and intermittent bombardments either of the trench lines or of the billets and communications in rear, disturbed the calm of the upper Alsatian front. Belfort was shelled from long range but remained inviolate. The front itself underwent no change, and in the hour of victory in Nov. 1918 it was still as the garrison of Belfort had made it at the end of 1914, close on four years before. For all that time the pivot on which rested the right flank of the Allied armies had remained firm, and these armies had been able to carry on their operations with no fear for their communications, while the centre of France, secured against attack, had been able to turn all its resources towards winning the war.

(F. T.)

VOYSEY, CHARLES (1828-1912), English theistic preacher, was born in London March 18 1828. Educated at Stockwell grammar school and St. Edmund Hall, Oxford, he was ordained in the Church of England and held various curacies up to 1860, when he became curate of St. Mark's, Whitechapel. Thence he was ejected for heterodox doctrine, and went to St. Mark's, Victoria Docks, and later to Healaugh, near Tadcaster, where he was first curate and then vicar. But in 1869 he was summoned before the chancery court of the diocese of York for heterodox teaching, and deprived of his living. He appealed to the privy council, but the decision was upheld. He then established a theistic church in London, where he continued to preach and teach up to the time of his death. He died at Hampstead July 20 1912.

WAGES.—In the following article, which should be read in connexion with those on **COST OF LIVING** and **PRICES**, the changes in wages during 1900–20 are considered.

United Kingdom.—In the movement of wages in recent years it is specially important to distinguish between rates of wages and earnings. Rates of wages are time-rates, sums payable for work in a definite time (hour, week consisting of a recognized number of hours and, rarely, a longer period) or piece-rates (sums payable for the performance of a definite task, or as additions to or in combination with time-rates, when the rate depends both on the quantity produced and the time taken in producing it). Earnings are the sums actually received by an employee, generally computed for a week or a year; the term is used specifically when the amount received on piece-rates is in question, and is also used to include payments for overtime in the case of time-workers. Time-rates are generally stated for the normal week or if the rate is an hourly one, as in the building trades, both for the hour and for the normal week; to get a comparable statement for piece-rates it is necessary to compute the average earnings of a number of men who worked normal hours. In modern times a statement of time-rates generally relates to rates agreed to by associations of employers and employees or umpired by the Government; these are frequently minimum rates and the relation between minimum rates and the average of those actually paid to a group of work-people can only be ascertained by special inquiries, such as those undertaken by the Board of Trade in 1886 and 1906. The assumption has to be made that between such inquiries average rates have kept the same proportion to minimum rates, which is only true over a short period and in the absence of disturbing causes. For piece payments the assumption that earnings move by the same percentage as the rates can never yield more than an approximation to the facts, and during the war such an assumption would be completely invalid even if reference was only made to earnings in a normal week, since there were very important changes in facilities for production, in the effort put into the work and in the nature of the work. In the absence of any general information about earnings, statistics in the war period must be confined to statements of time and piece-rates, which do not give a true picture of the economic position of the working class in that time; in 1920, however, industry was more nearly normal and overtime was relatively uncommon, so that a comparison of rates in 1920 and 1914 is not altogether misleading. In making such a comparison the general reduction of hours in 1918 and 1919 must be borne in mind; generally at the dates of reduction piece-rates and hourly rates were raised so as to give approximately the same earnings for the reduced as for the longer week, and weekly rates were the same before and after the reduction, but in some industries an increase for the week was arranged at the same time.

Table 1 shows the general movement from 1890 to 1914. The first column, computed from the XVII. *Abstract of Labour Statistics*, gives the average of a number of changes of time and of piece-rates. The second and third columns depend on additional data (see Bowley, *Elementary Manual of Statistics*, 1920, and Wood, *Statistical Journal*, 1909, p. 103, and 1912–3, p. 220), and give the computed averages based on the numbers in various occupations at the different dates, thus allowing for the relative increase of numbers in the better-paid industries. These figures should be taken in conjunction with the change in retail prices (see **COST OF LIVING**); the rise in wages from 1902 to 1913 was neutralized by the falling value of money.

Average annual earnings, allowing for unemployment and overtime, for all wage-earners in the United Kingdom (excluding shop assistants), men, women, boys and girls, are estimated at £51 in 1913 (*Change in Distribution of National Income*, Bowley, 1920, p. 13); average family earnings were probably between £95 and £100 annually. For full week's work the average earnings of a man were about 31s., for a woman 14s., for a boy 11s. 6d., and for a

girl 8 shillings. There were very few changes between 1913 and the outbreak of the war.

Table 1.—Estimates of money earnings of all wages earners in the United Kingdom (expressed as percentages of their level in 1913).

The dates and amounts of increase of rates of wages in the period 1914–20 may be illustrated by the records in a number of selected industries. The summary in Table 2 is taken from Bowley's *Prices and Wages in the United Kingdom, 1914–1920* (1921), pp. 105–6.

Table 2.—Estimate of movements of time-rates (for normal week) and of piece-rates in the United Kingdom, 1914–20. (Average rates expressed as percentages of those in 1914).

	1914 July	1915 July	1916 July	1917 July	1918 July	1919 July	1920 July
Bricklayers	100	103	108	123	160	188	228

The increases in the first two years of the war often took the form of a weekly war-bonus of the same amount for artisans and labourers (in some cases greater for the latter) to meet the rise of food prices (see **COST OF LIVING** and **PRICES**). In 1917 the usual method of changing miners' wages by percentage was replaced also by flat increases of 2s. or 3s. a shift to all underground workers, and no percentage increase was given till March 1920. In engineering and other trades in which munition work formed an important part an addition of 12½% to time-workers and 7½% to piece-workers reckoned on weekly earnings was awarded in

1917-8, but all time-rates (artisans and labourers) in engineering had been raised 7s. weekly before this award, and after it subsequent increases were a flat weekly rate for time-workers and piece-workers alike. Before the war certain proportions had been established, by the working of economic forces modified by collective bargaining, between the earnings (whether time or piece) in various occupations and industries; the effect of these uniform increments was to modify these proportions very considerably. Some of the results are evident from Table 2 (p. 939) and can be studied also in the subsequent tables. In the six years building and engineering and dock labourers' wages had increased by a markedly greater percentage than those of building or engineering artisans or of compositors. In 1914 the bricklayer's labourer's wage was two-thirds of the bricklayer's, in 1920 it was nearly nine-tenths. To some extent the result was due to a definite effort to raise the standard of living of the lowest-paid workers; the minimum rates fixed by the Trade Boards were in 1920 generally three times those in 1914; agricultural wages in Dorset were raised from about 14s. to 46s. but in Yorks from about 21s. to only 40s. No such tendency, however, is observable in the cotton industry, where the old method of percentage changes has been maintained; in the woollen industries percentage changes are still the rule, but increments are not given on the amount by which any pre-war earnings exceeded 30 shillings. In the reductions made in the early part of 1921 there was an expressed desire on the part of the workers that decreases should be uniform for all grades; reductions on this basis tend to restore the pre-war proportions.

Most wage arrangements from 1917 to 1921 were dominated by the increase and subsequent decrease in the cost of living. The woollen industry was the first to arrange changes by a definite formula relating them to the official index number of that cost (Sept. 1919). The railway agreement of Jan. 1920 included a similar formula, and some other industries have followed the same plan. Generally the increase on wages is somewhat less by the formulæ than if the percentage changes of the index number were applied to the whole of standard wages, e.g. the railwayman gets only 1s. when the index number rises 5% of its 1914 level, which would only be sufficient if his standard wage was 25s. or under, if the official index truly measured the cost of living; a fall in prices is therefore to the advantage of persons whose wages are thus determined.

Besides the movement already described there has been a tendency to remove local and occupational differences in wages by levelling up lower rates to higher. As a result of the Transport Workers' Inquiry (1920) the rates in all ports were raised to 8s. for the four hours half-day, whatever the previous amounts, and some differential payments for special work were abolished. In successive awards of minimum wages in agriculture the county minima show less deviation. In 1917 the increases since 1914 in all engineering wages were levelled up to 7s. whatever the previous advances, but this award and subsequent national flat increases do not include all increases; nominally the rates in Jan. 1920 were pre-war time-rates + 7s. to make permanent time-rates, + 26s. 6d. war wage, + 12½% on earnings. Actually the average of 120 districts for ironfounders shows an increase of 8s. 8d. in permanent time-rates and that of 189 districts for turners an increase of 9s. 2d.; these increases in the averages arise from the fact that in the districts where wages were much below the average in 1914 the increases were 12s. or more, and throughout the list it is seen that the lower the wage the greater the increase. In the printing trade before the war wage changes were made by local bargaining, but in May 1919 the districts in England and Wales were arranged in six groups and the London district, and the standard rates were fixed at 77s. 6d. (minimum time-rate, compositors, jobbing) in London, 75s. in Liverpool and Manchester, and 3s. less in successive groups till the lowest it was 60 shillings. Subsequent wage changes have been flat national increases, amounting by June 1920 to 17s. 6d. Prior to the grading there was considerable variation within each group. In other industries, also, there has been a tendency to standardize wages in groups of localities and to make changes nationally. The

movement is partly connected with a desire to establish a national minimum and to raise the wage of the worst paid, and partly to avoid competition from low-paid districts and a consequent cutting of rates. It is doubtful how far the pre-war rates were differentiated by economic causes, the local demand for the products of the industry, the possibility of family earnings because of the presence of other trades, the relative cost of food and rent, and how far by accident and custom. It is certain that where real wages were specially high the most skilled workmen were to be found. The partial removal of these differences must have wide-reaching effects on local distribution of industry, whatever their cause. Also the change in the proportion of wages of different grades, discussed in the previous paragraphs, must tend to diminish the supply of skilled labour.

The rates expressed by the percentages in the preceding tables are all for the normal week. After the Armistice English workmen were at first more anxious to secure better conditions of work than higher wages, especially as it was not then anticipated that prices would rise further. In 1918 and 1919 an 8-hour day was generally adopted. More correctly this should be described as a 48-hour week in many industries; e.g. in textile factories 48 hours are distributed between Monday to Friday and Saturday morning, whereas in building and dock labour overtime is payable after eight hours on any day and there is a Saturday half-holiday; the normal week is 44 hours. In mines, hours per shift were reduced from eight to seven, and, if 11 shifts are worked in a fortnight, weekly hours from 44 to 38½. In many industries work is done in two spells instead of three in a day, work before breakfast being abolished; this tends to diminish lost time, but in other cases the time lost in starting and stopping is taken out of a shorter day and is relatively more important. There are no sufficient figures to show what has been the net effect on output, but if output per hour of nominal work has neither increased nor diminished, and there are no compensating factors, wage-cost per unit output rose in the six years 1914 to 1920 not in the rates 100 to 255 or 260 as in Table 2, but 100 to 280 or 290, since weekly hours have diminished more than 10%.

In the following paragraphs details of wage changes are shown for a number of industries, in illustration of the general movements now outlined.

Time-rates.—In Table 3 illustrative figures are given. London builders' summer hours were reduced from 50 to 44 weekly between July 1919 and July 1920. Leeds and Birmingham turners' hours were reduced from 53 to 47 and Manchester printers' from 50 to 48 between July 1918 and July 1920. London dockers' daily hours were reduced from 10 to 8 between July 1918 and July 1919. No other changes of hours took place in the period. Turners' rates are typical of artisans in the engineering trades.

Table 3.—Illustrative standard time-rates of wages.

	London		Leeds	Birmingham	Manchester	Port of London
	Brick-layer	Brick-layer's labourer	Turner		Printer (compositor)	Docker
July	Hourly rates		Weekly rates		Weekly rates	Daily rates
1909	10½d.	7d.	34s.	37s.	36s. 6d.	5s.
1914	11½d.	8d.	37s.	38s.	38s. 6d.	5s. 10d.
1915	11½d.	8d.	40s.	40s.	38s. 6d.	6s. 4d.
1916	12½d.	9d.	41s.	43s.	40s. 6d.	6s. 10d.
1917	13½d.	10d.	49s.	51s.	50s.	7s. 10d.
1918	15½d. ¹	11½d. ¹	57s. ¹	59s. ¹	70s.	10s. 6d.
1919	21d.	17d.	65s. 6d. ¹	67s. 6d. ¹	75s.	11s. 8d.
1920	28d.	25d.	76s. 6d. ¹	78s. 6d. ¹	92s. 6d.	16s.

¹ In these cases 12½% was added to the weekly earnings, whether they were as here stated for normal hours or increased by overtime. Thus the bricklayer's effective rate in July 1918 was 18-9d. per hour.

Building.—The general movement of builders' wages in the United Kingdom is shown in Table 4 (XVII. *Abstract of Labour Statistics*, Cd. 7733, p. 66; *Labour Gazette*, May 1919, p. 172, April 1920, p. 170, and Feb. 1921, p. 62). The increase from 1909 to the end of 1913 was 4.4%. The lesser percentage for weekly than for hourly rates, shown in Table 4, is due to the reduction

Table 4.—Average of rates in a large number of towns.

	Bricklayers				Painters				Builders' Labourers			
	Hourly		Weekly		Hourly		Weekly		Hourly		Weekly	
	Amount	Per-cent-age	Amount	Per-cent-age	Amount	Per-cent-age	Amount	Per-cent-age	Amount	Per-cent-age	Amount	Per-cent-age
1914 Aug. 4	9.9d.	100	40s. 7d.	100	8.8d.	100	36s. 3d.	100	6.5d.	100	26s. 11d.	100
1919 April 30	18.6d.	188	17.9d.	203	14.9d.	229
1920 Feb. 29	22.0d.	223	83s. 7d.	206	21.5d.	244	81s. 5d.	224	18.5d.	284	70s. 3d.	261
1920 Dec. 31	27.5d.	278	100s. 10d.	248	27.1d.	308	99s. 3d.	274	23.8d.	365	87s. 3d.	324

of hours. It will be seen that nearly the same number of pence per hour was added in each occupation; and consequently the percentage increase is the greater the lower the initial wage.

Engineering.—Similar figures are given in Table 5 for engineers. The increase from 1909 to the end of 1913 was 3.6%. During 1915 increases of 3s. or 4s. were given to the majority of artisans and labourers in the engineering trades on time-rates, and 7½% or 10% on piece-rates and in 1916 a similar increase on time but not on piece. In April 1917 permanent time-rates 7s. (in some cases 8s.) and piece-rates only 10% above the pre-war level were arranged for both artisans and labourers, merging the former increments. War bonuses were subsequently granted as follows: April 1917 5s., Aug. 1917 3s., Jan. 1918 5s., Aug. 1918 3s. 6d., Dec. 1918 5s., Dec. 1919 5s., March 1920 and May 1920 each 3s. and 7½% on piece-rates.

Table 5.—Average of weekly time-rates (including bonuses) in a large number of towns.

	Turners		Moulders		Labourers	
	Amount	Per-cent-age	Amount	Per-cent-age	Amount	Per-cent-age
1914 Aug. 4	38s. 11d.	100	41s. 8d.	100	22s. 10d.	100
1919 April 30	76s. 10d.	197	79s. 10d.	192	58s. 3d.	255
1920 Feb. 29	82s. 5d.	212	85s. 6d.	206	63s. 11d.	280
1920 Dec. 31	89s. 2d.	229	92s. 3d.	221	70s. 4d.	304

In addition to these increases, aggregating 30s. 6d. for time-workers and 25% for piece-workers, an addition of 12½% on weekly earnings was granted to skilled munition time-workers in Oct. 1917, and a similar 7½% to piece-workers in Jan. 1918. This new increase was extended during the early part of 1918 to unskilled munition workers, to all engineers, to builders first on munition work and then to all, to iron and steel manufacturers, and to a number of allied trades.

By June 1920 a turner's wage for a normal week of 34s. in 1914, had increased to at least 73s. 6d. + 12½% = 82s. 8½d. A labourer's wage had increased from 22s. to 60s. 2½d.

Hours in engineering were generally reduced in Jan. 1919 from 53 or 54 to a uniform 48 weekly.

The increases awarded to piece-workers were less than those to time-workers because the former were during the war able to work with greater facility and to make a great amount of overtime. The earnings of time-workers were also greater during the war; that is indicated by the above rates for normal hours.

Railways.—Earnings of all workmen employed by railways averaged 25s. 4½d. in a selected week in Dec. 1909, and 25s. 10d., 26s. 8½d., 27s. 4½d., 27s. 11d. in successive Decembers; the increase from 1909 to 1913 is 10% (XVII. *Abstract of Labour Statistics*, p. 66). The average for a normal week, however, when overtime earnings are omitted, and men employed in railway workshops are excluded, is estimated at only 26s. 6d. at the end of 1913.

A flat increase was given to all grades in Feb. 1915 of 3s. to men earning less than 30s., 2s. to those earning more. In Oct. 1915 this was raised to 5s. for all, in Sept. 1916 to 10s., in April 1917 to 15s., in Nov. 1917 to 21s., in April 1918 to 25s., and in Nov. 1918 to 33s.; at the last-named date the average wage for the normal week was about 59s. 6d.

In Aug. 1919 for drivers and firemen, and in Jan. 1920 for other grades, new standard rates were established at about 38s. above the pre-war level, and at the same time wages of the worse-paid grades and districts were levelled up. In Jan. 1920 a sliding scale of wages was introduced by which all wages were to rise or

fall 1s. weekly for every five points that the cost-of-living index number rose or fell above its level in Dec. 1919 (125% above the pre-war level), but wages were not to fall below certain levels well above those of 1914. In addition to these changes a general increase was granted in June 1920 varying from 2s. to 7s. 6d. or 8s. 6d. and perhaps averaging 4s. 6d. Under the cost-of-living scale wages were raised 3s. in April, 2s. in July, 2s. in Oct. 1920 and 1s. in Jan. 1921 and reduced 4s. in April 1921.

In 1919 the week was reduced to 48 hours, beyond which overtime rates were payable (see *Labour Gazette*, Oct. 1919, p. 416, and June 1920, p. 290).

Agriculture.—In England and Wales the average cash weekly wages of ordinary agricultural labourers were estimated in 1907 at 14s. 0d., earnings (including piece payments, etc.) at 16s. 8d., and allowances in kind (including low rent) at 10d., making 17s. 6d. in all (Cd. 5460). Cash wages rose about 3½% by the end of 1913 according to one estimate (XVII. *Abstract of Labour Statistics*, p. 66) which gives 15s. 3d., but are computed at 15s. 10d. (with allowances at 1s.) in the estimates quoted in the *Report of the Committee to Inquire into the Cost of Living of Rural Workers* (Cmd. 76, p. 23, 57 seq.); in this report estimates are also given for 1918. By April 1915 average cash wages had risen to 17s. 10d. and by Aug. 1917 to 22s. 3d. (*Labour Gazette* June 1915, p. 200 and July 1917, p. 230). In Aug. 1917 a minimum rate of 25s. (to include the estimated value of allowance) was established by Parliament; in the summer of 1918 minimum rates were established for each county ranging from 30s. to 36s.; in May 1919 the range became 36s. 6d. to 42s.; in May 1920 a further increase was given, especially large in the lower-paid counties, making the range 42s. to 48s., and in Aug. 1920 they were further raised by 4s. (in two counties 4s. 6d.), making the range 46s. to 52s.: the lower rate applied to 35 out of 52 counties, and 52s. was paid in Cheshire alone, where the recognized hours were 54. In the fixing of minimum wages the hours of work corresponding to them are defined and overtime rates are payable for additional hours; in June 1919 the summer week was 54 and the winter 48 hours, and in Oct. 1919 summer hours were reduced to 48.

Piece-Rates—Cotton.—In the cotton trade no alteration was made in the method of arranging wage changes during the war. The wages of the great majority of operatives are paid by piece-rates, which are fixed in relation to standard lists, and changes are made by adding a general percentage to all rates depending on the standard. In recent years local differences have been merged and piece-rates in Lancs. and Cheshire move in accordance with percentage changes either in the preparing and spinning Bolton or Oldham lists or with the Blackburn and uniform weaving lists. Table 6 shows the changes from 1909 to 1921. Changes took place only at the dates shown till after April 1921. In July 1919 the weekly hours were reduced from 55½ to 48, and piece-rates were raised in the ratio 215:245 (= 48:54.7) to compensate. If the hourly output had been exactly maintained, the increase above the standard would have been 17½% in May 1920.

Earnings, however, depend not only on piece-rates but also on the number of hours and efficiency of work, and are affected by modifications of machinery and in management. The *Labour Gazette* gives monthly statistics of earnings from which it can be judged that (after an acute depression at the beginning of the war) they rose more rapidly than piece-rates in 1916 and 1917. Subsequent movements are indicated by Table 7 (Bowley, p. 179).[†]

[†] These are the earnings of all persons employed by certain firms and are affected to some extent by changes during the war.

Earnings increased as rapidly as rates in 1919 and the first half of 1920, after which there was a depression in trade.

Wool and Worsted.—In these industries the organization of wages and their changes is less standardized than in the cotton industry, and a much larger proportion of operatives are paid by time. Between 1900 and 1914 we have to depend on employers' statements to the Board of Trade (*Labour Gazette*, monthly) of average earnings, and from these it appears that earnings increased in the ratio 93 to 100 in these five years, whether owing to changes of rates or to better trade.

During the war earnings advanced very rapidly owing to the great demand for woollen goods, and the following figures relate to time-rates for the normal week or to piece-rates.

The most complete statement for the first three years of the war relates to the Huddersfield district. Here weekly bonuses were given to all workers (whether on time- or piece-rates) in rough proportion to their pre-war earnings, as follows: April 1915 6d. to 2s., Jan. 1916 6d., April 1916 1s. to 2s., Oct. 1916 1s. to 2s.; in Jan. 1917 the bonuses were increased especially to those with the highest earnings and the aggregates since July 1914 were 3s. 6d. to all earning 10s. weekly or less before the war, 5s. to those earning between 10s. and 15s., 6s. 6d. to women earning over 15s. and to men earning 15s. to 20s., and 10s. to men earning over 20 shillings.

In June 1917 a common system was arranged for most of the districts and occupations in the Yorkshire woollen and worsted industries. Instead of the war bonuses 50% was added to the time-rates customary before the war and this was increased successively to 60% in Oct. 1917, 72½% in March 1918, 81½% in Aug. 1918, 104½% in Nov. 1918 and 107% in Feb. 1919; after March 1918 the percentage was only given on 30s. If the basic rates exceeded this sum. Male piece-workers were given ⅓ths and female piece-workers ⅔ths of these sums, the percentages being based not on piece-rates but on pre-war earnings. In the spring or summer of 1919 an additional 10% was added to the basic rates. From Sept. 1919 the increases were related to the cost-of-living index number, and the addition moved upwards 10% on the original basic rates for every complete 10 points added to the cost-of-living number, these increments were at first not applied to the 10% added in 1919, nor to the excess of basic wages over 30s., and consequently rates moved rather less rapidly than the cost of living as officially measured. In Dec. 1920 the "cost-

of-living" wage was 175% of the basic rate, and owing to other changes the whole increment (to operatives where pre-war earnings were under 30s.) reached 216% for time-workers, 181% for male piece-workers and 190% for female piece-workers.

Hours were reduced in March 1919 from 55½ to 48 weekly, and in compensation piece-rates were increased 15% in addition to the increments already described, while weekly time-rates remained unchanged.

Coal-Mines.—The majority of men working in or at coal-mines in the United Kingdom are paid piece-rates, which used to be increased or lowered by agreed percentages in the various districts at frequent intervals, subject to a minimum day's payment for underground workers. The percentage levels reached in the principal districts from 1909 to 1917 are shown in Table 8.

Table 8.—Piece-rates in coal-mines (expressed as percentages of their amount) in July 1914.

	Northumberland	Durham	Federated Districts	South Wales	Scotland	General average
End of 1909	86	92	91	89	86	90
1910	87	91	91	91	86	90
1911	84	88	91	90	86	89
1912	92	93	94	95	97	94
July 1914	100	100	100	100	100	100
1915	109	107	115½	111	118	113
1916	141	120	127½	132	136	129
Feb. 1917	147	132	132½	146	136	136

In Sept. 1917 the adjustment by percentages in the different districts was given up, and, the mines being controlled by the Government, uniform movements over the whole country were arranged. In Sept. 1917 and also in June 1918 uniform increases of 1s. 6d. per day or shift were granted to all men, and a further increase of 2s. in Jan. 1919 resulted from the reports of the Coal Industry Commission. Evidence to this Commission showed that the average of all workers before the war was 6s. 6d. per shift and in Nov. 1918 as a result of the percentages increases and the bonuses of 3s. was 12s. 6d. In July 1919 the maximum time of a shift was reduced from eight to seven hours, piece-rates being increased to compensate for the shorter time. In March 1920 an increase of 20% on the wages paid before Sept. 1917 was added, bringing the average to nearly 17s. a shift; in Oct. 1920 after a strike further increases in proportion to any increase in output were arranged; in the early months of 1921 the demand for export coal fell off, and when control was removed or April 1 the miners refused to work at the lower rates offered.

Iron and Steel Manufacture.—Wages in these industries are generally related by a sliding scale to the selling price of the product. The movements in different districts have been so divergent that it is not possible to give a summary account of their results, but the following figures are illustrative.

In Cleveland (Yorks) ironstone mining, on Aug. 1917 piece rates had risen 60% over those of July 1914; from that date to April 1920 the same additions were made as in coal-mining.

In Cleveland and Durham pig-iron manufacture, blast-furnace operators' wages were in successive Julys, 1915 to 1919, respectively 8, 31, 44, 57, and 92% above July 1914, and in Oct. 1919 108% above. In Nov. 1919 a new percentage basis was changed. In addition a bonus of 5d. per shift was added in Feb. 1915 and raised to 10d. in April 1917, and a war wage of 1s. 6d. per shift was added in Aug. 1918.

In Northumberland, Durham, and Cleveland iron manufacture, iron millmen's rates were in Julys, 1915 to 1920, respectively 7½, 50, 67½, 82½, 147½, and 187½% above those of July 1914; some bonuses were granted but merged in subsequent increases.

Minimum Wage under the Trade Boards Acts.—Under the Trade Boards Act of 1909 minimum wages were established in the following industries. Chairmaking (1910), lace finishing

(1911), paper box making (1912), tailoring (1912), confectionery (1915), shirtmaking (1915), tin box manufacture (1915), hollow ware (1916). Under a subsequent Act of 1918 new powers were given to the Ministry of Labour, and a number of other industries in which the organization of the workers was imperfect and the wages low were included in the scope of the Acts. The Acts are not confined to women's wages only, but affect numbers of men in tailoring and other industries.

The hourly rates fixed in 1912-6 for women varied from 2½d. to 3½d., the lowest in 1914 being 2½d. The rates rose gradually during the war, but in many cases, owing to the higher earnings possible to women in munitions and other work, more than the minimum rates were in fact paid. More considerable increases took place in 1919 and 1920, and by the end of 1920 8½d. or 9d. was the common rate. A normal week, usually 48 hours, has been fixed, after which higher overtime rates are payable. Piece-rates are fixed so as to give an average worker more than the minimum time-rate.

Wages in other Countries.—Apart from the United States, there are very few authentic computations of the general movement of wages or earnings during the war. Sporadic statements of wages in particular industries exist, but they are of little use when a general view is desired. So far as the information goes it indicates that wages in the neutral and Allied countries followed much the same course as in the United Kingdom. The nominal weekly rates increased later than prices in 1914-8 and gained rapidly (in spite of reduction of hours) in 1919-20, till at the beginning of the depression in the autumn of 1920 it was doubtful whether wages expressed in commodities were higher or lower than in 1914.

The following paragraphs summarize the available statistics. For their relation to prices see **COST OF LIVING**.

Norway.—Up to the summer of 1918 wages as a whole appear to have increased about 90% since 1914. For April 1919 we have detailed statements such as follow, which indicate a general increase of 160 to 180%. Wage rates are compared with those in 1914 taken as 100. Bricklayers, urban 254, rural 271; carpenters, urban 282, rural 279; bricklayers' labourers, urban 291; excavators, urban 301, rural 281; urban painters 281, bakers 288, shoemakers 309, tailors 244, carters 282, dressmakers 238, laundry workers 229; agricultural labourers (not provided with food and lodging) 279; State employees, railway guards, etc., 276, gangers and pointsmen 264, head engine drivers 231, assistants 261, postmen 258. By new collective agreements in April and May 1919 hourly earnings in factories were increased till in July 1919 they are stated at 341 (1914 = 100), but weekly hours were reduced from 55½ to 48. Unskilled labourers' rates are stated as 388 in Nov. 1919.

Finally an employers' association estimated that in May 1920 skilled adults' hourly wages were 382 in export industries, 398 in other industries, 349 in handicrafts, and for women generally 407, as compared with 100 in 1914.

Denmark.—Hourly wages generally: 1914, 100; 1918, second quarter 170, third quarter 200; 1919, first quarter 224, second 257, third 338, fourth 352; 1920, first quarter 358, second 376, third 398. During 1919 daily hours were reduced till they were generally 8 in 1920 as compared with 10 in 1914. In 1919 (third quarter) hourly wages on the same basis were for male workers, skilled 330, unskilled 366, and for women 353. In April 1920 collective agreements made future changes proportional to the cost of living.

Greece.—The Minister of National Economy (Greece) gives the figures shown in Table 9 for Athens as corresponding closely with those for other parts of Greece.

Table 9.—Wages in Greece.

	Drachmas	
	1914	1920
Daily wage-earners:		
Dockers	3.50 to 4	30 to 40
Bricklayers	4 to 4.75	18 to 20
Carpenters	4 to 7	18 to 25
Painters	5 to 6.50	20 to 25
Smiths	4 to 6	15 to 20
Printers	3	17 to 25
Turners	3.80 to 6.50	8 to 15
Boiler-makers	3.50 to 6.50	12 to 15
Fitters	2.50 to 6.50	6 to 16
Tailors	6 to 7	25
Miners	3 to 5	5 to 10
Monthly wage-earners:		
Corn mill workers	100 to 140	305 to 420
Textile operatives	180 to 200	720 to 820

Germany.—It is estimated that earnings including overtime had increased 34% in industries generally between March 1914 and Sept. 1916, while hourly rates had probably increased 25%. In Sept. 1918 the average daily wage of male adults is stated as 12.46 marks and of women 6.01 marks, compared with 5.17 and 2.28 marks in March 1914 (241 and 264 if the earlier wages are taken as 100). The Federal Statistical Office gives weekly earnings for male adults as 35 marks for the year ending July 1914; if this is taken as 100 subsequent figures are Aug. 1919 286, Feb. 1920 486, Nov. 1920 686. Factory inspectors at the end of 1919 reported a tendency to approximation between wages of unskilled and skilled workers.

Austria.—The Austrian Trade Union Commission reported that in Oct. 1920 men's wages (in currency) were from 22 to 27½ times the rates in July 1914 and women's 20 to 25 times.

New Zealand.—The *Official Year Book* for 1919 contains an elaborate analysis of the minimum wages payable from 1901 to 1919 in 26 occupations. Wages do not necessarily move exactly with their minima, but in unskilled trades they are in fact generally the rates paid. The results are shown in Table 10, the level in 1911 being taken as 1000 in each occupation.

Table 10.—New Zealand. Minimum hourly rates.

	Skilled occupations	Semi-skilled occupations	Unskilled occupations	General average (weighted in proportion to the numbers in occupations)
1901	929	915	940	932
1905	964	939	955	954
1910	992	991	1001	996
1912	1009	1006	1004	1006
1913	1024	1067	1025	1036
1914	1073	1078	1102	1087
1915	1073	1086	1113	1094
1916	1095	1147	1193	1152
1917	1124	1188	1250	1200
1918	1208	1247	1297	1258
1919	1352	1439	1451	1418

The occupations included are bakers, boiler-makers, bookbinders, paper-makers, bootmakers (male), bricklayers, builders' labourers, butchers, carpenters, coach-builders, coal-miners, drivers (horse), engineers, fell-mongers, flour millers, freezing works employees, furniture makers, grocers' assistants, iron and brass moulders, painters, plasterers, plumbers, seamen, slaughtermen, tailors, tailorssees, water-side workers, and woollen mill operatives (male). The *Year Book* for 1920 (p. 279) gives statistics for average wages in all but the smallest factories and workshops (Table 11).

Table 11.—New Zealand. Average annual wages.

	Males		Females	
	Amount	Percentage	Amount	Percentage
1900-1	£81.9	71	£31.3	62
1905-6	88.5	77	41.9	83

1915-6	133.5	116	56.7	112
1918-9	159.4	139	68.8	136

Australia.—The *Official Year Book* for 1920 contains two statements relating to recent movements of wages from which Tables 12 and 13 are compiled. About 240,000 males and 80,000 females of all ages are included in the returns.

Table 12.—Australia. Average annual payment per employee.

	Males		Females	
	Amount	Percentage	Amount	Percentage

(A. L. Bo.)

United States.—That a large proportion of unskilled workers in the United States was paid wages, even in 1921, far too low for decent self-support is a fact confirmed by many wage investigations and well known even to those only slightly familiar with industrial conditions. Before the era of unprecedentedly high prices caused by the World War, it was the consensus of expert opinion that a weekly wage of \$8, or more, was necessary under urban conditions for the maintenance of a self-supporting woman in simple decency and working efficiency, and that a man with a wife and three children needed \$15 to \$20 weekly. Yet a study made in 1914 of women's wages in the United States led to the conclusion that 75% of female wage-earners received less than \$8 weekly, 50% less than \$6 and 15% less than \$4; and that the incomes from these wages were further reduced approximately 20% through lost time and unemployment. The pay of unskilled male workers was at a correspondingly low level. Frank H. Streightoff, in his discussion of American standards of living, estimated that at least 6,000,000 adult males, married as well as single, received less than \$600 a year, or \$12 a week. More intensive investigations bore out these figures. The U.S. Immigration Commission in 1907-10 studied many typical households of both native- and foreign-born, in 16 industries, and found that more than half the male heads of families earned less than \$500 a year, and nearly two-thirds less than \$600. The New York State Factory Investigating Commission examined the pay-rolls of over 2,000 stores and factories during the autumn, winter and spring of 1913-4, a year which may be regarded as normal, and found that of 57,000 women and girls, approximately 34,000, or 60%, earned less than \$8 in a typical week. Of 14,000 married men, 7,000 earned less than \$15. The causes of these low wages were: the lack of strong labour organizations and collective bargaining among this group of wage-earners; the belief of unskilled women wage-earners that their work was temporary; and the competition of married women who were only partially self-supporting; also a failure on the part of employers to recognize a relation between wages and productivity. In the United States, until the outbreak of the World War, the situation was further complicated by the stream of immigration, which furnished an abundant supply of cheap labour and provided still another barrier, in the shape of divergent language and customs, in the way of union organization.

During the war the wage level was appreciably raised, but owing to the great rise in prices that accompanied the change it is doubtful whether real wages were materially increased, except perhaps in a few war industries and in certain occupations covered by especially liberal Government wage awards. The average rate of wages failed to keep pace with the rising cost of living. Between Nov. 1918 and Jan. 1919 a study by the New York Industrial Commission of the earnings of 32,000 women in the same industries which had been covered by the Factory Investigating Commission in 1913-4 indicated that 60% of those in factories and 61% of those in stores received less than \$14 a week, the equivalent of \$8 in 1913. The average weekly wage of both sexes in many representative New York factories was \$24.83 in Sept. 1919, while in eight large industries for which data were collected by the National Industrial Conference Board, the average weekly wage for male workers was \$24.24 in Sept. 1918 and \$23.37 in March 1919. In the skilled trades the effect of trade unionism was to increase wage rates: union minimum rates as provided in agreements with employers rose above the 1913 rate 90% for hourly rates and 80% for full-time weekly rates, exclusive of overtime, paid for at an increased rate.

The demand for increased wages has been the most frequent cause of strikes since 1915, as was to be expected in a time of steadily advancing living costs. Many of the strikes or threatened strikes were settled by Government agency. Considerations which influenced the arbiters were: the concept of a minimum living wage; increases in the cost of living; the desire for standardization, both within a given industry and in a given territory; increase in productive efficiency; and the effect of overtime work in increasing weekly wages. The National War Labor Board created a Cost of Living Section associated with the

Bureau of Labor Statistics. The minimum requirement for an average American family of five members was found to be, for New York City, in June 1918, \$1,350 to \$1,400; in Dec. 1918, \$1,500. Therefore, if the eight-hour day were observed, 55-60 cents an hour would be the lowest which might properly be received by the breadwinner. It was, however, expected that overtime would be worked, and lower rates were set, 40-45 cents an hour.

Before the war there were inequalities in wage rates in different parts of the country and between union and non-union workers; the tendency of war-time adjustments was to establish standards. But the rates of pay of the unskilled rose more rapidly than those of the skilled. Wages of unorganized common labourers increased 100 to 200%. These men had formerly been paid less than enough to maintain an "American standard of living." During the war there was such a demand for their services that wages rose as employers bid against each other. In certain cases the Government agencies fixed arbitrary standards to prevent a flow of labour back and forth between localities and between establishments. There were great differences in wage increases gained by skilled workers. The least increases were in the building trades, which before the war had been among the best-paid employments; but men engaged in shipbuilding received increases greater than the average for the trade. The U.S. Bureau of Labor Statistics estimated that the cost of the working-class standard of living doubled between 1913 and 1920. The cost of food increased 118%, as calculated from the prices of 22 food articles reported to the Bureau. The accompanying table shows the increase per cent for both cost of living and wages. This wage index is computed by the present writer on the studies of wages in 12 important industries, made by the U.S. Bureau of Labor Statistics. The index number computed is a simple, unweighted, arithmetical average of average full-time wages, with 1913 used as a basis. Increases in the trades studied were as follows: bakery trades, 1913 \$18.14, 1920 \$41.28; boot and shoe, 1913 \$17.28, 1920 \$29.32; building trades, 1913 \$24.33, 1920 \$44.18; cotton manufacturing, 1913 \$10.17, 1920 \$29.05; iron and steel, 1913 \$28.47, 1920 \$68.84; metal trades, 1913 \$21.62, 1920 \$42.37; mill work, 1913 \$14.48, 1920 \$41.10; printing, 1913 \$19.56, 1920 \$35.80; silk manufacturing, 1913 \$12.30, 1919 \$21.99; woollen, 1913 \$10.14, 1920 \$35.18; farm labour, without board, 1913 \$7.58, 1920 \$16.24; railroads, 1913 \$21.04, Jan. 1920 \$25.91.

	Cost of Living	Wages
1913	100	100
1914	103.0	100.2
1915	107.4	103.3
1916	113.3	117.5
1917	140.5	134.4
1918	165.8	157.5
1919	190.2	185.5
1920	208.2	206.4

The increase of the cost of living was in advance of the increase of wages for the whole period from 1913 through 1919, except possibly during 1916. The discrepancy was greatest in 1918. The purchasing power of wages, measured by the cost of food, fell more in 1917 than in any year since 1890. The drop was one of 17.7% in the purchasing power of 1913. From the middle of 1908 to the middle of 1921 the purchasing power of wages continued to be less than in the period 1890-1907. The purchasing power of wages ("real wages") was greatest in 1896 and in 1900. Total "real income," however, was not necessarily greatest in these two years, due to changes in the volume of employment. It appears that the prices of labour are influenced by the changes in business conditions, but to a less degree than the prices of commodities. In general, the average wage declined after 1893, recovered in 1896, and dropped again for the years 1897 and 1898. In 1899 the wage began to advance, halted in 1904, and dropped slightly after 1907; beginning with 1909 the upward course was resumed, with a slight drop in 1914. This upward movement continued to 1920, and was especially rapid after 1916. In the various industries there were differences in the degree of the movement of wages. The fluctuations in the

iron and steel industry were numerous, as were also those in silk and cotton manufacturing. On the other hand, changes in the bakery and building trades were less noticeable. However, no industry escaped a reduction in wages after 1893, and none failed to register a large advance after 1916.

From 1914 to 1918 the purchasing power of hourly wages seems to have decreased considerably. But, due to steadiness of employment and to the overtime worked, actual weekly earnings may have increased. In 1919 and the early part of 1920 wages and wage rates rose more rapidly than the cost of living. The conservative and carefully compiled budget for 1918, drawn up by the Philadelphia Bureau of Municipal Research, specified \$1,637 as necessary to support a family of five in the "minimum standard of health and comfort." This standard is lower than the "standard of health and decency" adopted by the Bureau of Labor Statistics. Cost of living is no higher, and may be lower, in Philadelphia than in other industrial centres. The Philadelphia budget in Nov. 1919 required \$1,803 and in Aug. 1920 \$1,988. If the increase was distributed evenly throughout the nine months, the average wage in manufacture was insufficient to support this standard. The deficiency in the case of textiles was between \$450 and \$570; in boots and shoes and paper manufacturing and in printing, more than \$400; and in furniture manufacturing, more than \$700. By 1920 the situation was better; although only in one industry studied, the manufacture of rubber goods, was the average full-time yearly income able to support the standard. If retail prices of food are taken as an index of living costs, *union hourly* real wage rates in 1918 were 20% lower than the average for 1890-9, and full-time real *union weekly earnings* probably 25% lower, due to the decrease in the number of hours worked. Allowance must be made for the fact that food prices rise more rapidly than cost of living as a whole, and for the fact that the figures here refer to *union scales of wages*, which often represent the minimum wage actually paid. The total income of most workers increased during the war period, due to steady employment; to the overtime work, usually at increased rate of pay; and to the fact that the war called into industry more members of the family than are ordinarily wage-earning. It is necessary to call attention to the fact that unemployment has never been taken into consideration in computing "real wages." Until a coefficient of unemployment has been found, no chart of "real wages" will be able to show the actual state of well-being of the wage-earning class. The average retail price of food in 1920 was 103% higher than in 1913. During 1920 it continued to rise; the highest point reached was 119% higher than in 1913, in June and July 1920. After that the prices fell and reached a point in April 1921 52% greater than in 1913. According to the philosophy of employers, as living costs fall, wage rates also should fall. However, by April 1921 earnings had already decreased owing to the decrease in available employment. It is not agreed that the 1913 standard of living was adequate: workers who have emerged from the "minimum of subsistence" level are loth to return to an acceptance of insufficient purchasing power.

The Bureau of Labor Statistics reported changes in rates of wages between July 1 1920 and March 31 1921. The total number of changes reported was 2,714, of which 1,689, nearly two-thirds, were increases. Two-thirds of the increases in the three months of 1921 were in the printing and publishing industry. The largest number of decreases were in the textile industry. The largest number of decreases reported were in Jan. 1921, the largest number of increases in July, Aug. and Sept. of 1920. The most frequent cut in wage rates was between 10 and 20%; 30% also was reported in a large number of cases. It must be remembered that *per capita* earnings decreased still further, due to the decrease in the volume of employment. Under the agreement between employers and union in the men's clothing industry in Chicago, wages were reduced in April 1921 5% for those who had received a 5% increase in 1919 and 10% for all others, except that no wages were to be reduced below \$15 for the full-time week. In the same month the board of referees in the ladies' garment industry in Cleveland ordered the restoration of the

July 1919 wage scale, with some exceptions. The reasons given were, first that the cost of living had not continued to rise as had been expected but had fallen, and, second, the serious business depression. To secure the workers continuity of income, the employer was ordered by the award to retain the satisfactory worker 20 weeks in each half-year or to pay an unemployment benefit of two-thirds the weekly wage, the employer's liability to be limited to 74% of his direct labour cost for the guaranteed period. In July 1921 the U.S. Railway Labor Board, after hearings, ordered a 12% reduction in wages on 102 railways.

Babson's Statistical Organization reported the total earnings of employees in the manufacturing establishments in New York State in July 1921 as the smallest since May 1919. According to this study, wages reached a peak in Dec. 1918 at 120% greater than in June 1914, and again in Sept. 1919 at 129%, from which they rose to the highest peak in March and June 1920 with 177%. By April 1921 they had fallen to 95% greater than in June 1914.

WAGE-SYSTEM IN INDUSTRY.—The normal systems of payment for the work of persons employed in industry under the capitalist system are wage-payment and salary-payment. It is not easy to draw an absolute line of distinction between these two forms of payment. Wages are usually paid weekly, and salaries over a longer period—monthly, or quarterly, for example. There are, however, cases of weekly salaries, and of wages paid monthly. Moreover, a good many of the supervisory grades in various industries are paid what is called an "upstanding wage," which in many of its conditions approximates rather to the salary basis of payment than to the wage as ordinarily understood. Usually the salary-earner possesses a higher status and a slightly greater measure of security than the wage-earner. Wages are, as a rule, paid only for hours actually worked, subject to the conditions mentioned below, and any period of illness or suspension of work for any cause, whether under the worker's control or not, involves a cessation of the payment of wages. Salary-earners, on the other hand, are in many cases paid during periods of sickness, and are usually paid for a full week, or month, even if some spells of enforced absence from work or failure of work due to some other cause are included. There are, however, very many intermediate varieties between the continuous salary paid throughout the whole year, and the wage paid only for hours actually worked. The salary-earner, it should be remarked, is usually entitled to a longer period of notice, from a month upward, than the wage-earner, who can usually be dismissed or suspended on a week's notice or less. The period adopted as a basis for the calculation of wages differs from trade to trade, and even from district to district or factory to factory within the same trade. In some cases the basis is hourly, in others a weekly rate of wages is laid down. In either case, there may be, but in the majority of cases is not, what is termed the "guaranteed week," that is, a guaranteed minimum weekly payment, irrespective of the number of hours of employment which the employed person is actually able to secure. In certain other cases, notably that of the dockers, there is the "guaranteed day," but not the "guaranteed week." The demand for greater measure of security than is afforded by hourly payment, without any guarantee of the week or the day, has increased, and a number of trades have secured concessions giving them guarantees of one sort or another.

Broadly speaking, the methods of remunerating the wage-earner under the wage-system can be divided into two main

groups: (1) time-payments, and (2) "payment by results," although there are many intermediate varieties, and disputes often arise on the question whether a particular system is or is not to be regarded as "payment by results."

(1) Under the time-work (or "day-work") system, the worker's remuneration varies with the time which he actually spends on the employer's business. Thus, carpenters and joiners in certain districts in the building industry in Great Britain have a time-rate of 2s. an hour, and the majority of grades on the railways have time-rates varying from 65s. per week upward. These time-rates are practically always fixed in relation to a definite number of hours in the week, and if a larger number of hours has to be worked, the hours in excess of the standard week are termed overtime, and are usually remunerated on a slightly higher hourly rate—"time and a quarter," "time and a third," "time and a half" or "double time," for example. Extra payment is also frequently made for work done during the week-end or at night ("night-shift"). The time-work system operates throughout a large number of trades, including the greater part of the building industry and the railway and road transport services, and almost the whole range of non-manual employment. In many other industries it is found side by side with various systems of "payment by results." In almost every time-work industry there are some piece-workers; and in almost every piece-work industry some time-workers. A particularly obnoxious form of time-work is that known as "task-work," under which the worker is required to perform a definite amount of labour in return for a time wage, but receives no additional remuneration for higher output. This is strongly opposed by trade unions and does not prevail at all in organized industries in Great Britain.

(2) Under the term "payment by results" are comprehended many different methods of wage payment, the common factor among them being that, to a greater or less extent, the worker's earnings under them vary with the amount of output which he, either individually, or in conjunction with a group of his fellow-workers, is able to produce. The amount of work produced may not be the sole factor determining his remuneration under a system of "payment by results"; for such systems are very frequently, and in the organized trades usually, accompanied by guaranteed minimum or standard time-rates, which the worker is entitled to receive irrespective of the actual output which he produces. Strongly organized trade unions in many industries have consented to accept "payment by results" only on the condition that the standard time-rates of wages shall be guaranteed irrespective of output (e.g. engineering).

The simplest form of "payment by results" is that known as "piece-work." Under this system, a price is fixed for each unit of the commodity upon the production of which the worker is engaged, e.g. if the worker is turning out screws, a price will be fixed per hundred, or per gross of screws, this price being calculated, in theory at least, according to the time which is estimated to be necessary for the performance of the operation in question. Sometimes, as in the "time logs" in the tailoring trade, the piece-work price is expressed not in terms of money, but in terms of hours, and the worker is paid for so many hours at the standard rate, irrespective of the time actually occupied on the job. "Straight" piece-work systems vary very much in complexity. Where the operations are simple, and the character of the goods produced uniform, piece-work prices can be laid down with almost mathematical accuracy; but as soon as provision has to be made for a wide range of different products complications almost inevitably arise. These complications are of two kinds. The cotton industry in Great Britain is almost entirely a piece-work industry; but, despite the immense variety in the types of cotton goods produced and the variation in the times required for the spinning and weaving of different types of goods, piece-work rates can be devised to correspond with practically mathematical accuracy to the time required for the job because of the high degree of standardization at which the industry has arrived. The piece-work lists agreed to by the weaving trade unions and the cotton manufacturers are immensely

complicated, and only skilled technicians are able to understand them. The universal acceptance of piece-work in the cotton industry is mainly accounted for by the fact that, under the system which has been adopted, a given amount of effort can be approximately relied upon under normal conditions to produce equivalent earnings.

This is much more difficult to secure in such an industry as engineering, where the products are far less uniform and where also the machinery which the worker is called upon to manipulate is far less standardized, so that it may take very different times to do the same job on two different machines. The fixing of piece-work prices in the engineering industry in Great Britain is therefore a constant source of friction, and it has been found impossible to express, in any tables corresponding to the cotton piece-work lists, the fair remuneration for most forms of work on engineering products. Piece-work prices in the engineering industry are a constant subject of workshop and trade-union bargaining, and there is a strong resistance in many sections of the industry to the introduction of piece-work, largely because there is not, as in the cotton industry, any simple method of arriving at a fair price, and the system thus produces constant allegations of "speeding up" and "price-cutting" on the one side, and of "speeding down" and "restriction of output" on the other. Where, owing to special circumstances, it is regarded as impossible to fix in advance a piece-work price for a particular job, the worker, especially in the engineering and shipbuilding industries, is sometimes paid what is called a "lieu rate," e.g. "time and a third" or "time and a half" for the hours actually occupied on the job in lieu of a fixed piece-work price.

The other main system of payment by results is the system of "bonus on output." Under this system the worker is normally paid a time-rate irrespective of output; but, if the output exceeds a given minimum, an additional bonus, calculated upon this excess output, is paid. There are literally hundreds of different methods of calculating this bonus. The system to which the greatest attention has been attracted in recent years, both in Great Britain and in America, is the "premium bonus system" in its various forms, of which the two best-known are the "Halsey" and the "Rowan" premium bonus systems. Under both these systems, a "basis time" is fixed for the accomplishment of the piece of work in question. If the work is done in less than the basis time, the workman is paid, over and above his time-rate of wages, which is guaranteed, a bonus, proportionate in one way or another to the time saved. The effect of this method of payment is that, under both the Halsey and the Rowan system, the labour cost of the job to the employer falls with every increase in output, while at the same time the earnings of the workman increase, but not in proportion to the increase in output. The simpler of the two best-known premium bonus systems is the "Halsey" system, so called after its inventor Mr. F. A. Halsey, an American efficiency engineer. Under this system, the workman is paid a fraction, usually either a third or a half, of his time-rate for time saved. Thus supposing the time allowed for an operation is 12 hours, and a worker, whose time-rate is a shilling an hour, does it in 9 hours, he will be paid at his time-rate for the 9 hours, and in addition will receive payment for a further hour or for an hour and a half, according to the particular variety of the system adopted.

The Rowan system is more complicated. The simplest way of explaining it is to say that for every 10% that is saved on the time allowed, the workman receives a 10% increase in earnings. The more complicated way is to quote the quite unnecessarily abstruse formula which is usually adopted by those who desire to explain the system. This formula is as follows:—

$$\text{Bonus} = \frac{\text{Time saved}}{\text{Time allowed}} \times \text{Time taken.}$$

There are all manner of modifications of these two systems, in the direction both of greater simplicity and in that of greater complexity. The advocates of "scientific management" have been especially active in devising fresh variations in the method of payment, intended to stimulate the workers' productive efficiency

in the fullest degree. Efficiency engineers often contend that it is necessary to work out a different formula for each type of operation in order to apply in each case precisely the right stimulus to increased output. Most of these systems are based in one way or another on the premium bonus system in one or other of its two forms, or on the so-called "differential piece-rate" system advocated by Mr. F. W. Taylor, the founder of "scientific management." Under this system, two different piece-rates are fixed for the same job, and at the same time a standard output per hour is laid down. When the worker reaches or exceeds the standard output he is paid on the higher piece-rate; when he falls below the standard of output he is paid on the lower piece-rate. Day-work rates are not guaranteed. The object of this system is stated to be the elimination from the job of the less efficient worker by discouraging him with the offer of a lower piece-work price. It is impossible to attempt to chronicle the many different bonus and piece-work systems which have been put forward in Great Britain and America. The Ministry of Munitions in England, during the World War, accumulated a list of many hundreds of different systems which were actually in operation in the British engineering shops alone. It is particularly in the engineering and kindred industries that this wide diversity of forms of wage-payment exists.

It should be noted that both the piece-work system and the various bonus systems and adaptations of them can be operated either on an individual or on a collective basis. Under the individual system a single worker is remunerated in accordance with his individual output. Under the collective system a group of workers is treated as a unit, and the piece-work price or bonus is paid in respect of the output of the whole group. Collective systems are most often found where the work itself necessarily involves collaboration, and where it is therefore difficult or impossible to separate the individual contribution of the workers engaged upon it (e.g. "squad" or "gang" work). It has, however, been applied also in a large number of cases over a considerably wider area in the form of an output bonus paid on the work of a whole shop or factory. In these cases, bonus is sometimes paid only to workers directly engaged on production; but in other cases auxiliary workers, such as foremen, millwrights, maintenance workers, and even workers on the staff, may share in the pool. Many such systems were adopted in shell factories in various countries during the war.

A variety of collective "payment by results" is that which is known as the "fellowship" system. Under this system, the workers themselves form groups on a voluntary basis, and share out among themselves, either through the office of the firm, or by a subsequent re-division of the sums paid through the office, their collective earnings. This system usually operates among "fellowships" of skilled workers in a particular craft or in closely related crafts.

There are many different ways of sharing out the payment made under collective systems of "payment by results." The most usual method is that each worker included in the group shares in the payment in proportion to his time-rate and to the hours worked on the job. Sometimes, however, the pool, or any surplus over the time-rates of the workers concerned, is equally shared, and sometimes regard is paid only to one or other of the two factors mentioned above. In a few cases a specially large share in the pool is offered as an inducement to a leading worker, or to a few leading workers; but the system in this form approaches the system of "sub-contracting," which is universally objected to by the trade-union movement.

"Sub-contracting" is usually understood to mean a system under which one worker undertakes a piece of work which requires the coördinated labour of a group of workers. The sub-contractor receives the whole sum paid for the execution of the job, making, subject to any limitations that may be laid down in his contract, his own wage contract with the workers under him, and retaining any surplus for himself. Often a sub-contractor, himself paid "by results," remunerates the workers under him on a time-work basis. It is generally recognized that the sub-contracting system is open to grave abuse, and with the

advance of trade-union organization it has been gradually eliminated from industry, surviving only in a comparatively small number of cases. The outstanding instances of it in the past have been the "butty" system in the mining industry, which still exists in one or two British coalfields, and the methods of payment which used to be adopted in many sections of the iron and steel industry.

Distinct from both the piece-work system and the various bonus systems is the system of "commission," which is applied in a certain number of occupations. Under this system the worker receives a commission on "takings" or on profits either as his sole mode of remuneration, or as an addition to a minimum wage or salary. This is the position of most workers in the insurance business, and of a number of managerial and semi-managerial workers in the distributive trades. It is also found occasionally in other occupations.

The attitude of employers and workers towards these various systems of wage-payment differs widely from case to case. Recently, attention has been mainly concentrated on the endeavours of employers to introduce systems of "payment by results" into industries in which time-work systems are at present largely in operation, e.g. building, engineering, ship-building. Usually these attempts have met with strong trade-union opposition. It must not, however, be concluded that employers are universally favourable or trade unions universally opposed to "payment by results." The position differs from industry to industry. In the textile industries, and in a number of the less-organized occupations, "payment by results" has been introduced and maintained not merely with the acquiescence, but often at the instance of the workers, who have seen in it an opportunity of securing higher earnings. At the other extreme, the worst forms of "sweating" in industry are very frequently found in conjunction with the time-work system of payment. In the past, trade unions have usually favoured, or at least not opposed, "payment by results" in those industries in which a standard of measurement can be found of such a character as to insure that, under normal conditions, a given amount of effort expended will result in a given amount of output, and therefore of earnings under the system. On the other hand, the unions have generally been opposed to the introduction of "payment by results" in those industries in which no such standard can be laid down, as well as in other cases where it has been contended that "speeding up," consequent upon the inducement offered for higher output, would have the effect of impairing the quality of the work done (e.g. building). Where "payment by results" has been accepted in industries of this latter type, a struggle has often followed over the question whether the right of the organized workers to bargain collectively over the fixing of piece-work prices or "basis times" shall or shall not be recognized. This struggle is still in progress over a wide range of industries; but the fixing of piece-work prices and "basis times" is still normally done by the employer or his representative, subject only to protest by the workers or their representatives.

It should be noted that the growth of "scientific management" has given a great impetus to the introduction of "payment by results," and has also considerably affected the methods adopted by employers in fixing piece-work prices or "basis times." In the great majority of factories, other than textile factories, in which systems of payment by results are in operation, piece-work prices are still fixed in a very haphazard fashion, and modified from time to time in accordance with actual experience of their working. But, where one feature or another of "scientific management" has been introduced, experiments have been made designed to introduce a greater scientific accuracy into the fixing of prices and times. The methods which have been introduced with this object are mainly those of "time study" and "motion study." "Time study" means an attempt, by actual observation of the doing of a particular job, either by a selected worker or in a number of selected cases, to fix the time which ought to be occupied in the doing of it by a normal worker. "Motion study" means the observation of the doing of a job with a view to eliminating all surplus motions, and to the laying

down in detail of the method by which it can be done with the maximum of efficiency and in the least possible time. The former method has been adopted by a number of firms in Great Britain, the latter in comparatively few cases. Both are largely in operation in America. "Time study" and "motion study" are usually resented by the workers employed, and are regarded as devices adopted by the employer with a view to "speeding up." It is also contended that both, and especially "motion study," result in making work more monotonous and in taking such variety of initiative as remains to the worker under modern factory conditions out of his hands and in concentrating control in the hands of a small body of expert rate-fixers, or "time-study" and "motion-study" experts.

Where piece-work or bonus systems are in operation, friction is very likely to arise because there is a constant suspicion on the part of the workers that the employer is endeavouring to "cut" piece-work prices and to "speed up" the slower workers to the pace of the more rapid. Employers, on the other hand, allege that workers deliberately slow down with a view to forcing up piece-work prices. It is impossible to estimate the relative productivity of workers under time-work systems and under systems of "payment by results"; but it may be taken as certain that no system of "payment by results" which has yet been devised has succeeded in eliminating friction or the possibility of "price-cutting" on the one hand, and "restriction of output" with a view to securing higher prices on the other. Perhaps the nearest approach to the elimination of these two factors is in the cotton industry; but the comparatively smooth working of the piece-work system in this case is mainly due to the peculiar standardized character both of the product and of the machinery. The cotton "price-list" system cannot readily be adapted for use in the majority of industries.

REFERENCES.—There are only two books giving a general survey of the various wage systems. These are (1) *Methods of Industrial Remuneration* by D. F. Schoss (Williams and Norgate), which was written a good many years ago, and is now in many respects out of date, and (2) *The Payment of Wages* by G. D. H. Cole, which is the most recent study. See also, for conditions in England, *Industrial Democracy* by Sidney and Beatrice Webb, and *The Works Manager To-day* by Sidney Webb. There is an immense literature dealing with scientific management in relation to "payment by results." Reference may be made especially to *Scientific Management and Labour* by R. F. Hoxie; *Scientific Management* by C. B. Thomson; *Scientific Management* by F. W. Taylor; *Scientific Management* by H. B. Drury; *Efficiency* and other works by Harrington Emerson; *Work, Wages and Profit* by H. L. Gant; and *A Rational Wages System* by H. Atkinson. For premium bonus systems, see *The Premium System of Paying Wages*, published by *The Engineer*; *The Rowan Premium Bonus System* by W. Rowan Thompson; and *The Premium Bonus System, Report of an Enquiry*, published by the British Trades Union Congress. A great deal of information will also be found in the following reports issued by the Board of Trade: "Report on Collective Agreements" (1910) and "Report on Standard Piece-Rates." Unfortunately, however, no new or revised editions of these have been issued since some years before the war. See also the *Final Report of the Commission on Industrial Relations*, published by the U.S. Government in 1915. (G. D. H. C.)

WAGNER, ADOLF (1835-1917), German economist (see 28.235*), died in 1917.

WALLACE, ALFRED RUSSEL (1823-1913), British biologist, (see 28.275), died at Broadstone, Dorset, Nov. 7 1913. In 1910 he received the O.M. Among his latest publications were *The World and Life* (1910) and *Social Environment and Moral Progress* (1912).

WALLACE, SIR DONALD MACKENZIE (1841-1919), British author and journalist, was born Nov. 11 1841, the son of Robert Wallace of Boghead, Dumbartonshire. He was educated at the universities of Edinburgh, Berlin and Heidelberg and at the École de Droit, Paris. Even in his Edinburgh days he spent his vacations abroad and became proficient in modern languages, and when he completed his legal studies at Heidelberg he was already 28 years of age and was contemplating a career as a German professor in comparative law. He was, however, invited by a friend to visit Russia, and became so much interested that he remained there for six years. His *Russia* (1877), a volume dealing comprehensively with the country, had great success,

and was at once recognized as a classic; it was translated into many languages and was revised and reissued by its author both in 1905 and 1912. Shortly after its first appearance Mackenzie Wallace became correspondent of *The Times* in Petrograd; in 1878 he was moved in a similar capacity to Berlin, thence to Constantinople, and after the battle of Tel-el-Kebir (1882) to Egypt. From 1884-9 he was in India as private secretary to the Viceroy, Lord Dufferin, and to his successor, Lord Lansdowne. He accompanied the Tsarevich Nicholas during his Indian tour 1890-1 and the Duke of Cornwall (afterwards George V.) during his colonial tour in 1901. From 1891-9 he was director of the foreign department of *The Times*. In 1899 he undertook the editorship of the New Volumes (issued in 1902 as the 10th edition) of the *Encyclopædia Britannica*, which had been projected by *The Times* as a supplement to the 9th edition, with Dr. A. T. Hadley, then president of Yale University, as his American co-editor; but he felt somewhat overpowered by his task, and after April 1900, when Mr. Hugh Chisholm was brought in by *The Times* to assist his labours, Sir Donald left the editorial work in the sole charge of his younger colleague. He was made by Edward VII., with whom (as with Queen Victoria) he had long been on confidential terms, one of his official household, and was also included in that of George V. He had been created K.C.I.E. in 1887, and was made K.C.V.O. in 1901. In addition to his book on Russia he published *Egypt and the Egyptian Question* (1883) and *The Web of Empire* (1902). He died at Lymington Jan. 10 1919. A thorough diplomat of wide culture and personal charm, and one of the most remarkable linguists (speaking some twenty languages) and raconteurs of his time, he was also one of the most modest and unselfish of men. He was probably better informed than any other man of his day in the secret history of international politics, but he was also discretion personified in using his knowledge. One of his last important pieces of work for *The Times* was in 1905 at the Peace of Portsmouth (N.H., U.S.A.), which he attended as its correspondent, and he was able there to give valuable advice, in carrying the negotiations to a successful issue, to the Russian delegates, with whom he exercised considerable authority.

WALLACE, WILLIAM (1860-), British musical composer, was born at Greenock July 3 1860, the son of a doctor in good practice. He was educated at Fettes College and Glasgow University, where, with the view of entering the medical profession, he graduated M.B. in 1885 and M.D. in 1888. He afterwards specialized in ophthalmology, studying at the Moorfields eye hospital, and also at Paris and Vienna. His musical education was partly received at the Royal Academy of Music, but he remained there for less than a year, and was largely self-taught. His orchestral works include *The Passing of Beatrice* (1892); *The Creation, a Symphony* (1890); *Pelleas and Melisande* (1900); and the symphonic poems, *Wallace* (1905) and *Villon* (1909). He also published some fine songs and collections of songs (often to his own words), including *Freebooter Songs* (1899) and *Lords of the Sea* (1902) and *Three Songs of Blake*. He was for a period secretary of the Philharmonic Society. In addition to being a connoisseur of art in most forms, Wallace published several literary works of distinction. Of these *The Divine Surrender* was a mystery play; his books on musical history and theory, *The Threshold of Music* (1908) and *The Musical Faculty: its origin and processes* (1914), are both important in their way. Also he translated the operatic texts of Strauss's *Feuersnot*, Berlioz's *Faust*, *Le Chemineau*, *Muquette* and the poems of many songs by Sibelius and Weingartner. At one time he edited *The New Quarterly Musical Review*, and he was a frequent contributor to various magazines. During the World War he entered the R.A.M.C. as a captain, and acted as ophthalmologist to the Colchester military district, inspector of ophthalmic centres in the Eastern Command, and ophthalmological specialist for the London district, and he published various articles in scientific journals on the vision of the soldier and war injuries to the eye. In this way he made effective use of his earlier professional training. He married in 1905 Ottilie, daughter of Lord M'Laren, herself a sculptor who had been a pupil of Rodin; as deputy

* These figures indicate the volume and page number of the previous article.

assistant director of the W.R.W.S. she also did useful work in the war, and was given the O.B.E.

WALLENBERG, KNUT AGATON (1853–), Swedish statesman, was born in 1853, the eldest son of André Oscar Wallenberg (1816–1886), who in 1856 founded Stockholms Enskilda Bank. He went through the training of a naval officer, but in 1874 joined the directorate of the bank, was managing director during the years 1886–1911, and became chairman in 1917. This bank, under the control of K. A. Wallenberg and his brother Marcus, took a prominent place in the Swedish banking world and in the industrial life of the country. Through their good connexions abroad both brothers contributed much toward enabling Sweden to establish good economic relations with other countries. Both have played an important role in the developing of the iron-ore industry in northern Sweden. K. A. Wallenberg, in conjunction with the Crédit Lyonnais, introduced Swedish bonds into the French market in 1890, and during two decades he coöperated powerfully in taking up Swedish, Norwegian, Danish and Finnish state loans. In the Banque d'État de Maroc, which resulted from the Algéciras Conference, K. A. Wallenberg had a hand as a member of the governing board in Paris, a position in which he was succeeded in 1920 by his brother Marcus. K. A. Wallenberg was concerned in the founding of the Banque des Pays du Nord in Paris in 1911, and also in that of the British Bank of Northern Commerce in London in 1912, which in 1920 was amalgamated with C. J. Hambro & Son as Hambro's Bank of Northern Commerce, known as Hambro's Bank Ltd. since July 1 1921. He was a member of the town council of Stockholm from 1883–1914, a member of the First Chamber of the Riksdag from 1906–19, chairman of the Swedish Bankers' Association ("Svenska bankförening") from 1909–14, and a member of the Stockholm Chamber of Commerce from 1912–4 and again from 1918 onwards. He was one of the founders of the commercial high school ("Handelshögskolan") in Stockholm and its first donor. When Hammarskjöld formed his Government in 1914 (see SWEDEN), K. A. Wallenberg joined it as Foreign Minister, retaining this post until 1917. In 1918 he and his wife devoted 25 million kroner to the "Knut and Alice Wallenberg Foundation," the purpose of which was to further religious, social, scientific and educative movements and to support trade and industry.

His brother, **MARCUS WALLENBERG** (1864–), became an officer in the navy, and, after juridical studies and practice, joined the directorate of Stockholms Enskilda Bank and became managing director 1911–20, and later chairman. He founded or reorganized a large number of industrial enterprises, taking a chief part, for instance, in the financing of the mining-fields of northern Sweden, and founding in 1905 Norsk Hydro-elektrisk Kvaestof Aktieselskab in Norway, of which he became chairman. He was one of the founders of the Norwegian Central Bank, of the Swedish Bankers' Association, and the Industrial Union of Sweden ("Sveriges industriförbund"), besides having taken the initiative in founding the Taxpayers' Association ("Skattebetalarnes förening") in 1920. He became a member of several committees on banking and stock exchange questions, and a member of the Economic Council. The Swedish Government sent him to London as Swedish negotiator in 1916–7 and 1917–8 for bringing about an agreement with the Allied Powers regarding trade and shipping and finance questions. He was a member of the Neutral Powers' financial section of the Supreme Economic Council from Feb. to June 1919 in Paris, took part in the meeting at Amsterdam in 1919 which arranged for the International Financial Conference in Brussels in 1920, at which he was Sweden's representative. He was a member of the Committee of the Economic and Financial section of the League of Nations.

WALLER, LEWIS (1860–1915), English actor (see 28.283), died at Nottingham whilst on tour Nov. 1 1915, shortly after making a striking success at Wyndham's theatre, London, in *Gambler's All*. His wife, whose stage name was Florence West, died Nov. 14 1912.

WALSH, WILLIAM JOHN (1841–1921), Roman Catholic Archbishop of Dublin, was born in Dublin Jan. 30 1841, and was educated at St. Laurence O'Toole's seminary, Dublin, afterwards

entering the Catholic University and St. Patrick's College, Maynooth. In 1867 he became professor of dogmatic and moral theology at Maynooth, was appointed vice-president of the college in 1878, and in 1881 succeeded Dr. Russell as its president. Four years later he became Archbishop of Dublin on the death of Dr. McCabe. Archbishop Walsh, besides being an energetic worker and writer, was a keen politician, and was conspicuous for his extreme Nationalist opinions. He was one of the witnesses before the Parnell Commission of 1888–9, and served on many committees and boards, chiefly educational, becoming in 1891 a commissioner of education in Ireland. He would have nothing to do with the suggestion for settling the difficulty of Catholic higher education in Ireland by establishing a Roman Catholic faculty of theology in Trinity College, an institution which he attacked as a centre of Protestant influence, and insisted on the need for a university with a "Catholic atmosphere." In 1908 he became a member of the Dublin Statutory Commission appointed under the Irish University Act, which established the Catholic National University, of which he became chancellor.

In proportion as the Nationalist party seemed disposed to compromise with the Government, Dr. Walsh drew away from it; and after the concessions made to Ulster in 1914, and more especially after the rebellion of 1916, he threw his influence more and more on to the side of the extremists. In the election of Dec. 1918 he voted for a Sinn Féin republican candidate.

Dr. Walsh produced various volumes of addresses on religious and educational subjects, and also published *A Plain Exposition of the Irish Land Act of 1881* (1881); *The Queen's Colleges and the Royal University of Ireland* (1883–4); *The Irish University Question* (1897); and two attacks on Trinity College, Dublin, *Trinity College and the University of Dublin* (1902) and *Trinity College and its Medical School* (1906). He died in Dublin April 9 1921.

WALSINGHAM, THOMAS DE GREY, 6TH BARON (1843–1919), was born July 29 1843. He was educated at Eton and Trinity College, Cambridge, and succeeded his father in 1870. He was an enthusiastic entomologist and sportsman, and for some years travelled widely, making collections of specimens of all sorts, many of which he presented to the natural history section of the British Museum. In 1876 he was made a trustee of the British Museum; he was also a fellow of many learned societies and high steward of the university of Cambridge. He died Dec. 3 1919.

WARBURG, PAUL MORITZ (1868–), American banker, was born in Hamburg, Aug. 10 1868. After graduating from the Realgymnasium in 1886 he entered a banking house. From 1889 to 1892 he studied banking in England and France; then for the next ten years was engaged in the banking business in Hamburg. In 1902 he went to New York, where he became a member of the banking house of Kuhn, Loeb & Co. He was naturalized in 1911. He was an early advocate of a centralized banking system in the United States and in 1914 was appointed by President Wilson one of the original members of the Federal Reserve Board. In 1916 he was appointed vice-governor of this board, succeeding Frederick A. Delano, and in 1917 was reappointed. In 1918, at the end of the period of his appointment, he retired, wishing to relieve the Administration of any embarrassment that might follow his renomination. Considerable opposition to his holding the place had arisen after America's entrance into the World War, because of his German birth. On accepting the Government office he had resigned from Kuhn, Loeb & Co., as well as from numerous directorates, including the National Bank of Commerce, the U.S. Mortgage & Trust Co., Wells, Fargo & Co., the Westinghouse Electric & Manufacturing Co., the B. & O. R.R. Co., the National Railways of Mexico, and the Rockefeller Foundation. He was the author of *Essays on Banking Reform in the United States* (1914).

WARD, SIR ADOLPHUS WILLIAM (1837–), English man of letters (see 28.319), was knighted in 1913. His history *Germany 1815–1890* (1st vol. 1916, and vol. 1917) was a notable addition to his published works, together with various chapters in the *Cambridge History of English Literature*.

WARD, GENEVIEVE (1837–), English actress, was born in New York March 27 1837, the daughter of Col. Samuel Ward,

"2. He will report as to the desirability of forming an advisory committee from among those who have been consulted, for the purpose of carrying out the proposals agreed upon.

"The Commissioners are of opinion that no distinction should be made between officers and men lying in the same cemeteries in the form or nature of the memorials."

The recommendations of Sir Frederic Kenyon's report, which were adopted by the Commission, may be briefly summarized as follows:—

1. That the principle of equality of treatment should be expressed by the erection of uniform headstones over the graves of all officers and men who, in the words of the charter, may have died from wounds inflicted, accident occurring or disease contracted while on active service during the war.

2. That each cemetery should have a great memorial stone and a tall cross as central monuments.

3. That isolated graves should be concentrated into selected cemeteries.

It remained for the Commission to put the scheme into execution. Officials were appointed and made responsible for the organization and carrying out of the work in the different areas, and by the spring of 1918 the new establishment was on a practical basis.¹ In France and Belgium the preparation of architectural designs was entrusted to Sir Edwin Lutyens, Sir Reginald Blomfield and Mr. Herbert Baker; in Egypt, Macedonia, Italy and the United Kingdom to Sir Robert Lorimer; in Gallipoli and Palestine to Sir John Burnet; and in Mesopotamia to Maj. Edward Warren. In each of these areas there were assistant architects responsible to the principal architects named.

Work.—The type of regimental headstone finally selected by a committee consisting of Sir Frederic Kenyon, Sir C. J. Holmes, Mr. D. S. MacColl and Mr. Macdonald Gill, was of a design frequently found in churchyards in the United Kingdom. The dimensions are: height 2 ft. 6 in., breadth 1 ft. 3 in., thickness 3 inches. Each stone as a rule bears at the top the badge of the regiment or unit. Then follow the military details with the name of the deceased and the date of his death, below which is carved the symbol of his faith, while at the foot of the stone is engraved a personal inscription chosen by the next-of-kin.

Of the two central monuments the great altar-like Stone of Remembrance, designed by Sir Edwin Lutyens, bears the inscription chosen by Mr. Rudyard Kipling, "Their name liveth for evermore." The other memorial is the great Cross of Sacrifice designed by Sir Reginald Blomfield, to the shaft of which is fixed a crusader's sword of bronze. (See Plate.)

The preparation of cemetery registers, which will present a complete record of the fallen, is also a feature of the Commission's work. Each register will as a rule contain a map showing the situation of the cemetery, a plan giving the position of the grave, and an alphabetical list of those buried or commemorated in the cemetery, with a short addition, generally giving, among other details, age and parentage furnished by the next-of-kin.

To these duties must be added that of honouring the dead who have no known graves. This is no small task, for of these there are more than 250,000 and the precise form of the memorials was still in 1921 under consideration.

Nor did the Commission's responsibilities end here, for the commemoration of the navy's dead was also entrusted to them. In each of the three ports which throughout Britain's naval history have been intimately associated with the sea service a site was chosen for the erection of a memorial (which will also act as a sea-mark), bearing the names of those lost or buried at sea. These memorials were designed by Sir Robert Lorimer in consultation with the Board of Admiralty.

With equal generosity Belgium made provision similar to that of France for the acquisition of land for British cemeteries on her territory. Other countries followed the lead of France and Belgium. Measures of similar intent were passed by Italy in June 1918, and by Greece in Sept. 1920, while in Nov. 1918 the Egyptian Government promised to present to the Commission as a free gift the land on which British or Dominion soldiers were buried, as also did the Government of Palestine in Nov. 1920.

¹ The head office was set up in London, which will remain the permanent headquarters of the Commission.

Several of the enactments described above were followed by treaties or agreements. In Nov. 1918 an Anglo-French Agreement was signed enabling the Commission to act in France. An important clause provided for the establishment of an Anglo-French Committee (of which distinguished French and British officers are members), to represent the Commission in their relations with the French authorities, and to present claims for land for cemeteries, or for memorials by which some gallant exploit or feat of arms may be commemorated.

The Commission is represented by similar agencies with similar powers in Belgium, Greece, India, Canada, Malta, Gibraltar, Palestine and Mesopotamia. The Canadian Agency is responsible to the Commission for the entire execution of its purposes in Canada, the United States of America and Siberia; a committee established in India, in consultation with the Indian Government, is in the same way responsible for that country and Aden.

The unprecedented nature of the task with which the Commission was charged is obvious; its complexity and magnitude will be realized when it is remembered that the 600,000 known graves for which they were responsible were scattered all over the world in many different countries with different laws and customs, some of them the enemy countries with whom special provisions were made in the Treaties of Peace to ensure the graves being respected; and there are no less than 15,000 burial places in different parts of Europe and the East where British sailors and soldiers rest, the great majority being in civil cemeteries containing small groups of graves, but some 1,500 of them being cemeteries of considerable size, the largest containing 12,000 graves. As has been seen, the permanent construction work carried out in these cemeteries is of a simple but durable kind, but the Commission's gardeners set to work immediately after the Armistice, without waiting for the erection of the permanent headstones, planting shrubs, grass and flowers, taking as their guiding principle the words of Sir Frederic Kenyon's report: "There is no reason why cemeteries should be places of gloom; but the restfulness of grass and the brightness of flowers in fitting combination would appear to strike the proper note of brightness and life." It is hoped that these cemeteries may become a permanent landmark in the history of civilization.

When the Commission's policy was first announced it met with some criticism, particularly as regards equality of treatment as expressed by the principle of uniformity. This criticism found expression in a motion in the House of Commons. The debate which took place on this occasion (May 4 1920) has been described as one of the most moving in the history of the British Parliament. The result, by which the motion was negatived without a division, must have removed from the minds of the commissioners any fear that the sympathy of the country was not with them in the course they were pursuing.

II. FORCES OF FRANCE AND THE UNITED STATES.—While, as a rule, the Allies adopted similar methods of commemorating the fallen to those described above, the great differences in the numbers of their casualties and in the conditions obtaining in the different countries rendered certain divergences unavoidable.

France, on whose soil lay over three million dead, was faced with the problem of honouring her fallen soldiers without clogging the wheels of industry and agriculture, which were beginning to revive under peace conditions, even in the devastated areas where the graves lay thickest. The British helped to solve the difficulty by concentrating all isolated graves into cemeteries which would forever mark the British battle-line. The French adopted the further expedient of giving the next-of-kin the opportunity of having their dead re-buried at the State's expense in the churchyard or burial-ground of their native place, while those who were left would rest in great national cemeteries constructed by the State as a lasting monument to the heroism of the soldiers who died for France.

Many of the fallen soldiers of the American Expeditionary Force were borne back across the Atlantic to rest in their native land. The execution of this difficult task demanded careful organization, and it says much for the enthusiasm and the capacity of the staff of the Cemeterial Branch of the American

"STONE OF REMEMBRANCE" (BRITISH)

War Department that it was carried out with so much success; it would have certainly been impossible but for the fact that American death casualties did not amount to much more than one hundred thousand, a comparatively small number compared with that of the British Empire, whose losses approximated to the enormous total of one million men. It is probable that the American War Department would have hesitated before undertaking a task even of the magnitude mentioned had it not been for the fact that, before a single American battalion had left the shores of the United States, a pledge had been given that no American soldier who died fighting for his country and for the liberties of nations should be left to lie on foreign soil except at the express wish of his next-of-kin.

Many Americans were taken from British military cemeteries, where they were buried under stress of battle with their British comrades-in-arms. It was hoped that the empty spaces left after the removal of such French and American soldiers would be marked by memorials which would remind posterity how the armies of France, America and the British Commonwealth fought and fell together in the defence of a common ideal.

Those Americans left to rest in France were grouped together in three or four great cemeteries, the land being acquired by the French Government on behalf of the sister Republic under the law of 1915. The plan of construction of these cemeteries is based on the principle of uniform treatment of the graves, a principle which has for some considerable time found favour in America in the planning of cemeteries. Indeed the United States may justly claim to be the first nation to put this conception into practice, the most notable example being Arlington National Cemetery, where the men who died in the Civil War and in the Spanish-American War of 1898 lie buried. It is possible that the conspicuous success with which Arlington Cemetery has been designed had a share in influencing the Imperial War Graves Commission in the construction of the British war cemeteries on somewhat similar lines. (F. W.)

WAR LOAN PUBLICITY CAMPAIGNS.—In connexion with this account of publicity relating to war financing in Great Britain, the article *LIBERTY LOAN PUBLICITY CAMPAIGN* and the *United States* section of the article *SAVINGS MOVEMENT* will afford a broad view of the activities in these two countries. Prior to the outbreak of war in 1914, Government loans in Great Britain were subscribed by a very limited circle of large investors, businesses and corporations. Publicity in connexion with the floating of them began and ended with the issuing of a prospectus, its publication in the Press, and its distribution by a limited number of bankers and stockbrokers. In order, however, to raise the vast sums of money required by the Government for the prosecution of the war, other and far bolder publicity methods had to be inaugurated during 1914-9. It was necessary to appeal to a very much wider circle of subscribers—a circle eventually no narrower than the whole population of the British Islands—and to urge investment in War Loans as a patriotic duty. The first attempts at the application of modern methods of publicity to the flotation of War Loans were on a limited scale, being hampered by official reluctance to depart from traditional procedure and a prejudice against any lapse from official "dignity." A slight expansion of newspaper advertising, at first not widely departing from mere "publication of prospectus" advertising, and the use of posters displayed in the streets and on hoardings, marked the beginning of a new state of things. The work of the War Savings Committee from 1916 onwards, together with news of the successful publicity work in the U.S., helped to reconcile British officialism to an increase of activity in this direction.

By the time the so-called "Victory" Loan was floated, early in 1917, newspaper advertising had increased both in volume and effectiveness. Many more posters appeared on the hoardings. The services of local authorities were invoked, and public meetings were held, up and down the country, at which speakers drew attention to the country's pressing need of money and appealed openly for subscriptions. A great mass meeting in Trafalgar Square, held under the auspices of ministers of religion,

was an outstanding publicity feature in connexion with the Victory Loan and was the forerunner of many similar gatherings.

It was, however, in connexion with the campaign for National War Bonds, which were first offered to the public in Sept. 1917, that organized publicity on behalf of British war-loan subscriptions displayed the fullest measure of its possibilities and achieved its greatest success. The National war Bonds were short-dated securities continuously on offer—in contrast to earlier loans the subscription lists for which had remained open only for some weeks. They were introduced by Mr. Bonar Law, the then Chancellor of the Exchequer, in order to inaugurate a period of "continuous borrowing"—to provide a method by which the public could subscribe each week the weekly cost, or more than the weekly cost of the war. It was hoped by this means to avoid the dislocation of the money market and the inflation of currency (due to borrowing from banks for purposes of subscription) which had been found to attend the previous "closing date" loans.

Despite attractive terms the subscriptions for National War Bonds for the first two or three weeks were distinctly disappointing. Starting at an exceedingly low weekly total the receipts rapidly fell, and it says much for the extent to which publicity methods had already justified themselves that in Nov. 1917 the Chancellor of the Exchequer, faced with the prospect of the failure of the whole new scheme of continuous borrowing, saw fit to appoint Sir George (then Mr.) Sutton, the chairman of the Amalgamated Press Ltd., as Director of Publicity for the War Bond campaign—with an entirely free hand as to methods employed, and, within very wide limits, a free hand as to expenditure. The result was a complete change, from the first week of Dec. 1917, when the War Bond publicity campaign could have been said to be really started.

The backbone of the campaign was undoubtedly newspaper and periodical advertising. This advertising was practically continuous, though very widely varied. The appeal of it was cast and recast in a hundred ways. It struck first the finance note, the self-interest note, the explanatory "see what you get and what security" note, and then the loftier note of patriotism, of service, of exhortation to duty. The advertising was intensely human, written to appeal not merely to business men but to the people at large. It reached its highest pitch of emotional appeal during the terrible spring of 1918 when the Germans, pushing far into the Allied lines, threatened Amiens, and the whole British nation hung breathless upon the march of events. During those dark weeks the War Bond advertising told, almost day by day, the story of England in terms of Belgium; pointing out the inevitable and hideous consequences of defeat, and urging the duty of supporting with money the brave men then fighting.

Another point to be noted about the press advertising was its topicality. Appropriate "copy" was actually kept standing for immediate publication in the event of certain contingencies such as a great victory, or (on the other side of the picture) the air-bombing of important British towns.

It was recognized that in order to sustain interest in War Bonds over a long period the steady appeal of the press advertising required reinforcing by periods of special activity. The necessary stimulus was obtained by the organization throughout the country of special "weeks" such as "Tank Weeks"—"Business Men's Week"—"War Weapons Weeks"—"Feed the Guns Weeks." The main features of these were similar. They consisted essentially in the provision of some spectacular feature round which the appeal for subscriptions could centre. Tanks, for instance (then just newly invented), each with an officer and crew, took up their stand for a week at a time in the leading towns and cities. Officials of the Bank of England and of the Post Office accompanied the tanks, and very many million pounds' worth of bonds were sold by them.

The effect of the visit of a tank to a town was that for one week at least that town talked and thought of nothing but War Bonds. Local papers devoted columns to descriptions of the amount of business done, and local firms and business men vied with each other to subscribe the largest amounts.

Leaflets (which were frequently dropped from aeroplanes in order to obtain the maximum of spectacular effect), posters, speakers, etc., were, of course, supplied by the Director of Publicity for each tank in each town.

"Feed the Guns" weeks were run on the same principle, the tanks being replaced by giant howitzers fitted with an ingenious device whereby the bonds sold could actually be stamped in the breeches of the guns themselves.

"Business Men's Week," which was held simultaneously throughout the country, and "War Weapons Weeks," which were worked town by town, were run somewhat differently. In both these cases the cities and towns of the country were assessed to subscribe amounts calculated on a basis of £2 10s. od. per head of population, and this amount instead of being expressed in figures was expressed as some definite weapon of war which the amount in question would suffice to purchase. Thus a large city would be asked to subscribe sufficient in a week to purchase one or more battleships, a smaller town enough to purchase a cruiser, a township enough to purchase a squadron of aeroplanes, a village enough for a howitzer.

This dramatic method of presenting each community with an opportunity to achieve concrete expression of its duty as a community brought splendid results. Scarcely a town or city in the country failed to perform its task, and during very many of the weeks sums far in excess of the assessments were subscribed. Liverpool, for instance, asked to purchase a battleship, invested sufficient during its week to purchase no less than six!

All these separate campaigns of special weeks were "led off" by spectacular displays in Trafalgar Square, London, which was transformed for each occasion into something resembling a huge circus. Tanks or guns, as the case might be, were "parked" and surrounded with skilfully built imitation trenches and entanglements; barriers and huts were erected, painted scenery was provided to form a background, giant posters almost hid the façades of the National Gallery and the buildings surrounding the Square, and hundreds of thousands of people were attracted of a class which could probably not have been reached by any other form of appeal. Vast business was done during these Trafalgar Square weeks, sums running into many millions being invested during each. So great was the enthusiasm roused that some business firms actually marched down their employees with bands and flying flags to make their purchases of bonds during the prevailing excitement.

Not content with waiting in Trafalgar Square for subscriptions to come to them, two of these huge tanks snorted and puffed, day by day, through the streets of the city, calling at the offices of the leading insurance firms to collect applications for War Bonds. As a tank does not move swiftly it was necessary to limit this privilege of a "personal" call to firms desirous of investing £50,000 or over.

Government carrier-pigeons were also used, with great success from the point of view of publicity, to bring in applications from a distance to Trafalgar Square.

Another important publicity aspect of these special weeks was the opportunity each provided for an important official opening. Thus "Business Men's Week" was preceded by a great public meeting in the Connaught Rooms at which the Chancellor of the Exchequer was the chief speaker and to which all the leading bankers of the kingdom were invited. It is probable that from the financial point of view no more influential gathering than this has ever taken place. "Feed the Guns Weeks" were introduced by another great meeting at the Guildhall, addressed by the Chancellor of the Exchequer and the Rt.-Hon. A. J. Balfour.

The extent of the response to these special weeks was enormous, as may be judged by one of them only, the "Business Men's Week," which brought in £160,000,000—nearly eight times as much as the average weekly total.

Apart, however, from greatly increased purchases, these special weeks, "booms," and "stunts" were very valuable as yielding a continuous "news" story. The problem before the publicity director was to maintain interest in War Bonds week after week and month after month; and had the campaign once

been allowed to become a matter of routine, lacking new incidents, the "news" story of it would perforce have dropped out of the columns of the press. As it was, so great was the variety and so many the incidents that a full-size news agency had to be installed at headquarters, where a large staff was kept busily engaged in collecting news by telegram and telephone from all over the country and passing it on to the press.

A successful publicity device was the inter-town War Bond Race. The race, of course, was to secure the largest total of local holdings in War Bonds, and, promoted and fostered by the Publicity Director, it went gaily on for months—the varying position of the leading cities, now one leading, now another, forming for over a year an almost staple article of news.

Many other publicity devices were employed, among which the following may be noted:—

(1). Arranging with the Postmaster-General to adopt a cancellation mark carrying the words "Buy War Bonds," so that practically every citizen received a daily reminder of his duty on the envelope of every letter received. (2). A letter signed by the Chancellor of the Exchequer urging investment as a patriotic duty—sent out by the Bank of England with each dividend on a Government security. (3). A letter signed by the chairmen of banks to the individual depositors urging that deposits should be reduced and the money invested in War Bonds. (4). A letter sent out by limited liability companies simultaneously with the dispatch of their dividend warrants, urging that the amount of the dividend should be at once invested in War Bonds.

These letters ran, of course, into many millions, and the drafting, preparation, and printing of them was not the least arduous of the tasks which the Publicity Director and his staff had to face.

After the Armistice a closing date for War Bonds was announced, and a very extensive final appeal was organized which brought the total of investment in them up to the magnificent figure of £1,600,000,000—subscribed in under 17 months.

The publicity in connexion with War Bonds more than justified itself. It established the feasibility of the hitherto untried system of continuous borrowing; it secured a total of subscriptions far in excess of anything that the Chancellor of the Exchequer had contemplated; and it did, in fact, finance the war to a finish.

Publicity in connexion with post-Armistice loans—notably the Thanksgiving Loan of 1919 (popularly termed the "Joy Loan")—was conducted on similar lines. War, which altered and remodelled so much that had appeared fixed, certainly brought a new spirit and a new method into the floating of Government loans in Great Britain. The success achieved was so marked as to make it unlikely that any future Chancellor of the Exchequer would embark upon any big loan issue without first assuring himself of the services of the most influential publicity adviser.

(G. A. S.)

WARRE, EDMOND (1837-1920), English educationist, was born in London Feb. 12 1837, the son of Henry Warre, of Bindon House, near Wellington. He was educated at Eton and Balliol College, Oxford, where he had a distinguished career, taking a double first (1856 and 1859). In 1859 he was elected a fellow of All Souls. He went to Eton in 1860 as assistant master, and in 1884 was elected Headmaster, a position which he retained until 1905. After a period of retirement he was in 1909 appointed provost of Eton in succession to Dr. James Hornby, but during the greater part of his provostship he was incapacitated by ill health from taking any very active part in the government of the school. He was an hon. chaplain to Queen Victoria (1885-1901), and later occupied the same office in the households of King Edward VII. and King George V. He was created M.V.O. in 1901, C.B. in 1905, and C.V.O. in 1910. He died at Eton Jan. 22 1920. He took much interest in sport at Eton, and the high standard of rowing to which the Eton eights attained was due in a large measure to his coaching. His 45 years' connexion with Eton thoroughly identified him with its traditions and ideals, and, without being remarkable either as scholar or as teacher, he wielded a personal influence which has seldom been surpassed.

WARREN, WHITNEY (1864-), American architect, was born in New York City Jan. 29 1864. After studying at the

École des Beaux Arts, Paris, under Daumet and Girault (1885-1894), he began the practice of architecture in New York, later becoming associated with Charles D. Wetmore under the firm-name of Warren & Wetmore. They specialized in railway architecture, hotels, business buildings and residences, and were architects for the New York Central, Michigan Central, Canadian Northern, and Erie railways. Their numerous structures in New York City include the Chelsea docks and the hotels Belmont (1905), Vanderbilt (1910), Biltmore (1912), and Commodore (1916). During and following the World War, Warren supported actively the claims of Italy in the Adriatic. He was an intimate friend of d'Annunzio, and was appointed diplomatic representative in the United States of the "Free State of Fiume." In 1920 he was chosen by the International Committee to reconstruct the library of the university of Louvain, destroyed by the Germans in 1914. He was a member of the Institut de France, the Académie des Beaux Arts, the Royal Academy of St. Luke (Rome), and other foreign academies. He was the author of *Les Justes Revendications de l'Italie: la Question de Trente, de Trieste et de l'Adriatique*. Many of his addresses, delivered 1914-9, were published and widely distributed.

WASHINGTON, BOOKER TALIAFERRO (c. 1850-1915), American negro teacher and reformer (see 28,344), died at Tuskegee, Ala., Nov. 14 1915, as the result of a breakdown due to overwork. His last public address was delivered on Oct. 25 before the national conference of Congregational churches in New York City. At Tuskegee he was succeeded by Robert R. Moton. He was the author of *My Larger Education: Being Chapters From My Experience* (1911) and *The Man Farthest Down; a Record of Observation and Study in Europe* (1912).

See D. F. Riley, *Life of Booker T. Washington* (1916).

WASHINGTON, District of Columbia (see 28,349), the capital city of the United States, increased in pop. from 331,060 in 1910 to 437,571 in 1920, a gain of 106,502, or 32.2% as compared with 52,351 or 18.8%, in the preceding decade. Of the 1920 pop. 326,860 were white, 109,966 negro and 745 of other races (chiefly Chinese, Japanese, Filipino and Indian). With the entrance of the United States into the World War in 1917 Washington not only assumed new importance among world capitals, but it became the centre from which practically every significant activity in the United States, commercial and industrial as well as military and naval, was directed. Existing Government bureaus were expanded beyond precedent and many new ones were created. These activities brought to Washington within a single year 60,000 new residents, a large percentage of whom remained after the war came to an end. An acute shortage of housing facilities developed, and the Government was forced to commandeer every available building, as well as to construct a number of new ones.

Buildings.—In order to carry on the war work of the Government a number of temporary office buildings for the use of various departments were erected on the Mall between 3rd and 9th Streets. On B Street N.W., between 17th and 21st Streets, two large structures of the factory type, of cement and iron, were erected for the War and Navy Departments. One of the largest buildings in the capital, the Arlington Building, of stone and iron, was erected (1919) on the site of the old Arlington Hotel on Vermont Avenue and H Street N.W. for the use of the War Risk Bureau. Most of the other buildings constructed during the war period were of a temporary character, being designed merely to meet an emergency. Of this class were the Government hotels on the Union Station Plaza erected for war workers as late as 1919 and in use in 1921. There were in all 14 of these emergency buildings, two of which were used for administrative purposes. Among the new permanent buildings were the City Post Office (1914), near the Union Station; the building for the Department of the Interior (1917), occupying the block between E. F. 18th and 19th Streets N.W.; the Bureau of Engraving and Printing (1914), 14th Street between C and D Streets S.W.; the Treasury Department Annex, on Pennsylvania Avenue opposite the Treasury Building. The capacity of the Navy Yard was increased by the erection of three large buildings for a machine shop, gun shop, and joiner shop. New buildings were leased by the Government for the Department of Commerce, Department of Labor, Railroad Administration, Bureau of the Census, branches of the Department of Agriculture, and other executive organizations. Near Brightwood, about 4 m. north of the city proper, is the Walter Reed General Hospital, first established in 1905 for the U.S. army. To extend its

capacity, a number of additional buildings were constructed during the war, mostly of a temporary or semi-permanent character. The grounds embrace 97 ac. and it is next to the largest army hospital in the United States, the maximum capacity being 2,650. The grounds and buildings cost \$2,575,000. In the Mall, adjoining the Smithsonian Building on the west, is the Freer Art Gallery (1920), built at a cost of \$1,000,000 and donated to the Government by Charles Lang Freer of Detroit, Mich. In 1921 the construction of the \$5,000,000 Shrine of the Immaculate Conception, in the grounds of the Catholic university, was begun, and the erection of the Episcopal cathedral of St. Peter and St. Paul, at Mt. St. Alban, was well under way. When completed it will have cost \$5,000,000. In a commanding position at 16th and S Streets N.W. is the House of the Temple (1915), headquarters of the southern jurisdiction Scottish Rite Masons. It is of white marble, of Egyptian and Grecian architecture, 212 by 217 ft. in size, and cost \$1,000,000. The Pan-American Building, a white marble structure on 17th Street N.W., at the entrance to Potomac Park, was dedicated in 1910. It cost \$1,100,000, of which the American republics contributed \$250,000 and Andrew Carnegie \$850,000. Near it are the Red Cross Building (1917) and the building of the Daughters of the American Revolution (1910), both in white marble. The Georgetown, or Key Memorial, Bridge, which spans the Potomac river at Georgetown, was expected to be completed in 1922, the estimated cost being \$2,100,000. It is of reinforced concrete with seven arch spans, one of which is 208 ft. in length. Its total length, including piers, is 1,452 ft. 9 in.; the width of deck is 70 feet.

Streets and Parks.—Much improvement has been made in the thoroughfares and parks. The flats and lowlands along the Potomac river have been beautified and provided with picturesque driveways. Provision has been made for new parks and additions to those already existing. Asphalt pavement has been laid on 172 m. of city streets and avenues. The principal business section of the city now includes Pennsylvania Avenue from the Capitol to the Treasury Building, F, G, and H Streets running east and west, 7th, 9th and 14th Streets running north and south and Connecticut Avenue. A zoning law of 1920 restricts certain businesses to prescribed areas, and regulates the height and character of new structures.

Monuments.—The Lincoln Memorial, occupying an elevation in Potomac Park near the Washington Monument, was practically complete in the spring of 1921 at a cost of about \$3,000,000. It is a rectangular edifice of white marble surrounded by 36 Doric columns, one for each state of the Union at the time of Lincoln's death. The principal interior feature is a marble statue of Lincoln by Daniel C. French; on the walls within are lettered the Gettysburg Address and phrases from the second Inaugural Address. The memorial was designed by Henry Bacon and erected under the direction of a commission appointed by Congress in 1911. Across the Potomac river, in Arlington National Cemetery, are the amphitheatre and chapel erected at the instance of the Grand Army of the Republic in memory of all soldiers, sailors, and marines who have fought under the flag of the United States, and also intended to provide a place of assembly for the observance of Memorial Day. The amphitheatre is an enclosure with a colonnade of white marble; the turf is left uncovered and open to the sky. The chapel has a seating capacity of 5,000. The two buildings were completed shortly after the outbreak of the World War at a cost of \$825,000. Statues and monuments erected during the decade 1910-20 include Christopher Columbus by Lorado Taft, Union Station Plaza; John Paul Jones by C. H. Niehaus, Potomac Park; a monument to Maj. Pierre Charles L'Enfant who designed the plan on which the city has been built, in Arlington Cemetery; the Butt-Millet Fountain, Daniel C. French, sculptor, Thomas Hastings, architect, erected near the Washington Monument as a memorial to two men who lost their lives in the "Titanic" disaster (1912) and the James McMillan Fountain, Herbert Adams, sculptor, Thomas Hastings, architect. The Grant statue, nearing completion on the east front of the Botanic Garden, is the work of Edward P. Casey, architect, and Henry M. Shrady, sculptor, and will have cost about \$240,000. During the World War the statue of Frederick the Great, in the Army War College grounds, was removed. Flannery's Abraham Lincoln, at John Marshall Pl. and D Street, also removed, was to be replaced.

Education.—The Wilson Normal School, 11th and Harvard Streets, was erected in 1913 at a cost of \$257,000, and an expenditure of \$1,493,000 was made for the site and building of the New Central High School (1916), at 11th and Clifton Streets. The enrolment in the graded schools in Jan. 1921 was 53,840, and in the high schools, 8,735. There were 2,096 teachers—1,442 white, 654 negroes. More than one-third of the pupils were negroes.

Manufactures.—In 1919 there were in Washington 595 manufacturing establishments (exclusive of Government industries) whose products were valued at \$68,826,570, of which \$37,886,470 was added by manufacture. There were engaged in those industries 14,101 persons, whose salaries and wages amounted to \$18,856,410. In value of products there was an increase of 137.5% over 1914, and in salaries and wages an increase of 119.1%. Some of the principal industries in 1919 were: newspapers and periodicals, \$11,898,000; bakery products, \$10,626,000; meat-packing, \$5,012,000; ice cream, \$4,101,000. Statistics of governmental industries are shown in the table at the top of page 956.

Census Year	Persons engaged		Expenditures			Cost of Materials
	Total	Wage-Earners	Total	Salaries	Wages	
1919 . . .	22,423	20,169	\$59,074,889	\$3,540,566	\$29,794,728	\$25,346,438
1914 . . .	11,639	10,614	17,862,758	1,122,927	10,614,466	5,902,954
1909 . . .	11,470	10,657	15,508,250	1,016,745	10,663,040	3,807,626

The figures are in each case for 11 establishments, and include principally engraving and printing, instrument manufacture, and the naval gun factory. The marked increase in the figures for 1919 was due to the abnormal activity brought about by the war.

History and Finance.—During the participation of the United States in the war there was employed in the Government departments a maximum of 117,760 civil service employees, but this number had been reduced in 1920 to 86,846. The personal U.S. income taxes collected in the city of Washington in 1918 amounted to \$8,669,100. Local taxes collected in 1920 amounted to nearly \$3,000,000 on personal property and \$8,633,278 on realty. The total value of assessable real estate was \$426,623,630. The amount contributed by Congress for municipal expenses was more than \$8,000,000. In 1920 private building operations amounted to \$22,638,862, and for the 10 years 1910-20 to over \$151,000,000.

During the war the District of Columbia furnished 24,853 troops and subscribed \$127,129,650 for the purchase of Liberty and Victory Bonds and War Savings Stamps, and for contributions to Y.M.C.A. and other war funds. (J. C. P.)

WASHINGTON (State) (see 28.358).—The pop. in 1920 was 1,356,621, an increase of 214,631, or 18.8%, over the 1,141,990 of 1910, as against an increase of 120.4% in the preceding decade.

The density of pop. was 20.3 per sq. m.; in 1910 17.1. The urban pop. (in 35 places of 2,500 or more) was 55.2% of the whole, as against 53% in 1910. The pop. of the eight cities having more than 15,000 was:—

	1920	1910	Increase per cent
Seattle . . .	315,312	237,194	32.9
Spokane . . .	104,437	104,402	
Tacoma . . .	96,965	83,743	15.8
Everett . . .	27,644	24,814	11.4
Bellingham . . .	25,585	24,298	5.3
Yakima . . .	18,539	14,082	31.7
Walla Walla . . .	15,503	19,364	-19.9
Aberdeen . . .	15,337	13,660	12.3

The most significant change in the characteristics of the pop. was the increased number of Japanese and especially of Japanese women. In 1900 there were 5,617 Japanese, or 1.1% of the total pop., 96.7% being males. In 1910 the Japanese had increased 130.2% to a total of 12,929, which was still 1.1% of the total pop., 86.9% being males. In 1920 there were 17,114 Japanese, or 1.3% of the total. The rate of increase was 32.4% and the percentage of males had declined to 65.3. One reason for the proportional increase of females was the privilege, prior to the legislative session of 1921, of acquiring title to land in the names of native-born children of Japanese parents.

Agriculture.—During the decade 1910-20 the number of farms increased from 56,192 to 66,288; the acreage of improved land from 6,373,311 ac. to 7,129,343 ac.; the value of all farm property from \$637,543,411 to \$1,057,429,848. The average value of land per acre in 1910 was \$44.18; in 1920 \$60.22. The following table shows the change in acreage, production, and value of the chief crops for the decade 1909-19.

		Acreage	Production	Value
Wheat . . .	1919	2,494,160	41,837,909 bus.	\$91,206,642
	1909	2,118,015	40,920,390 "	35,102,370
Oats . . .	1919	191,673	8,073,481 "	8,073,481
	1909	269,742	13,228,003 "	5,870,857
Barley . . .	1919	84,568	2,249,856 "	3,374,792
	1909	171,888	5,834,615 "	3,331,930
Indian corn . . .	1919	34,799	901,905 "	1,623,433
	1909	26,033	563,025 "	404,367
Potatoes . . .	1919	55,132	5,866,710 "	12,320,093
	1909	57,897	7,667,171 "	2,993,737
Hay and forage . . .	1919	1,064,130	2,013,913 tons	47,717,065
	1909	742,741	1,399,597 "	17,200,252
Sugar beets . . .	1919	5,303	46,386 "	500,969
	1909	1,270	6,556 "	38,007

Crops of increasing importance are bulbs, flowers, vegetable seeds, flax, filberts, and English walnuts. Prohibition increased enormously the demand for berry-juices. Three-fifths of the loganberries produced in the United States come from Washington (1,157,778 qt. in 1919, valued at \$208,402). The evergreen wild blackberry (supposed to have been introduced from Hawaii) is spreading through the river valleys, and the fruit is shipped in carload lots to the canneries.

In 1919 the state ranked first in the production of apples and third in hops (1,615,761 lb., valued at \$727,092). The growth of the chief orchard crops between 1909 and 1919 was as follows:—

		Production	Value
Apples . . .	1919	21,568,691 bus.	\$38,823,641
	1909	2,672,100 "	2,925,761
Peaches . . .	1919	1,544,859 "	3,321,449
	1909	84,494 "	118,918
Pears . . .	1919	1,728,759 "	3,025,331
	1909	310,804 "	328,895
Plums and Prunes . . .	1919	785,920 "	1,532,546
	1909	1,032,077 "	600,593

The following table shows the growth in number and value of domestic animals during the decade 1910-20.

		Number	Value
Horses . . .	1920	296,381	\$25,069,336
	1910	280,572	29,680,849
Mules . . .	1920	23,091	2,930,813
	1910	12,185	1,776,297
Milch cows . . .	1920	289,935	23,648,537
	1910	186,233	7,988,133
Sheep . . .	1920	623,779	7,750,407
	1910	475,555	1,931,170
Swine . . .	1920	264,747	5,049,249
	1910	206,135	1,674,927

In 1917-8 condenseries used 205,657,654 lb. of whole milk to produce 1,844,097 cases of condensed milk, valued at \$8,870,825. Cream and butter were sent to the cities from 110 creameries. In 1919 in 19 factories the production of cheese was 2,004,365 lb., valued at \$348,669.

During the decade 1910-20 the irrigated farms increased from 7,664 to 13,271; irrigated acreage from 334,378 ac. to 529,899 acres. The Reclamation Service of the Federal Government has impounded the waters in Keechelus Lake (Kittitas county) and other lakes to serve large projects in the Yakima valley. The Kittitas county project under the state law was designed to reclaim 70,000 ac.; the Klickitat county project to irrigate 90,000 acres. The largest enterprise is the Columbia Basin project, to utilize the waters of Pend Oreille lake and river for the irrigation of 1,750,000 acres.

Mining.—The value of gold production decreased from \$840,000 in 1911 to \$280,000 in 1919. The amount of silver produced increased from 230,000 oz. to 299,000 oz.; copper from 196,000 lb. to 1,320,000 lb.; lead from 848,000 lb. to 1,700,000 lb.; zinc from 25,000 lb. to 39,000 pounds. Coal mined in 1911 was 3,573,000 tons; in 1919 3,100,000 tons. During the decade 1910-20 five new cement plants were established in the state, and large quantities of Portland cement exported. Of increasing importance are clay products, such as paving brick, sewer pipe, and terra cotta.

Manufactures.—The following table shows the growth of manufactures 1909-14.

	1914	1909
Number of establishments . . .	3,829	3,674
Wage-earners (average) . . .	67,205	69,120
Capital . . .	\$277,715,262	\$222,261,229
Salaries . . .	11,504,088	9,826,579
Wages . . .	51,703,052	49,766,368
Cost of materials . . .	136,609,309	117,887,688
Value of products . . .	245,326,456	220,746,421
Value added by manufacture . . .	108,717,147	102,858,733

The chief items were lumber and timber products, flour-mill and grist-mill products, slaughtering and meat-packing, butter, cheese and condensed milk, printing and publishing, malt liquors, canning and preserving. In 1914 the state ranked twenty-third in value of products and twenty-seventh in number of wage-earners.

Water Power.—Chief Engineer Merrill, of the Forest Service, U.S. Department of Agriculture, has prepared a chart showing the distribution of water-power resources in the United States. The total represents 54,000,000 H.P.—Washington is shown to exceed all other states, with 16% of the total, California being second with 14.5% and Oregon third with 12.3 per cent. Efforts were being made in 1921 to secure Government control of trunk lines for the distribution of hydro-electric power.

Ports and Commerce.—During and immediately after the World War the commerce passing through the district of Puget Sound was second only to that of New York. A law approved on March 14 1911

authorized the organization of ports, and where these are made coextensive with the areas of first-class counties they become ports of the first class. These have elaborate powers of taxation and management. Seattle, Tacoma, Aberdeen and other cities have taken advantage of this law to improve their harbours and to build great wharves and other conveniences to handle the increasing commerce.

Highways.—The state has embarked upon the task of providing an extensive system of improved roadways. These include the Washington link of the Pacific Highway, intended to extend from Alaska to the Straits of Magellan, another highway around Puget Sound to the Pacific; and highways across the Cascade Range and eastern Washington. The Federal Government maintains the Mt. Rainier National Park and the Olympic National Monument. Efforts were being made in 1921 to preserve the Mt. Baker and the Mt. Adam national parks. National forests include 12,000,000 ac. within the state. The Legislature has created a state Park Board authorized to receive lands for parks and to preserve strips of native forest growth along the highways.

History.—Ernest Lister, Democrat, became governor in 1913 and was reelected in 1916. He died June 14 1919, and was succeeded by Lt.-Gov. Louis F. Hart, Republican. Governor Hart was elected to succeed himself in 1920. He recommended what is known as the Governor's Administrative Code of 1921, one of the most significant changes in the state government since its organization. It was enacted by the Legislature, and many boards of commissioners were abolished. The work formerly in their hands was entrusted to appointive officers.

Commerce with many nations developed rapidly during the decade 1910-20. In Seattle there were in 1921 24 resident consuls representing foreign countries. By far the greater number of vessels coming to ports of Puget Sound were under the Japanese flag. Branches of Japanese banks were established. In 1921 the Legislature passed a law restricting alien ownership of land, aimed especially at the Japanese. It provides that: an alien shall not own land or take or hold title thereto; no person shall take or hold land or title to land for an alien; land now held by or for aliens in violation of the constitution of the state is forfeited to and declared to be the property of the state; land hereafter conveyed to or for the use of aliens in violation of the constitution or of this Act shall thereby be forfeited to and become the property of the state. The word "alien" is so defined that it does not include an alien who has in good faith declared his intention to become a citizen of the United States, but does include all other aliens and all corporations and other organized groups of persons a majority of whose capital stock is owned or controlled by aliens or a majority of whose members are aliens. During the World War many yards were established for the building of steel and wooden ships. A special railway was built into the spruce forests of Clallam county to get materials for airplanes. The Federal Government established a permanent cantonment at Camp Lewis, near Tacoma. A naval training station was established on the campus of the university of Washington in Seattle.

Progressiveness was shown in such legislation as the working men's compensation law (1911), initiative and referendum (1913), recall of public officers (1913) and aid for destitute mothers (1915). To meet the high cost of government the Legislature in 1921 enacted laws levying a poll-tax on every person between the ages of 21 and 50, and a tax of one cent on each gallon of gasoline used by motor vehicles; the tuition charges in state institutions of learning, and the fees for licences for automobiles and for fish-dealers and others were also increased.

During the World War the state supplied to the army 45,154 men; navy 11,887; and marine corps 1,767. The state's subscriptions to the Liberty loans were: First, \$17,070,650; Second, \$38,481,100; Third, \$42,907,950; Fourth, \$70,180,650; Fifth, \$45,024,150. (E. S. M.)

WASHINGTON CONFERENCE, 1921.—Preliminary invitations to a conference at Washington on the limitation of national armament were issued by President Harding on July 10 1921 to Great Britain, France, Italy, and Japan. On Aug. 11 formal invitations were sent to these Powers, to China, and later to Belgium, the Netherlands, and Portugal, President Harding having been authorized by Congress, in an amendment to the Naval Appropriations bill signed July 11 1921, to arrange for the Conference. The President made it plain that

he regarded disarmament questions as closely linked with the Pacific and Far Eastern problems. As American delegates Mr. Harding designated Secretary of State Hughes, Elihu Root, Senators Lodge and Underwood; the British Empire was represented by Mr. Balfour, Lord Lee of Fareham, Sir Auckland Geddes and Sir Robert Borden, as principal delegates; France by Premier Briand, M. Viviani, M. Sarraut, and M. Jusserand; Italy by Sig. Schanzer and Sig. Ricci; Japan by Prince Tokugawa, Admiral Kato, and Ambassador Shidehara; China by Mr. Wellington Koo and Mr. Sze.

The Conference assembled Nov. 12 1921, was addressed by Mr. Harding, and elected Mr. Hughes as its chairman. The latter at once placed the American proposals on naval disarmament before the gathering; they were so precise and far-reaching as to cause general surprise. Reviewing the failure of previous attempts at disarmament and emphasizing the existing opportunity, Mr. Hughes proposed that there should be a naval "holiday": "for a period of not less than 10 years there shall be no further construction of capital ships." He then presented a definite plan for the scrapping of certain of the older capital ships and of capital ships under construction, and the restriction of capital ship replacements by an agreed maximum of tonnage, as follows:—for the United States and Great Britain 500,000 tons each, for Japan 300,000 tons—a "5-5-3" ratio. Discussion of the tonnage allowance for France and Italy was reserved for later consideration. The directness with which Mr. Hughes stated his case struck a note which evoked hearty response from the delegates and the public, and he was at once supported by the British delegation. "We can no longer content ourselves," Mr. Hughes said, "with investigations, with statistics, with reports, with the circumlocution of inquiry. . . . The world wants a practical programme which shall at once be put into execution." At the second plenary conference, held Nov. 15, the representatives of France, Japan, and Italy also accepted the principles of the Hughes proposals, leaving the technical details for consideration by the experts.

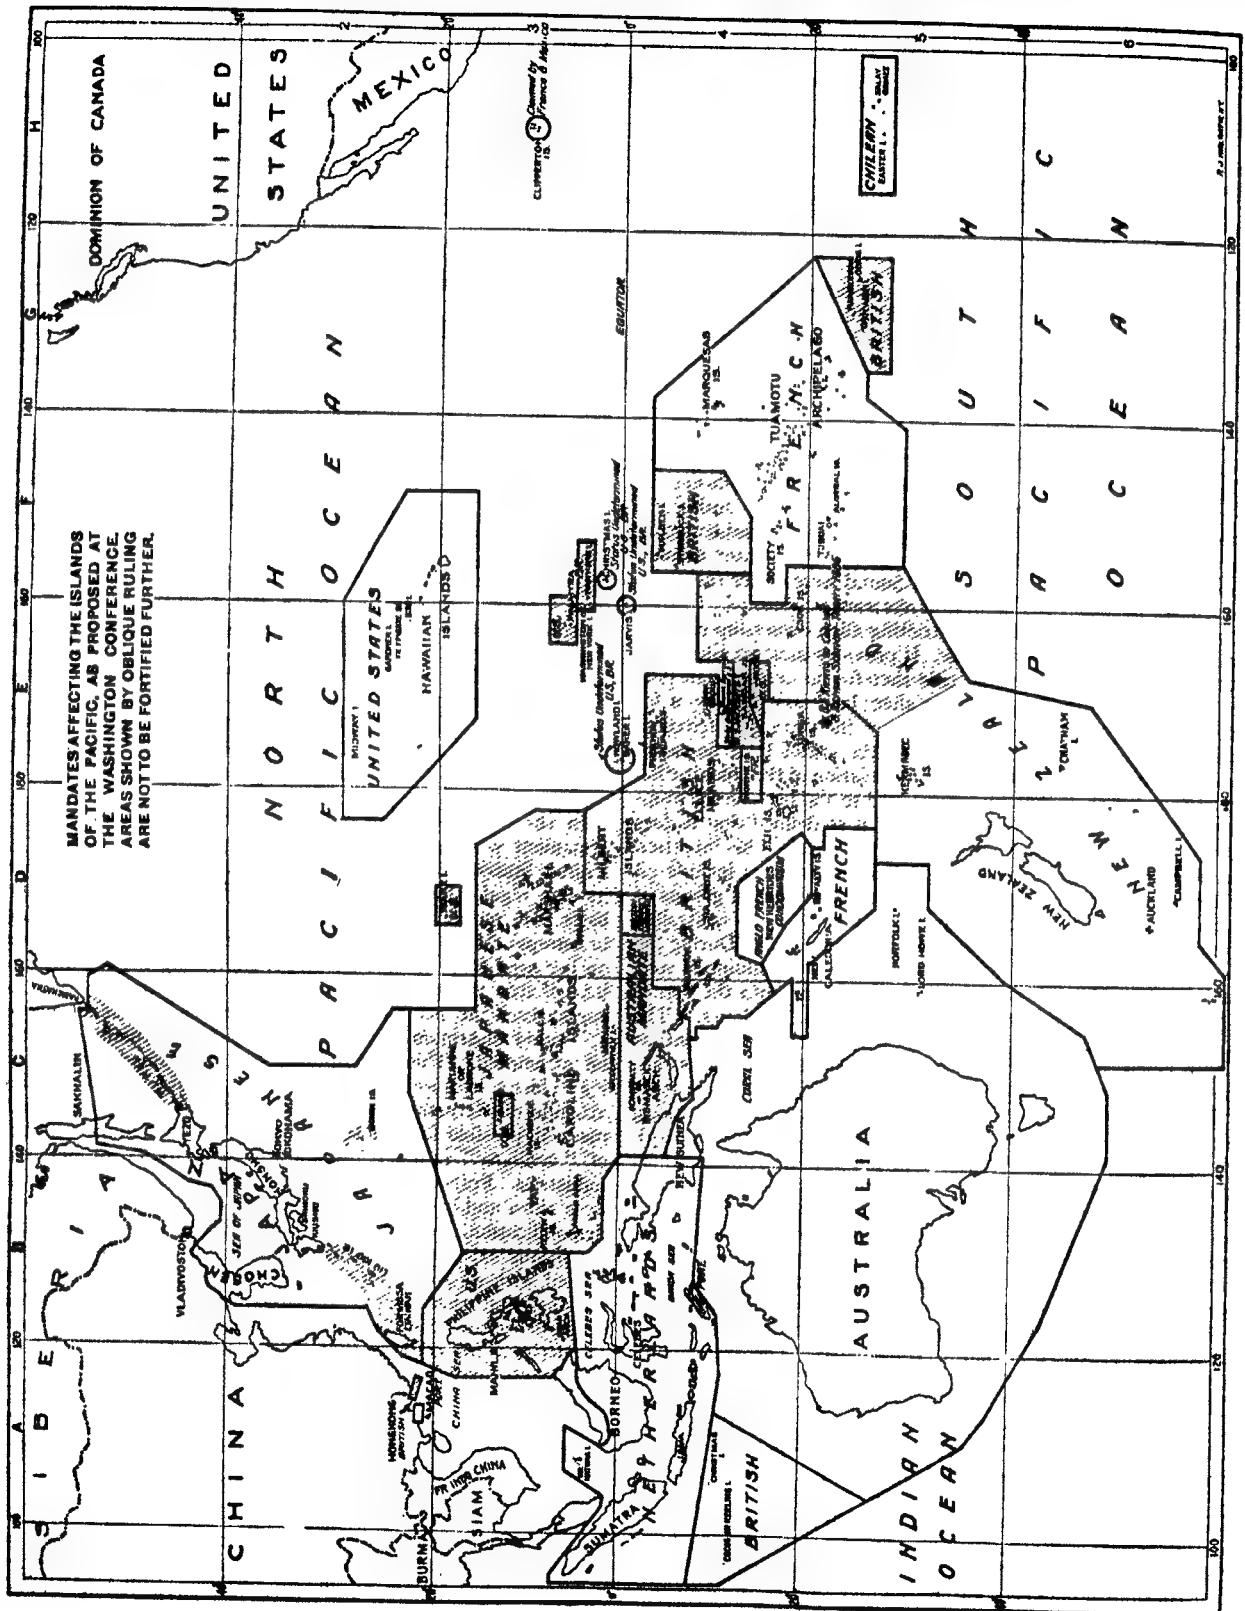

In the plenary session of Nov. 21 the subject of military armament was introduced by Mr. Hughes, who said that the United States had followed its traditional policy of reducing its own regular military establishment to the smallest possible basis. He recognized, however, the special difficulties existing in Europe. M. Briand explained the attitude of France as based on her need for security in Europe; expressing the readiness of his country to take any steps necessary to ensure peace, he emphasized the necessity of a genuine atmosphere of peace, a "moral disarmament," before physical disarmament could be attempted. This atmosphere, he maintained, was lacking—chiefly because of what France regarded as the warlike attitude of Germany, the carefully maintained system which made it possible for her suddenly to convert a huge number of "civilians" into troops, and the availability of her war industries. France, he claimed, had already reduced her army by a third and was planning to reduce it by a half. Complete demobilization, however, was impossible for her under the conditions existing in Germany and Russia. M. Briand concluded with an appeal for the moral support of France by other nations, and this evoked a sympathetic response from the other delegates. Sig. Schanzer of Italy, however, made plain the desire of his country that "the general limitation of land armaments may become a reality within the shortest space of time." The result of the attitude of France was to establish the impracticability of discussing any definite plan for the limitation of armies. A sub-committee was appointed, however, to consider the questions of air-craft, poison gases, and the rules for the conduct of war.

The agenda of the Conference were dealt with by two committees of the whole, one composed of the delegates of the five principal Powers to deal with limitation of armament, the other, composed of delegates of all nine Powers, including China, Belgium, the Netherlands, and Portugal, to deal with matters affecting the Pacific and the Far East.

WASHINGTON CONFERENCE

Meetings of these committees and their sub-committees, beginning with their first sessions, Nov. 14 and 15, were held in the Pan-American Building and were not open to the public. Lengthy

sessions, of which six were held. The decisions reached were in regard to navies, including submarines; poison gases; the Pacific Ocean and its islands; and Chinese affairs.

communiqués were published on the progress of the discussions, and their results were reported formally at the open plenary ses-

The committee on armament discussed fully the maximum tonnage and ratio of capital ships to which each Power should

restrict itself; and on Dec. 20 a provisional agreement was reached. Japan maintained (Dec. 20) that 60 per cent of the quota proposed for the United States and Great Britain—on the 5-5-3 plan—was insufficient for her defensive needs, and asked that it be increased to 70 per cent; her delegates were especially unwilling to sacrifice the "Mutsu," a new capital ship (in large measure paid for by popular subscription) which, under the Hughes plan, would have to be scrapped. This obstacle was overcome by permitting Japan to retain the "Mutsu," on condition that an older ship, the "Setsu," should be scrapped. This change gave Japan two post-Jutland ships and an increased capital-ship tonnage, to offset which it was agreed that the United States should complete two ships still in process of construction, and that Great Britain should construct two new vessels not to exceed 35,000 tons each. In replacement tonnage the ratio was to stand thus: United States and Great Britain 525,000 tons each, and Japan 315,000 tons—a ratio of 5-5-3. This agreement was stated to be contingent upon a suitable arrangement for France and Italy, who had been offered a replacement tonnage of 175,000 each. But M. Sarraut, representing France, held out for an aggregate of 350,000 tons, to be constructed on a replacement basis from 1925 onwards. The controversy was finally laid before M. Briand, who had returned to France; he agreed to accept for France the capital-ship ratio of 1.75 as against 1.60 for the United States and for Great Britain, but made his consent conditional on the obtaining of a larger proportion of auxiliary craft and submarines, which were regarded by France as purely defensive weapons. "The idea which dominates the Washington Conference," he telegraphed, "is to restrict naval armaments which are offensive and costly. But I do not believe that it is the programme to deny to a nation like France, which has a large extent of coasts and a great number of distant colonies, the means of defending its communications and its security."

The French reply settled the problem of capital ships, but a warm controversy was provoked over submarines. Mr. Balfour, on behalf of the British delegation, proposing the complete abolition of the submarine, on the ground that it was an inhuman agent of warfare, effective only in illegal attacks upon commerce. Mr. Hughes proposed a reduction of submarine tonnage for the United States and Great Britain to 60,000 apiece, and approximately the *status quo* for France, Japan, and Italy (31,500 for the first two, 21,000 tons for the last). But the French delegates refused to accept less than 90,000 tons for submarines and 330,000 for cruisers and auxiliary craft. Mr. Balfour then made it plain that, failing action against the submarine itself, Great Britain could accept no limitation for anti-submarine craft.

As a result, the treaty, as finally agreed upon by the five major Powers, did not include limitation of total tonnage of submarine or auxiliary craft. Limits, however, were placed upon the total tonnage of aircraft carriers and upon individual tonnage of capital ships and cruisers, as well as upon the calibre of guns carried.

The failure of the British attempt to abolish the submarine was mitigated by the passage of a series of resolutions presented by Mr. Root and later embodied in a treaty. As accepted, they stated the rules of international law as to "visit and search" on the high seas, and declared that belligerent submarines are not exempt from these rules. They invited the adherence of all civilized Powers to this statement. In the third place, they recognized that the use of submarines as commerce destroyers was practically impossible without violation of these rules, and that prohibition of such use should be accepted as a law of nations; they declared the assent of the contracting Powers to such prohibition and invited that of all other nations. No definition of a merchant ship was adopted. In the fourth place, they declared that commanders of all ships transgressing international rules should be subject to punishment for piracy. Aircraft limitation was rejected by the Conference, after a technical report of the sub-committee had declared limitation to be impracticable, but an inquiry commission was appointed.

The abolition of the use of poison gas in international warfare, on the other hand, was advocated by the Naval Committee Jan. 7 1922, on the motion of Mr. Hughes, and prohibition of poison gas was embodied in a treaty.

In respect of the problems of the Pacific one of the most important accomplishments of the Conference was the drafting of a new treaty, presented at the plenary session Dec. 10 1921, between the United States, Great Britain, France and Japan. It pledged each to respect the rights of the others in relation to their insular possessions and insular dominions in the Pacific, to accept mediation in case of controversy over these possessions, and to open frank discussions if their rights were threatened by any other Power. The treaty was to remain in force for 10 years, and upon its ratification the Anglo-Japanese Alliance was automatically to be terminated. A reservation accompanied the treaty embodying provisions to the effect that it should not be deemed an assent on the part of the United States to "mandates" granted in the Pacific under the Peace Treaty of Versailles, and should not preclude agreements relative to mandated islands.

The reservation also excepted from arbitrable controversies questions lying within the domestic jurisdiction of the contracting Powers. To the treaty was later appended also a second agreement, defining the phrase "insular possessions and insular dominions" in such a way as to exclude Japan proper from its scope. The representatives of the United States and Japan also signed a treaty regarding Yap, according to which the United States was to have free access there on a footing of entire equality with Japan in all that related to cable and radio service, and received certain privileges and exemptions in relation to electrical communications. Subject to various conditions the United States consented to the administration by Japan of the mandated islands in the Pacific north of the equator.

Chinese problems were presented Nov. 16 1921 by Mr. Sze in the form of ten points, which the Conference was asked to adopt. They called for recognition of the territorial integrity and political and administrative independence of China, the "open door" neutrality, and the complete removal of all political, jurisdictional, and administrative restrictions upon the Chinese Republic.

The general attitude of the Conference towards China was crystallized Nov. 21, when four resolutions presented by Mr. Root were adopted. They declared the intention of the Powers to respect the sovereignty, the independence, and the territorial and administrative integrity of China, their desire to maintain the principle of equal opportunity for the commerce and industry of all nations, and their agreement not to seek special rights or privileges. Details of specific arrangements to be enforced led to long discussions. A resolution was adopted (Dec. 24) providing for the voluntary withdrawal of foreign post offices from China Jan. 1 1923, on condition that China should maintain efficient service and continue the supervision of the foreign co-director general. The problem of extra-territorial rights could not be settled definitely, but it was referred to an international committee for intensive study and report within a year. The demand for the withdrawal of foreign troops from China was referred to a sub-committee, and finally it was agreed that, while the principle of withdrawal was accepted, the issues raised should be made the subject of inquiry, in order to determine the conditions upon which withdrawal must depend. On the other hand the Powers passed a resolution urging China to reduce the large military forces maintained by the military governors. The relinquishment of foreign leaseholds in China was not actually secured (though Great Britain announced her readiness in this respect if other countries would join her); but China's fight for "open diplomacy" was virtually won when a resolution was passed (Dec. 8) pledging the nine Powers not to enter into any agreement that might impair the force of the four Root resolutions. As regards the customs tariffs, the demand for China for complete autonomy was not granted, nor the request made, in view of the nation's financial necessities, that her quota be raised from 5% to 12½%. It was decided, however, that China's customs revenue should be increased by \$46,000,000 silver annually, through an advance to 5% effective, a surtax of 2½%, and a surtax not exceeding 5% on luxuries. Other resolutions included agreements that foreign radio stations should transmit only Government messages, that there should be no unfair discrimination in railway rates, an expression of hope that the railway system might be unified under Chinese Government control, and an agreement for the establishment of a Board of Reference for Far Eastern Questions.

The question of the Japanese occupation of Shantung entailed long negotiations, which at times seemed dead-locked, especially those relating to the Tsing-tao-Tsinan-fu railway. Largely through the mediation of Mr. Hughes and Mr. Balfour a separate agreement was finally reached between Japan and China and signed Feb. 4. It provided for the return to China of the former German leasehold and 50-km. zone in Shantung, and the withdrawal of Japanese troops and gendarmes; China was to purchase the Tsinan-fu railway for \$30,000,000, but, before complete redemption, there were to be appointed a Japanese traffic manager subject to the direction of the Chinese managing director, a Japanese accountant, and a Chinese accountant of equal rank. Japan renounced all rights

to foreign assistance stipulated in the Chinese-German Treaty of 1898, and relinquished the maritime customs at Tsing-tao and former German public properties. As to Siberian problems, Baron Shidehara made a full statement to the effect that it was "the fixed and settled policy" of Japan to respect the territorial integrity of Russia, and to observe the principle of non-intervention in the internal affairs of that country, as well as the principle of equal opportunity for the commerce and industry of all nations.

The decisions taken by the Conference were embodied in seven treaties and various supplementary resolutions. (1) *Five-Power Naval Treaty*, designating specifically the capital ships to be retained by each of the contracting Powers and determining the ratio of capital ship replacement: 525,000 tons for the United States and Great Britain, 315,000 tons for Japan, 175,000 tons for France and Italy each—or 5:5:3:1:66. This treaty also limited the tonnage of individual capital ships to 35,000 and the calibre of guns to 16 inches; individual cruisers were limited to 10,000 tons and their guns to 8-in. calibre. Aircraft carriers were limited in general to an individual tonnage of 27,000, with a total tonnage of 135,000 for the United States and Great Britain, 81,000 for Japan, 60,000 for France and Italy each. With certain exceptions, the *status quo* was to be maintained with regard to fortifications and naval bases in the Pacific. (2) *Five-Power Treaty Relating to the Use of Submarines and Noxious Gases in Warfare*, embodying the resolutions described above. Accompanying these treaties were two resolutions for a commission of jurists to consider amendment of the laws of war and limitation of their jurisdiction. (3) *Four-Power Treaty*, between the United States, Great Britain, France, and Japan, relating to insular possessions and insular dominions in the Pacific, accompanied by the declaration of the United States. (4) *Four-Power Treaty*, between the same Powers, relating to the foregoing, and defining "insular" so as to exclude Japan proper from its scope. (5) *Nine-Power Treaty*, relating to principles and policies to be followed in matters concerning China, as described above. This was supplemented by ten resolutions embodying the decisions taken as to a Board of Reference, extra-territoriality, foreign postal agencies, foreign armed forces, unification of railways, Chinese military forces, existing commitments of China or with respect to China, the Chinese Eastern Railway. The treaty embodied the Root resolutions as its Article 1, and strongly emphasized the principles of the "open door." (6) *Nine-Power Treaty*, relating to Chinese customs tariffs. (7) *Chinese-Japanese Treaty*, regarding Shantung. Two other treaties connected with the work of the Conference were: *United States-Japanese Treaty*, regarding Yap; and the *Six-Power Treaty*, allocating German cables in the Pacific. The Conference on Limitation of Armament was formally terminated Feb. 6 1922. On March 1 the U. S. Senate ratified, by a vote of 67 to 22, the treaty with Japan regarding Yap. (C. SEV.)

WATERHOUSE, JOHN WILLIAM (1847-1917), English painter (see 28,370), died in London Feb. 10 1917.

WATERLOW, SIR ERNEST ALBERT (1850-1919), English painter (see 28,381), died at Hampstead Oct. 25 1919.

WATER SUPPLY, MILITARY.—The problem of military water supply bears the same relation to similar work in civil life that military bridges do to those of ordinary construction; that is to say, although the ultimate object, and the underlying principles, are the same, the circumstances of construction are so different that the whole subject requires separate consideration. It has been long recognized that military bridges form a distinct branch of the art of war. Experience now points to the fact that water supply must be similarly treated. Of its great importance there is no question. The whole of the military operations in a campaign may turn on its adequate provision. The health and comfort of the troops and animals depend on this more than on any other supply question. Railways demand its provision, both in quantity and quality. It is therefore a matter both of operations and of administration, besides being an engineering problem of the utmost complexity.

In the following account of the most recent experience and practice connected with this subject, the purely engineering aspects of the problem will not be considered, and hydraulic calculations, sources of supply and the calculations entailed, well sinking and boring, pipe line design, reservoir dams and all other similar purely engineering technicalities will be omitted. It is proposed to consider the matter only in its military subdivisions.

I. *Personnel.*—The duties of officers and other ranks charged with water supply are broadly to carry out the engineering work involved in the obtaining and storage of water, and in the arrangements for insuring its purity till it reaches the custody of the troops supplied, and also to control all means of its distribution. There should be in all this organized work every care taken to ensure standardization of practice; there must be an adequate and competent executive staff,

and efficient subordinates. On the staff of the engineer-in-chief of an army there should be an officer of high rank and of water experience, especially in charge of the whole control from the front to the base. There should be water engineers, under the chief engineers of the various formations, whose duties will be not only to carry out work actually ordered, but to reconnoitre, think out schemes, and generally to have such a grasp of the technicalities of the problem in relation to the whole military operations, that their advice may be of value to the army, corps and divisional commanders in considering the possibilities of operations. It is obviously of the very utmost importance that the general staff should keep the water engineers informed, to the fullest possible degree, as to impending developments, so that water policy may be framed accordingly.

As a general rule the field units of engineering carry out water supply as part of their normal duties, but in large operations they may be so fully occupied otherwise that it is necessary to provide special units for water duties. These would comprise (a) water supply companies, each about 8 officers and 250 other ranks, for general water work; (b) lorry or barge purification units, each 5 officers and 120 other ranks, for operating purification plant; (c) water control units, each 1 officer, 46 others, for provision of turn cocks, police at water points, etc.; (d) water transport companies, 7 officers, 300 others for distribution by rail, road or canal, and (e) well-boring sections, each 2 officers and 74 others for wells.

The equipment for these will vary according to the circumstances of the country. Obviously the water transport companies will have to be provided with many motor lorries fitted with tanks, and the purification companies with mobile laboratories. The above approximate sketch of the various units required will, however, indicate the nature of the equipment to be provided.

II. *Quantities to be Provided.*—In any water supply scheme the aim should be to provide as much water as can be *advantageously* used, for abundant supply means health and comfort. But concurrently, there must be rigid control of distribution so as to ensure reduction of waste. In giving, therefore, certain approximate estimates of quantities required, it must be noted that, in hot climates especially, circumstances may call for considerable modification.

Men require, in semi-permanent camps with water-borne sewage, baths, etc., 30 gal. per head per diem; in standing camps, without water-borne sewage, 15 gal.; in temporary camps, 5 gallons. The absolute minimum is 1 gal. at rest, and on the march for periods not exceeding three days at a time $\frac{1}{2}$ gallon. Horses in temperate climates drink 6 to 10 gal. a day and the absolute minimum is 3 gallons. A horse drinks 3 gal. at a watering, and takes 6 minutes to drink it. In hot countries and with much work horses may require more than 10 gallons. Oxen and mules drink as much as horses, sheep and pigs about 1 gal. per diem, camels 10, with 20 every third day. A camel takes 20 minutes to water and drinks in two bouts with an interval of 10 minutes.

In hospitals and standing camps allow per diem, for each slipper bath 200 gal., W. C. 30, lavatory basin 20, urinal 40, yard tap 40, each vehicle washed 10 gallons.

On railways each broad-gauge locomotive needs 7,000 gal. per diem, each metre-gauge locomotive 2,500, 60-cm.-gauge 1,800. Horizontal stationary engines of compound modern type need 2 gal. per H.P. hour, and for the non-condensing type 4 gallons. For broad-gauge locomotives an alternative figure is 120 gal. per train mile. They require also for washing out about 3,000 gal. every 7 or 14 days. Boilers require about 20 gal. per H.P. hour under normal conditions. Petrol and oil engines require for cooling at rate of 7 gal. per H.P. hour and 35 gal. tank capacity per 6 H.P.

III. *Distribution under varying Tactical Conditions.*—(a) When a forced landing is contemplated, arrangements must be made for sea-borne water, in quantities much in excess of requirements, for accidents are almost certain to happen to some of the water-bearing vessels. Even if it is known that water does exist on shore, such precautions are necessary, for, in event of hostile resistance, it is more than likely that a retreating enemy will damage the existing supplies. Parties of engineers, provided with the proper plant and tools, must be told off beforehand for water-supply work on landing, and extra water carts, pack animals with filled receptacles, etc., should accompany the troops.

(b) When disembarkation takes place on friendly territory, watering arrangements—standpipes, fillers for water bottles, troughs for animals—must be provided near the points of concentration. The sites for such filling points must be carefully chosen so as not to impede concentration. Such work as this should be carried out by an advanced party of engineers, assisted by any local help available.

(c) For troops on the march, in a country reasonably well supplied, the procedure is for an engineer officer with a party of men equipped for testing the quality, and noting the quantities of water, to go ahead, fix watering places for men and animals, if possible improve the local conditions and generally make all arrangements so that everything may be ready in plenty of time before the troops arrive. But if the march is in a land that has no natural supplies or where the quality and quantity is doubtful, the problem is different. The first thing to establish is an initial watering point (I. W. P.) or points, as far forward as possible before the advance takes place. Water must be collected there in temporary tanks and so arranged that lorries can be filled quickly therefrom and dispatched regularly.

Adequate arrangements for the reception of the lorry-borne water must be provided at forward-water points, where the tank lorries can be quickly emptied into other improvised tanks whence they can be drawn by the troops in their water carts. At $\frac{1}{2}$ gal. per man and 5 per horse per diem a division requires about 300 tons of water and this means 150 to 300 lorries according to the state of the roads, each lorry doing one trip per day. With pack animals, in countries where no roads are available, the same principles apply, only in addition to the contents of the receptacles carried for the troops, an allowance must be made for the carrying animals' own requirements.

(d) During position warfare there are three areas to be considered—forward, concentration, and back. The forward area, i.e. between front line and the rear of the heavy artillery zone, will require only drinking water for the fighting troops. This will be distributed (apart from any existing sources) usually from water carts or lorries filling at "points" in rear. Tank trucks on light railways and pipe lines to water points may possibly be used, but this is not so usual. While existing supplies should be utilized as much as possible, it is obvious that the greatest precautions against contamination are imperative. Distribution by water carts (holding 118 gal.) and water lorries, i.e. ordinary motor lorries fitted with two or more tanks, can be made where roads exist with sufficient security against hostile fire. They convey water from the supplies in rear to storage tanks of temporary construction. These "spill tanks" in the forward area should be small, numerous, and not too near each other so as to distribute risk of damage by hostile action. Sheltered positions, convenient for the troops, should be selected for their location. In some soils (e.g. in chalk) it is possible to mine underground tanks holding large quantities, and to bring supplies of water on light railway trucks. With heavy batteries in the vicinity of light railways such tank trucks can be used to deliver water to individual units. Storage for the daily supply must be arranged in such cases. A piped supply to a forward area is hardly practicable within 5,000 yd. of the line, where shelling is active. Such a system requires much care in maintenance, will be subject to great risk of damage and therefore to waste of water, hence it should not be adopted without full consideration of other alternatives. If adopted the general plan should be very simple, with as few branches as possible from main lines. It is better to construct radiating lines from the source rather than multiply branches. All pipes should be buried with 3 ft. of cover; although this involves their being out of sight, it is less disadvantageous than the exposure to shrapnel and frost. Protected shelters for pipe repairs and maintenance parties, together with supplies of tools and special fittings, must be arranged at intervals along the lines. As frequent breaks may be expected, frequent storage points must be provided; these will generally be a series of small tanks, say 400 gal. each, dug in and fed direct from the mains. Such points must be arranged to serve an area of the defence or made for the supply of dressing stations, etc. The ground must be well drained and all possible protection from shell fire must be given. The last stage of the travel of the water consumed by the troops in the front line must be by manual labour. Receptacles such as petrol tins may be used, and when filled may be carried to forward dumps on pack animals, tram lines, etc., so as to minimize hand carriage as much as possible, but in the last resort men have to be carriers. At the battle of Messines pipe lines were used to take water forward from catch pits on the Kemmel Hills, from sterilizing barges on the Lys, and from existing lakes, the quantity being 45,000 to 60,000 gal. daily. Arrangements were made to transport the water to the troops by pack animals and carrying parties. During the attack, water reached the troops within 20 to 40 minutes of the capture of positions. This is one instance out of many which illustrate the application of the principles above generally described.

It is in the concentration area (the line of demarcation between this and the forward area being taken as the rear of the heavy batteries) that the main source of supply and main arrangements for distribution to the forward area will be carried out. There will be in addition extensive arrangements for troops in reserve, casualty clearing stations, etc. Whether a comprehensive pipe system should be constructed, whether there should be a number of pumping stations, or whether there should be one or two main installations, are matters which will have to be carefully considered in the light of local circumstances and available labour and plant. In any case a thorough system of control with personnel trained in manipulating the various valves governing the branches, and a time-table giving equitable distribution, will have to be organized. The concentration area will be divided up into water areas with water "points" whence fighting units can draw their supplies by means of their water carts, but there will be casualty clearing stations requiring special attention where water should be laid on to standpipes near kitchens, ablution rooms, operating rooms, etc.

In the back areas the circumstances resemble those of a semi-permanent camp. The requirements will be for divisions in billets, reinforcement camps, schools of instruction, etc., and the arrangements only differ from those in regular encampments in cases where in villages, etc., it is found more convenient to have water cart points rather than piped supplies laid on to camping grounds.

(e) Before and after an attack the water supply arrangements include the supply during concentration, and keeping up supply as the troops advance. In the former case the work is very much as

already described for position warfare. Every endeavour must be made to develop resources rapidly and secretly on all parts where attack is contemplated, and the most thorough training must be given to the technical troops in the rapid extension of the water system. In Palestine prior to the great attack, material was brought during night to the farthest advanced positions, and concealed in orange groves, etc., while the personnel was drilled in rapid laying of pipes and erecting of pumping plant. The supply after the initial advance will depend on the nature of the country and the initial success, and the most complete and accurate intelligence of the water resources of the country is of paramount importance. While the construction of pipe lines in the rear of an advancing army may be of the utmost value in securing a position won (as at the Somme in 1916), it is hopeless with a rapid advance (as in Palestine in 1918), so that in this case either independent sources of supply must be relied on, or transport by lorry must take place, and this places a tremendous strain on the transport organization and is, therefore, not lightly to be considered. Where pipe lines are decided upon, it is well to take them in entirely fresh installations rather than attempt to extend existing systems.

(f) A few details may be added of various constructional matters common to all phases of operations.

"Filling points" are tank and standpipe installations where water carts, lorries, "dixies" and water bottles are filled. Preferably there should be separate standpipes and approaches for carts and for lorries, so that the one may not impede the other, but all the standpipes should be such as can be equally used by either. There should be provision off the main road for waiting vehicles (within call of the "point" police).

As there is a limit to the number of horses that should be watered at one point, it is best to establish numerous small "watering points," with 200 ft. run of troughs as a maximum, and to locate the positions of the stables accordingly. The troughs should be near a road, but not next a main road where strings of horses would impede traffic, and, above all, horses must not cross a road to reach the troughs. The approaches to the troughs and the standings must be well made, drained and fenced in; otherwise the whole place becomes a morass. The frontage for each horse at the trough is about 2½ feet. In an actual instance 6,000 cavalry horses per hour were watered at 500 ft. of trough, using both sides. This works out at 12 horses per ft. of double troughing, each horse being 5 minutes inside the enclosure. Probably the best figures for general use are 6 minutes each horse and 2½ ft. frontage. If watering is to be on both sides the trough should be at least 3 ft. wide. Canvas troughs (600 gallons) are 36 ft. long, and should be in strong framing.

Where, as is often the case in Oriental countries, water lies deep below the ground, necessitating the use of pumping machinery, the watering of large numbers of animals becomes exceedingly difficult. In the Palestine campaign the water distribution unit was 1 lift and force pump, with hose, and 1 600-gallon trough, which unit with good management could water some 180 horses or 54 camels per hour. Only 18 camels can use a trough at the same time, and each relay takes 20 minutes to water. The requirements of a division are about 100,000 gallons a day, so each field company of Water Engineers carried 12 water units, or 36 per division. For the men's drinking water 10 large canvas tanks each holding about 1,500 gallons are needed. For storage, while at rest, large canvas buckwails, specially proofed and holding some 7,000 gallons, are useful, but it has been found better to construct tanks of masonry or planking and to reserve canvas tanks for mobile use. Copper vessels, holding 12 gallons, called *fantassis*, were used for camel transport.

Some notes may here be given about Oriental methods of raising water. The *shaduf* is a bucket hung by a rope to a horizontal swinging pole, slung from a vertical standard and weighted at the end furthest from the bucket. It can raise about 1,500 gallons an hour from a depth of 6 feet. The Persian wheel or *sakkieh*, a system of small jars working on an endless band round a vertical wheel above a well, and actuated by oxen or camels turning a horizontal wheel, can raise 3,000 gallons an hour from 40 feet. The *charsa*, or skin bag, worked by a bullock hauling a rope attached to the bag over a pulley above the well, can raise 1,500 gallons from 40 feet.

IV. *Distribution in Standing Camps and Cantonments.*—This is a comparatively easy problem. Certain quantities of supply will have to be assumed, in accordance with experience in similar cases, at various points, and then the sizes of the pipes can be calculated by ordinary hydraulic rules. But it is well to keep the sizes of the pipes fairly uniform, giving rather larger than the calculated diameters, both because the data on which the calculations are based are at best conjectural, and because it is well to avoid a multiplicity of different sizes. In designing the system it should be arranged that "dead ends" of pipes are avoided, i.e. that the possibility of water remaining stagnant in an isolated length of pipe should be reduced to a minimum. Supply will be from an existing town main, or from some independent source (well, river, etc.) whence the water is pumped to an overhead service reservoir that overlooks and can supply by gravitation the whole system.

V. *Purification of Water.*—A safe water may be turbid in appearance and even disagreeable to taste and therefore repulsive; a dangerous water may be clear and palatable and therefore attractive. War experience has shown that few waters are so foul that they

cannot be rendered safe by suitable treatment. The aim of purification is to obtain an effluent which is not only safe, but is palatable, of good appearance and attractive.

Water for horses is not usually purified. Almost any clear river or pond may be used in the crude state, and the instinct of the animals often leads them to refuse a contaminated water, even if it looks pure. In many cases in Flanders in the World War water from ponds and marshes, though foul and repulsive, was made quite potable by simple treatment. The military value of this fact is evident. Broadly speaking the purifying processes are those which remove suspended matter, and those which render innocuous bacteria which would be harmful.

English waterworks practice in civil life relies almost entirely on the action of the gelatinous film forming on the surface of a sand filter, for removing bacteria, but the processes of sedimentation, filtration and oxidation, which purify water in natural streams and lakes, can be imitated by artificial means working more rapidly than the ordinary sand filter process. Sedimentation can be accelerated by the addition to the water of an alum solution. Filtration can be effected by passing the water under some pressure through a porous medium; oxidation of bacteria by agents such as chlorine in measured quantities. In the field the steps taken are to precipitate the suspended matter by alum solution and then to treat the clear water by chlorination. The former process, though helpful in the latter treatment, is not in itself sufficient to produce a potable water. Chlorination is generally effected by introducing into the water a solution of calcium hypochlorite (bleaching powder) by means of the Horrocks apparatus. This is designed so that a test may be readily applied by men of intelligence to ascertain the condition of the water as regards free chlorine, and to calculate from this the amount of bleaching powder which must be introduced in order to destroy bacteria.

The apparatus for chlorination consists of a box containing six cups to be filled with the water, two tin spoons each holding 2 grammes of bleaching powder, a special cup for the chloride of lime solution, glass bottles containing a test solution of zinc iodide and starch (which has a certain colouring effect on water containing free chlorine), pipettes, stirring rods, etc. The method of using is to put varying quantities of the test solution in each of the six cups of water and observe after half an hour. From the coloration of the water, bleaching powder in proportionate quantities is added for every 100 gal. of water in the chlorinating tank.

Poisons can be removed from water by various chemical processes, though it may be easier and cheaper, and certainly safer, to transport other water by road or rail rather than trust to remedial measures. A contaminated well can be rendered usable in a few days by cleaning out and continuous pumping, and in the case of organic pollution by the addition of large quantities of bleaching powder, followed by pumping out after a period of rest.

VI. *Plant and Machinery.*—The British service water cart (Mark VII.) holds 118 gal. and consists of a galvanized iron cylinder, together with filtering apparatus, two pumps, a box for small stores, a sterilizing kettle, the whole being mounted on a wooden frame with cranked axle and wheels for horse draught. The two filters are placed on the frame in front of the cylindrical tank and can be used either separately or together. Each consists of a steel cylinder in which is contained a cloth-covered steel reel and a chamber for the clarifying powder.

Tank lorries are ordinarily improvised from ordinary motor lorries by mounting two 300-gal. tanks anchored to a wooden frame bolted to the chassis, with a 2-in. pipe connecting the tanks and a 2-in. draw-off. These tanks should have internal baffle plates to reduce the swaying action of the water in travelling. Another method is to sling canvas tanks from framing on the lorry.

The Norton tube well, a perforated tube with hard driving head, and driven by blows from a "monkey," is useful in obtaining supplies near the surface in certain soils. Used with a lift and force pump they are suitable for small installations, but they only yield 200 gal. per hour. They were very useful in the cavalry operations in the Sinai peninsula, where water was, by their use, frequently obtained in the dry beds of *wadis*.

The lift and force pump, which is an article of store, can lift water through a suction hose from 20–28 ft. and force it to a height of 60 ft. above its former level. It consists of a horizontal barrel 4½ in. bore with a double piston working with a 4-in. stroke and operated by a crank pivoted above the barrel and worked by manual power. The suction hose comprises four 12-ft. lengths of prepared hose, internally wired, and at the end there is a strainer, a perforated steel drum. The delivery hose consists of one 30-ft. length of 2-in. canvas hose. This pump is very handy and easily worked by unskilled labour.

Other pumps for manual power are the semi-rotary for small deliveries up to 30 gal. a minute (an ordinary piston and plunger pump) and the chain helix pump, which is an endless chain, or spirally wound band, with a weight at the end suspended and worked by a vertical wheel at the top of the well. The surface tension of small quantities of water adhering to the links of the chain, or the spiral band, is not broken in the rapid movement of the rising chain until it is discharged at the summit of the circuit. It is a very simple form of pump, but only suitable for small discharges.

Of the many patterns of power pumps there are comparatively few that meet the needs of an army in the field, in respect of being easily transported, reasonably free from chance of breakdown, and economy of fuel. It is important that the types used in the field should be few and that parts should be standardized so as to facilitate repairs. There should always be a number of spare parts accompanying each machine, and there should be other spares kept for general use at store depots. All suction and delivery connexions especially should be standardized. As a motive power, high-speed internal combustion engines are generally of most use, if properly connected with the pump and operated by competent personnel. Slow and medium-speed oil engines may be found very useful.

A pumping set will generally consist of (i.) prime mover, direct gear, or belt coupled to (ii.) pump with valves, strainer, suction piping and foot valves (iii.) starting gear for engine or motor, set of spanners, etc. Different classes of pumps will be required for delivery to tanks near the supply, hasty installations on pipe lines, deliberate installations for rest camps, etc., and pumping from deep wells. The variety of pumps suitable for each class is considerable. Mention, however, may suitably be made of the air lift pump, which, on account of its having no working parts below ground, and for several other reasons, is the most useful form of pump for military work. Such a pump can be mounted on a lorry and can go round a series of wells, pumping from each the day's supply into an extemporized reservoir and then going on to the next. It is a device for raising water by compressed air introduced in a vertical tube connected with the rising main, either concentrically with that pipe, or in a separate tube parallel to it. The utility and efficiency of this device has been amply tested in war, and much attention and valuable experience has been devoted to the theory and practice of its use.

As regards pipe-laying, cast iron pipes, though ordinarily used in civil water supplies, with their lead joints are unsuitable for military work because of the relatively heavy weight as compared with steel tubes of the same diameter; also they are brittle and unsuited for rough handling, and the jointing takes more time than the screwing up of steel tubes. The latter should, therefore, be invariably used in the field. As a rule they are not made of larger diameters than 6 in. but larger pipes can be obtained, and many miles of 10-in. and 12-in. pipes were put down in the Sinai peninsula in 1916. For most purposes wrought iron screwed and socketed piping is suitable; the British standard threads for the pipe ends should be insisted on and the whole should be capable of standing a test of 300 lb. per sq. in. (690-ft. head). If in mountainous country (as with the British in Italy, where heads of 2,000 and 4,000 ft. had to be negotiated) the pipes must be of the *hydraulic* type, with special joints.

Many special fittings are required with a pipe system, elbows, tees, crosses, etc., and many devices for control and delivery, such as valves, taps and stop cocks. The main point to remember is that there is no economy in having inferior and cheap fittings, for the waste of water which follows their use costs far more than the extra cost of water and more reliable articles. (G. K. S. M.)

WATSON, JOHN CHRISTIAN (1867–), Australian politician, was born at Valparaiso, Chile, April 9 1867, when his parents were on their way as emigrants to Australasia. He was educated at the public school of Oamaru, N.Z., and as a boy began work as a compositor. He also made an early entrance into politics, attaching himself to the Labour party, which came into prominence during the great strike of Australian dock and transport workers. He was president of the Sydney Trades and Labour Council in 1890. From 1894–1901 he was a member of the N.S.W. Legislature, where he opposed plural voting and inclined towards protection as a means for keeping up the white man's wages. Consequently after federation, as a member of the Commonwealth Parliament he gave his support to Sir Edmund Barton and Mr. Deakin and exacted in return legislation in labour interests. For a short time in 1904, on the resignation of Deakin, he formed a Labour Ministry, but resigned after a few months, though he continued to lead the Labour party until a tariff, of which he could approve, had been passed by Mr. Deakin in 1908. He then retired from public life.

WATSON, SIR WILLIAM (1858–), English poet (see 28.414), was knighted in 1917. His later poems include *The Heralds of the Dawn* (1912); *The Muse in Exile* (1913); *Retrospection* (1916); *The Man Who Saw* (1917) and *The Superhuman Antagonists* (1919).

WATTERSON, HENRY (1840–1921), American journalist (see 28.418), was among the first to urge, in 1911, the nomination of Governor Woodrow Wilson as Democratic candidate for president. In Aug. 1918 he retired from active editorship of the Louisville (Ky.) *Courier-Journal*, remaining "editor emeritus." On March 2 1919 a special edition of this paper was published containing tributes from his admirers throughout the world.

In April he severed all connexion with the paper because of its support of the League of Nations which he opposed. He died at Jacksonville, Fla., Dec. 22 1921. He was the author of *Old London Town* (1910); *History of the Manhattan Club* (1915) and "*Marse Henry*": an *Autobiography* (1919).

WATTS, SIR PHILIP (1846—), British naval architect, was born in Kent May 30 1846, and was educated at the College of Naval Architecture, becoming a constructor to the Admiralty up to 1885. From 1885 to 1901 he was director of the War Shipping department of Armstrong, Whitworth & Co. at Elswick (subsequently returning as a director of the company in 1912); but in 1901 he was appointed Director of Naval Construction at the Admiralty. This post he held until 1912, when he was succeeded by Sir Eustace Tennyson d'Eyncourt (b.1868) and became Adviser to the Admiralty on Naval Construction. In this capacity he played an important part when the World War came, and it was his fate, as the designer of the first "Dreadnought," to see the use that was made of the fleet which he had brought into being in previous years. He was a member of the royal commission on the Supply and Storage of Liquid Fuel (1912), and of the Council of the Royal Society. He was created K.C.B. in 1905.

WATTS-DUNTON, [WALTER] THEODORE (1832-1914), English man of letters (see 28.422), died at Putney June 6 1914.

WAY, SIR SAMUEL JAMES, 1ST BART. (1836-1916), Australian lawyer and politician, was born at Portsmouth April 11 1836. He went to Australia in 1853 and was called to the South Australian bar in 1861, becoming Q.C. ten years later, Attorney-General in 1875 and Chief Justice of S.A. in 1876. He entered the House of Assembly 1875, and in 1890 was lieutenant-governor. He administered the government of the Colony ten times between 1877 and 1890, and in 1897 became the first representative of the Australasian Colonies on the Judicial Committee of the Privy Council. He was created a baronet in Aug. 1899. He did much to help Australian sheep-breeding, and introduced the improved Shropshire sheep into Australia. He died Jan. 6 1916.

WEAVER, JAMES BAIRD (1833-1912), American lawyer and political leader (see 28.439), died at Des Moines, Iowa, Feb. 6 1912.

WEBB, SIR ASTON (1849—), English architect, son of Edward Webb, a distinguished engraver and painter, was born in London May 22 1849. His architectural education was in the office of Banks & Barry (the latter the son of Sir Charles Barry), but it was to his own self-study—and in particular to his power of sketching during his many travels, rather than to his pupilage instruction, that his expression in design and planning are to be ascribed. One of his earliest commissions, on establishing himself in practice, was the restoration of the important Norman church of St. Bartholomew's, Smithfield (1880), a work which lasted through several years. But Webb's peculiar distinction lies in the large number of important buildings for which he has been responsible. Many of these were the result of competitions and include the Victoria Courts at Birmingham, the Assurance offices in Moorgate St., and the Christ's Hospital school at Horsham, all carried out in partnership with Mr. Ingress Bell. His roll of important buildings is a long one, and may well be headed by the completion of the Victoria and Albert museum, South Kensington, and its close neighbours the Royal College of Science and the Imperial College of Technology. The first of these was the successful design in a very keenly contested competition. The plan has the merit of being simple and easy to grasp; the long vistas it presents, the octagon hall, and the galleries are treated boldly and with dignity of proportion. The Admiralty entrusted to Sir Aston the new Britannia Royal Naval College at Dartmouth, and, in conjunction with Mr. Ingress Bell, he carried out the Royal United Service Institution building, Whitehall, and that for the university of Birmingham. The National Monument to Queen Victoria, opposite Buckingham Palace, was, again, the result of a competition, and included a fine but simple lay-out of the Mall and other approaches to the site occupied by the central feature which embodies the noteworthy sculptural work of Mr. Brock. The unworthy setting and background offered to this fine monu-

ment presented by the cement-fronted elevation of Buckingham Palace, for which John Nash and, later, Blore were responsible, led to the long talked of recasting of the front toward the Mall, and this work was placed in the hands of Sir A. Webb. He also designed the entrance from Charing Cross to the Mall, which is ingeniously masked by a building with curved frontages, in order that the change in the line of access at this point may not be noticeable. He was responsible for a large number of private houses—including Yeaton-Peverly, Shrewsbury—and for churches—both new and restored—in Worcester, Burford and Witely, and the French Protestant church, Soho. In 1902 Webb was elected president of the Royal Institute of British Architects, and in 1905 was presented with the institute's gold medal. He was made a Royal Academician in 1903, received his knighthood in 1914, and in 1919, on the death of Sir Edward Poynter, was elected president of the Royal Academy. This was an unusual honour to be awarded to an architectural member, and one for which in the long history of that society there had only been one precedent—that of James Wyatt in 1805, and even in his case the election was never officially confirmed.

WEBB, SIDNEY (1850—), British Socialist and author (see 28.455). From 1909, when Mr. Webb, with his wife, Beatrice, was actively organizing opinion in favour of the Minority Report of the Poor Law Commission, he continued to play an influential part in the Labour and Socialist movement. He became one of the commissioners under the Development Act in 1913. His election upon the national executive of the Labour party in the early part of the World War brought him into a still closer connexion with the responsible leaders of Labour, and two years later the entire constitution of the Labour party was remodelled and a programme constructed (*Labour and the New Social Order*), which was closely in accord with Mr. Webb's views and policy. During the war Mr. Webb and his wife served on numerous departmental and other committees. In opposition to the majority report of the War Cabinet Committee on Women in Industry, Mrs. Webb put forward a Minority Report which was afterwards (in 1920) published separately. At the general election of Dec. 1918 Mr. Webb stood unsuccessfully as Labour candidate for London University (in which he held the professorship of Public Administration), being second in the poll. In the coal crisis of the spring of 1919 he was appointed a member of the Coal Industry Commission and also put forward in evidence a complete scheme of nationalization of the coal-mines. In the same year he was appointed to the Central Committee set up under the Profiteering Act of 1919. Among the publications of Mr. and Mrs. Webb after 1906, the following were the most important:—*English Local Government: The Manor and the Borough* (1908); *The Break-up of the Poor Law and The Public Organization of the Labour Market* (1909); *English Poor Law Policy* (1910); *The State and the Doctor* (1910); *The Story of the King's Highway* (1913); *The History of Trade Unionism* (new and revised ed. 1920); *A Constitution for the Socialist Commonwealth of Great Britain* (1920) and *The Consumers' Coöperative Movement* (1921). Mr. Webb also produced *Grants in Aid* (1911); *How to Pay for the War* (1916); *The Works Manager To-day* (1917); and *The Story of the Durham Miners* (1921). Mr. and Mrs. Webb were concerned in the founding of the weekly *New Statesman* in 1913, and have been since 1895 active movers in the development of the London School of Economics and Political Science (university of London).

WEBER, SIR HERMANN (1823-1918), British physician, was born at Holzkirchen, Germany, Dec. 30 1823, the son of a German father and an Italian mother. He studied medicine at Fulda, Marburg and Bonn, where he took his M.D. degree in 1848. His residence at Bonn brought him into touch with the English colony there, and through this connexion he received the position of house physician at the German Hospital, Dalston, London. When this appointment came to an end, he started in private practice, having become a naturalized British subject, and studied at Guy's Hospital with the object of obtaining an English qualification (1855). Weber came into great promi-

nence as a pioneer of the open-air treatment for tuberculosis, and himself spent many winters in Switzerland in charge of patients. In 1899 he was appointed a delegate to the Berlin congress on the prevention of tuberculosis, and the same year was knighted. He retired from practice at the age of 80, but retained his health and vigour till his death, which took place in London Nov. 11 1918, in his 95th year.

WEDMORE, SIR FREDERICK (1844–1921), English art critic and man of letters (see 28.466), was knighted in 1912. He published that year his *Memories*, a book of reminiscences, social and literary. He also published *Painters and Painting* (1913) and a novel, *Brenda Walks On* (1916). He died at Sevenoaks Feb. 25 1921. His daughter, MILICENT WEDMORE (b. 1879), herself the author of two volumes of verse, helped him to edit during the World War *Poems of the Love and Pride of England*.

WEEKS, JOHN WINGATE (1860–), American public official, was born at Lancaster, N.H., April 11 1860. He graduated from the U.S. Naval Academy in 1881, served two years as midshipman, then resigned from the navy and became a civil engineer. From 1886 he was assistant land commissioner of the Florida Southern Railroad. In the latter year he helped to organize the banking and brokerage firm of Hornblower & Weeks, Boston, Mass., of which he was a member until 1912. His interest in the navy meanwhile continued. In 1890 he joined the Mass. naval brigade, was made captain, and during the Spanish-American War commanded the second division of the auxiliary U.S. naval force on the Atlantic coast. From 1894 to 1900 he was a member of the Mass. military advisory board and of the military board of examiners; in 1896 he was a member of the board of visitors of the U.S. Naval Academy. He was elected alderman of Newton, Mass., in 1900, was reelected for two terms, and then elected mayor (1903–4). In 1905 he was chairman of the Mass. Republican State Convention. During 1905–13 he was a member of the national House of Representatives and as a member of the committee on banking and currency took an active part in framing the Aldrich-Vreeland Currency bill. In 1913 he entered the U.S. Senate, succeeding Winthrop Murray Crane, but was defeated for reelection in 1919. As a member of the Senate committee on military affairs during the World War he took part in investigations which resulted in a reorganization of the ordnance and quartermaster departments as well as the aircraft production board. In 1921 he entered the Cabinet of President Harding as Secretary of War.

WEISMANN, AUGUST (1834–1914), German biologist (see 28.400), died at Freiburg-in-Baden Nov. 6 1914. His latest publications were an estimate of Darwin's work and *Die Selectionstheorie*, both published in 1900.

WEISS, BERNHARD (1827–1914), German Protestant New Testament scholar (see 28.400), died in 1914.

WEKERLE, ALEXANDER (1848–), Hungarian statesman (see 28.500), was again appointed prime minister on Aug. 20 1917, and resigned in a public sitting of Parliament in 1918 (see HUNGARY). At the time of the Bolshevik rule in Hungary he was held prisoner as a hostage.

WELBY, REGINALD EARLE, 1ST BARON (1832–1915), English civil servant, was born at Harston, Leics., Aug. 3 1832. He was educated at Eton and Trinity College, Cambridge, and accepted a Treasury clerkship in 1856. There his financial ability soon showed itself and his rise was rapid, especially after W. E. Gladstone became Chancellor of the Exchequer. Finally in 1885 he became permanent secretary to the Treasury. He was made K.C.B. in 1882, G.C.B. in 1892, and a peerage was bestowed on him on his retirement. After that event he became an alderman of the London County Council and in 1899 was elected its chairman. He died in London Oct. 30 1915.

WELDING (see 28.500).—This article discusses Electric Welding and Gas-Torch Welding. For Thermit Welding, see the separate article THERMIT and THERMIT WELDING.

(1) **ELECTRIC WELDING**.—An important development known as Spot Welding has taken place in recent years. It is a modification of the Thomson process, peculiarly applicable to

uniting overlapped sheets of metal by welded "spots" or localized areas of union of the sheets in place of riveting them. It has the merit of leaving little or no projection or deformation on the outer surfaces of the sheets so united.

FIG. 1.

FIG. 2a.

FIG. 2b.

The machine for such work is called a "spot welder," and usually has two electrodes arranged in a vertical line, one above the other. The electrodes consist of short, heavy, blunt copper bars, E E (fig. 1) (water-cooled in the larger machines); the upper electrode E is made movable up and down under control of a manually operated pressure lever, L, or by a piston actuated by air or water pressure controlled by a valve. The opposed ends of the electrodes, which bear upon and form contact with the sheets to be united, are usually chamfered or given the form of frustums of shallow cones. This reduces resistance loss in the electrodes and adds to their rigidity and durability. The electrodes, as in other resistance welders, are made the terminals of the heavy secondary circuit of a welding transformer, T, the usual single turn of large section. The current is large, but is delivered to the work at low voltage. The weld which unites the sheets is a spot, usually round in form, confined in extent to the area covered by the ends of the electrodes. The opposed faces of the sheets are thus locally and quickly heated to welding temperature, and the pressure of the electrodes causes complete union; such welded spots are successively made at intervals over any extent of surface of the sheets, as in riveting (see fig. 2, a and b). While spot welding has been found to be best adapted to the union of overlapped sheets or edges of comparatively thin metal, plates of $\frac{1}{8}$ in. or more in thickness may be spot-welded by heavy welders constructed for the purpose. In some of these, for mechanical and electrical reasons, two spot welds are made simultaneously by the same current passed in series through two spots covered by two pairs of opposed electrodes connected in series in the welding circuit. Another form of welding, known as "projection" welding, is akin to spot welding, differing therefrom, however, in the use of electrode faces which do not in themselves determine the welded area or spot, and in permitting the instantaneous union of plates or pieces at many parts of their surfaces. This is accomplished by forming raised spots or projections on one or both pieces, which when brought together form the paths for current and consequent development of welding heat irrespectively of the other parts of the plates, and irrespectively also of the electrode contact with the sheets, such contact covering a wide extent of the pieces to be welded, and serving to press them together as the projections between them become heated and softened.

Roller Welding.—Roller welding, applicable to forming continuous lapped seams in sheet metal work, has attained in late years some considerable importance. In this operation the overlapped edges of the sheets to be united are passed steadily between an upper copper roll with an edge of the width of seam weld desired, and a conducting mandrel, plate, or similar copper roll forming the under electrode. The weld so formed is a line or strip of a width determined by the width of the contact surface of the welding roll. Thin steel tubes with lap welds are made by this method, and it has also found application in the construction of thin metal containers such as steel thermos bottles, the parts of which are united without solder.

Snap Welding.—This term is now commonly applied in connexion with the Thomson resistance process to welds made by light contact of the pieces during heating, followed by quick application

of heavy pressure to force the heated surfaces together. With iron and steel the method secures a very strong weld and the heating is confined closely to the weld itself. Moreover, there is a saving of time and often of energy.

Percussion Welding.—If an electric condenser of large capacity be discharged by wire terminals of relatively small section made to approach each other in line, the discharge occurs with a flash of light at or before actual contact, depending on their potential difference. With sufficient capacity of condenser the restricted areas of the opposed ends of the discharge wires are brought superficially for an instant to a high temperature, and if immediately pressed into firm contact will weld or unite. In percussive or percussion welding the condenser (or, better, a polarization battery of limited capacity) is charged from any suitable source of electric energy and its terminals attached to the work pieces, which are then brought into percussive contact, as by arranging to have one of them fall toward the other from an appropriate height determined by experiment. The percussion may be assisted by a weight or spring suitably adjusted. The discharge occurs as above described, and the heated opposed surfaces are brought instantly together by the forcible impact. A weld may thus be obtained between the pieces. The rise of temperature is confined almost entirely to the thin layer of metal forming the joint. The heating effect is thus more local than in any other form of welding. It is applicable to small work and it extends to a considerable degree the practical possibilities of electric welding. The stored energy of an electro-magnetic circuit may also be employed for the instantaneous discharge demanded by percussion welding.

Electric Arc Welding.—Stimulated in large measure by the need of rapid ship construction in the World War, and the modern extension of electric supply, that form of fusion welding in which the electric arc is employed has in the past few years grown rapidly in importance and extent of application. Many forms of arc-welded joint in steel structures have already been to a degree standardized. The arc terminal applied to the work (usually the negative electrode when direct current is used) is a wire or rod of mild steel, mounted in a suitable holder manipulated by the operator, upon whose skill the perfection of the work largely depends. These electrode wires ordinarily vary in diameter according to the scale of the work or current strength used, and range from $\frac{1}{16}$ in. to $\frac{1}{2}$ in. or more. As the welding wire is rapidly consumed in the operation of fusing a joint, it is constantly fed forward. Automatic arc welders have been devised and in these the arc separation is controlled automatically and the wire also fed automatically from a reel. In operation the arc voltage may be from 10 to 20 volts and the current traversing the arc may be from 80 to 200 amperes or more. The welding is attended by much sputtering and projection of fused and superheated globules of iron from the end of the wire electrode toward the cooler and heavier masses of the work pieces. In fact, the deposition of metal on the work is possibly due to a jet of iron vapour from the electrode wire, carrying fused iron globules as a result of explosive boiling of the iron. This action would be a natural consequence of the central area of the end of the electrode wire being at the highest temperature, as it loses heat by radiation less readily than the outer surface of the wire at the arc. This central area reaches a temperature of about the boiling point of iron. The temperature of the arc is so high that the surface of the work pieces, however massive such pieces may be, is penetrated and fused so that incorporation of the metal of the work and that from the welding electrode wire takes place. The welding may be regarded as a progressive filling or plastering action by condensed iron vapour and fused iron. The operation is facilitated by coating the electrode wire lightly with mineral films, such as lime, which probably act by furnishing volatile material which adds to the stability of the arc. Depending on the strength of current in the arc and the skill of the operator, from 1 lb. to 2 lb. of metal per hour may be deposited in effecting the welds, and about 80% of the metal of the wire used enters the welds, the remaining 20% being vapourized, burned into oxide, or scattered in small globules. When plates of over $\frac{1}{4}$ in. in thickness are to be butt-welded they should be bevelled before abutting them, so that a groove of not less than 60° flare shall be provided, to be filled with the fused metal (see fig. 3.). Where the plates meet at an angle, as in fig. 4, the fused metal is deposited either at a or b, or both.

FIG. 3.

FIG. 4.

Arc welding can be carried on even upon the under side of the work (such as a boiler or tank *in situ*). In this case the electric arc is at the upper end of the welding wire, and the disadvantageous position results in the rate of forming the welds being about 60% of that in ordinary work. The actual rate at which seams can be

made in arc welding naturally depends upon the thickness of the plates to be united, the kind of joint to be made and other conditions. With automatic machines on small work it may rise to about 2 ft. per minute, while in heavy work by hand operation it may not exceed 2 in. per minute. Ordinary arc welds on steel may possess a tensile strength of as high as 50,000 lb. per sq. in., but there is almost negligible elongation. Cast iron is amenable to arc welding when proper precautions are taken. Likewise bronze and copper may be arc-welded, a favourable condition for which is preheating of the work pieces. Arc welding has usually been done by the use of direct current, and special dynamo generators are constructed for supplying the current, such generators having been designed with regulating characteristics suitable to welding. The alternating-current arc is, however, adaptable to welding, provided the frequency is not too low. Arc welding covers a large field of application, constantly extending. It is employed in the construction of tanks, and is especially useful in caulking the seams of tanks which must retain oil or thin liquids without leak. It is revolutionizing the fabrication of many structures of iron and steel, and is much used for repair work. It is readily applicable to joining broken pieces and to replacing metal worn away in use, of which the restoration of rail surfaces of tramways *in situ* is now a familiar instance. It is generally found to be less costly in application than the other forms of fusion welding, such as that by the use of oxygen blowpipe or thermit welding. (E. T.)

(2) **GAS-TORCH WELDING.**—Gas-torch welding is variously known as "autogenous" welding, "oxy-acetylene blowpipe" welding, "hot gas flame" welding, "fusion" welding, and other terms which are more or less inaccurate, general, and confusing. The gas combinations more commonly used for torch or blowpipe welding are either oxygen-acetylene or oxygen-hydrogen. Of these two, oxy-acetylene is in more general use for welding, while oxy-hydrogen, on account of its longer flame, is generally used to supply heat for steel-cutting torches. The oxy-acetylene flame has a maximum heat under ideal conditions of about 3,400° C., and oxy-hydrogen about 2,000° C.

FIG. 1.—Principle of the low pressure or injector type of gas torch.

The use of a blowpipe or torch in some form was known to the ancients, but the high-temperature gas flame is a development of the last quarter of a century, and especially the past ten years. The application of the oxy-acetylene torch to metallic welding dates experimentally from 1901 and commercially from 1903; Edmond Fouché, Paris, who did considerable experimenting in conjunction with Picard, is generally credited with making the first really practical torch. The early torches used both oxygen and acetylene under high pressure, but this proved too dangerous, and a low-pressure or injector type was next used. Following this was the Gauthier-Ely positive or medium pressure torch, which used both gases under moderate and independent pressure. The injector and the positive-pressure types are the ones now in commercial use. The development of the latter is largely due to Augustine Davis and Eugene Bournonville.

FIG. 2.—Principle of the medium or positive-pressure type of gas torch.

The fundamental principle of the low-pressure or injector type of torch is shown in fig. 1. The acetylene enters at A and the oxygen

at B. The acetylene, at less than 1-lb. pressure, goes to chamber C, from which it is sucked by the oxygen, under 5 to 30-lb. pressure, pouring out of nozzle D, and is carried along with the oxygen into the mixing chamber E. The thoroughly mixed gases issue from the nozzle of the torch, where they are burned.

FIG. 3. A typical positive-pressure gas torch

The positive-pressure torch principle is illustrated in fig. 2. Here the oxygen, at from 1 to 14-lb. pressure, enters at A, and the acetylene, at from 1 to 24-lb. pressure, enters at B. The oxygen enters the small chamber C and thence out through the centre hole. The acetylene goes to chamber D and also out through the centre hole. The two gases start to mix at E and are thoroughly mixed in the channel F in the torch nozzle G. A typical positive-pressure torch is shown in fig. 3. Torches are made with tips set at various angles from 90° to straight, the latter being principally used in welding and cutting machines. Where the work is heavy the tips are water-cooled. In welding very thin metal the edges are often turned up or "flanged" and the torch used to fuse them together without using any additional metal. On heavier work the edges to be welded are V-ee'd out at an angle of from 60° to 90°, and this channel is filled in by using a welding rod or wire, care being taken to obtain perfect fusion between the old metal and new. Welding of this kind is progressive, as the welder gradually works along the channel, filling

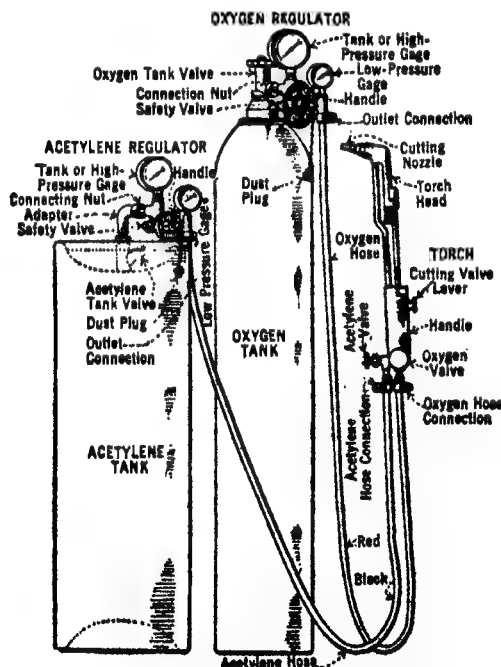

FIG. 4. Typical oxy-acetylene cutting unit

as he goes. The torch is given a weaving motion from side to side in order to fuse the sides of the V and to puddle in the added metal from the rod. On all torch welding work allowance must be made for expansion and contraction, and on repair work of complicated design, like an automobile cylinder, preheating with charcoal, gas-and-air torches, or other means is usually necessary. Preheating is also sometimes resorted to in order to save the more expensive gases. Nearly all of the common metals may be welded with the gas torch, though some are more difficult than others. Steel ship or boiler plate

is about the easiest, though aluminium, cast iron, copper, and many alloys present no serious difficulties.

The set-up for a welding outfit is practically the same as that of the one for cutting shown in fig. 4. A cutting torch, however, differs from a welding torch in that it has a separate high-pressure oxygen vent. The cutting of steel and wrought iron is based on the fact that a jet of oxygen directed on to a previously heated spot of steel causes it to ignite and burn away rapidly in the form of iron oxide. The oxide runs or is blown out of the cut or "kerf," in a stream, provided the torch is fed along properly. The tips used for cutting may have one or several heating jets preceding or surrounding the cutting oxygen jet. Only steel or wrought-iron can be successfully cut on a commercial scale, though channels or slots may be melted in any metal. A typical job of steel plate cutting is shown in fig. 5, and a typical cutting torch in fig. 6. Cast iron is cut with difficulty, and only by using a special tip and highly preheating the oxygen in a positive-pressure torch or by using an excess of acetylene and an unusually large tip on the low-pressure types.

FIG. 5. Cutting through a steel plate

FIG. 6. A typical cutting torch

The same sources of gas supply are used in cutting as in welding. These are commonly cylinders or drums containing the gases under pressure up to 225 lb. per sq. in. and from 100 to 300 cu. ft. capacity for acetylene, and 1,800 lb. per sq. in. and from 100 to 200 cu. ft. capacity for oxygen or hydrogen. Acetylene, however, may be generated on the premises, in which case the pressure must not exceed 15 lb. per square inch. Obviously pressure as great as that mentioned for cylinders must be reduced for use in the torch and for this purpose regulators are used which automatically keep the gases supplied to the torch close to the pressure for which they are set. Gas-torch welding machines that are practically automatic are in use in many large plants for straight or circular seam welding of drums, cylinders, tubes, kettles and the like. Cutting machines are much more commonly used than welding machines. The cutting machines range from the simple, hand-fed, straight-line cutters to complicated motor-driven automatic machines that will cut rounds, squares, ovals or other patterns. One type of cutting machine is made on the pantograph principle, and by following a template or pattern the operator can use two torches and cut two separate steel plates at once. A cutting machine will, as a rule, cut a narrower and more even kerf than can be done by hand. Under favourable conditions a machine can be made to cut a kerf not over $\frac{1}{4}$ in. wide, while a careless or inexperienced operator with a hand torch may cut a kerf $\frac{1}{2}$ in. or more in width. (E. Vi.)

WELFARE WORK IN INDUSTRY.—Human beings possess intelligence, and their well-being depends on psychological as well as on physiological make-up. Mental and physical activity are necessary to health. From the industrial point of view both require to be maintained in order to ensure the efficiency which represents for the employer a contented personnel, and for the employed not merely physical health, but a "worth while" life.

The development of industrial processes brought about during the last century and a half by the application of mechanical power has introduced greater variations into the conditions of life and of work than formerly existed. During the period while control was being established over the efficiency of mechanical devices, the relation of the worker to these devices, and study of the efficiency of human beings in relation to altered conditions of work, were largely neglected. Nevertheless, industrial development in England, as elsewhere, has been followed step by step by "occupational" legislation, controlling employment in factories, mines, workshops and other places, aimed at protecting physical health. But knowledge of how to protect health lagged for many years behind the rapid alterations which were taking place; and the hurry onward to develop wealth-producing industries left no time for taking full advantage of what knowledge did exist. Certainly no organized effort was made during the 19th century to acquire new knowledge, and little or no recognition was given to the new psychological influences brought into existence even though their effect upon the workers was manifested in riots and strikes.

The commencement of the 20th century saw a few far-seeing employers coming to appreciate that their workers were individuals with whom personal contact must be established and maintained, and that modern industrial concerns were far too large to permit of this contact being established by a busy works manager. These employers delegated this side of their duties to definite persons, entrusted with supervision of the welfare of their workers. The result of this action was in every case markedly successful, and 30 British factories in 1913 sent representatives to a conference held at York. Nevertheless, previous to the World War the possibilities of welfare work were undeveloped. One of its results has been to attract more and more attention to its importance.

Welfare work, as such, may for convenience be considered alone. In practice it cannot be separated from supervision of health. The difference between health supervision and welfare is the difference between supervising the health of domestic animals such as prize cattle and of human beings. Mere provision of healthy surroundings and of means for personal hygiene does not meet the needs; there must be appeal to and coöperation with those concerned. The true spirit of industrial welfare work cannot be fostered merely by enforcing compliance with legal requirements. Welfare work means something different; it means educating and training each individual worker to take an intelligent interest not only in his own health and efficiency but also in that of his fellow workers, and in that of the industrial establishment of which he forms a part. Legal requirements can but seldom go further than fixing a minimum standard of accommodation needed; they cannot deal with the personal idiosyncrasy of workers, or establish a code of healthy etiquette, or ensure personal coöperation.

The unprecedented demand in the United Kingdom for munitions during the World War called for action to meet varying needs more rapid and elastic than that of ordinary peace requirements. In 1915, on the formation of the Ministry of Munitions, Mr. Lloyd George appointed the Health of Munition Workers' Committee who promptly recommended the adoption of welfare supervision for munition workers, using the following words of a well-known employer in support:—"If the welfare workers have the confidence of the employees, and are always in touch with them, they will naturally be the medium whereby matters occasioning dissatisfaction or misunderstanding can be investigated and put right. By suggesting and advising upon improvements in conditions of work that may be helpful on the business side, by initiating and supervising recreative and other clubs, societies and classes, by visiting the sick, by endeavouring to foster the spirit of good fellowship amongst all grades of employees, and by being ready to give advice and assistance in matters affecting individual employees personally and privately—by these and other methods welfare workers may find means of giving practical effect to the desire of employers to realize their obligations towards their workers." The Committee also

issued a series of valuable memoranda dealing with workers' food and industrial canteens; employment of women and of juveniles; hours of work; industrial efficiency and fatigue; sickness, injury, and special industrial diseases; ventilation and lighting; washing facilities; and eyesight in industry. These various memoranda formed the basis of work undertaken by a special section established in the Ministry of Munitions entrusted with the welfare and health of workers.

Officers of the factory department (lent for the purpose by the Home Office) directed the work, which is historically important since thereby the foundations of industrial welfare were laid, and for the first time official propaganda going ahead of legal requirements and statute law were largely and successfully employed. The work was essentially advisory rather than punitive; it aimed at pointing out the lines reforms should take, and assisting and expediting in every way the carrying out of improvements. The following memoranda, issued by the Ministry of Munitions, indicate the scope of the work which was being initiated:—

I. WELFARE FOR WOMEN AND GIRLS

The experience which has now been obtained in National and other factories making munitions of war has demonstrated that the post of welfare supervisor is a valuable asset to factory management wherever women are employed. Through this channel attention has been drawn to conditions of work, previously unnoted, which were inimical to the well-being of those employed. The following notes have, therefore, been prepared for the information of employers who have not hitherto engaged such officers, but who desire to know the position a welfare supervisor should take and the duties and authority which, it is suggested, might be delegated to her.

It has generally been found convenient that the welfare supervisor should be directly responsible to the general manager, and should be given a definite position on the managerial staff in connexion with the Labour Employment Department of the factory. She is thus able to refer all matters calling for attention direct to the general manager and may be regarded by him as a *liaison* between him and the various departments dealing with the women employees. The duty of a welfare supervisor is to obtain and to maintain a healthy staff of workers and to help in maintaining satisfactory conditions for the work. In order to obtain both a satisfactory staff from the point of view of health and technical efficiency, it has been found to be an advantage to bring the welfare supervisor into the business of selecting women and girls for employment.

Her function is to consider the general health, physical capacity and character of each applicant. As regards those under 16 years of age, she could obtain useful advice as to health from the certifying surgeon when he grants certificates of fitness. The management can, if they think fit, empower her to refer for medical advice to their panel doctor other applicants concerning whose general fitness she is in doubt. The selection of employees furnishes the welfare supervisor with a valuable opportunity for establishing a personal link with the workers. Her function is thus concerned with selection on general grounds, while the actual engaging of those selected may be carried out by the overlooker or other person responsible for the technical side of the work. In this way both aspects of appointment receive full consideration.

The management may find further that it is useful to consult the welfare supervisor as to promotions of women in the factory, thus continuing the principle of regarding not only technical efficiency but also general considerations in the control in the factory.

The welfare supervisor should ascertain what are the particular needs of the workers. These needs will then be found to group themselves under two headings:—

- (a) Needs within the factory—Intramural Welfare.
- (b) Needs outside the factory—Extramural Welfare.

Intramural Welfare.

The welfare supervisor may be made responsible for the following matters:—

(a) General behaviour of women and girls inside the factory.—While responsibility for the technical side of the work must rest with the technical staff, the welfare supervisor should be responsible for all questions of general behaviour.

(b) Transfer.—The welfare supervisor would, if the health of a woman was affected by the particular process on which she is engaged, be allowed, after having consulted the foreman concerned, to suggest to the management the possibility of transfer of the woman to work more suited to the state of health.

(c) Night Supervision.—The welfare supervisor should have a deputy for night-work and should herself occasionally visit the factory at night to see that satisfactory conditions are maintained.

(d) Dismissal.—It will be in keeping with the general suggestions as to the functions of the welfare supervisor if she is consulted on general grounds with regard to the dismissal of women and girls.

tion (1860), presenting it with the Elcho challenge shield for a yearly competition. He retained his vigour and energy almost till his death, which took place in London June 30 1914, at the great age of ninety-five. He was succeeded by his fourth but eldest surviving son, HUGO RICHARD, LORD ELCHO (b. 1857).

WERNER, ANTON ALEXANDER VON (1843-1915), German painter (*see* 28.523), died in Berlin Jan. 3 1915.

WERNHER, SIR JULIUS CHARLES, 1ST BART. (1850-1912), British S.A. financier, was born at Darmstadt in 1850, entered a banking house in Frankfurt, and early in 1870 came to London as a clerk. On the outbreak of the Franco-German War he returned to Germany to take his place in the army, and was present at the fall of Paris. At the end of 1871 he was sent by Mr. Jules Porges, diamond merchant of London and Paris, on a mission to Kimberley. There he remained till 1880, when he was transferred to London as English representative of the firm of Porges and Wernher, interested not only in diamonds but in the gold mines of S. Africa. In 1888, when the Kimberley diamond mines were amalgamated by Cecil Rhodes and Alfred Beit, he became a life governor of the De Beers Corporation. Beit was now a member of his firm, and in 1880, when Porges retired, the name of the firm was changed to Wernher, Beit & Co. (*see* 3.659). Out of his enormous fortune, Sir Julius Wernher, who was created a baronet in 1905, spent large sums on public objects, including education; he gave £10,000 to the National Physical Laboratory and, with Beit, endowed the S. African University with £500,000. He died in London May 21 1912.

WERTHEIMER, CHARLES JOHN (1842-1911), art collector, was born in London Feb. 17 1842, of German-Jewish parentage. He early devoted himself to the collection of china, pictures and *objets d'art* of all kinds, travelling widely with this purpose in view, and amassing a wonderful collection. He suffered a considerable loss in 1907, about £40,000 worth of treasures being stolen from his London house on Feb. 12. He died in London April 25 1911. His collection was sold after his death and realized a very large sum.

His brother, ASHER WERTHEIMER (1844-1918), entered his father's art galleries in Bond Street, and later assumed control of the business. He made many noteworthy purchases, the most famous being the acquisition of the Hope collection of Dutch pictures (1898) and, in conjunction with M. Seligmann of Paris, the Chermetteff collection of Sèvres porcelain (1906), which was exhibited in Bond Street. He died at Eastbourne Aug. 9 1918. By the terms of his will, the splendid series of portraits of the Wertheimer family by J. S. Sargent was left to the nation, after the death of his wife.

WESTERMARCK, EDWARD ALEXANDER (1862-), Finnish anthropologist, was born at Helsingfors Nov. 20 1862. Educated at a lyceum in his native town and at the university of Finland he became professor of moral philosophy at his own university; but he came to England about 1890 and in 1907 was appointed professor of sociology at the university of London. He made a special study of primitive marriage and ethical origins and has published *The Origin of Human Marriage* (1880); *The History of Human Marriage* (1891); *The Origin and Development of the Moral Ideas* (1906); *Marriage Ceremonies in Morocco* (1914) and other scientific papers.

WESTERN EUROPEAN FRONT CAMPAIGNS, 1914-8.—The story of the successive campaigns in Belgium and France during the World War, embracing the continuous struggle on the western front from Aug. 2 1914 to Nov. 11 1918, is dealt with below under four main sections, representing the phases into which it naturally divides itself:—viz. the "open" warfare campaign of 1914, which ended without decisive victory to either side in the open field and left the armies "stabilized" on a continuous line from Nieuport to the Swiss frontier; the three years of trench-warfare campaigns, 1915-7; the great German offensives of March-July 1918, which, breaking the stability of the trench-warfare system, re-introduced a condition of semi-open warfare; and finally, the allied offensive which synchronized at its outset with the last German attack effort, and closed with the Armistice at 11 A.M. on Nov. 11 1918.

I. THE CAMPAIGN OF AUG.-NOV. 1914

France's Defence Problem.—During the years which followed the Franco-Prussian War of 1870-1, a *guerre de revanche* for the reconquest of Alsace and Lorraine was very frequently discussed in France. But it implied aggressive action against Germany, and those who judged with reason and not with sentiment knew very well that such action was impossible. In fact, Germany, at every international crisis that arose, asserted, sharply and menacingly, her readiness to accept a challenge, while France prudently yielded and avoided a conflict.

It may be observed that, under similar military systems—that is, under laws of universal military service—the effort of France could not surpass the effort of Germany, for France counted less than 40 million inhabitants against the 65 to 70 millions of Germany. Presuming equality of national effort, the *vis viva* of France in relation to that of Germany would be in the proportion of 4 to 7; and this calculation makes no allowance for the fact that in Germany all factors combined to exalt the army, to intensify war preparation, and to produce solid cadres and reserves, while in France the tendency of politics was to depreciate the army and to lower its quality, to minimize its training periods, and to depress its military spirit. It is not unfair to say therefore that the possible warlike power of Germany was at least double the possible warlike power of France.

If, next, we cast a glance at the theatre of the possible war, we see at once that France had no natural frontier with respect to Germany, and was obliged to make good this defect by a system of fortresses and entrenched camps—a form of defence which it is exceedingly difficult to maintain at such a level as to be capable of resisting at any moment an artillery that itself is constantly evolving in the direction of increased power. On the side of Germany, on the other hand (even leaving out of consideration her first-class fortresses, for which money was never lacking), there was a line of defence of the very first order, the Rhine—impossible to turn even if the neutrality both of Holland and of Switzerland were violated, for its flanks rest on the Alps and the sea. There are not in Europe two lines of defence of this value, and it was reinforced by a chapter of entrenched camps. Supposing then that, in spite of the conditions mentioned, France somehow contrived an initial superiority, her penetrative effort could in no case pass the Rhine, while, in a German penetration of France, Paris was within measurable reach.

From the point of view of numbers, the French alliance with Russia might seem at first sight not only to redress the balance but even to weigh down the scales heavily in France's favour. The effective utilization of these numbers was, however, subjected in practice to grave limitations. The strategic conditions of what came to be called the eastern front are discussed in the article EASTERN EUROPEAN FRONT CAMPAIGNS, and here it is only necessary to say that these conditions and in particular the paucity of railway communications and of rolling-stock in Russia—evident from a glance at any map of central and eastern Europe—left it within Germany's power to use by far the greater part of her forces in an initial campaign against France. These forces might, from the relation of the two populations concerned and the characters of their respective politics, attain a figure almost double those of France. In such a contingency, the French armies almost might be crushed under a very considerable numerical superiority; the Germans could sweep up to Paris; and there probably the war would end. Germany would rapidly bring back her armies to deal with Russia, aided both by the general E.-W. orientation of her railways and by their perfect technical preparedness. That the German plans did not always take this form, that the soundness of its principle was a matter of considerable controversy, within the German General Staff as well as in military publications, and that the numerical German superiority was not in fact attained, may be freely admitted. But, as the most dangerous alternative that France had to consider, this plan was found to be taken on the logical basis upon which the military policy of the defence should be build up. Whether Germany's own allies would coöperate in such an invasion, and if so, to what extent, was doubtful. Austria's main

effort would have to be made in the East; and as regards Italy, it was known that her obligation under the Triple Alliance would become operative only if one of her Allies was defending itself against attack. On the other hand, the *Entente Cordiale* between England and France had enabled the latter to concentrate her naval effort in the Mediterranean, and the details of possible coöperation on land, for some years before 1914, had been studied by the British and French general staffs in concert. But England reserved to herself complete freedom to decide for or against intervention if and when the case arose. It was not till Aug. 2 1914 that Sir Edward Grey engaged that the British navy would protect the Channel coast of France, and not till the actual violation of Belgian neutrality by Germany that the British Government declared war on their own account.

Armies require, for their operations, zones with fronts proportionate to their effectives, for it is obvious that they should neither occupy a space so vast as to deprive them of the density necessary for powerful action, nor on the other hand be so overcrowded that their component parts cannot each contribute at the proper time its share in the effort towards a common object. The proper width of these zones depends on the balance of many factors between two reasonable limits; but, above all, it is necessary that all the elements that are to be brought into action at the same time should have at their disposal enough routes, more or less parallel, leading to the objective, and that these routes should be approximately *at deploying interval* apart. Now if Germany attacked France without violating any neutralities, the available width between Switzerland and Luxemburg was practically the same as it had been in 1870. The frontier had changed its position. It is true that Strassburg and Metz were comprised no longer in France but in Germany, and to that extent Germany had gained. But, apart from the fortresses, this frontier was only a conventional line, devoid of strategic interest. The space available for the deployment of the armies, and the distance in a straight line from one neutral frontier to the other, had not altered. Further, not all this space was equally utilisable; the Vosges region, for instance, which was very unsuitable for military operations, formed a large part of it. Thus if the available zone of the Franco-German frontier had seemed somewhat cramped even in 1870, it was far more so—and was becoming impossibly so—for the much larger armies of 1914. If the Germans violated no neutrality, it was out of their power to bring into play the *ensemble* of their attacking forces, and this fact gave to the French army—presumed to be numerically much inferior—an immense advantage. With its fortresses of Belfort, Épinal, Toul and Verdun, the French front of contact was very strong, and moreover, organized both to resist any brusque attack of the nature of a “bolt from the blue” and to enable the French army on mobilization to concentrate close up to the frontier without fear of being disturbed. Such, at any rate, was the adopted French view, though the experience of the war, which brought into play destructive engines of a power formerly unimagined, suggests grave doubts as to its accuracy.

In any case, it was clear that, if the Germans wished to obtain in a short time a success decisive enough to put France out of action, or at least to cripple her sufficiently to enable a large part of their forces to be sent against Russia, the violation of one or another national neutrality was a necessity for her—that of Switzerland if it was decided to envelop the French right, that of Belgium and of Luxemburg if the French left was to be the object of the manœuvre. It was not necessary to violate the neutralities of both flanks, but military opinion was divided as to which would be selected. Each had its partisans in the German General Staff, and neither possibility was ignored by the French. At first sight, the passage through Switzerland might seem the more difficult. But, examined more closely, it loses most of its difficulties. For, in effect, the operation would consist in slicing off such a corner of Switzerland as would give the necessary number of roads, railways and Rhine passages (which could, of course, be multiplied in the sequel). For this, the Jura region alone would be enough; and the Swiss forces, massed on the flank of the invaders, would be held in check by another

army, presumably Austrian. For it must be borne in mind that the Swiss army could not have been mobilized and concentrated quickly enough to hold the line of the Rhine in sufficient strength to bar access, and that Switzerland possessed not a single fortress to support it. On the other hand, the probability of the Belgian route being the one chosen—as it was—was indicated by the systematic and prolonged German preparation of rail facilities on that front.

Thus, for many years, it had been regarded as certain that part of the German army of invasion would traverse either Belgium or Switzerland. But it was not possible to foresee the proportioning of forces that would be adopted by the Germans on the thus extended front, for the high development of their railway network, and the consequent flexibility of their concentration transports, gave every facility for changes of plan and variants. Further, it was naturally to be presumed that they would make efforts to secure in advance the agreement of the state whose territory they proposed to borrow, and the success or otherwise of these diplomatic moves would necessarily react on the proportioning of forces on the military front. And this was true whether the Germans sought by way of Belgium to reach Paris and deal France a mortal blow by capturing the capital, or by way of Switzerland to cut France in two. In either event, the French armies of the eastern frontier, once turned, would have no alternative but retreat.

The French General Staff naturally foresaw that, since the holding of Russia would devolve upon Austria, the French army would probably have to struggle alone against greatly superior German forces (possibly against a preponderance of almost 7 to 4, as previously stated). The first effort must be directed towards establishing a well-prepared and fortified front, proportioned to the forces available, and to locate this as near to the Alsace-Lorraine frontier, whence the enemy could launch a direct attack at any moment, as was possible without exposing the army to the risk of a surprise. In the next place, the possibilities of attack through both Belgium and Switzerland must be guarded against. To extend the line of battle sufficiently to secure both approaches, or even one of them, in an adequate manner, would involve such a weakening of the whole front as would enable the enemy to attack anywhere with a certainty of finding only a third to a quarter of the French forces against him. Any such plan was contrary to all the principles of war, and therefore unthinkable. A completely defensive line must extend from Dunkirk to the Vosges, the Donon, and thence, in order to guard the Swiss frontier as far as Bellegarde, to the Rhine; at the rate of one army corps to 7.5 km. of front, this line (750 km.) would require 100 army corps, without reckoning reserves, to secure it—or more than four times the whole of the numbers available. If the violation of Belgium could be taken as certain the Swiss frontier need not be considered; the line would then run from Belfort to Dunkirk, a length of 550 km.; but 73 army corps—more than the entire French army—would even so be required for its defence. However, if the French staff acted on this assumption, the German army would undoubtedly abandon the Belgian plan and advance through Switzerland; in which case the French army would be turned on the right in such a way that the forces sent to secure the northern frontier could not possibly arrive in time to stop the enemy from crossing the plains of the Saône and coming down into the basin of the Seine. Such a disposition was therefore impossible. The French force must occupy the centre of the line, in Alsace-Lorraine, which was the part most threatened, and be ready to oppose on the north or the south according to the enemy's decision. Accordingly, the following dispositions were made. They are the key to the whole of the first period of the war.

The choice of the first line of defence, to be held against direct attack, was determined by the necessity of fixing it at a sufficient distance from the fortress of Metz, the outer defences of which almost touched the frontier, so that the zone of action of the entrenched camp extended into French territory in the Woëvre plain, which could not be defended. The most advanced line of battle considered practicable was that of the *Meuse* slopes,

which dominate the Woëvre and continue into the neighbourhood of Verdun. This accordingly became an entrenched camp, which had to be raised to the highest pitch of efficiency as a counter to Metz, the "loaded pistol pointed at the heart of France." The line of battle was based on Verdun, and, consolidated by forts constructed on the Meuse slopes, passed in its natural course through Toul and then through the good defensive positions afforded by the left slope of the valley of the Moselle. Between Épinal and Mirecourt these heights lay further from the river, and accordingly the French line drew away from Épinal to arrive at a hill called the Côte de Vivine. Thus the entrenched camp of Épinal, on the Moselle, lay in the advance of the battle-line, and enabled an offensive flank movement against the left of the enemy attack to be made under the protection of its artillery. Behind this first very solid line, which could be held by forces very inferior to those of the enemy, a whole series of positions were available in case of a retreat, in the valleys of the rivers flowing south and north.

The front being rendered secure from direct attack, there remained the question of the two flanks, in the event of an invasion by way of either Belgium or Switzerland. Facing the road from Switzerland there was a great concave arc of positions commanding the plain of the Saône and based on entrenched camps, i.e. Belfort, Épinal, Langres and Dijon. In front of these stood Besançon, in a position to divide and delay the invading stream. Facing the Belgium road, with Verdun, which acted as a sort of left shoulder, as the starting point, was a returning arc marked by the entrenched camps Reims, Laon and La Fère. In advance of these positions Maubeuge played a part corresponding to that of Besançon on the other side.

The enemy must take a certain line to traverse either of the neutral countries, even supposing that he met with no opposition. This would allow time for the French reserves to form, and for the first-line army to concentrate along the Verdun-Toul-Épinal line, to prepare positions facing N. on the left flank of an invader from Belgium or facing S. on the right of an invader from Switzerland, and to be ready to attack, in either event, at the favourable moment. Reason and prudence dictated these dispositions, in view of France's isolation, separated as she was from her Russian ally, and of the fact that Germany and Austria had the advantage of "interior lines."

The dimensions of the two flanks—from Verdun to Reims-Laon-La Fère, and from Belfort to Épinal-Langres-Dijon, respectively—were in accordance with the resources provided by the French recruiting laws in force for some years after 1872; but they had become insufficient for those given by the law of 1889, which greatly increased the military sacrifices demanded from the nation and added considerably to the war effectiveness. The result was that the flank facing an attack from Belgium, instead of ending at the Laon-La Fère system, which was becoming useless, was prolonged as far as Paris, which, as an immense fortified camp, must, by the mere fact of its presence, play a supremely important part, as was seen in 1914. Compared with this great entrenched camp, Reims itself was quite secondary. As for the other flank, it could be continued indefinitely beyond Dijon, by means of the formidable defensive positions provided by the mountains of the Côte-d'Or, which commanded the plains of the Saône. No new fortifications had been considered necessary. The line of battle opposed to Metz could also, because of the increased military resources, be prolonged N. of Verdun, still keeping the edge of the Meuse slopes up to Stenay and even beyond, so as to constitute a threat to the German right, on condition, however, that this right did not extend into Belgium. In the event of a turning movement by way of Belgium, the French left was not to go beyond the Verdun shoulder, and thence would trend away into a defensive, refused flank.

An alternative policy, that of entering Belgium and by reinforcement enabling the Belgians to hold the line of the Meuse, was the subject of a good deal of consideration in French military circles before the war. It involved, however, an extremely complex problem. The attitude of Belgium on the question of admitting French and British forces had been one of marked reserve,

although there had been *pourparlers* at different times between the Belgian and the British authorities; and in fact it was not till Aug. 4 1914 that Belgium asked for the support of England, France and Russia, undertaking herself the defence of the fortified places. Yet, even had Belgium accepted British and French aid earlier and a united Allied front been formed along the Meuse, the strategic situation thus created would have been very difficult, owing to a cause which was operative whether the French advanced to the Belgian Meuse or not. The line of the Meuse runs N.-S. between Mézières and Maastricht, while the direction of the frontier between Mézières and the Vosges is substantially E.-W. A German concentration in the region Aachen-Trier would therefore occupy a zone midway between these two lines, and could act in the direction of either as circumstances dictated. Thus, whether the French army, flung northward, was to go as far as the Belgian Meuse or only to the French territory adjacent, was certainly a question of very great local significance, because the 300-km. line of defence from the angle to the sea, destitute of natural defences and weak in artificial, was distinctly inferior to the short, strong, well-fortified line Givet-Namur-Liège. But it did not alter the fact that the German forces concentrated between Aachen and Trier might, after perplexing the defence by demonstrations, fling their weight upon the line between Mézières and Verdun, break it by means of superior numbers, and so gain a position not only between the separated halves of the French but also nearer to Paris than either.

These conditions, together with Belgium's hesitating attitude, practically imposed the defensive principles upon which the French General Staff must proceed. Obscured as they were by the dramatic events of Aug. 1914,—by the glorious insistence of Belgium, the French offensives into Alsace, Lorraine, and the Ardennes, the tidal wave of the German I. and II. Armies traversing the Belgian plain and northern France,—it was nevertheless on these principles that the German effort was shipwrecked. For in Sept. 1914 the breakwater of the defence was established solidly on the line, marked substantially by the Vosges, the natural defences of Lorraine, the Côte de Meuse, Verdun, the Montagne de Reims and the advanced defences of Paris, which strategic reasoning had already indicated as the basic line of defence for France in the given conditions.

These conditions include other alternatives than the one selected by the Germans; and it may be asserted that, given the fact of Belgium's resistance and of England's intervention, the course taken by the Germans was—as against the alternative of a violation of Swiss neutrality, which would have occasioned much less concern to England than that of Belgium, and even as against that of a frontal forcing of the Lorraine defence, which perhaps was not as invulnerable as it was believed to be—the course which was the least disadvantageous for France.

(H. Bz.)

The French "Plan 17."—The characteristic of all French plans of concentration up to those bearing the No. 16 was that they were all applications of the defensive principles outlined above, differing only in detail, and providing for an initial defensive phase of operations out of which an appropriate counter-offensive would arise when the occasion was ripe. From 1912 onwards, however, a new school of thought had begun to prevail in the French General Staff. The teachings of Colonel (afterwards General) Loiseau de Grandmaison, the constant improvement of the mobilization scheme in details, the sharper tone of policy and sentiment after the Agadir crisis, all combined to create a "younger school" in the staff which did not admit that the army was so inferior in power or war-readiness that the defensive need be assumed *a priori*, as had hitherto been the case. Military France, like the rest of military Europe, was caught by a wave of enthusiasm for the offensive *per se*; doctrines and text-books were revised, senior officers, and generalissimo-designate, having predilections, real or alleged, for the defensive, were got rid of; and as soon as it became clear that the process of mobilization and concentration had been sufficiently accelerated, "Plan 17" was drawn up, with the immediate general offensive in full force as its keynote.

"Plan 17," issued to commanders-designate of armies and their chief-of-staff in Feb. 1914, was based on certain assumptions which may be summarized as follows: On the right wing, the hypothesis of a German invasion through Switzerland was assumed to be so improbable that only an echelon of three reserve divisions, and these available for active operations towards Belfort, was allotted to that flank. On the left flank, the problem was far more delicate and difficult, as it depended on whether or not Belgian neutrality would be violated, and, if so, how far N. the right of the German forces would extend. It was involved with two other questions, that of the attitude of Belgium and that of the strength of the German army; neither of these was answered very definitely, and the assumptions of the plan proved substantially incorrect. Belgian aid was not counted upon—indeed, in one important detail provision was made for the case of the Belgians not interfering with a German march-through—and the German army for battle purposes was assumed to contain only some 20 or 21 active corps, the reserve divisions, it was thought, not being available till after an interval, and then only for subsidiary functions such as sieges and railway guarding. The conclusion drawn was that the German right, in case Belgian territory was taken in, would extend to the limit of the Ardennes—i.e. the Belgian Meuse—at the farthest, if as far. But the hypothesis of a frontal attempt of the Germans to break through between Longwy and the Vosges, without touching Belgian territory, was the basis of the plan; and the measures to be taken in case Luxemburg and the Belgian Ardennes came into the theatre of war were embodied in a "variant." It was supposed, in addition, that attempts might be made by the Germans in Lorraine or the Woëvre to break into the French concentration areas in the first days of hostilities; and a very strong protective system (drawn back in the Woëvre out of range of a sortie from the Metz outer defences) was provided against this emergency, the augmentations of the peace effectives brought about by the "Three Years Law" having made this possible. On to this protective system, constituted by one corps of each front-line army, the remaining corps were to graft themselves as they arrived, and the whole was to be ready for active operations on the 12th day of mobilization. It was assumed—correctly—that the Germans would attack, and—incorrectly—that their attack would be a simultaneous onset of fairly evenly distributed forces; and it was argued that a French offensive, debouching with startling rapidity, would create a situation with which the German military system was not elastic enough to deal.

These active operations, if Belgian territory remained untouched, were to be a general offensive of four armies with another immediately behind them, directed eastward from the Meuse below Verdun and northeastward from the Nancy-Vosges front, northward from Belfort; and, if Luxemburg and Belgium were infringed, an equally general offensive with all five armies in line, those of Alsace and Lorraine directed as before, but those of the Woëvre and the middle Meuse northeastward and even northward according to the positions found to be occupied by the German right. In either case the central army, besides helping its neighbours as required, was to drive back all sorties from Metz and begin the investment of that place.

The dispositions of the plan were as follows: The *I. Army* (five corps, two cavalry divisions and army artillery) was to attack with its main body from the concentration area west of the Vosges in the direction Baccarat-Saarburg-Saargemünd; the right, VII. Corps and a cavalry division based on Belfort, to advance into upper Alsace, rouse the population to a revolt, and hold as large a German force engaged as possible; between the VII. Corps and the main body, a smaller force in the Vosges was to maintain liaison and by descents into Alsace to coöperate with the advance from Belfort.

The *II. Army* (five corps, two cavalry divisions and army artillery), grouped initially about Nancy and Lunéville, on the left of the *I.*, was to attack in the direction Château Salins-Saarbrücken. The improvised fortifications of Nancy in the first stage, and a group of reserve divisions issuing therefrom in the later stages, were to protect the left of this army against Metz;

and the *I. Army*, developing its advance along the Vosges, was to guard the right, coöperating in the battle of the *II. Army* with all the forces not absorbed by the flank along the Vosges.

The *III. Army* (three corps, three reserve divisions, one cavalry division and army artillery) was to connect this "principal attack" in Lorraine with the other "principal attack" mentioned below, first by holding the Côte de Meuse between Verdun and Toul, next by repelling sorties from Metz and blocking up the west front of that fortress, and lastly by giving support to the attacks of the neighbouring armies.

The *V. Army* (five corps, two reserve divisions, one cavalry division and army artillery) had to deal with two alternatives, those of violation or non-violation of Belgian territory. In the latter case, it was to drive eastward from its concentration area N. of Verdun and the Argonne across the Meuse, dropping in its progress a flank-guard to watch the Belgian frontier; its objects were to defeat and drive northward all German forces encountered, and to storm or invest, according to circumstances, the fortifications of Thionville (Diedenhofen), guarded and assisted on its right by the *III. Army*. In the first alternative, it was to be so disposed that it could both attack northeastward on Neufchâteau and Florenville in the Ardennes, and guard its left rear with a special detachment.

The *IV. Army* (three corps, one cavalry division and army artillery), concentrated behind the *III.*, was the general reserve. It was destined to be used either on the right or on the left of the *III. Army* according to which of the two "principal" attacks—Lorraine or Ardennes—needed additional weight. If the offensive of the *V. Army* was directed upon Neufchâteau and Florenville, the *IV. Army* was to come in between the *V.* and the *III.*, and fight its way in the direction of Arlon. Behind the right were to be three reserve divisions, ready to follow up the *VII. Corps* and take over the guard of the Rhine as it advanced. Behind the left, but not definitely allocated to the *V. Army*, were to be three more reserve divisions about Vervins, with a somewhat indeterminate mission. A corps of several cavalry divisions was to form about Mézières in the first days of mobilization on the left of the protective system, and thereafter to operate eastward or northeastward into the Ardennes as required. Its supporting infantry was to occupy the bridges between Dinant and Namur if the Belgian Government did not do so.

This was the plan which was carried into effect when war came in August 1914. As early as Aug. 2, it was decided to act on the hypothesis of a German movement through the Belgian Ardennes, the seizure of Luxemburg by the German advanced guards on that day being a sufficiently suspicious indication. But during the following days the French General Headquarters were confronted with a mass of definite and indefinite information which it was hard indeed to appraise. On the protective line, apart from two severe local fights, at Mangiennes in the Woëvre and Lagarde in Lorraine—the first a French, the second a German victory—there were no events and no important indications. To the N. of the left flank, want of liaison, and, it must be added, of mutual confidence, made it difficult for the French to gauge exactly what the Belgian army would do, and especially what was happening at Liège. That fortress was attacked on Aug. 5, and its capture (*see LIÈGE*) was announced as a *fait accompli* on Aug. 7, yet for many days thereafter the gathering masses of the Germans between Aachen and the Ardennes seemed to make no move.

The British Expeditionary Force (four divisions and a cavalry division) was about to land in France, but it was not comprised in "Plan 17." A secret appendix to the plan, known to a few, provided for a hypothetical "Army W." landing from overseas and proceeding to the region of Valenciennes and Maubeuge, but the way in which this army (should it materialize) might best be employed could not be seen until the rôle of the French *V. Army* had become clearer. Meantime, it was to double the part of left echelon which was assigned to the French reserve formations about Vervins.

But meantime, the troop-trains were arriving in the concentration areas, and the broad "Plan 17" had to be replaced by an

operation order "No. 1." On the morning of Aug. 8, therefore, General Joffre, general-in-chief of the "Armies of the North-East," issued his specific instructions.

The French Offensive.—The enemy, it seemed, had grouped his main forces in the region of Metz, in front of Thionville (Diedenhofen), and in Luxemburg, with some 12 divisions in Lorraine and Alsace and an undetermined force which included parts of 10 divisions in the Liège and Ardennes regions. This main force (Metz-Luxemburg) seemed to be pointing westward, but might equally well swing southward, pivoting on its fortifications. The French armies were, consequently, to take the offensive—which was to be as *foudroyante* as possible—and with all forces in combination to seek to bring the enemy to decisive battle, resting their right flank on the Rhine. In order to ensure simultaneity and unison in the battle effort, it was laid down that the left wing armies might have to hold back, so as not to become involved in battle with German masses traversing the southern Ardennes or northern Woëvre, or both, before the right wing had advanced and made effective contact with its opponents.

The I. Army (Gen. Dubail), composed as in "Plan 17," was, instead of merely coöperating with and flankguarding the II. (as in the plan), to become the main offensive element in Lorraine and Alsace. Its VII. Corps, with a cavalry division, was to break into upper Alsace at once from Belfort, to drive back all forces it met, and, progressively reinforced by the three reserve divisions from Vesoul, to gain ground towards the fortified barrier Strassburg-Molsheim, destroying bridges and blocking-up bridgeheads on the Rhine as it advanced. The main body of the army, with a frankly E.N.E. direction, was to push towards the front Fenestrang (Finstingen)-Saarburg-the Donon, and to drive back its opponents on Strassburg and into lower Alsace.

The II. Army (Gen. de Castelnau), composed as in the plan, was now to play the part of auxiliary to the I. Its first objective was to be the front Delme-Salins-Dieuze, and its axis Château Salins-Saarbrücken. It was to flankguard towards Metz, and, moreover, to leave two of its five corps in the region of Toul at General Joffre's disposal.

The III. Army (Gen. Ruffey), constituted as in the plan, was disposed in the Woëvre facing Metz, and was to be ready either to counter-attack any German forces emerging from the Metz region or to take the offensive northward, with its left on Damvillers, according to the situation. The two corps taken from Castelnau would probably be employed in concert with this army, either in repelling a counter-offensive from Metz or in a northward movement.

The rôles to be given to the IV. and V. Armies were now defined more precisely. The IV. (Gen. de Langle de Cary) was to group itself between Argonne and Meuse, and the V. Army (Gen. Lanrezac) to condense between Vouziers and Aubenton, ready either (a) to attack any German army which traversed the Meuse between Mézières and the line Damvillers-Montfaucon or (b) to cross the Meuse themselves for the Ardennes-Arlon offensive. The II. Corps, hitherto the left wing of the protective system and attached to the V. Army, was now added to the IV. Army and directed to hold firmly to the northern outliers of Verdun and the left flank of Ruffey's army. Beyond the flank of Lanrezac was the group of reserve divisions about Vervins; the cavalry corps operating E. of Mézières and Montmédy was expected, if and when forced back over the Meuse, to take positions about Marienburg and Chimay. The rôle of "Army W." was as yet quite unsettled, as also was that of the Belgians.

Such was the order which initiated the "Battle of the Frontiers," the opening of the World War on the western front. The intentions may be, and have been, criticized, but they are clear. The general offensive of the French right wing, fixed for the 12th day of mobilization (Aug. 14), was directed N.E. and E.N.E. into the Rhine lands behind Strassburg and Molsheim, with a subsidiary effort in Alsace which would make good a front facing Molsheim-Strassburg-Neu Breisach and the upper Rhine fortifications, and, in case of success bringing the I. Army to behind Strassburg, besiege that fortress. The general offensive of the left was to be timed to coincide with the decisive phase of the

operations of the right, but placed according to the progress of the main enemy armies which were presumed to have their right flank not farther N. than Mézières and their left flank on or in the fortified region Metz-Thionville.

But the possibility of arranging for the whole system to take its time from Dubail was made doubtful by a geographical factor—the Meuse. Had the areas in which the IV. and V. Armies were to act formed a single region, it would have been different, but the critical question was how to get these two armies over the Meuse at the exact moment determined by events in Lorraine, which might also be the very moment at which the German masses from Luxemburg themselves arrived on the river. It was this disturbing factor, quite as much as any events to the N. of Mézières, which governed the development of the French scheme. The details of this development, so far as concerns the left wing, are extremely complex and must be studied in the documents reproduced in F. Engerand's *Brieux, Joffre's Préparation de la guerre et conduite des opérations*, Lanrezac's *Le plan de campagne français*, and the anonymous *Le Plan XVII*. (publ. Payot). Here only a summary can be given.

By Aug. 13, the eve of the day fixed originally for the general offensive, the order of Aug. 8 had ceased to apply integrally to the left wing. While Dubail and Castelnau were to advance on the front Donon-Saarburg-Saarbrücken, as previously indicated, and a new and stronger army of Alsace under Gen. Pau was to carry out that part of the scheme which the VII. Corps had just attempted with disastrous results (*see* FRONTIERS, BATTLES OF THE: section *Alsace*), Ruffey, de Langle de Cary and Lanrezac were directed according to a new scheme which was independent in time as well as place of operations in Lorraine. It was now clear that the German northern group was stronger than had been supposed, but the evidence of its intention to cross the Meuse above Liège and sweep round through the Belgian plain seemed less convincing than the probability of its descending southward, and the French Command, after much interchange of views with Lanrezac, decided to push part of the V. Army northward into the region W. of Givet as a defensive precaution, and with the remainder and the IV. and III. Armies to carry out a series of preparations which would suit either of two hypotheses. If the Germans moving westward through the Ardennes were well advanced, they were to be struck by an offensive against the front, flank and rear, as soon as they were thoroughly involved in the crossing of the Meuse; if, as now seemed more probable, they were grouped with greater density in the northern and northeastern parts of the Ardennes, there would still be time for the V. and IV. Armies to advance before battle, not only over the Meuse, but also over the Lemoy and the lower Chiers. In that event the III. Army, which, with various mobile forces belonging to Toul and Verdun and the corps of the II. Army reserved to the general-in-chief by the order of Aug. 8, could assemble a considerable force, was to divide into a defensive group facing Metz and an offensive group which would aim northward, conforming to the right of the IV. Army, which would make good the lower Chiers; while the V. Army, holding defensively on the Meuse at Givet, was to reach the front Beauraing-Gedinne-Palisseul-Cugnon.

On Aug. 14, the offensive in Lorraine opened. Its progress was slow, but not marked by any untoward incidents up to Aug. 19. It was independent of events to the left of the Moselle except in so far as sorties might emerge from the S. and S.E. fronts of Metz, against which contingency the defensive group of the III. Army, the two reserved corps near Toul, and the echeloned left wing of the II. Army, were an adequate safeguard. On the other wing, however, obscurity still prevailed. Though Lanrezac was becoming more and more uneasy as to his left flank, and the Belgians, standing on the Geete line, called for support, nothing positive as to the German dispositions revealed itself, but on the evening of the 15th the veil was, partly at least, torn away. The part of Lanrezac's army which was stationed in the angle of the Sambre and Meuse became engaged with a large force of the enemy at Dinant. This consisted in reality only of cavalry and light infantry, but was estimated by the French commander, Franchet d'Espérey, as an army corps at least. At the same time, information came in tending to show that the Germans in the Ardennes included sixteen divisions. Moreover, the impression was formed both by Franchet d'Espérey opposing them and by the French cavalry commander skirting their southern flank, that the Dinant Germans were flankguarding a much more considerable force engaged in passing the Meuse below Namur; and Lanrezac energetically insisted on the fact that such large enemy forces could not conceivably be intended to operate entirely on the right bank of the Meuse. A remarkable absence of troops, at the same time, was reported by the French aviators reconnoitring the Arlon region. Thereupon Joffre formed a new plan. The V. Army, except one corps (already attached to the IV.), and its two reserve divisions, reinforced by one of the reserve corps on the Moselle and by forces from Algeria, newly arrived, was to join the forces already in the angle of the Sambre and Meuse, and to coöperate with the Belgians and the British—both of which armies now for the first time figured in the scheme of operations—in attacking the front and outer flank of the German "northern" forces, while the IV. Army was to prepare to debouch from the front Sedan-Montmédy in the direction

of Neufchâteau against the "southern" enemy group (formerly presumed to be the "main" one) advancing from Luxemburg on the front Sedan-Damvillers; and the offensive portion of the III. by Etain and Jametz, was to be ready to march on Longwy, to break into the rear of this force. But this manoeuvre was merely sketched out by preparations, and next day the veil descended again. The supposed movement of German masses over the Belgian Meuse was unconfirmed, and indeed denied; and without for the moment devoting more attention to the details of the coöperation to be obtained between the three distinct and independent commands W. of the Meuse (especially as Sir John French indicated Aug. 21 as the earliest date at which the British could come into action), Joffre's headquarters merely sent the cavalry corps withdrawn from the Ardennes to get into touch with the right of the Belgian positions on the Geete and—as a precaution against minor inroads through the Belgian plain into the industrial region of Lille—began the transfer to Arras of some ill-equipped territorial divisions, which, under General D'Amade, had hitherto watched the Italian frontier. It was to the proposed offensive of the IV. and especially of the II. Army that Joffre devoted his principal attention. For, on the estimate which had been formed of the German strength—which, however, was radically incorrect because it ignored the presence of reserve corps in immediate proximity to active corps—it seemed to certain of the directing brains at Vitry-le-François that the more forces the Germans placed west of the Belgian Meuse the slighter would be the resistance to be expected about Neufchâteau and Longwy and the better the chances of cutting the enemy in two by the offensive directed on these points.

From day to day the situation developed without becoming quite clear (for the Germans veiled their dispositions with the utmost success), and Joffre held stubbornly to the conception of his Neufchâteau-Longwy offensive. Lanrezac's anxieties and those of the Belgians increased, but they served only to confirm the impression that the drive into the Ardennes would, if properly timed and directed, reap a great harvest; and the declaration of Sir John French that he would not be able to begin operations till Aug. 23, instead of Aug. 21, caused the scheme of a combined operation N. of the Sambre to recede still farther into the background. On Aug. 20, Joffre, estimating that all the German forces destined for the Meuse had by that time passed out of the region Audun-le-Roman, Arlon, Luxemburg, gave the orders which launched the IV. Army into the Ardennes and the III. on Virton and Longwy.

The period of *nuances* was at an end. On that very day, on the one flank, Dubail's and Castelnau's offensive, which had penetrated to Morhange, Saarburg and the Donon, met defeat (*see FRONTIERS, BATTLES OF THE: section Lorraine*). Castelnau drew back hastily towards Nancy-Lunéville; Dubail, in spite of the exposure of his long right flank in the Vosges (which Pau's methodical advance from Belfort had done little to shorten), took down his left more steadily; but almost in a moment both were back in their concentration areas, followed by the eager enemy. On the other flank, the German masses facing the Belgian army front, hitherto screened by their cavalry, had at last declared themselves on Aug. 18, and the Belgian army, threatened with separation from Antwerp, yet most unwilling to give up the expectation of British or French support on its S. flank, was falling back from one position to another. Its decision to close up northward and fall out of the main operations was, it must be recognized, put off to the last possible moment, but the disconnectedness of the Allied movements left no alternative. For at that date Sir John French was not ready; and in the angle of Sambre and Meuse, Lanrezac, a prey to new and not ill-founded anxieties regarding his liaison with de Langle de Cary, was, with Joffre's approval, standing fast till Aug. 23, the date British coöperation should arrive.

In spite of the anxieties and disappointments caused by these events, Joffre held firmly to his intention. On the morning of Aug. 21 the executive order for which the IV. and III. Armies were waiting was sent. For the situation was now clear, and the plan of breaking through between the German manoeuvre-masses and their fixed pivot, which in one form or another had been consistently followed in the period of obscurity, seemed destined now to have its reward. But there was one fundamental miscalculation. The old error which had led the professional soldiers of Napoleon III.'s day to regard the Prussian citizen-army as a "sort of militia," had reappeared in the form of a contempt for "reserve" formations. It was a mere matter of calculation that Germany's resources permitted her to create such formations; but that they should figure in the *masse de choc* was regarded as incredible. Yet it was true; and thus, instead of meeting a battle-army of 42 to 50 divisions with an array of 73 French, 6 Belgian and 4 British, as anticipated, the Allies encountered in reality one of 77 divisions, *i.e.* an equivalent instead of a much inferior force. This was especially important as bearing on the prospects of success in the Neufchâteau and Arlon directions. Strength was encountered where weakness was expected, and the relatively small numerical superiority of the attack did not suffice.

The story of the battles of Longwy and the Ardennes, of Charleroi, and Mons, will be found in detail in the article *FRONTIERS, BATTLES OF THE*. Here it must suffice to say that the French offensive into the Ardennes and towards Virton-Longwy-Audun-le-Roman met with general failure, and in some places with disaster; that the

German II. and I. Armies, swinging on Huy as a pivot, swept down upon the French V. Army at Charleroi and the British Expeditionary Force at Mons, and bore them back; and that on Aug. 25 at 22:00 hours (10 P.M.) Joffre's orders were issued for a general retreat. The German plan of campaign had prevailed, and the German Command had the initiative in its hands.

At this point, then, the story of the operations is most conveniently told from the point of view of that side which dictated their course.

The German Plan of Campaign.—For the Germans, a war against France was essentially part of a two-front war. The resources of the country not being equal to simultaneous offensives against France and Russia, the choice had to be made between (a) standing on the defensive against France while seeking a decision in battle in the East, (b) waging a defensive war on both fronts, and (c) striving to crush France while standing on the defensive in the East. Of these (b) was held to be excluded by the presumed impossibility, for an industrial state, of enduring a long war, as well as by obvious military objections; (a) was never completely excluded, and had until some ten years before the war been the fundamental war-plan of the German General Staff; while (c) had in those last years obtained general acceptance, owing to the difficulty, for Germany, of waiting till the slow-moving Russians could be brought to action and defeated in a battle of the first magnitude. Whether, in view of the increased strength of the defensive on the one hand and the increased war-readiness of Russia on the other, the adoption, once more, of alternative (a) was not the best policy for Germany in the circumstances of 1914, is an open question; but, in fact, (c) was maintained and carried into effect.

But this increased readiness of Russia made it imperative for the Germans to protect East Prussia by a force at least sufficient to offer a step-by-step defence of that province and also, with their main armies reduced to that extent, to obtain a decision of the war in the West at the earliest possible moment, so as to release the greater part of the forces which had gained it for service in the East. The proportioning of means to the two theatres, therefore, was a very difficult problem, admitting of many *a priori* solutions, which might bring either victory or ruin.

The solution that found most adherents was that of Count von Schlieffen, chief-of-staff of the German army, in the first years of the present century. On assuming office, he had both restudied the draft plans of campaign and the tactical doctrines in vogue, and he had come to these conclusions: (a) that an offensive of maximum power, carried so far as to put France out of action definitively, was the only way to secure freedom of action in the East; (b) that this offensive, to secure the result aimed at—nothing less would suffice—must be developed on so broad a front as to grip and out-wing the most northerly and the most westerly points of France's defensive dispositions; (c) that a maximum density must be sought for on the right wing, even at the cost of exposing Lorraine and the Rhine lands to invasion.

The first of these considerations led to the acceptance—contrary to all the traditions of the German army—of the principle that not only active, but reserve, Ersatz and every other category of soldier must be effectively used. Schlieffen even proposed an intimate mixture, practically an amalgamation, of active and other elements, and aimed at putting into the field—in case of a *single-front* war, it is true—no less than 114 divisions against France. The second consideration led to the idea of a swing through Belgium and northern France far wider than that which was actually carried out. The route of the outer flank, which in spite of its extension beyond all probable French defences was to have a defensive echelon following on, was to touch Dunkirk, Abbeville, Rouen and pass round by Chartres, far to the W. of Paris—which would be invested automatically—so as to march in upon Auxerre and Troyes from the east. The line Ghent-Maubeuge-Thionville was to be reached on the 22d and the line Amiens-Rethel-Thionville on the 31st day of mobilization; that is, not hurry but certainty and power were to be the executive rules.

The third consideration, however, led to an even more remarkable result than the second. Of the 114 divisions no fewer than 100 were to operate N. and W. of the Thionville pivot, Lorraine,

Alsace and the Rhine lands being committed to 13, of which two were allocated to the fortresses. The *leitmotiv* of extreme density on the right occurs in all Schlieffen's drafts and schemes. "Macht mir nur den rechten Flügel stark" were his half-conscious dying words. In a second scheme, based on the *two-front* war, which provided for a defence force in East Prussia approximately equal to that which von Moltke actually placed there in 1914, the total force was lessened to that extent, but the ratio of about seven divisions N.W. of Thionville to one S.E. of that pivot was maintained.

When von Moltke, the younger, succeeded Schlieffen, the above plans were gradually blunted, first because the idea of making the active army a simple kernel for soldiers of all categories was accepted only in part, and secondly because the growing war-readiness of the French army, the fever of offensive spirit that had obviously seized it, and after 1913 its very high peace-strength, made it increasingly likely that the French would open the war with a determined offensive into Lorraine and the Rhine lands. In these circumstances so drastic a depletion of the forces to the left of Metz as that contemplated by Schlieffen did not commend itself to Moltke, who found a compromise in allocating one-quarter of the whole available force, instead of one-eighth, to the defensive (or defensive-offensive) front, and holding large quantities of empty rolling-stock on the Rhine in readiness to transfer a proportion of this quarter to the right wing as soon as circumstances should allow this to be done. The amplitude of the swing was, however, undeniably diminished thereby.

In one point, Schlieffen and Moltke were agreed—the necessity of pushing out beyond the line of the Belgian Meuse. In both schemes therefore the quick seizure of Liège and a deployment foreground beyond that fortress figured as an indispensable preliminary to the operations proper.

The German plan, to which effect was given in August 1914, provided as follows: (a) A protective system was formed all along the line, consisting, not as had been expected of complete formations, but of single brigades of infantry (with a proportion of other arms), brought up from their peace stations without waiting to receive and equip their reservists. These brigades took over from the local troops the positions of the line that their respective army corps were to occupy, and their reservists rejoined by parties. (b) There was a concentration of the remainder of each corps, after mobilization in the usual way, behind its own representatives in the protective system. This concentration of the active corps was completed by the 14th day of mobilization (Aug. 15). (c) Concentration of reserve corps, as a rule immediately behind or to a flank of the corresponding active corps, was completed by the 16th day (Aug. 17). (d) Concentration of other formations, Ersatz divisions and mixed Landwehr brigades, was completed from the 11th to the 17th day. (e) The six advanced, peace-strength brigades of the corps intended to assemble about Aachen were employed as a striking force under General von Emmich, which without waiting for siege artillery was to attempt to storm Liège at once, if the Belgians did not agree to let the Germans pass. The German ultimatum to Belgium was handed in late on the evening of Aug. 2 (1st day of mobilization), and required an answer within twelve hours. There is reason to believe that, on Belgium's refusal, a proposal was made to Holland to allow the use of the Maestricht tongue as a gateway into the Belgian plain, but, whether this be so or not, it was only on the evening of the 3rd day of mobilization that the striking force crossed the frontier.

The order of battle, and allocation of the German forces N. of the pivot, was as follows: I. Army (General-Oberst von Kluck), five corps, assembled behind the Maestricht tongue (Jülich-Krefeld area); II. Army (General-Oberst von Bülow), seven corps, including one attached from I. Army, assembled facing the Liège frontier (Aachen-Malmédy-Euskirchen); III. Army (General-Oberst von Hausen), four corps, assembled in the area St. Vith-Wittlich-Bittburg; IV. Army (Duke Albrecht of Württemberg), five corps, assembled in the area Luxemburg (seized Aug. 2)—Trier-Diekirch-Wadern; V. Army (Wilhelm, German

Crown Prince), five corps, assembled in the area Metz-Thionville-Saarbrücken.

Thus twenty-six active and reserve corps (52 divisions)—with a number of Landwehr brigades to follow—were allocated to the five armies of the moving wing, of which nearly half were to cross the Meuse between Namur and the Dutch frontier as soon as the way was clear. The remainder were to traverse the Ardennes from E. to W. in echelon from the right (III. Army) and to prepare to wheel gradually S.W. in proportion to the progress of the I. and II. Armies on the other side of the Meuse.

The 2nd Cavalry Command was of three divisions in front of the I. and II. Armies; the 1st Cavalry Command of three divisions in front of the III.; the 4th Cavalry Command of two divisions in front of the IV. They were individually responsible to the Supreme Command, except when from time to time placed at the disposal of certain armies. Similarly, the armies were in principle directly subordinate to the Kaiser's headquarters, *i.e.* to General-Oberst von Moltke, Chief of the General Staff, unless temporarily paired, as was the case at the outset, with the I. and II. Armies, of which Bülow was in general charge.

The organization of the forces E. and S.E. of Metz was somewhat different. Rupprecht, Crown Prince of Bavaria, was appointed not only Chief of the VI. Army, but "Commander-in-Chief in the Rhine lands," a title with wider implications than that of an army commander, and his task included the protection of the left flank of "the Army" or "the main forces." He had under him his own VI. Army (five corps, of which four were Bavarian), the VII. Army of General-Oberst von Heeringen (three corps) and the 3rd Cavalry Command (three divisions), in addition to the war garrisons of Metz, Strassburg, and the upper Rhine defences (Neu Breisach, Istein). These 16 active and reserve divisions were to be supplemented a few days later by 6½ Ersatz divisions, and mixed Landwehr brigades, which were grouped in some cases in "Landwehr Commands."

In all, the formations assigned to the western theatre of war comprised 68 active and reserve divisions, 6½ Ersatz divisions, 17½ Landwehr brigades and 10 cavalry divisions.

The First Operations of the Germans.—The first operations to be carried out were: (1) The seizure of Liège and of as large a foreground as possible beyond; (2) the securing of the left flank of "the Army," and the attraction of as many French divisions as possible to Lorraine and Alsace, by the living and passive forces under Prince Rupprecht. Both these essentials having been provided for, the five armies (I.–V.) were to proceed at once to the main task, which was to be a great "wheel through Belgium into France, pivoting on Thionville-Metz," in which wheel the II. and I. Armies were to govern the pace. The II. Army was to swing on the arc Liège-Wavre, the I. following in echelon on the arc Tongres-Brussels, flankguarding towards Antwerp, whither, it was presumed, the Belgian field army would retire. No very distant objectives were fixed. When Liège and the region W. of the Meuse had been occupied, and the cavalry divisions of the I. Cavalry Command had fixed the situation of the Belgian army, of the British forces expected to land at Ostend, and of the French forces which might be pushed into Belgium from the S., specific orders could be given. Meanwhile, the problem was to deploy the two highly condensed armies of Kluck and Bülow on the W. side of the Meuse, in spite of Liège and of the Belgian field army. On this, as the I. and II. Armies were to give the time to the rest, the whole movement depended; but while the III., IV. and V. Armies awaited developments, the 2nd and 4th Cavalry Commands were to push through the Ardennes and towards Damvillers, in order to clear up the situation in the Meuse valley from Namur to St. Mihiel—a mission which naturally brought about a series of conflicts with the French cavalry, and, above Stenay, with the French protective infantry system in the Woëvre. In point of information, this cavalry activity probably yielded only confirmations of the obvious, but it was invaluable in veiling the army movements when later these were begun.

The Liège operation is described under Liège. There was no surprise, Belgium having mobilized her available forces at an early

date in the European crisis; and five out of six brigade attacks on the night of Aug. 5-6 failed. One, however, penetrated into Liège, and for some days neither the German nor the Belgian, British or French Commands seem to have been able to form a clear view of the situation, as the fort-ring held out. Reconnoitring patrols of the German 2nd Cavalry Command, which passed the Meuse near the Dutch frontier simultaneously with parts of the attacking force, learned nothing of the Belgian dispositions, and the main body remained near its bridge. On Aug. 8 the situation at Liège was clear enough to enable the cavalry to push westward, and in the days following it established the front of the Belgian field army as lying approximately on the Geete line from S. of Jodoigne to Diest. But on Aug. 12, the attempt of the Germans to work round to the left of this position was checked in a severe local action at Haelen. The Liège forts, meantime, had to be reduced by super-heavy siege artillery, one by one, and it was not till Aug. 15 that the masses of the German I. and II. armies were able to begin to cross into the area comprised between Liège and the Geete. The resistance of the Liège forts had put back the start of the great wheeling movement for four days.

Thus the difficult and essential preliminary operation of seizing a bridgehead beyond the Meuse did not pass off quite according to programme. It had often been alleged that the Germans had obtained a long start in their concentration by means of surreptitious mobilization. That this was not actually the case has been shown by a study published in 1920 by the Belgian General Staff; but even had such a mobilization taken place, it would not have helped to solve the problem of Liège. All that infantry could contribute to its solution, the first six peace-strength brigades contributed. The rest was a matter of siege artillery, and it must be regarded as a serious flaw in Moltke's plans that this artillery did not put in an appearance on Aug. 6 instead of on Aug. 10.

On the other flank, the operations in Lorraine and Alsace, which were to maintain the "pivot" of the wheel against French attack proceeded more favourably than had been anticipated—too favourably, as the sequel was to show. The problem was difficult, and *a priori* reasoning could not assist its solution materially. For here, much more than on the Belgian flank, events depended upon the independent will of a great enemy army which was equally capable of the offensive or of the defensive-offensive; and although the tendency of French military thought in the last years before the war had evidently been towards the former, it was not clear how far this tendency had actually gone. Prince Rupprecht's task included not only the maintenance of the Metz-Thionville pivot but the attraction of as large a force of the French as possible; and if their old policy of defensive-offensive still held good, then, in order to set up this attraction, he must attack. If not, although attack would not be necessary, a much larger proportion of the total force than that which Schlieffen had thought sufficient would have to be allotted to the front E. of Metz. For Schlieffen had reckoned with certainty on a defensive-offensive policy in his opponents, and had argued therefrom that no deep inroad of large forces into the Rhine lands would in fact be attempted by the French, when a tidal wave of seventy to a hundred German divisions was advancing through northeastern France. But the situation was quite different if the French offensive in full force was to be launched at the outset, while the tide in the N. was still dammed up. For these reasons, Prince Rupprecht was given about one-quarter of the total available forces, and instructed: (a) to take the offensive over the Lorraine frontier in order to draw upon himself as much as possible of the enemy's forces, in the event of these being handled according to the old policy; (b) to prepare a great defensive system, Metz-Lower Nied-Saar-Vosges-Strasbourg, against the contingency of an immediate powerful offensive of the French; (c) in the latter event, to suspend the offensive initiated in accordance with (a), and to draw back from line to line till the Saar was reached, where a standing defence would be made in conjunction with counter-attack on the French left from the Metz-Nied system. In the least likely alternative of only minor forces of the French being met with in Lorraine, Prince Rupprecht might utilize the Metz system to cover the transfer of part of his forces W. of the Moselle for coöperation with the V. Army. Upper Alsace was to be held against light forces, but evacuated step by step if seriously invaded. The VI. Army with the 3rd Cavalry Command was assembled accordingly in Lorraine, the VII. Army (minus two expected Italian cavalry divisions) in Alsace; and mobilized and civil labour on a large scale was employed in creating the "Nied" position, which ran from where the newest Metz works touched that river to its mouth N.W. of Saarouis.

The French I. and II. Armies, ready for operations as soon as the Germans, spared the latter the necessity of testing their intentions by advancing on Aug. 14 in great force. Accordingly, the German VI. Army drew back from position to position, while the VII. Army, which had defeated the first inroad of the French VII. Corps at Mülhausen, likewise drew back gradually before the army of Pau, dispatching part of its forces by Zabern to the upper Saar to assist the VI. Army's defence, and preparing with the remainder to hold the line Schirmeck-Molsheim-Strasbourg firmly. But this withdrawal, after making all preparations for the offensive in the first place, was only unwillingly and half-heartedly carried out by Rupprecht's headquarters. And when, on Aug. 17, news arrived from Moltke

that the French advance into Lorraine was, after all, not their main offensive, Rupprecht determined to fight on the line of his rear-guard on Aug. 20. Thus, just at the moment when the French had decided to push their offensive without further hesitation, the Germans changed their policy into one of flank attack. The battles of Morhange (Mörchingen) and Saarburg followed (see *FRONTIERS, BATTLES OF THE: section Lorraine*), in which the Germans were victorious. A hot pursuit was initiated, and with that disappeared for the time being all possibility of drawing off any part of Prince Rupprecht's forces for the benefit of the "Army." Moltke's rolling-stock on the Rhine waited in vain. The Commander-in-Chief in the Rhine lands had brilliantly performed both his tasks, but he had become a commander of two ardent armies who could see only the enemy in front of him.

The German Advance through Belgium and France.—Once the Liège foreground had been secured, and the pivot of Thionville-Metz been made firm, there was no need, in Schlieffen's opinion, for overhaste in the development of the main operation, which required principally power. Moltke, on the other hand, sought to remedy the reduction of power on the striking wing by urging it to speed. This was not easy, for the administrative and technical marching arrangements required for drawing the five or six corps of the I. Army through the narrow tunnel between Liège and the Dutch frontier were complicated, while Bülow's II. Army displayed no great energy in crossing the Meuse above Liège. Thus the Belgian main army was left undisturbed on the Geete—the most forward position which it could safely adopt in view of the risk of being outflanked by a German movement through Dutch territory—till Aug. 10, when, threatened with severance from Antwerp, it began to retire westward with but little fighting. Even then, however, the task of the German I. Army was by no means clear. The possible arrival of a British Expeditionary Force on its outer flank was a standing menace, and until the true right flank of the system, Bülow's II. Army, had begun its advance in earnest its protective echelon (I. Army) could not operate to any purpose. On the evening of Aug. 10—the 18th day of mobilization—the outer flank of the wheel had only reached the line Thildonck-Tirlemont (I. Army)—Sart Rib-sart-Mehaigne (II. Army), while the armies traversing the Ardennes were at Marche (III.) and Bastogne-Arlon (IV.) respectively. The V. Army was just beginning to draw out of the Thionville area towards Longwy. On Aug. 20, learning that a large French army had been assembled in the Charleroi region, Bülow prepared its encirclement by beginning to wheel in not only the II. Army's right wing but the I. Army (then under his orders) as well; but as the coöperation of the III. Army moving on Dinant was intended, that army, as well as the I., had to be given time, and the concentric blow upon Lanrezac was fixed for Aug. 23, while the left wing of the II. Army was to attack Namur from both banks of the Meuse. Had these measures been carried out, the "vast wheeling movement" would, on the 22nd day of mobilization, have occupied the line Nivelles-Charleroi-Dinant-Neufchâteau-Arlon-Thionville instead of the line Ghent-E. front of Maubeuge-Sedan-Thionville, as Schlieffen had planned for that day. But the fact of being a few days in arrear was of small importance relatively to the fact that, instead of continuing to swing out, the German line would be beginning already to roll in. The essential principle of the movement, that of outflanking not only the momentary position, but also any and every position of the enemy's left wing, was sacrificed. The British Expeditionary Force, unlocated, lay outside instead of inside the scope of the wheel.

But during Aug. 20-23 events crowded upon one another at almost every point of the German line. The left wing of the II. Army stormed Namur, with the powerful aid of the super-heavy artillery (this time deployed from the outset), while the right became engaged front-to-front with Lanrezac (see *FRONTIERS, BATTLES OF THE: section Charleroi*). The I. Army, advancing in echelon to the battlefield indicated by Bülow, but seeking still to preserve both its rearward echelonment and its power of extending outwards, came into contact, with its left wing, with the British Expeditionary Force in the neighbourhood of Mons (see *FRONTIERS, BATTLES OF THE: section Mons*). Meanwhile, the German III. Army, drawing out of the W.S.W. direction in order to coöperate in the battle proposed for Aug. 23, had lost

touch with the situation of Bülow's army (apparently through the neglect of the latter to keep Hausen posted as to events on the Sambre), and the IV. Army in the heart of the Ardennes had already begun to wheel forward and southward in order to protect Hausen's left when it received the full weight of the French IV. Army's offensive from the Chiers. Lastly, the V. Army, on which a defensive attitude was at first imposed by the Supreme Command, managed to convert its defensive, flushed by success in the battle of Longwy, into a flank offensive which threatened to create a gap between the five armies and the Thionville-Metz pivot, on which they were to wheel. (See FRONTIERS, BATTLES OF THE: section *Ardennes*.)

Thus, at almost every point, local situations and the initiative of army commanders and troops turned the smooth and regular tide into a series of eddies. On the German side, as on that of the Allies, the northern half of the battle of the Frontiers was a chain of fierce local battles which only a very strong Higher Command could take in hand, either to straighten the links or to reforge them in a different pattern.

From that point to the battle of the Marne, the contest is less between schemes, less even between armies, than between the capacities of the two Supreme Commands.

At the head of the German armies was a man in indifferent health, by nature kindly rather than insistent, one for whom responsibility was rather a burden than a source of strength. He carried, moreover, the strain of watching and attempting to direct affairs on the eastern front. His opponent was a different man and differently placed. Essentially authoritative in temperament, sound in health, and concerned with one task only, Joffre was a commander in the full sense where Moltke was a responsible adviser only. Leaving the details of planning to his staff, and in particular to General Berthelot, Joffre devoted himself entirely to the rôle of commanding. His personal activity in the days after the battle of the Frontiers is astonishing, but it is essentially of the moral and not the operative kind—deciding, encouraging, punishing—the rôle of King William I. in the war of 1870-1, and one which the Emperor William II. was unable to sustain in 1914. Add to the factors weighing against Moltke, the prestige and confidence of his army commanders, most of whom had won victories, none sustained defeat, whereas no French subordinate general had obtained an important tactical success, and it is evident that the higher control was necessarily firmer on the side of the French than on that of the Germans.

The prevailing impression on the German side after the battles along the frontiers was that a decisive victory *had* been won, and that the next phase was to be one of exploitation. The consequences of this impression, which soon penetrated to General Headquarters, were: (a) the decision to send six corps (two from each portion of the line) to the East Prussian front; (b) freedom of action granted to the V. Army to cut loose from contact with Thionville and join in the general pursuit by a movement round the N. of Verdun; (c) non-interference with Prince Rupprecht's pursuit in Lorraine; and (d) a new orientation of the I., II., III., IV. and V. Armies, which, abandoning the "wheel," were to advance in line in a general S.W. direction, with the I. Army heading for the lower Seine, the II. for Paris, the III. for Château-Thierry, the IV. for Epervan, and the V. for Vitry-le-François, the last named flankguarding against Verdun and the first preserving a defensive echelon on its right.

The new orders were issued on Aug. 27, after the battle of Landrecies-Le Cateau had accounted for all undisclosed British forces and established the feebleness of the French cordon to the left of them, while the III. Army was well S. of Rocroi and the IV. bordered the Meuse from Sedan to Stenay. They were not executed with the certainty and confidence of an exploitation. The V. Army, in the act of letting go its connexion with Thionville-Metz, had on Aug. 25 exposed its left flank to a very sharp offensive of the defensive portion of the French III. Army now styled "Army of Lorraine," under General Maunoury, whose progress had been stopped only by orders from Paris. The French III. and IV. Armies, quickly rallied from their Ardennes-Longwy defeats, gave ground only slowly and with frequent counter-strokes (see FRONTIERS, BATTLES OF THE: section *Ardennes*), and the German III. Army was continually drawn southward, off its line of advance, to assist the IV. in real or supposed crises. Thus a great gap opened up between the III. Army and the II.; and the latter, uneasy as to its left flank, gradually drew away into a southerly direction, while Kluck's I. Army continued S.W. on Amiens. Almost immediately thereafter, the I. Army began to come into contact with French forces, distinctly superior in number and in quality from those hitherto met on this outer flank. While driving these back in various minor actions, and expanding ever westward in so doing, it was suddenly checked and caused to swerve southward by demands for assistance from the II. Army, which, unsupported on its left by the III., found itself counter-attacked, with a vigour that had not been observed since Charleroi, by Lanrezac (see GUISE, BATTLE OF). This crisis, like similar crises on a smaller scale in the area affecting the IV. and

III. Armies, passed away after a time, but the disintegration of the German mass-movement had now reached a climax. Apart from regulating special questions between armies as they arose, the German Higher Command had not intervened in the conduct of operations since its instruction of Aug. 27. On the night of Aug. 31, the I. Army, in the vain hope of seizing the left flank of the British or of Lanrezac, had pushed its left far to the S. to the Aisne below Soissons, while its right was in the Lassigny hills and W. of Montdidier and even farther north. The II. Army had not progressed beyond the Guise-St. Quentin battlefield, its front facing due S. between Essigny-le-Grand and Vervins; the III. Army on the contrary was on the upper Aisne on both sides of Reims, the IV. astride the northern Argonne between Semuy and Buzancy, the V. wrapping itself round the N. side of Verdun while still maintaining considerable forces in the Woëvre facing the E. front of that fortress, and the Côte de Meuse. Two corps had left for the eastern front, belonging not to the subsidiary armies in Lorraine but to the striking wing. One corps had been left to face the Belgians in Antwerp, one and a quarter corps to besiege Maubeuge, other detachments here and there to guard lines of communication or to invest small French forts such as Givet. The only new forces on their way to the West were the two divisions of the IX. Res. Corps and certain Ersatz brigades, all of which were needed to support the dangerously weak cordon of the III. Res. Corps facing Antwerp and to be on the spot in case of a Russian and British landing at Ostend, rumours of which at this time filled western Europe.

In Lorraine, the pursuit from the battlefields of Morhange and Saarburg had led the German VI. and VII. Armies in a southerly direction, substantially on Rambervillers and Charmes. Forced to condense into two main groups by the fort of Manonville—a work condemned as useless by peace-time critics—and by the forest of Parroy, they had exposed their right flank to counter-attack by the restored army of Castelnau, which held the fortifications N. and E. of Nancy and the north flank of the so-called Trouée de Charmes. This French counter-stroke not only gravely imperilled Prince Rupprecht's army—for Manonville resisted long enough to act as an anvil to Castelnau's hammer—but deprived the German Command in Lorraine of its initiative. With that loss, it forfeited all real power of holding larger French forces in its front; and though the German Supreme Command, in the same confident general instructions of Aug. 27 which initiated the southwestward pursuit of the I.-V. Armies, ordered the Bavarian Prince to break through the French line in the direction of Neufchâteau on the upper Meuse, it soon appeared that Joffre had the "inner line." He could take troops from Lorraine for other service, while his opponent could only continue costly holding attacks that did not hold.

On Sept. 1 the German Supreme Command gave up the conception of a general southwesterly pursuit, which, by its incidents, had not only lost its direction but brought the armies into a very irregular array and resumed the original conception of the wheel pivoting on Thionville, or rather, in the new situation, on the troops of the V. Army facing the N. side of Verdun. By now, however, with losses and detachments, the frontage of such a sweep was reduced by the front of a whole army, if not two armies. The appearance of French active and reserve forces N. of Paris made it clear that a protective echelon—such as had always been prescribed and rarely formed by the I. Army—would have to follow the rear of the army on the outer flank, and, moreover, the gap between the II. and III. Armies must be closed. The new general instructions, therefore, prescribed that the II. Army should steadily drive the French in a southeasterly direction, followed in echelon by the I., which was to watch Paris and break up the communications leading thither. But almost immediately after the I. Army, still well in advance of the II., received this order, one of its corps, exploiting a local advantage, crossed the Marne at Chézy and Château-Thierry, and Kluck determined to support it rather than withdraw it. The Supreme Command made no protest, all the more so as he reported evidences of real dissolution in the ranks of the retreating enemy. Kluck pushed on. The echelon facing Paris was maintained, but it was growing thinner and thinner. On Sept. 4 the Supreme Command, in increasing uneasiness, limited the offensive front still more. Not only was the I. Army to stand fast between the Oise and the Marne, but the II. Army was to wheel outwards and fill the space between the Marne and the upper Seine. The III. Army, now become the operating wing, was to march on Troyes and to the E. thereof, continuing in close liaison with the IV. and V. while the Lorraine armies were to renew their attempt to break through the upper Moselle front.

The final phases of the battle in Lorraine represent the endeavour of exhausted forces to carry out their part in this scheme. The central and western portion came to nothing, for although Kluck began at 23:00 hours (11 P.M.) on Sept. 5 to counter-march his army so as to fill the space between the Oise and the Marne, now guarded only by the last relic of his echelon, and Bülow gained ground between the Marne and the Seine as far as Montmirail and the marshes of St. Goud, General Joffre had, on the afternoon of Sept. 4, issued the command to his armies to face about and attack.

The Preparation of the Counter-Offensive.—While on the German side we see the battles of the frontiers followed by a high-

spirited chase in which the driver was able to keep little more than the semblance of order in his team, on the French side the picture is one of an astonished and confused, but in no sense a routed citizen-army, too clear-sighted to believe itself betrayed and yet too ignorant of the ensemble to see where miscalculations had led to disaster. In the hands of one who had specialized in the art of inspiring confidence, whose silence even was imperturbable, and whose career had been spent not in technical subtleties of operations but in varied branches of administration, it had every chance of early recovery, provided that it was handled according to a definite policy and not exposed to incidents. This definite policy was laid down in a general order of Aug. 25, which began with the phrase: "As it has proved impossible to carry out the projected offensive, the next operations will be regulated so as to constitute on the left,—by means of the IV. and V. Armies, the British army, and new forces from the eastern front,—a mass capable of resuming the offensive while the others hold up the enemy for the required time." Following this cool and convincing statement, the detail paragraphs prescribe a retreat to the line Braye-sur-Somme—Ham for the British, to Vermand—Moy for the offensive portion of the V. Army, to La Fère—Laon—Craonne—St. Erme for the defensive wing of that army, to the middle Aisne for the IV. Army and to the Argonne—Verdun line for the III. "From this situation the offensive will be resumed," said the order. On the left of this line a barrage against cavalry inroads was to be formed between Picquigny and the sea, and either between Domart and Corbie or between Picquigny and Villers-Bretonneux there was to be formed a new army, soon to be designated the VI., and composed, as regards its staff and several of its divisions, of the troops which had just defeated the left of the German Crown Prince as it sidled past Étain. This was to be ready for action on Sept. 2, and the direction of its offensive would be either St. Pol—Arras or Arras—Bapaume, according to the position of the extreme right of the Germans. The British would attack on Bertincourt or Le Catelet, according to the situation, the V. Army wing on Bohain. The right of the V., the IV., and the III. were to defend the line laid down and eventually to attack from it. To the I. and II. Armies went the laconic instruction, "the rôle of these armies is, to endure."

But the pressure of the German pursuit in its first freshness did not admit of the British coming to a halt on the line ordered, and when the elements of the new VI. Army began to assemble about Amiens the battle had passed far to the south of them. Similarly, with the V. Army, the battle of Guise, which may be considered as a section of the proposed general offensive, led to small results because the British element was wanting on its outer flank. The controversies which have arisen as to the rapidity of the British retirement from the battlefield of Le Cateau to behind the Oise need not here be discussed, for it is more than doubtful in any case whether the state of the French army, in its ensemble on Aug. 31, justified the risk of incurring final defeat. Be this as it may, Joffre put aside all temptations to exploit the local successes at Guise on the Meuse, and in a new general order of Sept. 1 laid down that the VI. Army and the British having insufficiently checked the enemy's turning movement, the whole system must pivot about its right continuing to retreat, until the left of the V. Army should be free from the menace of envelopment. Then the armies would take the offensive, this time utilizing the position of the III. Army, protected by Verdun on the N. and the Côte de Meuse on the E., to strike the chief blow. The position from which the offensive would be resumed was now well back from Paris, which was to be left to itself (though Joffre suggested that its troops might coöperate in the general offensive), the V. Army behind the upper Seine (Nogent), the detachment Foch (IX. Army) and the IV. Army behind the Aube and S. of Vitry, the III. Army, augmented by defence troops borrowed from the Côte de Meuse and possibly by troops from the Lorraine front, N. of Bar-le-Duc. The British and the VI. Army were to constitute with Gallieni's local troops a Paris group which should hold the Seine from Melun to Juvisy, and the E. and N.E. fronts of Paris.

Thus was prepared the initial situation of the battle of the Marne. The scheme as outlined at first underwent many modifications, due to the ardent initiatives of Gallieni in Paris, and of Sarraill, commander of the III. Army, S. of Verdun, as well as to other causes. These are discussed in the article *MARNE, BATTLE OF THE*. Here it is not necessary to analyse too closely the form projected for the battle. Essentially, the fact to be retained by history is that a great army, in retreat after failure, could be energized, ordered to turn about, and launched to the attack, by a modern commander-in-chief whose influence must filter through a complex hierarchy before reaching the fighting soldier. Many had believed this to be an impossibility, and they were proved wrong. The operative scheme of the battle of the Marne and even its apparent barrenness of specific military results, are of insignificant importance compared with the fact that the battle of the Marne was actually fought. (X.)

The "Race to the Sea."—The establishment of the German defensive on the line of the Aisne, prolonged across the plain of Champagne, which ended the Marne battle, did not put an end to the Anglo-French offensive. The front between Compiègne and Verdun was stabilized here and there, but the battle of movement continued at the free extremity, that is, to the W. of Compiègne, and beyond. This new offensive has improperly been called the "Race to the Sea." In reality it was not a question of reaching the coast as quickly as possible, so as to obtain there an absolute protection against turning movements. If it had been so, the shortest line for the Allies, and the easiest to hold, would have been that of the Somme, from Compiègne to Montdidier and Amiens. To the estuary of the Somme, this line does not measure much more than 100 km., while the line from S. to N., which was that of the actual "Race to the Sea," ended N. of the Yser and was nearly double that length, presenting features of very various nature, among which some entirely lacked defensive value.

The truth is that the offensive, which was throughout the policy of the French Command, did not stop at the Marne victory. On Sept. 11, when the VI. Army (Maunoury) arrived at Compiègne, the Commander-in-Chief gave the order for this force to place immediately as many troops as possible on the right bank of the Oise. On Sept. 17 he indicated his plan by ordering the formation, on the left wing, of a force capable of parrying a flanking movement by the enemy as the best precaution to be taken. But Sir John French has stated that on the very next day (Sept. 18) General Joffre informed him that he was developing a new plan which aimed at attacking and enveloping the German right flank. The enemy, moreover, showed by his method of occupying the ground that the initiative no longer rested with him.

At the extreme end of the Allied line on the Oise the valley of the Aisne cleaves its way through a forest-clad massif, cutting it in two S. of the Aisne; the larger part of this mass consists of the forest of Compiègne and the northern part is the forest of Laigne. If the Germans, very skilled in turning forests to military account and manœuvring in them, had retained any hope of resuming the offensive against the Allied left flank, they would have occupied the forest of Compiègne in order to make it the starting point of their turning movement and force the Allied left to retreat towards Paris. But they abandoned that front; nor did they retain the forest of Laigne, on the plateau to the N. of Attichy. The offensive impulse in the World War was thus on the side of the Allies and they kept it until the fatal day of Russia's defeat on the eastern front. Until that time every attack which resulted in the gain of ground came from the Allies, who, save for a few occasions, methodically pushed back the enemy from one entrenched position to another. The Germans had later to defend their right flank, more and more threatened as it became more and more prolonged. And, as the best way of arresting the progress of the Allies would have been to strike at their offensive, they tried without ceasing to outflank them, while they were resisting in front.

Thus the "Race to the Sea," viewed as a whole, consisted in establishing an offensive Allied flank against the German right,

and, this flank being always unsupported at one extremity, in German efforts to seize this extremity from two directions. These attempts, on either side, taking place farther and farther from Compiègne, appeared as a "Race to the Sea"; but in reality neither side was deliberately making for the coast. The S.-N. direction taken by the line of contact was not sought by either opponent; it resulted from the balance of forces.

It is evident that, whatever resources on either side were furnished by reserves and new formations, the extension of the front of contact over a length of 200 km. was only possible on condition of leaving much thinner forces on the stabilized front than had been required for the battle of movement, from Aug. 20 to Sept. 12. In proportion as the lines extended to the N., transferences took place, depleting the line from Belfort to Compiègne, as had already been done in the Vosges and in Lorraine, to enforce the regions where the struggle was being carried on in open country.

As regards such transferences, the advantage was with the Germans, because they occupied the interior of the angle whose apex points to Compiègne, while the Allied troops had to be moved around this point.

On the German side, the manoeuvre brought 18 new army corps into the line. On the Allied side it resulted in the transference of the II. Army (de Castelnau) between the Oise and the Somme; the formation of the X. Army (Maud'huy), N. of the Somme, and the VIII. Army (d'Urbal), which included the Belgian army, brought back from Antwerp; and lastly in the shifting of the British army into Flanders. To these transfers and new creations must be added various formations constituted on the spot, of which the most important was a group of territorial divisions placed under the orders of General Brugère. Some of these formations had already joined in the offensive after the battle of the Marne, notably at Amiens, which they had cleared of the German units scattered through Picardy and Artois. This ensemble was placed under the command of General Foch, but was only brought to completion by degrees. The successive steps will now be described.

The first offensive action against the German right began on Sept. 11, in accordance with the order given by General Joffre. It was carried out by the VI. Army, with one additional corps on the right bank of the Oise. It immediately encountered energetic resistance on the Aronde, a small tributary prolonging the depression of the Aisne valley on the opposite side of the Oise. On the northern bank of this stream wooded heights extend between Compiègne, Lassigny and Noyon, and surround Ribécourt—names which all became famous during the war.

The VI. Army had a difficult task in the subduing of them, and could hardly have achieved it, threatened as it was with an attack in flank, without the help of the II. Army (de Castelnau), which, detraining in the Clermont-Beauvais area, had to cover 30 or 40 km. in order to outflank the German right. At the same time the cavalry and the territorial divisions of General Brugère extended the movement towards the north.

The resulting battles were prolonged until the end of Sept. with alternations of success and reverse, through Lassigny, Roye, and Chaulnes, as far as Péronne. From Péronne to Lassigny, where the wooded hills ceased, the terrain consisted of undulating plains, where no line of battle could be found. It was thus the balance of forces that determined the front of contact, which was gradually fortified on either side.

On Sept. 24 the French retook Péronne and lost it again. This little place, in a hollow, offering no possibility of outlook or of action outside its walls, had no military value. The positions which should have been occupied in the circumstances were the heights of the Somme above Péronne which formed a very considerable obstacle. The great value of this line, especially facing eastward, owing to the command of the country in that direction given by the heights, did not escape the German staff, and for a long time their efforts were directed towards preventing the Allies from securing the heights, by the defence of improvised fortifications, at some distance in front of them. Later it will be seen how these lines were linked up with that of the Ancre.

It will now be shown how, after the preliminary fighting, the German front became established between the Aisne and the Oise. A salient is always a weakness. The front was fixed from E. to W. along the Aisne; and the flank resolving itself into a new front running N. and S. the German line exhibited a right-angle salient pointing towards the forest of Laigne. It was very largely to smooth out this salient that the line was traced behind the forest in such a way as to form a great arc instead of a point. South of the portion of the line of the Somme between Péronne and Ham it was necessary to connect this arc with the fortified line S. of Péronne; the line Chaulnes-Roye-Lassigny was thus strongly indicated as the connecting line.

On Sept. 23 there was fighting near Lassigny, on Sept. 25 near Roye, and on Sept. 29 in the same places and also at Chaulnes, where the Allies were repulsed, as they were at the salient itself. On Oct. 1 the fighting-line extended to near Arras. It will be seen how it came to be fixed on the N. of Péronne.

The old fortress of Arras, which was no longer more than half fortified, but whose citadel had been maintained in good condition, was a *point d'appui* for the Allies. The interval, 40 km. wide, between Arras and the Somme, provided some features which were favourable to the establishment of a line. First, near Arras, there was the little valley of the Crinchon. The stream itself is unimportant, but its banks afford positions which are good in default of better ones. Next, a connecting line had to be ensured over about 15 km., from N. to S., across the undulating plateau, to the course of the Ancre, which forms a deep ravine both above and below Albert. The river bends in a S.W. direction as far as Corbie on the Somme.

Thus the line traced by the depression favourable to a line of resistance forms a series of zigzags: the Ancre near Albert, the Somme from Corbie to Péronne, the Somme from Péronne to Ham. It was because of this peculiarity that the Germans, when they were defending the line of the Ancre, opposite Albert, could not make use of the section of the Somme between Péronne and Ham, because it was 20 km. to the rear. Their solution consisted therefore of drawing a line through the Corbie salient, behind which lay Combles, transformed into a magazine and supply depot. This brought them in front of the section of the Somme between Péronne and Ham.

During the "Race to the Sea" the fighting round Albert and Arras (see ARTOIS, BATTLES IN) began at the end of Sept. and on Oct. 1 respectively. The X. French Army then came into the line. The Germans were already strongly entrenched on the Thiépval plateau, opposite Albert, where they were to pile up the defensive works which the British were to capture, one by one, two years later.

On Oct. 2-3 the X. Army (Maud'huy) made an effort to seize the German flank at its northern extremity by moving forward to Douai, where there had been for some time a detachment of the territorial army, which did not succeed in maintaining its hold. But the Germans opposed with heavy forces of infantry and cavalry. The French were pressed back; the enemy occupied Lens and made a vigorous but unsuccessful attack on Arras. For a long time afterwards the Allies' line left Lens in possession of the Germans, lying farther westward on a line from Arras towards Béthune. Arras was included indeed, but the important positions of Vimy and Notre Dame de Lorette, of which the Germans would not lose hold, were cut off. Their importance consisted in their facing N.E. and later their capture necessitated long and painful effort.

The German cavalry was in all the country which lay beyond in the N.; it occupied Ypres and Bailleul, and sent out patrols still farther forward. The situation was very difficult for the Allies, and its improvement was an urgent matter. The VIII. Army (d'Urbal) had its base at Dunkirk, but it was still inadequately constituted. The French cavalry and General Brugère's territorial divisions were maintaining an arduous and very fatiguing struggle. At that moment the British army, which could now be withdrawn from the Aisne, as that front was strong and solid and could be held by a small force, was summoned N. Reinforcements were also brought from the eastern area, and lastly the Belgian army, no longer of any use in Antwerp, came to take its place in the ensemble. The story of the siege of Antwerp and of the escape of the Belgian field army from the place is told under ANTWERP.

At the time of the fall of Antwerp Sir John French and General Joffre met at Doullens, on Oct. 8. The British II. Corps arrived on Oct. 12 near Béthune and Aire, and was able to attack the enemy's flank in a combined operation with the X. French Army. The III. Corps detrained at St. Omer on Oct. 12; the I. followed. Finally the IV. Corps, supporting the Belgian army in its retreat, would rejoin the rest.

It is evident that if the organization and transport of the new army corps which were to swell the forces of Sir John French had been accomplished more quickly, and the N. of France occupied earlier, that region would have been more easily freed from the enemy invasion, and the blow at his flank aimed at by the Command would have resulted instead of the "Race to the Sea." But it must not be forgotten that Great Britain created this new army *ab ovo*—a stupendous military effort—and that armies cannot be improvised. Until about Oct. 8, the Germans had only cavalry in the regions around to the north of Lille. It was then strengthened by the arrival of a strong army corps, which came from the neighbourhood of Antwerp by way of Courtrai.

The Lille Question.—On Oct. 8 the enemy arrived before Lille. The fortress closed its gates and resisted with the few troops that it possessed. The Germans did not trouble to attack it in earnest. They contented themselves with bombarding the town from a distance and demolished about a thousand houses. On Oct. 13, after five or six days of bombardment, Lille yielded. This short resistance was not useless, for it enabled the British army to take up its position behind Lille and to consolidate it. The question of Lille gave rise to much discussion in France. The arguments cannot be examined here, but a few words must nevertheless be said on the subject. If it had held out longer, it might have formed part of the battleline, like Reims, in which case it would inevitably have been destroyed, and with it the industrial towns of Roubaix and Tourcoing. Should the sacrifice have been made? The British front would have gained about 15 km. on the E. but the general line would have passed along the Yser on the N. and through Arras on the S. just the same. It would, moreover, have been difficult to find a good connecting line to link up Lille and Arras, across country very ill-adapted for defence, especially in the southern half. If the defence of Lille had been included in the general scheme of operations from the beginning, a very strong garrison must have been left there, proportional to the extent and number of works of the entrenched camp. It would have had to be an immobilized force whose task was to immobilize an enemy force also, as at Maubeuge. But it would not, any more than Maubeuge, have hindered the enemy's turning movement. Thus, to assume the resistance of Lille, until the arrival of the British army at the beginning of Oct., is to assume that it could have sustained a siege and bombardment from the last week in Aug. onwards—that is, for over 40 days. The fate of other isolated fortresses, such as Liège and Antwerp, leaves no doubt that this would have been impossible.

On Oct. 12 a junction was effected between the Belgian army, retreating towards Ypres with the French marine fusiliers, and the II. British Corps (General Smith-Dorrien) in the region between Béthune and Bailleul, along the canal and the Lys, while the III. Corps (General Pulteney) marched on the left of the II. towards the line running from Armentières to Ypres, to occupy the heights of Messines, later so fiercely disputed. On Oct. 13 the British cavalry, which held the left of the advance, took the heights which stretch between Cassel and Messines (Mont Noir, Mont des Cots, etc.) and which are of great military importance. On Oct. 14 the II. Corps entered Bailleul. The same day General Byng's cavalry division arrived at Ypres, with a French territorial division.

Definition of the Front of Contact.—Although the struggle never ceased and a great German offensive was immediately prepared in Belgium against the left of the line, at Ypres, on the Yser, the "Race to the Sea" must be considered to have ended on Oct. 15 1914, the date on which the Allies occupied the whole front from Ypres to the sea. At that date the left, on the Yser, was at Nieupoort, and possessed a bridgehead at Lombartzyde in advance of the line of the river and near its mouth. The Yser front passed through Dixmude. To the S. of that town it is delimited partly by the course of the river, which spreads out like a fan a little farther to the S., partly by the Ypres canal, after passing the ancient fort of Kruke. Then it goes beyond the canal to the villages situated farther E. on the stream of the St. Jean, in order to arrive at the heights which surround the basin of the Yser and its tributaries, reaching them at Gheluvelt, on the road from Ypres to Menin. It held the crest and the heights as far as Messines. The French were on the left, from Nieupoort to Dixmude; the English on the right, on either side of Ypres: the Belgians were between the two, their feeble effectives occupying only a small portion of the front.

From the beginning the Yser front was well selected and lent itself well to defence, not so much owing to the obstacle formed by the Yser, as because the country behind, much cut off by water-courses, was very ill-adapted for an offensive by large masses. At the same time, this part of the front, which was entirely defensive, had not its full value until it was flooded. The dykes were burst open on Oct. 22, the floods then gained ground little by little as they rose higher. The effect was not

obtained very rapidly, because the whole volume of water in the basin is not great. It did not hinder the enemy from crossing the river below Dixmude on Oct. 26, and penetrating thence to a depth of 4 km. till he was stopped by the lines in the rear, and especially by the railway embankment. But two days later the Germans were forced to retreat, partly by the Allied counter-attacks, partly by the water, which was spreading and rising. The part of the line which passed in front of the Ypres canal near the little river St. Jean could not be made very solid, but it was necessary in order to form a link with the Gheluvelt heights. But the true line of battle, which overlooked a large stretch of country to the E., was only attained in the last phase of the war, with the capture of the entire line of heights in the direction of Staden, at least as far as Westroosebeke, the point where the ridge is crossed by the high road from Ypres to Ghent. Also, during the whole of the first period of the struggle, the British army was always very vigorously attacked around Ypres and at Ypres itself. The most important *point d'appui* was the portion of the heights lying directly to the S. of Ypres, Wytchaete and Messines,—that is, the eastern end of the line of the Monts de Flandre, which run from Messines to Cassel and appear again farther on to the N. of St. Omer. These hills are of immense importance in the whole defence of Flanders. This was seen in the last phase of the war, when they fell into the hands of the enemy as far as Bailleul, and it took very hard fighting and the greatest energy to arrest his progress in this direction and to stave off still more fatal consequences.

Between the promontory of Messines and the cliff formed by the heights of Notre Dame de Lorette and of Vimy, above the plain of Lens, stretched a sector with a front of nearly 50 km. which afforded no continuous line of any length, and included only isolated strong-points, sometimes in a position favourable to the Allies, sometimes to the enemy. Those most useful to the Allies were the ridges of Messines and Vimy. The first was taken by the Allies on Oct. 15 1914; the second was at first occupied by the French, and later their success was repeated by the British. The French front line passed 2 km. to the west of Notre Dame de Lorette, the key to the position. The attack on this point began on Oct. 20; but the conquest of the whole ridge necessitated efforts which were renewed up to the middle of April 1917.

In the plain, about midway between Messines and Arras, is a point relatively stronger than the rest, owing to the canals and marshes which protect its approaches. This is the little town of La Bassée, occupied and strongly fortified by the Germans; and for a long time it delayed the progress of the British army. The difficulty of the advance towards Vimy was very largely owing to the part played by La Bassée in preventing the British in the plain of Lens from taking part in it, in striking at the rear of all their attempts in the neighbourhood of Lens, especially those which aimed at outflanking the town on the north. But hard as were the local struggles in the Messines-Vimy sector, no great action ever developed there until 1918: first, because as regards an Allied action a great offensive in the direction of Lille would have been very risky unless it was led up to by a more strongly protected movement either to the S. in the region of Arras, Peronne and Ham, or in the N. towards Belgium; secondly, because as regards a German action, the sector to be conquered to carry out a flank offensive against the Allied left was that of Ypres and the Monts de Flandre.

Such was the real meaning of the German project *Nach Calais*, which cost the army of William II. so dearly. For the Germans, to engage themselves in the Messines-Vimy sector, in order to reach St. Omer, would have been to run into the jaws of a pair of pinchers formed on the N. by the Monts de Flandre and on the S. by the ridge of Vimy-Notre Dame de Lorette, extending to the S. of Béthune and Brie. It would have meant the formation of a salient, which would be more vulnerable the farther it was pushed in the direction of Calais. The result of all this was that almost up to the end of the war the front passing through Armentières and Arras underwent very little change.

It has already been related how the front was determined first between Arras and Albert, then S. of Albert in front of the Somme between Péronne and Ham, and lastly as far as the salient opposite the forest of Laigne. The attack on this very strongly fortified part of the German front was only begun in the early part of Dec. 1914.

At that time the French still held Thiépval wood on the enemy slope of the Ancre. Farther S., some fluctuations occurred on the plateau, in the region of Chaulnes and Roye. But there was no great action other than the Anglo-French general offensive, which developed between July 1916 and March 1917.

All this leads to the conclusion that the last half of Oct. 1914 may be considered to mark the end of the "Race to the Sea," and the establishment of equilibrium, except for local fluctuations, along the whole length of the immense line of contact. (H. BE.)

II. TRENCH WARFARE, 1915-17

While weary British troops were handing over their lines in the salient to their French comrades at the close of the first battle of Ypres (*see* YPRES AND THE YSER, BATTLES OF) and they had time to think of other things than the grim struggle that had just ended, it dawned upon them that the war in the west had entered upon a new phase. The trench barrier had been completed from the North Sea to the Swiss frontier, and a war of movement and manœuvre, for which most of them had been trained, had become impossible. This was a development which had not been foreseen by the military world of Europe and it took it by surprise. For the Germans this surprise was less unpleasant in the winter of 1914-15 than for the French and the British. When their second great effort to win the war in the west had failed they had decided to adopt a defensive policy in France and Belgium while they attacked in the east. Therefore they could regard the difficulties of attack upon trench lines and the restrictions of manœuvre with some complacency, while they were better prepared for the new type of warfare than were either of their opponents, more particularly the British. The fortifications of the French and Russian frontiers had compelled the Germans to study closely the art and science of siege warfare and to make preparations for such warfare. They had assimilated the experiences of the Russo-Japanese War and had learnt from them to their profit. Therefore trench mortars, hand and rifle grenades, searchlights and pistol lights, and the possibilities of mining, were to them no novelty; and having the plant ready for the manufacture of the material required for siege warfare, and considerable stocks of such material already in store, it was not difficult for them to meet quickly the demands made by their soldiers in the trenches on the western front.

The British army was in very different case. Its chiefs before the war believed that it would be employed only in a war of movement, and the study of siege warfare had been confined to a small body of engineers, amongst whom it was largely theoretical. All the money to be found for the Army Votes had been used in the training and equipment of the Expeditionary Force, and there was none left for the provision of the material required for the attack of fortresses. The cost even of hand grenades, with which experiments had been made when the reports of British observers in Manchuria came home, was held to be prohibitive. For these reasons the winter of 1914-15 was for the British infantry in France and Flanders a period of unmitigated suffering. Theebb and flow of attack and defence had left the Germans almost everywhere along the British front in possession of the higher and drier ground, while in the low-lands of Flanders water was found at a few feet and even sometimes a few inches below the surface; under incessant rain, parapets melted away unless held up by sand-bags constantly replaced, but the British army had not sand-bags in sufficient quantities. The construction of communication trenches was all but impossible, and material had to be brought up to the front lines by parties floundering through the mud at night. Lying in sodden trenches, before an enemy who possessed weapons which they had not, the British infantry endured at this time a longer and in many respects a severer test of their constancy than in some of the worst crises of the war. The strain upon the French was less severe because a small part only of the French army had to endure the incomparable mud of Flanders, and from the first it was better provided with H.E. shell, while the greater military resources of France made it possible to meet the new conditions more readily.

Operations in 1915.—While the soldiers in front were enduring

and slowly learning to mitigate the horrors of trench warfare, those behind were planning. There were not lacking active brains in Paris and in London who saw that the assaults upon the ever-widening barriers of barbed wire and the evermore serried lines of trenches must prove a slow and bloody business. These brains sought eagerly for a way round the barrier which would lead to a speedier and less costly victory, and so began the controversy between "Easterners" and "Westerners" which endured while the war lasted. There were signs early in 1915 of preparation for an Austro-German attack upon Serbia; and Mr. Lloyd George, inspired by his friends in France, proposed at once to save a weak Ally and to attack the weakest link in the opposing chain by transferring the bulk of the British army to the Balkans and reinforcing it with the New Armies as they became ready for the field. Both the French and the British commanders-in-chief hotly opposed this proposal. The lines of communication through Serbia were long and difficult, and it was very doubtful whether they could be made to maintain an adequate force. The transference of the British army to the Balkans must in any event have taken many months, during which it would have been condemned to an inactivity of which the enemy on the inside of the circle, with not only shorter but better communications, would certainly have profited. The Balkan enterprise was therefore condemned, and the immediate outcome of the controversy on the British side was the starting of the Dardanelles adventure.

Joffre's plan was simpler. He desired to attack on the western front at the earliest possible moment and with all possible force. It was argued at the time, and has repeatedly been argued since, that it would have been better to have awaited the development of the British army and the increase of the Allied artillery and the improvement of their stock of munitions, and to have employed the interval in gaining advantages over less formidable foes in other theatres of war. To these arguments Joffre's answer was that the Germans were in occupation of a great part of France, that near Noyon they were only 50 miles from Paris, on the Somme they were barely 20 miles from Amiens, the main junction connecting the British and French in Flanders and Artois with the remainder of the French troops, while farther N. they were little more than 40 miles from Calais. At the beginning of 1915 he was assured of a definite numerical superiority over the Germans in the W., but the Germans had not nearly reached the limits of their man-power, and they might at any time call a halt on the Russian front, and by reversing the process which they had carried out after the first battle of Ypres bring back troops to France. A successful German attack at any one of a number of parts of the western front might gravely cripple the Allied armies, for German guns might be brought up to within range of Paris or of Calais, or the enemy might again occupy Amiens. The French commander-in-chief maintained that the security of the western front must be a paramount consideration in Allied strategy, and that to secure the position in the W. it was necessary to drive the Germans farther back.

Sir John French was in general agreement with Joffre's views. He at first desired a combined naval and military attack upon the coast of Belgium, but on receiving representations from Lord Kitchener that neither the men nor the munitions required for this operation could be made ready in time, he abandoned this proposal and set himself whole-heartedly to coöperate in Joffre's plans. These plans comprised a grand attack by the British army N. of the La Bassée canal and by the French northern group of armies under Foch on the front between the La Bassée canal and Arras. The hope was that this attack would give the Allies the Vimy Ridge and compel the Germans to evacuate Lille. In order that Foch might have the forces necessary for such a battle it was agreed between the commanders-in-chief that the British should relieve the French troops, who had occupied the Ypres salient when Haig's men had been withdrawn from it after the first battle of Ypres. Sir John French had at the end of 1914 received one more regular British division, the 27th, made up by Kitchener from foreign garrisons, while another, the 28th, arrived early in January. The 1st Canadian

Div. disembarked in France in the second week of February. This gave him a total of 13 infantry and 5 cavalry divisions, besides a number of selected territorial battalions. These reinforcements allowed him to form his command into two armies, the first under Sir Douglas Haig and the second under Sir Horace Smith-Dorrien, and at the same time to extend his front gradually N. into the Ypres salient.

A further integral part of the preparation for the spring campaign consisted of a number of attacks intended to divert the enemy's attention from the Artois front and to gain experience in the tactics of trench warfare. One of these attacks was carried out by the French during the winter against the salient of St. Mihiel, when they learnt that the position (which appears from a map to be almost untenable) could with the aid of trenches and barbed wire be made very formidable. Other attacks were made in Champagne on either side of the Perto and in Flanders. In the latter of these British troops coöperated by a minor attack opposite Wytschaete, which had very little success. In fact on the whole the Germans gained the chief success in this preliminary sparring, for in the middle of Jan. 1915 they made an attack upon the lines which had been held during the battle of the Aisne by the British army, N. of that river near Soissons, and drove the French back to the S. bank.

The British army, which like other European armies, had been trained to believe in the supreme virtue of attack, had since the beginning of the war, with the exception of the short period of the advance to the Marne and the Aisne, been compelled to fight defensively, and Sir John French desired to give it a wider experience of attack upon entrenchments. For this purpose he had been carefully saving up artillery ammunition by strictly limiting the amount to be expended in the routine of trench warfare, and he calculated that he would have sufficient at his disposal to allow him to engage in a considerable battle early in March. He entrusted the execution of this battle to Sir Douglas Haig's I. Army, which was directed to attack the German lines near Neuve Chapelle, an operation which it was hoped would result in a favourable position for the further battle which was to be undertaken later in coöperation with Foch. The battle of Neuve Chapelle opened on Mar. 10 with what was in those days held to be a very heavy bombardment. This bombardment was followed by an infantry assault, which was at first successful, and carried the village of Neuve Chapelle, but was soon brought to a standstill by the enemy's machine-guns. In this battle the British first experienced the difficulty of bringing up reserves at the right time through roads blocked by the debris of battle and over ground scarred by trenches and torn by shell-fire. On the whole, however, both the French and the British were impressed by the result of the bombardment, which was held to promise great things when there should be more guns and more ammunition. Preparations for further battles therefore went forward.

The Germans, guessing what was on foot, were not slow to interfere with these preparations. On April 17 a portion of Smith-Dorrien's II. Army attacked and gained a footing upon Hill 60, an important feature on the S. face of the Ypres salient. The Germans, counter-attacking, promptly regained possession of the hill and followed up this success by a far more serious enterprise on April 22. By then Foch's preparations for the attack on the Vimy Ridge were far advanced, and to obtain the troops he needed for the coming battle he had greatly weakened the French forces left in the N. portion of the Ypres salient. Against this portion the Germans launched waves of poison gas discharged from cylinders, which completely overwhelmed the French troops, who had no protection against this utterly unexpected barbarity. The flank of the 1st Canadian Div. was completely exposed, and for a short time a definite breach was created in the Allied line. Fortunately the Germans were unprepared for the extent of their success, and had not the troops at hand to take immediate advantage of it, while the gallantry of the 1st Canadian Div. and the 28th Div. held the enemy at bay until reinforcements could be brought up. The first complete British territorial division to arrive in France, the

46th North Midland Div., was fortunately in the neighbourhood, and these and other reinforcements, some contributed by Foch from the reserves he was holding in readiness for his battle, sufficed to save Ypres and to patch up a new line.

But the second battle of Ypres, if it did not give the Germans all the success they might have attained had they been ready to follow up the first success gained by the employment of a method of attack which no civilized nation had conceived to be possible in modern war, at least gained a great part of their purpose by weakening the forces and exhausting the meagre supply of ammunition which the Allies were accumulating for their projected battle.

That battle began on May 9 with an attack by the I. British Army under Sir Douglas Haig on either side of Fromelles, and an attack by the I. French Army, commanded by General d'Urbal but under the direction of Foch, on a much wider front which extended from the Scarpe to the N. of the Souchez. The British attack made very little progress and it was soon evident that the preliminary bombardment had not sufficed to destroy sufficiently the enemy's defences, or, what was of greater importance, to overcome his machine-guns. Sir John French, however, felt himself bound by his agreement with Joffre and Foch to keep the enemy occupied on his front as long as possible, and the battle of Fromelles became merged in the battle of Festubert by bringing the front of attack slightly S. into what it was hoped would prove more favourable ground. The experience of Festubert was, however, hardly more favourable than that of Fromelles, for again the German machine-gunners checked all real progress, while the lack of artillery ammunition became more and more felt. The situation was made more difficult in this latter respect by renewed German attacks in the Ypres salient upon the II. Army, now under the command of Sir Herbert Plumer. The situation of the British army in Flanders was somewhat eased by the arrival of five more divisions of territorials, followed by the first of the New Army divisions, the 9th, but it was lack of shell rather than lack of men which forced Sir John French to stop his attacks, and the battle of Festubert petered out on May 25.

Meanwhile, on the British right, Foch was making encouraging if slow and very costly progress. In the battle of Souchez the villages of Ablain St. Nazaire, Carency, Neuville St. Vaast and Thélus were carried by d'Urbal's men, who fought their way doggedly up the W. slopes of the Vimy Ridge. The French found the German machine-guns to be the chief obstacle to progress and the prime cause of casualties, particularly in the villages, in which the enemy's machine-gunners fought indomitably from cellar to cellar and in a certain elaborate series of works which became known to fame as the Labyrinth. The French had by this time embodied the flower of the manhood of the nation in their army, and the splendid gallantry with which Foch's regiments fought their way forward in the battle of Souchez, enduring tremendous losses but ever gaining ground, if only at the rate of a score or two of yards per day, towards the crest of the Vimy Ridge, was never surpassed in the whole long war. When the British ceased their attacks on May 25, Foch had made enough headway to encourage him to believe that he could gain the whole ridge, and he determined to continue the battle alone. But for this he wanted more troops, and an extension of the British front, which would set free Frenchmen, while both he and Joffre were fearful lest the New Army divisions preparing to leave England should be sent to the Dardanelles. The French commander-in-chief therefore wrote, at the end of May, a letter to Kitchener which contains the key to the developments of the following months. It ran as follows:—

"The retreat of the Russian army, consequent upon the temporary failure of its offensive, will doubtless allow the Central Powers to withdraw, at least for a time, a certain number of army corps which they will be able to use on another front, but it is probable that the greater part of these will be required to meet the situation created by the entry of Italy into the war.¹ The situation of the Russians, who will be for some time to come unable to undertake a decisive offensive, and the difficulties of ground which the Italian

¹ The Italian troops crossed the frontier at midnight May 24-25.

theatre of war presents until the Italian armies are able to debouch into the plains, show clearly that the principal effort of the Allies must be made in France. The developments of Arras¹ have proved that it is tactically possible to break the German front, but that for success an even more powerful effort is required, and that it is necessary to attack simultaneously at a number of points. France has at the present time 2,200,000 men engaged on her N.E. front and has reached the limits of her man-power. She can maintain her armies at their actual figure but she cannot increase them. The solution of the problem is then in the hands of England. If she sends us her New Armies we shall be able to make not only an English and a French effort but an English effort and two French efforts simultaneously at the most favourable moment and with great power. The British forces, reinforced by the New Armies, will be given zones of operation proportionate with their strength. They will retain their present zone, extending it on both flanks to the N. of Ypres and to the S. of La Bassée canal, and they will take over the zone to the S. of Arras towards the Somme. They will thus lie on either side of the French X. Army, which will hold the front of attack which it has organized. The alternation of French and British troops has always given the best results. The principal effort of the English armies will be directed between the left of the French X. Army and the La Bassée canal and will extend to the N. of the canal; thus it will be linked up with the French attack in the neighbourhood of Arras.

"Of course, if the Germans are compelled to fall back before all the British forces are in line, their whole strength will be directed towards exploiting the success won in the direction of Antwerp and of Brussels. We owe it to ourselves and to our Allies to make a great effort now. It is therefore at the present time of the highest importance that the New British Armies should be dispatched as rapidly as possible and at dates and under conditions fixed beforehand, so that definite plans of operations may be drawn up in agreement by the two commanders-in-chief. I am firmly convinced that our action will be decisive, if it is combined and co-ordinated."

This letter shows that Joffre had not, at the end of May, much hope that Foch would capture the Vimy Ridge, but the latter's fiery spirit would not permit him to admit failure while the prize seemed to be within his grasp, and he persuaded the commander-in-chief to let him continue the battle. So the battle of Souchez, which had begun on May 9, dragged on until July 13. Twice Foch's men won their way to the crest of the ridge, only to be driven back, and at last Joffre called a halt and decided to prepare for the greater effort of which he had written to Kitchener. In that letter Joffre had indicated that he proposed to renew the attempts on the Arras front to take the Vimy Ridge, while the British army fought on the left of the French X. Army, but he had said nothing about the second French effort. This he designed to be the principal blow to be delivered in Champagne, to the E. of Reims. To obtain the French troops for this campaign he required the British army to extend its front to the right and left, and also to relieve de Castelnau's VI. Army on the Somme front. The remainder of the summer was occupied by these changes, which became possible as the New Army divisions arrived from England. The 2nd and 3rd of these reached France, disembarked at the end of May, and 6 more before the end of July, so that by then the 4 divisions and the cavalry division of Mons had in 11 months increased to 28 divisions and 5 cavalry divisions. These reinforcements enabled a British III. Army to be formed under Sir Charles Monro, which took over some 17 miles of front from a point to the S. of Arras as far as the Somme, eventually extending its lines to the S. of that river. Haig's I. Army prolonged its right S. of the La Bassée canal to the neighbourhood of Lens, and thus found itself facing the open plain of Loos, while Plumer's II. Army relieved the remaining French troops in the Ypres salient and brought its left into contact with the right of the Belgians.

While these movements were in progress, vast preparations were taking place on the battle-front. Guns, trench mortars, shells and military stores of all kinds had accumulated in hitherto undreamt-of quantities. Joffre and his staff had it in their minds at this time that they were engaged in operations in the nature of a huge siege, and that the essential was to blow a practicable breach in the enemy's lines through which the infantry could be poured to the assault. A study of the previous battles of trench warfare had convinced them that with sufficient guns and sufficient ammunition this was possible. The output of the

French factories had been increased enormously, and though the British Ministry of Munitions had hardly yet begun to be productive, still the supply of heavy guns and shells for the British army had been greatly increased and it was equipped to reply effectively to the German gas. For these reasons the hopes which Joffre had expressed in his letter to Kitchener were very generally shared in the Allied armies. The one fly in the ointment was that there had been a renewal in the British Cabinet of the controversy between the "Easterners" and the "Westerners" and Mr. Churchill had pressed with all his eloquence and skill for a decisive campaign which should open the road to Constantinople. The result was a compromise, and three of the New Army divisions had gone to the East. Some compensation for this was obtained by the arrival of two more New Army divisions in France, and by the formation of a Guards' division, which had been made possible by the creation of new battalions of Guards and the replacement of those already in France by other battalions. This gave Sir John French an additional army corps, which he kept in his hands as a reserve.

Joffre opened his autumn campaign on Sept. 25. In addition to his great attack in Champagne, Foch with the French X. Army attempted once more to storm the Vimy Ridge, while Haig's I. Army attacked between the La Bassée canal and Lens, in conjunction with a secondary British attack to the N. of the canal and demonstrations on the front near Armentières. The general plan of the N. battle was that Foch, having carried the Vimy Ridge, should advance E. to the S. of Lens, while Haig pushed E. through Loos to the N. of Lens and joined hands with Foch beyond that town. In this way the Allies would avoid the mass of ruined buildings and miners' cottages which composed the town and would form admirable refuges for the German machine-guns. The tactical methods to be employed on both the S. and N. battlefields were similar in conception, that is to say, there was to be a great rush forward of the assaulting infantry as soon as the attack had been adequately prepared by the artillery, and the reserves were to follow hard after the first-line troops. Only in the matter of the preparation of the attack was there any essential difference in the methods to be employed by the British and the French. The former had determined to replace an intense bombardment by a discharge of gas from cylinders similar to that from which they had suffered in the second battle of Ypres.

Of the British share in the general plan, the demonstrations in front of Armentières proved quite ineffective, while the attack N. of the La Bassée canal failed. On the front opposite Loos, however, the discharge of gas surprised the Germans and overcame the resistance of their first-line troops, though it caused some casualties among the British themselves and made it difficult to direct the attack. Despite this, the first wave of British infantry passed through and beyond Loos, when it appeared that they only needed the prompt arrival of the reserves to secure a very considerable success. Sir John French had, however, kept these back until he saw how the battle progressed, and when they arrived late in the evening the New Army division which formed two-thirds of the reserve found great difficulty in making their way through the confusion of the battlefield under conditions entirely strange to them, and were unable to confirm the first success won, so that, though Loos was held, German counter-attacks recovered a considerable part of the ground gained, and in particular the important Hill 70, which dominates Loos on the north. Worse still, Foch's attack on the Vimy Ridge failed almost completely and the Germans remained in possession of the crest. This alone condemned the N. attack to failure, for the British front of battle was not large enough to insure a breach in the enemy's defences sufficiently wide to be exploited successfully. The remainder of the battle of Loos, which lasted until Oct. 15, resolved itself into the repulse of a number of fierce German counter-attacks, which ended in mutual exhaustion, with the British in possession of the salient extending round Lens to the La Bassée canal.

The great battle in Champagne was an even more severe disappointment, because more had been expected. The first news

¹ The battle of Souchez.

from the field aroused high hopes. The first two German lines of defence were carried on a wide front, and many prisoners and guns were captured, while on the fourth day of the battle the third German line, which was believed to be the enemy's last system of defence, was for a time breached near Sainte Marie; but again the solution of the problem of bringing up reserves at the right time and in good order was not found, while the enemy's reserves, which came up fresh through country which had not been fought over, arrived in time to fill the breach. The battle of Champagne ran on into Nov., developing into a series of struggles for tactical points of importance, but ended with no material change in the position won by the French at the end of the fourth day of the battle.

So the campaign of 1915 closed on the western front, with the Allies still asking themselves how it was possible to get through the trench barrier and drive the Germans from France and Belgium. The great bombardment followed by the assault in mass had failed, and some other method of attack was required.

Ere the year closed a new problem had developed in the Near East, which had its repercussion on the western front. German, Austrian and Bulgarian forces had overrun Serbia, and the Allied Governments had decided to send a relief expedition to Salonika. Part of the troops required for this new enterprise came from the Dardanelles, but more were needed and these had to be supplied from the western front. Five divisions of French troops under the command of General Sarrail were ordered off, and were accompanied by the three British divisions of the III. Army which had been holding the line S. of the Somme, the 27th, 28th, and 22nd. It was also decided to spare the two divisions of Indian infantry which had proved such a timely reinforcement at the time of the first battle of Ypres, the horrors of another winter of trench warfare in Flanders, and they were sent off to Mesopotamia. This reduction of the British army was made good by the arrival in France before the end of the year of the 2nd and 3rd Canadian Divs. and the 16th Irish Div., and of the 21st, 23rd, 24th, 25th, 26th, 36th and 38th New Army Divs., so that the strength of the British army in France and Belgium stood at 36 divisions and 5 cavalry divisions, a combatant strength of about 750,000 men. The Allies on the western front had therefore at this time about 3,100,000 men, opposed to 2,000,000 Germans. These figures gave rise to anxious discussion as to what superiority of numbers was necessary to ensure success under conditions of trench warfare, and whether and how the Allies could obtain the necessary superiority.

While these discussions were going on important changes took place in the Allied Command. Joffre had hitherto been nominally chief of the French General Staff. He was now definitely appointed commander-in-chief of the armies of the N.E., with de Castelnau as his chief-of-staff. In the British army Sir John French was brought home to command the troops in Great Britain and was succeeded by Sir Douglas Haig, with General Kiggell as his chief-of-staff, while Sir William Robertson, who had been chief-of-staff to French, became chief of the Imperial General Staff at the War Office.

Operations in 1916.—In Dec. 1915 the first serious attempts to obtain unity of action between the Allies took place, and a conference of commanders-in-chief and chiefs-of-staff of the British, French, Belgian, and Italian armies, attended also by representatives of the Russian and Japanese armies, was held at Joffre's headquarters. At this conference it was agreed to attack the enemy as early in 1916 as possible, sufficient time being allowed for the training of the New Army divisions that the British army was receiving, and for the reëquipment of the Russian armies. These plans, however, never matured, because the enemy anticipated them, and it is therefore unnecessary to refer to them further.

During Dec. 1915 and Jan. 1916 the Germans developed considerable activity along the front and made local attacks at Nieuport on the North Sea coast, against more than one point in the Ypres salient, at Givenchy on the Vimy Ridge front, on the Somme, and in Feb. on the Alsace front. The majority of these attacks took the form of experiments in various methods

of bombardment which the Germans wished to test in view of a greater effort which they were planning. There had not been wanting signs that the enemy were preparing an attack on the Verdun sector; and considerable anxiety having been expressed as to the adequacy of the French defences on that part of the front, General de Castelnau was sent thither by Joffre, and he ordered certain improvements, but the time was lacking to give full effect to his recommendations (*see* VERDUN). In fact, the Allied defences at this period of the war were notably inferior to those of the Germans. The Allies had spent the greater part of 1915 either in carrying out the vast preparations necessary for an attack in trench warfare or in attacking, and had little energy or labour left for the elaboration of defences. The Germans on the other hand had been on the defensive throughout the year, and they enjoyed the great advantage of being able to employ upon their entrenchments forced labour from Belgium and the occupied provinces of France, and the large number of prisoners they had captured on the Russian front. Further, they had immediately behind their zone of battle the forests of Alsace and of the Ardennes, which provided them with an almost unlimited amount of timber. The Allies could only find labour either at the expense of the fighting troops or of the munition factories, and the British army was forced to import the greater part of the timber it required. It was not until much later in the war, when elaborate arrangements were made for the provision of native labour, and for the exploitation of the French forests, that conditions became at all equal in these respects.

It was the superior strength of their defences which enabled the Germans, while inferior in numbers on the whole front, to concentrate sufficient force for a great attack upon one part of that front. That attack opened on a front of nine miles on the banks of the Meuse opposite Verdun on Feb. 21, 5 German divisions attacking 2 French divisions. The enemy at once gained a startling success, penetrating the French defences, and on the fourth day of the battle capturing Fort Douaumont, one of the chief of the outlying works of the fortress of Verdun. This success was greater than any yet gained by the Allies in attack, though their relative superiority in men on the battle-fronts had been far greater than that of the Germans at the beginning of the battle of Verdun. The Germans won their successes mainly by the skilful handling of their medium and heavy guns, of which they had assembled a great number for the attack. They had before the war made a much closer study of the use of heavy and medium howitzers, both for field and siege warfare, than had either the British or the French, and they had numbers of gunners highly trained in their use, while careful experiments in bombardment, carried out before the battle, bore good fruit. It is to these causes that the tactical success won by the Germans in the first days of Verdun may be attributed. At Mons 5 German divisions had attacked 2 divisions of the British II. Corps, but the Germans had not had time to bring up their heavy artillery and at the end of a day's fighting had done little more than drive in the British outposts, while at Verdun, with the help of a mass of heavy guns, 5 German divisions had overcome 2 French divisions and gained such a position as menaced seriously the French fortress. The result was, therefore, a tactical victory for the German artillery.

Joffre dealt with the crisis promptly. De Castelnau was sent again to Verdun and arranged with Langle de Cary, who commanded the group of armies of the Centre, a command which included Verdun, as to the disposal of the reinforcements which were hurrying to the battle-field and as to the methods of defence. Joffre also sent with these reinforcements General Pétain, who arrived on Feb. 26 and assumed command in the battle-zone. The German attempts to gain ground beyond Douaumont were repulsed, and the French commander-in-chief had time to look round and survey the whole position. He had at once realized that the enemy was in deadly earnest. "*C'est la bataille*," was one of his first remarks when he heard of the German attack. He had immediately requested Haig to relieve his X. Army on the Arras front, and had asked Kitchener to hasten the dispatch of British reinforcements to France. Two more New Army divi-

sions and 1 Territorial division had reached France from England in January, while 3 more New Army divisions and 3 more Territorial divisions from England were to be in France before the end of May. The Dardanelles Expeditionary Force was being rapidly reorganized and refitted in Egypt by Sir A. Murray, and 2 British, 4 Australian, and 1 New Zealand divisions were expected to come from that country to the western front before the end of June. Haig had lost in Jan. one more division, which had gone to Salonika, but reinforcements would give him by the middle of the year an increase of no less than 15 divisions to his strength in Dec. 1915.

Both commanders-in-chief were agreed that the principles on which the plans of battle in 1915 had been drawn up required modification. It was seen that the analogy of the great siege did not hold, that something more was required than to blast a great breach in the enemy's lines and then to launch a great assault. The something more was the defeat of the enemy's reserves, which came up fresh and in good order to meet troops when the assault had been thrown into some confusion. It was agreed, therefore, that the first object of battle should be to draw in and exhaust the enemy's reserves, and that until that object had been achieved no decisive success could be expected. So long as the enemy continued to attack Verdun, it would, on this principle, be to the advantage of the French to endure these attacks provided always that the enemy gained no success which would affect seriously the strategical position on the whole front, and provided that the exhaustion of the French man-power was not excessive. Joffre therefore proposed to fight defensively at Verdun as long as possible, but to be ready to strike back as soon as the situation there appeared to him too dangerous, or as soon as the French army was approaching the limits of endurance. He therefore asked Haig not only to relieve the French X. Army but to prepare to attack N. of the Somme on a front as wide as the resources of the British army would permit, and undertook to support that attack with a French attack S. of the river on a scale which would depend upon the effect of the battle of Verdun upon the French army.

The Germans had at this time arrived at a very similar theory of battle. The chief of their General Staff, Falkenhayn, has said that he believed the strain of the war upon France to be such that a break might occur if the strain could be increased. This was not an unduly optimistic appreciation of the position if it be remembered that in the previous May Joffre had told Kitchener that France had then reached the limits of her capacity to expand her military forces. Materially Falkenhayn was not far wrong, but he understood the psychology of his enemies no better than other Germans, and he failed to appreciate the spirit of France. The maxim of Verdun—"on ne passera pas"—became for France an inspiration as potent as the influence of Jeanne d'Arc. The object of the Germans in the battle of Verdun was to bleed France white, while the object of the Allies during that period was to wear down the military power of Germany as the preparation for striking the *coup de grace*. So upon both sides the theory of the war of exhaustion developed.

During March, April and May the struggle for Verdun continued, the Germans in their several attacks gaining sufficient ground to encourage them to make a new effort now on the right bank of the Meuse, now on the left. During all this fighting the reputation of two of the defenders of Verdun increased steadily, and in May General Pétain succeeded to the command of the group of armies of the Centre, General Nivelle taking his place in command on the actual front of battle.

Between Jan. and July the British strength in bayonets and sabres grew from 450,000 to 660,000, and there was a more than corresponding increase in artillery and aircraft. This enabled Haig to fall in completely with Joffre's wishes, and as soon as the relief of the French X. Army was completed he set about preparing for the great attack on the front N. of the Somme. The growth of the armies made necessary the creation of a IV. Army under the command of Sir Henry Rawlinson. The III. Army was not commanded by Sir E. Allenby, and Sir Charles Monro, who had gone out to supervise the evacuation of the Dardanelles,

returned to command the I. Army. British troops now held a continuous line from the Yser canal to the Somme, and were actively preparing to take upon themselves more of the brunt of the war on the western front, a burden of which nearly seven-eighths had hitherto fallen on their French comrades. This preparation entailed enormous labour, for it not only involved the accumulation of immense stores and piles of munitions of all kinds on the selected front of attack, the construction of miles of roads, railways and trenches and many other preliminaries of a great attack in trench warfare, but also the completion of the training of hitherto untried troops. The British army was, in fact, in process of becoming a national army. The old regulars were now little more than a small leaven of the whole lump, and though the new troops arrived in France with considerable knowledge of their duties as cavalrymen, infantrymen, gunners and airmen, they had had little opportunity of learning to work together as part of a great machine. The problem of training was the more complicated because of the great variety of new weapons and methods which had been developed since the outbreak of war; and to teach each part of the army the powers and limitations of every other part, and the whole to work together in combination, was a very heavy task. To this task Haig at once addressed himself, and formed behind the lines schools of instruction in every branch of trench and battle warfare, while careful arrangements were made for the training in attack of divisions when out of the line. All this busy work behind the lines did not mean any cessation of activity on the front, and during these months of preparation a long series of raids into the enemy's trenches were planned and executed, raids which gave the new troops valuable experience and kept the enemy on continual tenterhooks.

In the latter part of May the German Crown Prince redoubled his attacks on the Verdun front, and on the 21st the Germans stormed the Mort Homme hill on the left bank of the Meuse, for which they had been struggling for weeks. Pétain at once called Joffre's attention to the gravity of the situation, and pressed for an early beginning of the counter-offensive on the Somme, but Joffre was anxious to give Haig as much time as possible for the training of his troops, and made Pétain endure yet longer. Fire from the Mort Homme hill had long impeded German progress on the right bank of the Meuse, but with the hill in their possession the enemy in the beginning of June began to press hard on that bank and on the 7th captured Fort Vaux. Thereupon Pétain renewed his representation to Foch, who in consultation with Haig decided that the battle of the Somme should begin on July 1. The preliminary bombardment was begun a week earlier, on June 24, the day on which the Germans, after capturing Fort Thiaumont, stormed the village of Fleury and attained the farthest point in their progress towards Verdun. While this preliminary bombardment was in progress, a bombardment so intense that the guns could be heard in England, no less than 70 raids were carried on the British front between Ypres and the Somme, and gas was discharged into the enemy's lines from 40 different points. The troops which were about to attack the German trenches from Gommécourt to the Somme included the flower of British manhood, and no more splendid body of men has ever gone forward to battle. British aircraft had already gained the ascendancy over the enemy's airmen, and the British army was now well equipped with machine-guns, trench mortars, bombs, gas-projectors, and all other new appliances which experience of trench warfare had shown to be necessary; the tunnellers had proved themselves to be more than a match for the enemy's mines, and for the first time in the war there was a sufficiency of heavy and medium guns and an assurance of an adequate if not abundant supply of shells. Expectation therefore ran high.

The results of the first attack were a heavy disappointment. The main attack was delivered by Rawlinson's IV. Army between the Ancre and Maricourt, about a mile N. of the Somme, where they joined hands with the French VI. Army commanded by General Fayolle, who was to attack astride the river under the general direction of Foch. This main attack was combined with

a subsidiary attack by the IV. Army N. of the Ancre, and yet another by the III. Army upon the Gommécourt salient. Upon July 1 both the subsidiary attacks and the whole left of the main British attack failed completely and with heavy loss, but the right of the main attack and the whole of the French attack made such good progress as to warrant the continuance of the battle. The British failures were in the main due to want of experience in the artillery. More than two-thirds of the British batteries engaged had been created since the outbreak of war, and at that time they did not possess sufficient ammunition to gain such practical experience in intense bombardment as the Germans had given their gunners before the battle of Verdun. The chalky soil of the Somme hills lent itself to the construction of deep dugouts, of which the enemy had a great number, and to prevent his men from coming out of these in time to meet the British infantry special and very accurate methods of artillery preparation were required. In default of these the infantry yet again found themselves checked on the greater part of the front by the deadly German machine-guns, and it was mainly through the devoted valour of the infantry through the first days of the battle that the gains made by the right of the IV. Army were confirmed and extended. The first successes won by Foch's men along the river itself were greater and were obtained at less cost, partly because the Germans, overrating the effect of the battle of Verdun, had not expected attack from that quarter, and partly because of the better preparation of the attack by the French artillery, the French having a far larger number than the British of trained gunners for the expansion of that arm. The lesson of the first days of this great battle is that the creation of new armies during the course of a war is an even more intricate and difficult business than had been imagined, even by those who, knowing some of the difficulties, had undertaken the creation of Kitchener's armies with devotion and enthusiasm.

One of the results of the events of the first days of the battle was that Sir Douglas Haig decided to divide his fighting front between two armies. He directed Rawlinson with the IV. Army to exploit the advantages won on the right, and formed on his left a V. Army under Sir Hubert Gough which was to keep the enemy busy on its front and act as a pivot to the IV. Army. The battle was fought out in three phases, the first being the struggle up the slopes from the valleys of the Ancre and of the Somme to the S. crest of the Somme plateau, the second the struggle for possession of the plateau, the third phase consisting of the advance down the N. slopes. The first phase was consummated by a brilliant night attack by the IV. Army on July 14, and on July 17, the British and French troops N. of the river were abreast of the French S. of the Somme, who had for some time been established opposite to Péronne. The whole front of attack could again move forward together. The second phase constituted a long series of fierce struggles, the Germans bringing up more and more troops and disputing every yard of ground, so it was not until Sept. 9 that the British, with the French on their right, were able to look down upon the N. slopes of the plateau and the plains beyond.

By this time two of the objects for which the battle had been fought were gained. The Germans, forced to transfer troops to the Somme, had to relax their pressure on Verdun. The French retook Fort Thiaumont on June 30, while throughout July they slowly regained part of the ground which had been won from them, and on Aug. 17 drove the enemy out of Fleury. Verdun was no longer in danger, and Pétain and Nivelle were able to plan at leisure counter-attacks on a more extensive scale. The second object of the battle of the Somme, the exhaustion of the enemy's reserves, was being obtained as surely. When the battle began, the front attacked by the British was held by 6 German divisions, that attacked by the French by two. In the 2 months 36 German divisions had been engaged on the British front, 18 on the French. In the 6 months of Verdun the Germans had employed 43 divisions in battle, so that their defence on the Somme was far more exhausting than their attacks at Verdun.

At the end of Aug. the failure of Falkenhayn's plans was publicly admitted by his supersession by Hindenburg, with

Ludendorff as his chief assistant. The latter, after visiting the fields of Verdun and the Somme, found the German position on the western front to be one of great gravity, and the chief problem confronting him to be how to stop "the progressive falling off" of the German fighting power. The situation of the Allies had improved marvellously since June, when men were wondering how long it would be before the Germans entered Verdun. Not only had Verdun been saved and the Germans been forced to fight desperately on the defensive, but the Italians had driven back the attacking Austrians in the Alps and had then passed themselves to attack on the Isonzo. On the Russian front Brusilov had won great victories on the Bukovina, and Rumania had entered the war, too late certainly to profit by Brusilov's success, but none the less adding apparently another ally to those who confronted the Central Powers. The whole machinery of the Allies was, for the first time, simultaneously at work, and Joffre's strategy appeared to be triumphant.

It was in these encouraging circumstances that the third phase of the battle of the Somme began on Sept. 15. The attack of that day was made famous not only by the successes won, which were considerable, but by the fact that tanks then made their first appearance in battle. There has been much controversy as to the wisdom of this step (see TANKS). The experts have maintained that the value of this invention was discounted by premature use, that it should have been kept in reserve to surprise the enemy when large numbers of the new weapon were ready, and that it should have been first used on ground more favourable than a shell-torn battlefield. It was decided to employ tanks in the Somme battle for two reasons. Firstly, so much having been gained at great cost, the moment seemed to have come to press the enemy with every available means. The chief obstacle to the progress of the infantry continued to be the German machine-guns, and tanks were reputed to be the ideal means of overcoming machine-guns. If it would have been foolish not to have pressed the advantage won, it would have been criminal to have withheld from the sorely tried infantry the protection and aid which was at hand. The second reason was that experience was required in the use of tanks in battle. It was necessary to learn both how the tanks would comport themselves when put to the highest test, and how they would work in combination with infantry and artillery. The effective coöperation of infantry, tanks and artillery undoubtedly went a long way towards winning the war in 1918, but it is a legitimate belief that this coöperation would not have resulted unless experience had been gained in 1916.

Despite the employment of tanks, and despite the splendid valour of the infantry of the New Armies, the resistance of the enemy was not broken in the third phase of the battle of the Somme. The days were growing shorter and the weather became uncertain, while the enemy, drawing troops from all parts of the front to prevent his line from breaking, fought with fine courage. By Nov. 17, when rain and mud put an end to the battle, the Germans had engaged no less than 127 divisions. The enemy's reserves had indeed been worn down; in the valley of the Ancre he was hemmed by Gough's V. Army into an awkward salient, but the weather had broken and it was too late to reap the harvest on the battle-front. The first fruits of the Somme were garnered elsewhere.

On Oct. 24 Nivelle began an attack on the right bank of the Meuse, and on the following day recaptured Fort Douaumont. This conspicuous success was followed by the recapture of Fort Vaux on Nov. 2. The battle ended in a complete victory for the French, 6 French divisions overcoming 7 German divisions at surprisingly small cost. Nivelle and Mangin, who commanded the army corps engaged, became the heroes of France. The victory was largely due to the skilful handling of massed artillery, and the Nivelle method became famous. Its fame was extended when, on Dec. 14, a second attack won an even more brilliant success, which made Verdun quite secure and brought in 11,387 prisoners and 115 guns, again at small cost.

When the statesmen of Paris and London compared the results of these two battles at Verdun, which had resulted not only in

sions and 1 Territorial division had reached France from England in January, while 3 more New Army divisions and 3 more Territorial divisions from England were to be in France before the end of May. The Dardanelles Expeditionary Force was being rapidly reorganized and refitted in Egypt by Sir A. Murray, and 2 British, 4 Australian, and 1 New Zealand divisions were expected to come from that country to the western front before the end of June. Haig had lost in Jan. one more division, which had gone to Salonika, but reinforcements would give him by the middle of the year an increase of no less than 15 divisions to his strength in Dec. 1915.

Both commanders-in-chief were agreed that the principles on which the plans of battle in 1915 had been drawn up required modification. It was seen that the analogy of the great siege did not hold, that something more was required than to blast a great breach in the enemy's lines and then to launch a great assault. The something more was the defeat of the enemy's reserves, which came up fresh and in good order to meet troops when the assault had been thrown into some confusion. It was agreed, therefore, that the first object of battle should be to draw in and exhaust the enemy's reserves, and that until that object had been achieved no decisive success could be expected. So long as the enemy continued to attack Verdun, it would, on this principle, be to the advantage of the French to endure these attacks provided always that the enemy gained no success which would affect seriously the strategical position on the whole front, and provided that the exhaustion of the French man-power was not excessive. Joffre therefore proposed to fight defensively at Verdun as long as possible, but to be ready to strike back as soon as the situation there appeared to him too dangerous, or as soon as the French army was approaching the limits of endurance. He therefore asked Haig not only to relieve the French X. Army but to prepare to attack N. of the Somme on a front as wide as the resources of the British army would permit, and undertook to support that attack with a French attack S. of the river on a scale which would depend upon the effect of the battle of Verdun upon the French army.

The Germans had at this time arrived at a very similar theory of battle. The chief of their General Staff, Falkenhayn, has said that he believed the strain of the war upon France to be such that a break might occur if the strain could be increased. This was not an unduly optimistic appreciation of the position if it be remembered that in the previous May Joffre had told Kitchener that France had then reached the limits of her capacity to expand her military forces. Materially Falkenhayn was not far wrong, but he understood the psychology of his enemies no better than other Germans, and he failed to appreciate the spirit of France. The maxim of Verdun—"on ne passera pas"—became for France an inspiration as potent as the influence of Jeanne d'Arc. The object of the Germans in the battle of Verdun was to bleed France white, while the object of the Allies during that period was to wear down the military power of Germany as the preparation for striking the *coup de grace*. So upon both sides the theory of the war of exhaustion developed.

During March, April and May the struggle for Verdun continued, the Germans in their several attacks gaining sufficient ground to encourage them to make a new effort now on the right bank of the Meuse, now on the left. During all this fighting the reputation of two of the defenders of Verdun increased steadily, and in May General Pétain succeeded to the command of the group of armies of the Centre, General Nivelle taking his place in command on the actual front of battle.

Between Jan. and July the British strength in bayonets and sabres grew from 450,000 to 660,000, and there was a more than corresponding increase in artillery and aircraft. This enabled Haig to fall in completely with Joffre's wishes, and as soon as the relief of the French X. Army was completed he set about preparing for the great attack on the front N. of the Somme. The growth of the armies made necessary the creation of a IV. Army under the command of Sir Henry Rawlinson. The III. Army was not commanded by Sir E. Allenby, and Sir Charles Monro, who had gone out to supervise the evacuation of the Dardanelles,

returned to command the I. Army. British troops now held a continuous line from the Yser canal to the Somme, and were actively preparing to take upon themselves more of the brunt of the war on the western front, a burden of which nearly seven-eighths had hitherto fallen on their French comrades. This preparation entailed enormous labour, for it not only involved the accumulation of immense stores and piles of munitions of all kinds on the selected front of attack, the construction of miles of roads, railways and trenches and many other preliminaries of a great attack in trench warfare, but also the completion of the training of hitherto untried troops. The British army was, in fact, in process of becoming a national army. The old regulars were now little more than a small leaven of the whole lump, and though the new troops arrived in France with considerable knowledge of their duties as cavalrymen, infantrymen, gunners and airmen, they had had little opportunity of learning to work together as part of a great machine. The problem of training was the more complicated because of the great variety of new weapons and methods which had been developed since the outbreak of war; and to teach each part of the army the powers and limitations of every other part, and the whole to work together in combination, was a very heavy task. To this task Haig at once addressed himself, and formed behind the lines schools of instruction in every branch of trench and battle warfare, while careful arrangements were made for the training in attack of divisions when out of the line. All this busy work behind the lines did not mean any cessation of activity on the front, and during these months of preparation a long series of raids into the enemy's trenches were planned and executed, raids which gave the new troops valuable experience and kept the enemy on continual tenterhooks.

In the latter part of May the German Crown Prince redoubled his attacks on the Verdun front, and on the 21st the Germans stormed the Mort Homme hill on the left bank of the Meuse, for which they had been struggling for weeks. Pétain at once called Joffre's attention to the gravity of the situation, and pressed for an early beginning of the counter-offensive on the Somme, but Joffre was anxious to give Haig as much time as possible for the training of his troops, and made Pétain endure yet longer. Fire from the Mort Homme hill had long impeded German progress on the right bank of the Meuse, but with the hill in their possession the enemy in the beginning of June began to press hard on that bank and on the 7th captured Fort Vaux. Thereupon Pétain renewed his representation to Foch, who in consultation with Haig decided that the battle of the Somme should begin on July 1. The preliminary bombardment was begun a week earlier, on June 24, the day on which the Germans, after capturing Fort Thiaumont, stormed the village of Fleury and attained the farthest point in their progress towards Verdun. While this preliminary bombardment was in progress, a bombardment so intense that the guns could be heard in England, no less than 70 raids were carried on the British front between Ypres and the Somme, and gas was discharged into the enemy's lines from 40 different points. The troops which were about to attack the German trenches from Gommécourt to the Somme included the flower of British manhood, and no more splendid body of men has ever gone forward to battle. British aircraft had already gained the ascendancy over the enemy's airmen, and the British army was now well equipped with machine-guns, trench mortars, bombs, gas-projectors, and all other new appliances which experience of trench warfare had shown to be necessary; the tunnellers had proved themselves to be more than a match for the enemy's mines, and for the first time in the war there was a sufficiency of heavy and medium guns and an assurance of an adequate if not abundant supply of shells. Expectation therefore ran high.

The results of the first attack were a heavy disappointment. The main attack was delivered by Rawlinson's IV. Army between the Ancre and Maricourt, about a mile N. of the Somme, where they joined hands with the French VI. Army commanded by General Fayolle, who was to attack astride the river under the general direction of Foch. This main attack was combined with

devastated, villages were burnt, roads and railways destroyed, fruit trees cut down and everything of any value was removed, and mines which exploded at a touch were prepared with diabolical ingenuity. In these circumstances a rapid pursuit became impossible, and the Germans were able to delay the advance of the Allies by rearguards, while they removed their heavy artillery and established their main bodies in the Hindenburg lines.

This manœuvre, planned and successfully carried through by Ludendorff, effected a great change in the situation to the benefit of the Germans. Not only did it materially shorten their front and thereby enable them to increase their reserves, but their troops exchanged the battered defences of the Somme battlefield with its awkward salients for the strongest lines which had yet been built upon the western front. Further, the enemy had withdrawn from a considerable part of the front which Nivelle had intended to attack, and this made necessary a further postponement of his battles, but he still adhered to the main features of his plan. In the altered circumstances grave doubts arose in the minds of some of the senior French generals as to the feasibility of this plan, and when these came to the ears of the French War Minister, M. Painlevé, he assembled a Council of War on April 6, on the very eve of the offensive, at which criticisms of the plan were presented by certain of the commanders who were to take a leading part in its execution. Nevertheless, the French Government decided not to interfere with Gen. Nivelle. It is difficult to conceive of a more unfortunate prelude to a great battle. However, these doubts and hesitations of the leaders were not known to the rank and file of the army or to the French people; and when, on April 9, the spring campaign began by an attack by Allenby's III. Army on the enemy's lines E. of Arras, and by the Canadian corps with one brigade of the 5th Div. on the Vimy Ridge, and met with an immediate success, hopes soared high. The French public was deeply impressed by the rapid capture of the Vimy Ridge, which had for so long resisted Foch's attacks, and great things were expected when the French army advanced.

The second of Nivelle's blows was delivered by the group of armies of the centre, now under Franchet d'Espérey, against the German front in the neighbourhood of St. Quentin; but Franchet d'Espérey was here in contact with a part of the main Hindenburg line, and he had neither the time nor the means to prepare effectively for an attack upon their formidable defences. The operations of the centre group of armies, which had been intended to be an important part of Nivelle's programme, dwindled therefore into little more than a demonstration, which took place on April 14 and had no material results. Nivelle's main battle, which took place on the front between Reims and Anizy, began on April 16. It had been planned that the assaulting troops should on the first day of battle break through the first three German lines. The attack was made by Mangin's VI. Army and Mazel's V. Army, with Duchesne's X. Army and a mass of cavalry in reserve ready to exploit their success. Antonine's IV. Army struck in to the E. of Reims on the 17th. The left of Mazel's attack failed almost entirely; and elsewhere, though the first German line was captured, little progress was made beyond it. The dream of a rapid rupture of the enemy's front had to be abandoned, and a fresh plan of battle had to be formed.

One of the first results of the failure of Nivelle to realize his hopes was that he had to request Haig to press his attacks to the E. of Arras with all possible vigour, so as to keep the largest possible number of Germans occupied in that quarter. This entailed a prolongation of the battle of Arras into a period when gains became small and were only purchased at great price. None the less Haig decided that the situation made it necessary to support the French with all his power, and he fought on till May 17, by which time the British front was established some 4 m. to the E. of Arras and in the plain to the E. of the Vimy Ridge. While Haig was thus battling in the N., Nivelle on the Aisne front had brought his X. Army into his front line, and by slow and bitter fighting had won his way up the Chemin des Dames ridge, of which he captured the eastern portion. Early in May it was quite evident that there was no prospect of

such a break-through as had been planned, and on the 15th the French Government replaced Nivelle by General Pétain, while General Foch, recalled from semi-retirement, became chief of the staff in Paris. Pétain's first task was to wind up the operations on the Aisne front, and the battle ended definitely on May 20.

The spring campaign had proved a failure in comparison with what might have been, and still more in comparison with what Nivelle had promised, but its results were far from being insignificant. The German retreat in March, which was a direct consequence of the battle of the Somme, had at last brought about the attainment of one of the objects for which Joffre had been striving for so long. The Allies had now more elbow room on one of the most vital parts of their front, that which covered directly the roads to Amiens and Paris. Had the Germans in March 1918 started from the positions which they held in Feb. 1917, and had their attacks progressed at the same rate, they would have entered Amiens on the second day of the battle, which would have ended with the German guns bombarding Abbeville and communication between the French and British armies severed. It is therefore not too much to say that the retreat which was forced upon the Germans by the battle of the Somme saved the Allies in the following year. But how much greater might the results have been if the plan formed by Joffre and Haig in the previous Nov. had been followed—if the Germans had been pressed on the Somme battlefield during the winter, and if they had been attacked early in Feb. before their plans for retreat had been completed. Despite all the difficulties with which the successful conduct of that retreat by the Germans had confronted them, the Allied armies had in the battles of April and May captured 62,000 prisoners, 446 guns, and 1,000 machine-guns, and had gained positions of the first importance; 57 divisions had been compelled to fight upon the French front and 99 on the British front. Had Nivelle been content to follow Joffre's example, and to prepare methodically for the exhaustion of the German reserves without overtaxing the endurance of the sorely tried French army before attempting to break through the enemy's lines, he might have claimed a conspicuous success for his first campaign. But the hopes which he had roused had been extravagant, and the dejection when they were not realized was correspondingly great. The dejection was increased by the news of the Russian revolution, and by exaggerated reports of the losses in the Aisne battles; and it was hardly alleviated by America's entry into the war, for it was well understood that American troops could not be ready to take their places in the firing line during 1917. The immediate consequence of this dejection was the outbreak of a series of mutinies in the French armies, which so affected the *moral* of the French troops that Pétain found it necessary to appeal to Haig to keep the enemy engaged while he restored the confidence of his men.

If the attention of the Germans was to be occupied by the British armies it was necessary that they should be forced to fight. Upon any part of the British front S. of the point where it bends S. from the Belgian frontier N.W. of Lille it was possible for the Germans to repeat their manœuvre of March and avoid a battle by retiring into another system of defences, for in doing this they would be merely abandoning a portion of French territory which was of no great value to them, while they might by this method economize sufficient troops to enable them to fall upon the French. On the Belgian front they could not fall back without risking their hold upon the ports of Ostend and Zeebrugge, which were to them important bases for their submarine campaign, and without endangering the security of the chief aerodromes from which their air attacks upon England were made. For these reasons Haig decided to press the enemy with all his available means upon the Belgian front, and on June 7 he began this campaign with the battle of Messines. This battle was most skilfully and thoroughly prepared by Sir Herbert Plumer, and was fought and won by his II. Army. The battle began with the explosion of a number of huge mines, the secret of which had been preserved by constant and devoted watchfulness on the part of the miners, who had tunnelled beneath the enemy's lines many months previously and awaited patiently the opportunity

for their use. The effect of these explosions, combined with a very skilfully planned bombardment of massed guns of all calibres, was such that, except in the right of the attack in the neighbourhood of Messines, the infantry, for once, had little to do. The whole of the Messines-Wytschaete ridge was captured at comparatively very light cost, and the Ypres salient, a name of ill omen for the British army since Oct. 1914, disappeared.

The strength of the British army in combatant troops was now at its greatest. Haig had 64 divisions and 10 cavalry divisions under his orders, and a mass of heavy artillery, tanks and aeroplanes. It was well that this was so, for the army was to be called upon to endure greatly while Pétain and his men got their second wind. Nor was it only the situation on the western front which called for resolute action, for the condition of the Russian army was far more critical than that of the French army. Kornilov had, on July 1, begun an offensive, and if he was supported and encouraged by success in the W. it was still possible that the Russians might continue to be a powerful factor in the war.

With these heavy responsibilities on his shoulders, Haig began on July 31 the second battle of Ypres, with a great attack by the V. Army, which had been moved N. for the purpose. This attack was combined with a subsidiary attack by the French IV. Army under General Antoiné on the British left. The object was to gain possession of the Passchendaele ridge, so as to be able to sweep with gun-fire the plains beyond it toward Zeebrugge and Ostend. This achieved, a combined naval and military attack, which had been secretly prepared in England, was to be made on the Belgian coast, which it was hoped would gain possession of the ports and so relieve the British Admiralty of some of the many anxieties caused by the German "U" boats. In preparation for the landing the British took over from the French the lines on the Belgian coast near Nieuport and moved other troops up to the coast behind these lines. The position at Nieuport, which consisted of a narrow strip of ground, with the Yser at its back, was not easy to hold against determined attacks, and before the British preparations for defence were completed the Germans attacked and captured the lines E. of the river. This was an inauspicious beginning, but worse followed, for the weather broke immediately after the battle began and then followed a rainfall unprecedented for August.

The plan of battle was to deliver a series of blows, each with an objective limited by the support which the artillery could give without changing position. It was believed that the experience of Messines and of Verdun had shown that this would allow the infantry to reach their objective without heavy loss. Ludendorff, however, met this method of attack by a new method which he called the elastic system of defence. He made no attempt to hold his front lines in strength, but withdrew the bulk of his infantry from the zone which would be most heavily bombarded and relied mainly upon machine-guns in concrete "pill-boxes" to break up the British infantry attack, and upon counter-attacks by the troops whom he had held back. But it was less this method of defence than the mud of Flanders which prevented British progress. The opening battle of July 31 gave the British possession of the whole of the Pilken Ridge, of the German first line of defence between Nordshoote and Klein Zillebeke, a front of 10 m., and of most of the German second line, but it was not until Sept. 20 that the enemy's third line was penetrated, and not until Oct. 4 that the British were established on the high ground between Broodseinde and Beclacre. The difficulty of getting guns and ammunition forward through the slough of mud prevented the delivery of a rapid succession of blows, each with a limited objective, as had been planned, and in the event a more terrible strain was imposed upon the British troops than in any other battle of the war. As in the case of the battle of the Somme, the first fruits of the third battle of Ypres were reaped elsewhere than on the battle-front. The Germans, forced to send more and more troops into the fiery furnace which blazed in the Ypres ridges, were compelled to leave the French alone, and Pétain had time to restore the confidence of his army. Part of his method was the delivery of very carefully prepared attacks on a comparatively small front, supported by a great

mass of artillery which should leave the infantry little more to do than to occupy the ground won. The first of these attacks was delivered by Guillaumat's II. Army on the Verdun front, and was completely successful, ending with the French in possession of all the ground which the Germans had won in 6 months fighting in 1916. This was followed by a more important attack delivered on Oct. 23 by Maitre's VI. Army, which gave the French the whole of the Chemin des Dames ridge, and resulted in the capture of 11,000 prisoners and 200 guns. Then and not till then Pétain expressed himself as satisfied that his immediate purpose was achieved.

The British troops, struggling in the mud of Flanders, could not be told the reasons which had called for a supreme effort from them, and the terrible struggle through the mud, unrelieved by any conspicuous success, was a heavy strain upon them. As events turned out it would probably have been wiser to have brought the third battle of Ypres to a close immediately after the French had won the Chemin des Dames, but at that time the British were within a short distance of the crest of the Passchendaele ridge, while information received at G.H.Q. showed that the strain upon the German army had been far greater and that there had been a very appreciable lowering of the *moral* of the German troops. Haig had yet another blow in preparation. The continued bad weather and the slowness of the progress had caused the abandonment of the project of landing on the Belgian coast, and all hope of driving the Germans from the Belgian ports had gone, but there still appeared to be an opportunity of profiting from the exhaustion of the German reserves before the winter gave them a period for recovery, as it had after the battle of the Somme. A final reason for continuing the struggle was that on Oct. 24 an Austro-German attack had been launched in Italy, and at Caporetto had broken through the Italian lines. It was therefore of importance to keep up the pressure upon the Germans on the western front. So the third battle of Ypres was continued, until the ridge and village of Passchendaele were captured on Nov. 3.

A fortnight later Byng's III. Army attacked the German front opposite Cambrai. This battle opened a new era in trench warfare. One of the outstanding difficulties which the trench barrier had created was that it had hitherto eliminated one of the chief resources of generalship, surprise. The time and labour required to prepare for a great bombardment, and the accumulation of the huge stores of material of war on the selected front of battle, made it impossible to conceal intentions from the enemy. But at Cambrai these difficulties were overcome by using a great number of tanks, brought up secretly to take the place of the bombardment in breaking the enemy's defences. The attack was made upon one of the strongest parts of the Hindenburg system, but the tanks successfully broke through, and the surprise was complete. At Messines the guns had left nothing for the tanks to do, and in the third battle of Ypres they had been defeated by the mud of Flanders, but at Cambrai they came into their own. One thing alone was lacking as far as their part in the battle went. The coöperation between the tanks and the artillery in the later stages of the attack was not complete, so that numbers of tanks fell easy victims to the German guns, a lesson of which advantage was taken in 1918. Of greater importance was the fact that 6 French and 5 British divisions had been transferred to Italy to help the Italian army to stem the disaster of Caporetto, so that Haig had not the troops to complete and extend the first successes won at Cambrai. It is a typical illustration of the advantage which their central position conferred upon the Germans that several of the British divisions which would have been invaluable at Cambrai had not reached the Italian front at the time when the Austro-Germans were checked on the Piave and the battle of Caporetto came to an end. So the German counter-attacks won back a good part of the ground which Byng had gained in the first advance, and the battle of Cambrai ended on Dec. 7 in one more disappointment for the Allies.

The campaign of 1917 on the western front had been fatally hampered by the change of plan which had been made by

Nivelle when he succeeded Joffre. That change had permitted Ludendorff to prepare for and carry through the retreat into the Hindenburg line, and had postponed the date of the Allied offensive from Feb. 1, the date fixed by Joffre, until April 9—a delay of nine precious weeks. As Joffre had anticipated, it had been necessary for the British army to bear the brunt of the fighting, but it would have done so under very different conditions if the Germans had been hustled back into the Hindenburg line, as they were in Sept. 1918, and if Messines had been fought at the beginning of April, and the third battle of Ypres had begun on May 30 instead of July 31. The battle of Cambrai might then have synchronized with the last offensive of the Russian army, and the combined effect might well have been such as to have saved that army from dissolution, for adequate French and British reserves would have been available in France to support Byng's attack, and the war might have ended victoriously in the autumn of 1917. As it was, the battles of 1917 showed clearly that the solution of the problems of trench warfare at which Haig and Joffre had arrived was correct. It was first necessary to exhaust the German reserves and then to strike a surprise blow or series of surprise blows. Cambrai had shown how surprise might be achieved. But all this experience, which had been purchased at great cost, had been acquired too late to be put to profit in 1917, owing to the fatal delay in opening the campaign of that year. The collapse of Russia was definite and complete, and the Germans were transferring their divisions from E. to W. as rapidly as their railways could carry them. The French divisions had since the middle of the year been gradually reduced in strength, as France had no longer the men to replace the losses in the ranks, and now Pétain found himself compelled to cut down the number of his divisions. The British army was not receiving from home the men to fill the gaps caused by the bloody fighting of Passchendaele; and Haig, early in 1918, was compelled to follow the example of the French and reduce the strength of his divisions, while 11 British and French divisions had been removed to Italy. True, American troops had reached France, but it was improbable that they would be able to take their place in the line of battle before the middle of the summer. In April 1917 there were in France and Belgium 64 British, 108 French and 6 Belgian divisions, or 178 in all, opposed to 128 German divisions. At the end of the year there were 59 British, 98 French and 6 Belgian divisions, a total of 163, opposed to 175 German divisions. Further, the British and French divisions were considerably weaker at the end of the year than they had been at the beginning, though this was offset, to some extent, by a corresponding reduction in the size of the German divisions. Most important of all, there were still large German reinforcements, which might amount to as many as 40 divisions, and did, in fact, amount to 32, ready to come across from the Russian front. The Allies could only obtain reinforcements in the shape of formed divisions by withdrawing troops from Palestine and Salonika, and to this their statesmen were opposed. So fate decreed that at the very time when the Allies had at last found out how to breach the trench barrier, they were thrown willy-nilly on the defensive, and had to prepare to meet the greatest effort which Germany had yet made in the west. (F. B. M.)

III. GERMAN OFFENSIVE, 1918

The military situation of the Central Powers at the end of the year 1917 and the beginning of 1918 has been thus described by Ludendorff in his *Memories of the War*:—

"Throughout the latter half of 1917 I had strained every nerve to bring about the results that had now been attained, sparing myself no more than I spared others. The western front had held, the Italian army was defeated and the Austro-Hungarian armies in Italy were inspired with new courage. The Macedonian front was holding out. In the east the armistice negotiations were finished and the way to peace lay open to the diplomats. Negotiations at Brest Litovsk were to begin about Christmas. There was a prospect of our winning the war. Only in Asia Minor had there been any hitch, but the great events in Europe had pushed into the background."

Under the influence of this hopeful outlook the German Supreme Command decided in favour of a decisive battle in the

western theatre of war in the spring of 1918. This decision was justified in the first place by the collapse of Russia. Fortune had favoured the Central Powers there, apart from their own military successes. Yet these might be regarded by them as having made good fortune deserved. The problem of a "war on many fronts" had been clearly comprehended, and the principle of first completing the work that had to be done in the east had been consistently maintained. But the fortunes of war are seldom all on one side—as Hindenburg and Ludendorff were to discover. The peace negotiations in the spring of 1918 dragged on so long in Trotsky's hands that not only did a new appeal to arms, though a brief one, become necessary, but the final result was merely an "armed peace." This involved keeping strong German forces tied up in the east to secure the treaty and profit by it, and prevented the best use being made of these forces in the decisive battle of the war on French soil. But the fact remains that the chief presupposition—indeed, the indispensable one—on which the Supreme Command founded their project was the breaking up of the enemy in the east. By the end of March 44 divisions had gone to the west, followed in April and May by 15 other divisions, among which were 3 of cavalry.

It was a question of considerable importance whether, and to what extent, the participation of the Austro-Hungarian forces in the coming decisive battle would be possible. The Italian army, though not destroyed by the short autumn campaign of 1917, had been so thoroughly beaten, and was so unstrung morally, that it might reasonably be neglected as a military factor for the next few months. The offensive there had also had the important result of drawing off 11 French and English divisions from the French theatre of war to Italy. The duration of Italy's collapse was, of course, uncertain. It would presumably end automatically when the Central Powers dropped their menacing attitude. All the more was it important to maintain this. But it was not considered necessary to keep German fighting forces in the Italian theatre of war to this end. The moral of the Austro-Hungarian army had risen so markedly since the success of the last offensive that it seemed equal to carrying out this task without German support. The 6 German divisions in Italy were accordingly withdrawn during the winter, and were in the French theatre of war by the end of March. The German Supreme Command would have liked to use the Austro-Hungarian army to still greater advantage in the general scheme by bringing over a number of good fighting divisions and some heavy artillery to take a direct part in the forthcoming battles in France. This had been agreed upon in principle at a conference between Ludendorff and General von Arz on Nov. 3. The matter was further discussed in writing up to the beginning of Jan. 1918. But in the meantime other influences were at work, opposing the designs of the two Supreme Commands. According to Gen. von Arz the Austrian Emperor and Empress were averse to sending Austrian troops to fight on French soil against the French; and the non-German nations of the Austro-Hungarian Monarchy, supported by the Social Democrats, were strongly opposed to taking part in the war in the west. The German Supreme Command, on being informed of this, sent Gen. von Cramon, their representative with the Austro-Hungarian army in the beginning of 1918, "a definite order to insist upon a binding declaration." Arz replied that no Austro-Hungarian divisions would be available until peace had been concluded with Russia and Rumania, but that artillery could be sent, though it would be deficient in munitions. This offer was accepted.¹ General von Cramon succeeded in persuading Hindenburg and Ludendorff, in spite of the doubts which these proceedings had aroused in them, to make another request for the coöperation of Austro-Hungarian divisions in the western theatre of war. But Cramon's intervention with General von Arz in the meantime did not succeed. General von Arz explained to him in the end in strict confidence that it would not be agreeable to those in high places if infantry were sent to the west. As a last resource now the German Supreme Command tried to stir up its ally to an attack in Italy. On March 15

¹ Von Cramon, *Unser Oesterreichisch-Ungarischer Verbündeter*, p. 6. The number of heavy batteries sent was 46.

Hindenburg implored General von Arz to arrange for an immediate offensive by the Austro-Hungarian armies in Italy, to relieve the German army in its difficult decisive battle. After some hesitation Arz replied on March 27 that he would rally all the means at his disposal and deliver a blow against Italy at the end of May which should completely break her.

Germany was thus left to carry out the decisive battle on French soil on her own resources. There were three enemies to be reckoned with: England, France and America. The British had borne the chief burden of the fighting during the latter half of 1917, when the great battle in Flanders had towered over all other events in significance. In spite of the lost ground in the Ypres sector, and the unavoidably heavy loss in fighting power, it could in the end be registered as a German victory in so far as the English had failed to achieve their strategic aim, the destruction of the German submarine base in Flanders. For the estimation of future prospects, at least as important as this happy issue was the apparent failure of the British attack system—with its unreserved employment of masses in a battle of *matériel*, and its methodical conduct of the offensive as a series of thoroughly prepared attacks with objectives limited in space and, once chosen, rigidly adhered to. It was believed that this system revealed a lack of capacity for operative manoeuvring inherent in British leadership and in the British army. The tank battle at Cambrai in Nov. was looked upon as a further proof of this. Should the Germans succeed in bringing about a war of movement again in the west, their conviction was that they would prove themselves superior to the British.

Contrasted with the powerful effort that the British had put forth to gain the victory in Flanders, the ends for which their French allies were striving in the second half of 1917, after the failure of the great Aisne offensive, were apparently more modest. The local attacks to which they confined themselves at Verdun and later in the Laffaux corner turned out favourably for them, it is true, and inflicted considerable losses on the Germans. But on the whole their cautious strategy led to the deduction that the moral depression of the French nation and the army, which had set in after the battle of the Aisne, and was not hidden from the Germans, had not been overcome. Not that the German Command was likely to regard the spirit of France as permanently paralysed; on the contrary it was considered certain that the French army, in the following spring, would enter the struggle for final victory completely refreshed and stronger than before. In comparison with England she was the militarily stronger opponent, more skilled in strategy and tactics, and more dangerous.

When it had to be decided upon which of the two the German blow was next to fall, a success over the British therefore suggested itself as being more easily and certainly obtainable. Added to this there was the consideration—decisive from a political standpoint—that the principal enemy, England, would probably be more inclined for peace when she herself had suffered a crushing defeat. In this respect the estimated value of the respective opponents had altered considerably from that made by Falkenhayn, which had passed muster two years earlier. The war in which England was fighting with her own forces on the European continent was, since the battle of the Somme, no longer a "side show." She was, on the contrary, now conducting it with all her available forces, with the utmost tenacity and with her own weapons. For the rest it might be assumed that when the German "hammer blow" fell on the one enemy, the other would not stand idly looking on, but would either directly assist his ally or proceed to a relief offensive. One hammer blow would not suffice. A general battle was therefore launched. Ludendorff dwelt on this in making his report to the Kaiser on Feb. 13 1918 at Schloss Homburg, when he said:—

"The battle in the west which the year 1918 will bring presents the biggest military problem ever set before an army. France and England have grappled with it in vain for 2 years. . . . It must not be imagined that we are going to have another such offensive as in Galicia or Italy. It will be a stupendous struggle, beginning in one place and continuing in another, and will take up a long time."

As regards the relative strengths of the two sides, the German High Command cherished no illusions as to any marked numerical

superiority for their own forces. The strength of the German army in the west was brought up to 194 divisions by the addition of divisions brought up from the eastern and Italian theatres. The Entente forces in France in Feb. 1918 were estimated at 167 divisions. If the 11 French-English divisions in Italy, which were easily available, were added to these, there remained only a slight superiority in the number of divisions on the German side. In artillery the German western army was not even quite as strong as its opponents. Ludendorff based his decision on the theory that the totals of the two fighting forces would balance each other. A factor which counted for much with the Germans was the physical condition of the army. An offensive attack best suited the character of the nation and the tradition and training of the troops. It was the more powerful form of warfare. Germany owed to it all her previous tangible successes. The ordinary citizen could see, through all his heartfelt longing for peace, that his efforts could only be rewarded when Germany had overthrown her enemies. Here and there, it is true, the same disintegrating influences which were undermining the war spirit at home could be seen at work in the army. But the influence of the good elements, which far outweighed the rest, stamped the whole as an excellent body of men. Their "will to win" was not indeed inspired purely by victory for its own sake. The attack was longed for also as a deliverance from the terrible battering which they had endured for years with resignation and with courage.

It now became supremely important to find out the precise moment at which the American forces would actively intervene. In a review of the situation drawn up by the German Supreme Command in the winter of 1917-8 it was stated:—

"The United States are forming an army of about 50 divisions, of which three only have as yet landed in France. One of these is at the front to be trained. The two others are in need of more training behind the front. By the spring of 1918 the American forces in France may reach a strength of about 15 divisions. The mass of the divisions will only be suitable for use on quiet fronts. Only the 3 divisions now in France may be expected to take part in a spring offensive. The corps of officers is not yet trained for war on a large scale. On these grounds the independent use of large American units in difficult positions will be out of the question at present. The drafting of reserves and the arming and equipment of the American troops are good. Training is still inadequate. But the first regiment put in at the front fought well during a German attack, and it is therefore to be expected that the American soldier, after more training and experience, will prove himself a worthy opponent."

In another calculation, made in Dec. 1917, the Supreme Command estimated the whole of the American forces that had been landed in France up to the spring at 450,000 men at most. A larger number was not to be expected on account of the lack of shipping for transport. The mass of this army could not be ready for an attack by the spring of 1918. The value of the Americans at first would therefore lie in their power to set free English-French divisions on quiet fronts. As a matter of fact this calculation of the American strength was too generous. The total number of Americans landed in France up to the end of March 1918 has been stated by the American Secretary of War at just under 370,000. Of these only 144,000 were included in the 5 fighting divisions. The fact that the Germans did not at once realize the full extent of the increase in American transports, from April onward, in response to the urgent demands of England and France, does not actually affect their review of the situation at the end of 1917 and the beginning of 1918. When Hindenburg and Ludendorff resolved on the decisive attack they were entitled to hope for so crushing a victory over the English and the French by beginning operations early that the palm of victory could not be snatched from them again even by very considerable masses of American troops, whose intervention would only become effective in the later war of movement. Supposing—as a basis for the actual starting-point of the offensive—the Germans to be in possession of the line Doullens-Amiens by the beginning of April, which was within the realm of possibility, the annihilation of the British army might be completed within that month. Meanwhile the battle against the French would have broken out in full force. During the months of May and June a decisive defeat had to be inflicted on them also. If that succeeded, the

Americans—whose troops were for the most part not yet sufficiently trained for a war of movement—would merely be swept into the general debacle. Entirely inexperienced in the leading of great masses, they would hardly change the decrees of fate.

The Germans had of course to take into account the fact that even a complete military victory by the Central Powers in 1918 on the continent would not end the war, so long as the will of Lloyd George in England was unbroken. Again, should the Entente by a great effort succeed in readjusting the situation on the continent, the war of starvation could be carried on with greater effect in proportion as the submarine menace diminished. The question was therefore whether the Central Powers, after subduing their enemies on the continent of Europe, could still hold out economically. The opening of the Ukraine had come so late that it was extremely doubtful whether its resources would be available in time to stave off the threatened economic collapse of the nations of the Quadruple Alliance. Ludendorff had no illusions upon this point, being convinced that it was absolutely essential to have his military offensive in the west accompanied and supported simultaneously by a political offensive on a large scale on the English home front. This would be directed toward bringing about the fall of Lloyd George and persuading the English nation to accept rather Lord Lansdowne's efforts in the direction of peace. It was for the political leaders to call into being and carry out a propaganda offensive of this nature. The commander-in-chief could only demand it—and this he did.

As early as the middle of Jan. 1918, Ludendorff had handed in to the Imperial Chancellor, with a strong personal recommendation, a memorandum for a German political offensive drawn up by Colonel von Haeften. But this urgent warning to the political leaders of the State met with no response. The politicians were unmoved. Once more, on June 3 1918, Ludendorff made another passionate appeal to the Chancellor to undertake a political offensive against the English home front, again sending a memorandum by Colonel von Haeften, which this time included a detailed plan of campaign. But it was unavailing.

The question arises here whether the German Supreme Command would not have done better, at a moment when they were militarily strong, to attempt their utmost to induce the political heads of State to prepare the way for peace. Ludendorff's published memoirs show that it was never opposed to efforts aiming at an honourable peace that would safeguard the existence of the German Empire. But all the attempts in this direction made by the political leaders found the Allied Governments unresponsive, and were regarded merely as signs of internal weakening in the Central Powers. Ludendorff was to see for himself, shortly before the beginning of the great spring offensive, how little the attitude of the Entente statesmen had changed and how hopeless and damaging the renewal of any such attempt would prove. According to a credible report from a neutral country, Washington's readiness to enter into official peace negotiations depended upon the following preliminary conditions: the unconditional evacuation of northern France and Belgium; the payment of reconstruction expenses; Alsace and Lorraine to be made independent; the annulling of the treaty of Brest Litovsk, just concluded in the east; reference of all eastern questions to a peace conference to be summoned by the Entente; and a complete change of the Government system in Germany on lines to be laid down and enforced by President Wilson later. A commander-in-chief who, in the spring of 1918, should have pressed the political leaders to pave the way for peace negotiations under such conditions, without having tried for a decision on the field, would have been cursed by his fatherland.

Plan for a Break-through at St. Quentin.—Suggestions for an offensive had been made by the higher command of Prince Rupprecht of Bavaria's army group after the English offensive in Flanders had died down in the beginning of Nov. 1917. The suggestions culminated in the proposal to launch the main attack from the Armentières-La Bassée front in the direction of Hazebrouck against the right flank and rear of the British, on the assumption that they would certainly concentrate their forces in Flanders in the coming spring for a renewed break-through

operation in the direction of the German submarine base. The Allies would then obviously be in a difficult operative position. The mass of their fighting forces would be crowded up on the extreme N. wing of the whole western front. To bring up strategic reserves would take time. On their left flank and rear lay the sea. For the British in particular, strategically less trained as they were, it would not be easy to deploy their closely packed masses in the direction of the right flank and to cover their threatened communications, all the more so as a large part of their non-mobile fighting material was rigidly fixed. Tactically the prospect of breaking through the front was a good one, since the attackers would be faced by few positions technically very strong. It was, however, recognized that the country would be a difficult one in which to follow up the attack, which would be hemmed in between two commanding ranges of hills, and still further confined to the left by the La Bassée canal. It would therefore have to advance mainly in the wet Lys depression, and the ascent to the Bailleul and Hazebrouck heights would have to be carried by fighting. On account of the wet ground the operation would probably have to wait until the middle of April. General Ludendorff fully acknowledged the advantages of the proposed operation, but laid stress on the serious difficulties presented by the ground, and above all on the point that the attack, being dependent on the weather, could not be made early enough. He considered that an attack in the region of St. Quentin offered better prospects. When the line of the Somme-Péronne-Ham had been captured, the attack could proceed in a N.W. direction, resting its flank on the Somme, and might succeed in rolling up the British front. The higher command of Crown Prince Rupprecht's army group held to its own point of view, however, that the attack on the line Armentières-La Bassée in the direction of Hazebrouck—code name "St. George"—was to be preferred on tactical and strategical grounds to any other offensive setting in farther to the south. Their reasons were thus stated in a memorandum of Nov. 20:—

"In consideration of the general political situation and the appearance on the scene of the Americans, the attack should clearly be made as soon as possible. On the other hand a decisive effect can only be attained if the objective, i.e. the mass of the British army, is securely united in massed groups in Flanders. This condition of security can only exist when the British in Flanders are preparing to attack. Our offensive can only set in when this has become a certainty. The British must attack in Flanders again in the coming year. They are forced to do so by our submarine base. We may therefore count on it with certainty and make a strategic use of the situation. Side by side with these considerations arises that of the difficult nature of the ground in the Lys depression, which makes it imperative *not to attack too early*. From previous experience and observation it would appear that considerable difficulty may be expected with the ground and the water up to about the middle of April. . . . The British in Flanders have similar ground conditions to consider. If they proceed to the offensive, our attack at Armentières-Estaires would presumably be possible also. We should do best therefore—both as regards the operative effect and the state of the ground—to wait until the British attack in Flanders. It will then be necessary at first for us to give way before the enemy offensive in Flanders, and—so far as possible—on the French front also. If we accept the defensive battle, we shall have to tie up such strong forces in the process that we shall not be powerful enough for an attack. We can without hesitation afford to retire as far as the line Vladoloe-W. of Roselare-Werwicq, as the submarine base will still be covered."

Opposition was also raised in some quarters to an attack from the La Bassée canal front to the corner of Bullecourt, on the ground that it would come up against a strongly fortified system, and that no rapid result at the start could be expected. The enemy would, it might be assumed, gain time for bringing up his reserves from the north and the south. "Unless the circumstances change considerably in our favour there is a danger of the operations resulting in a pocket being formed in the front and not in a decision in the war of movement."

The idea of an attack delivered from the II. Army's front—code name "Michael"—was criticized as follows by the higher command of Prince Rupprecht's army group:—

"Decisive operations by the II. Army can only aim at a break-through of the enemy front and the attainment of the best possible results in the war of movement against the enemy's reserves. The

Somme—an unusually powerful obstacle—will serve as a support for the left flank. The main idea of an operation on the II. Army front must therefore be to break through the enemy front in the first place, in order to protect the left flank against the French and roll up the enemy front toward the north. The operation would then be continued in the area between the Somme and the Pas de Calais against the enemy forces there, as a war of movement with a N.W. direction. The enemy would have his back to the sea. There would be a prospect of a decisive victory if the operation were pushed far enough forward. The progress of the operation in detail after the successful break-through would depend upon the measures taken by the enemy, and cannot be foreseen. Operations of this order presuppose strong forces, considerably stronger than would be necessary for the "St. George" scheme. The advantages of this scheme are that in the II. Army area operations are possible at all seasons; that the enemy positions—excepting those S. of St. Quentin—are not strongly built up and are but thinly occupied at the moment; that the question of strong enemy reserves need hardly be considered, as the British will make their attack in Flanders, and the French are not likely to make theirs against the II. Army. If the French should prepare an attack at St. Quentin, the German attack would have to set in farther to the north. The disadvantages are that the operations would lead through the ruined tract of country "Alberich,"¹ and would involve crossing the wide area of the Somme battle, strewn with positions and craters; that the II. Army front runs from N.W. to S.E., while the direction desired for the main operation is N.W. It therefore becomes considerably more difficult to roll up the enemy front towards the N.W. after the successful break-through.

"The attack would first have to be made in a W. direction as far as the Somme, and could only later develop toward the N.W. A certain amount of time would necessarily be wasted before the operation of movement came into swing. This would give the enemy an opportunity of bringing up his reserves, the network of railways being favourable for the purpose."

Although General Ludendorff and the chief of the general staff of Rupprecht's group of armies, General von Kuhl, were agreed on the main point that the offensive should be directed against the British, the chief of the general staff of the German Crown Prince's army group, Count von der Schulenburg, held at first a directly opposite view, considering an attack on the French to be the better policy. "England, with her dogged self-confidence," he said, "is not likely to end the war on account of a partial defeat of her army. She will be more inclined for peace when the power of the French is broken by a heavy defeat." Count Schulenburg's proposal was "to attack in the Argonne and to the E. of it, and simultaneously to carry out a strong attack from the St. Mihiel region in a W. direction. The objective of the attack would be Verdun, and, if possible, the destruction of the portion of the French army enveloped by the attack. The wooded, indistinct character of the deployment area would make it easier to hide the preparations for attack. The attacks would have a good chance of success if managed as a surprise. The French would never get over the loss of Verdun. If the seizure of the fortress were combined with a decisive victory over a portion of the French army, which would mean depriving the French of the possibility of a really promising offensive in 1918, the French nation and its army would be swept by a great wave of depression:—

"The British are certain to attack in Flanders if we attack the French at Verdun. A French offensive may be predicted with equal certainty if the British are attacked. If the Supreme Command is not in a position to execute a big attack, and at the same moment fight a defensive battle in another place, there remains the possibility of evading the enemy attack on the threatened front by retreating. This could be carried out by the VII., I. and III. Armies, and also to a limited extent in Flanders presumably, but not E. of the Argonne or on the V. Army's front."

The armistice concluded with Russia on Dec. 15 made a considerable difference in the general situation. Russia no longer counted as a military factor, and the balance of power in the western theatre of war had now readjusted itself in favour of the Germans in consequence. All the reports received pointed to the conclusion that the Entente Powers would for the present limit themselves to a strategic defence, and would refrain from a great offensive until strong American forces became available. This was all the more probable because the effect of the submarine war so far could not apparently be considered so successful

"Alberich" was the code name for the destruction of the ground rendered on retreat to the Siegfried positions in the spring of 1917.

as to force Great Britain to undertake the destruction of the German submarine base in Flanders at an early date. This change in the situation removed the principal presupposition on which Gen. von Kuhl's proposed offensive at Armentières-La Bassée in the direction of Hazebrouck was based. The close massing of the British main forces in Flanders in the coming spring could not be relied on. It was far more likely that the Allies would distribute their reserves behind the front and place them in readiness round important railway junctions. It could not be denied that the operative conditions for a break-through in the St. Quentin region might also be unfavourably affected. The possibility of a French relief offensive had still to be faced.

In these circumstances Ludendorff refrained from laying down any definite direction for the attack against the British for the time being, reserving his decision until he could see how the situation developed. On one point only did he insist—the moment of the offensive must be fixed as early as possible on account of the Americans. With this in view the Supreme Command issued an order on Dec. 27 1917 for the preparation of several attacks on different parts of the front. The preparations were to be pushed forward so as to be complete by the end of March.

Count Schulenburg's original proposal—an enveloping operation at Verdun—had not yet been rejected, but was for the present only to be treated as a rough draft, the German Crown Prince's group using it as a foundation for an offensive from Champagne and the W. of Verdun on Clermont, and Duke Albrecht's group for an attack over the Meuse, S. of Verdun (code name "Castor and Pollux").

On one point the Supreme Command was now quite clear. The offensive must not take the form of a battle of *matériel*, such as the Allies had over and over again attempted, invariably without results. German aims would not be furthered by an offensive which condemned the forces to months of strain. The break-through must be made to lead up to a decisive operation in the open field. This could only be done if the enemy's trench system were overrun so rapidly that the reserves he had brought up could not arrive in time to intercept the blow behind the dented-in front. A prompt and complete success was only conceivable at the moment of the surprise. This could only be attained by observing the strictest secrecy with the troops concerned in the attacks. Each army must be convinced that the attack which it was preparing was intended to be the one actually selected. To this end all preparations for attack, in respect of laying out communications, shelters, aerodromes, etc., were to be spread over the whole army front as far as possible. The placing of the troops in readiness was to come later, and was to be undertaken outside the selected battlefield by various large groups which could be quickly and secretly formed up for deployment in different directions by train and by night marches. Another feature was to be the deception of the enemy, who was to be perplexed by the semblance of an attack on the whole army front (artillery registration and so forth), by partial actions with limited objectives, and by feints of great attacks in other places. All the attack preparations were to be carefully observed on the ground and from the air, to see that they were not attracting attention. Although it might be impossible to prevent the enemy from discovering the direction of the attack in time, it might reasonably be hoped to keep him in uncertainty as to the movement and the scope of the attack, and the form which it was to take. Success therefore depended very considerably on the most rapid execution of the attack itself.

On Jan. 24 the Supreme Command decided which of the attacks should be carried out. The choice fell on the "Michael" operation in the zone of the XVII., II. and XVIII. Armies. At the same time the XVIII. Army was ordered to be transferred to the German Crown Prince's group of armies with the Omignon brook for its northern boundary.

In preparing for the Michael attack, the XVIII. Army's direction was to the N.E. of Bapaume, the II. Army's to the N. of the Omignon brook, and the XVII. Army's to the S. of the Omignon brook on both sides of St. Quentin. The XVII. Army was to prepare a simultaneous attack S. of the Scarpe (code

name "Mars South"), and the VII. Army another S. of the Oise across the front of the Crépy group (code name "Archangel"). The Michael operation was to take place about March 20, the Mars South and Archangel attacks a few days later after the regrouping of the necessary artillery and mine-throwers. The aim of the Michael attack was to be a break-through of the enemy front as far as the Somme on the line Ham-Péronne, and an advance, in conjunction with the Mars attack, on the right back of the Somme through Péronne-Arras. The Archangel attack had merely to make a diversion, and try to seize the heights E. of the Oise-Aisne canal.

The Supreme Command also gave instructions that preparations for the attack over the Lys depression at Armentières-Estaire (St. George I.) and towards the Ypres salient (St. George II.) by the VI. and IV. Armies were to be pushed forward so as to be completed by the beginning of April. The idea of an enveloping attack at Verdun ("Castor and Pollux") was allowed to drop, as the chief of the general staff of army detachment C. had held out only very moderate hopes of success for an offensive S. of Verdun across the Meuse. On the other hand, in the event of a great French attack in Champagne, there was some thought of letting the III. Army fall back within certain limits, while the I. Army delivered a flanking counter-attack.

Ludendorff thus held fast to his plan of directing his offensive blow against the British. In choosing the Michael instead of the St. George operation, he was influenced chiefly by the fact that it would be independent of seasons and weather conditions and could therefore be carried out earlier. The tactical attack would, moreover, fall on a particularly weak spot in the enemy's front.

The idea of a diversion on a large scale, to take place either before or simultaneously with the Michael operation, was abandoned, as it seemed necessary to use all the available forces for carrying out successfully the one great blow as planned. On the other hand the Supreme Command arranged for deceptive measures to be taken at various points on the armies' front, e.g. a lively artillery battle on the St. George and Archangel fronts; partial actions on the I. and III. Armies' fronts, particularly at Verdun; a long-range artillery battle on the Lorraine front. These commenced in some cases in the beginning of March, and were continued in the days immediately preceding the battle and until after it was well started.

On March 10 Hindenburg sent out a definite order fixing the morning of March 21 for the attack. According to this order the centre of gravity of the operations lay in the XVII. and II. Armies both at the beginning and during the later development. After achieving the first great tactical aim—the cutting off of the British in the Cambrai sector, the offensive was to be carried N. of the Omignon brook in the direction of Albert-Arras and beyond, where the British front was to be dislocated by the VI. Army. The XVIII. Army was only required to cover the left flank S. of the Omignon brook, and to this end to take possession of the Somme and of the Crozat canal. Its deeply echeloned right wing could be extended northward to Péronne in case of necessity. An additional order from the German Crown Prince's army group in the meantime paved the way for the idea of a new move by the XVIII. Army by contemplating the possibility of its advance over the Somme and the Crozat canal. General von Hutier, commanding the XVIII. Army, at once grasped this idea—it had probably occurred to him before—and, in a document handed in to the army group on March 15, proposed as the XVIII. Army's task "as soon as the Somme and the Crozat canal had been crossed, to draw upon itself the French reserves designed for the support of the British and beat them, and to break the communications between the British and the French. . . . The sooner the army reached the line Chaulnes-Roye, the more chance would it have of meeting the French while they were still deploying, and the better the prospect of bringing about the war of movement." The Higher Command of the army group passed on the proposal with the additional note: "the more the French counter-offensive spends itself on Rupprecht's army group, the more effectually will the proposed operation hit the French. The enemy will be quick to recognize its decisive meaning

and the threat to his capital. We may, therefore, expect a very strong resistance, and on that account the operation must be launched by powerful forces."

Ludendorff's attitude toward this proposal is not known. It would appear from a conversation over the telephone with General von Kuhl on March 20 that he had already weighed the possibility of accommodating himself to the idea if circumstances so shaped themselves, since he now intimated his intention of fixing the centre of gravity for the advance of the XVII. Army in the direction of St. Pol, and that of the II. Army in the direction of Doullens-Amiens—in case the XVIII. Army should meet with strong French opposition on the line Bray-Noyon if not earlier.

The peace training of the German General Staff was based on the strategic and tactical principles of its former chief of many years' standing, Count Schlieffen. Although a declared champion of the Cannae idea, the Count had also definitely accepted the break-through in his reflexions and teachings, though only under the conditions of a war of movement. In choosing the spot for the break-through Count Schlieffen considered the tactical weak spot within the enemy's lines to be of the first importance as a clue. At the same time there must be the possibility of following up a successful assault and break-through by an operation in a useful direction. He therefore considered a simultaneous attack against the whole enemy front to be the best means of breaking through, as by this their forces would be tied up, the reserves engaged and the shifting of troops to another place prevented.

When Ludendorff in 1918 was faced with the problem of the break-through, it was *not* under the conditions of a war of movement. The outward appearance of the war had fundamentally changed in the war of positions which had lasted for years. The defence was established along the whole front in a modern field position constructed according to a technique based on experience. The German attacking force was therefore confronted everywhere with the task of overcoming the opposition of the enemy in its tactically strong positions. For this he needed—at whatever point the break-through was attempted—the means employed in siege warfare, in particular a large quantity of heavy artillery and flame-throwers. For all that, however, the enemy positions were not everywhere equal in their tactical power of resistance. The ground, constructional work, density of occupation, formation of reserves, and value of the defence troops, showed many points of difference, and admitted of the sorting out of strong and weaker portions of the front. Ludendorff formed his decision quite in the spirit of Schlieffen's teaching. He, too, spied out the enemy's weakness. For the choice of the English front the leading political motive was probably primarily responsible, but the decision also happened to be in agreement with the military considerations. For although the British and French troops, in respect of their power of resistance, in tactical defence might be assessed at equal value, the British were inferior to the French in the skilled handling of masses, in the art of defensive battle and in power of strategic manoeuvre. The weak points within the 140-m. British front in question, Armentières-La Bassée and St. Quentin, had undergone an exhaustive critical examination by the Higher Command of Rupprecht's army group. If Ludendorff decided to attack at St. Quentin it was because he would be hitting the enemy at his weakest point.

Military critics have raised the objection that Ludendorff let himself be swayed too much by tactical considerations and neglected the demands of strategy, seeing his own task from the very beginning only as a battering performance, consisting of a succession of independent hammer-blows. There is nothing to support such views. Rather is it evident that Ludendorff, here as always, was basing his strategy on the prospect of a promising tactical battle in complete accordance with the Schlieffen ideas. The attack delivered from Lens in the direction of St. Pol, as recommended by the French Gen. Buat, was extremely difficult tactically and did not offer any guarantee of a prompt initial success. But on this everything depended. Moreover, Ludendorff, in placing the attack where he did, had had visions of one great definite strategic aim, to break through the front of the

British army on its S. wing, cut it off from the French, and by pressing on its right flank and attacking it from the front cause it to waver and fall to pieces and force it back to the coast. What was that but a "Cannae operation," in which a natural obstacle—the sea—took the place of Hasdrubal? A second natural obstacle—the Somme—was to serve the German left wing, advancing in deeply echeloned formation, as a protection against a French flank attack. The difficulties presented by the unavoidable traversing of the ruined Alberich area, and the Somme battlefield with its craters, were fully recognized, particularly as regards shelter and the bringing up of fresh drafts. These difficulties would diminish, however, as soon as the operation reached out into the country as yet untouched by battle, to the W. of this zone. Only in case that did not succeed would the disadvantages of this wilderness as a permanent stopping-place become evident.

On one point indeed, and that the most vital, did Ludendorff's procedure differ from Schlieffen's form of strategy. The German attack was directed, not against the whole enemy front, but against a limited section only. The perfectly obvious reason for this was that the fighting forces and battle requirements came nowhere near being sufficient for such an undertaking. The question is, whether it would have been possible and desirable to carry out the Schlieffen idea in a general sense, if not literally. The aim of the attack on the whole front was to engage all the enemy's forces, particularly his reserves, who might otherwise in due course intercept and choke off the break-through, just as it became ripe for operative development. Ludendorff saw the danger of this quite clearly, and sought to avert it by feint attacks on as many parts of the front as possible, by threats of a great attack and by partial actions on a small scale. These measures undoubtedly had a great temporary effect. Pétain refused to send more than 3 divisions to Haig's hard-pressed front on March 24, on the ground that Ludendorff's main attack was to be at Reims, where the artillery battle had already begun. But the effect of these measures lasted only a short time, of course, and were limited as to material. The enemy's reserves were not absorbed, but could still, though after much delay, be moved and brought up to the decisive battlefield. It would certainly have been more in accordance with the Schlieffen idea if, alongside of these feint attacks and reaching beyond them, a serious diversion had been undertaken shortly before the main attack began. It would have had to be carried out by a strong but strictly limited number of troops, to give promise of a prompt initial success and to have a limited objective. For this purpose, so far as the British front was concerned the "St. George" operations across the Lys depression were not possible, on account of the season and weather conditions. In Flanders the circumstances were similar. There remained only the VI. Army front between the La Bassée canal and Arras. It may be questioned whether the attack, which was tactically very difficult here, would have succeeded to a sufficient extent in its object of tying up the strong enemy reserves. There were, in any case, important reasons for the decision not to make a preliminary diversion at this point in order to have a more powerful force to put in to the decisive battle itself.

On the French front things were essentially different. It was of the utmost importance that if the proposed operation were to succeed it should be secured from a strong flank attack by the French, and not be brought to a standstill by a relief offensive on a large scale. It is known that Ludendorff had intended the VII. Army to execute a diversion. But this was to take place after the great offensive had begun, and could not therefore have the effect of drawing off strong reserves of the enemy in a wrong direction and holding them fast there. The diversion would also be too closely in touch with the main attack as regards space. Several places had been proposed for a German diversion on the French front, such as the Chemin des Dames region and Champagne. Verdun was less suitable on account of the large force that would be required. The front of Duke Albrecht's army group in the Meuse (Treuschthal) also seemed suitable. If the attack were made there the French reserves would be far away from the point of the coming decisive battle.

As far as the actual number of good attack divisions was concerned there were ample forces available. The spring offensive opened on March 21 with 62 divisions. Up to the close on April 5, 92 divisions had been put in, and even so not all the divisions available for attack purposes had been used up. This powerful mass would probably have been even more effective if it had not been used exclusively and directly for the break-through operation itself, but had been devoted in part to putting the French reserves into fetters at another place. General Buat even goes so far as to say that only by a series of diversions, delivered simultaneously or in rapid succession in different places, could the operative success of the break-through have been guaranteed. He admits however—and herein lies the point of the decision—that this method was impracticable for Ludendorff owing to lack of sufficient forces. For it was a question not only of having in readiness the required number of divisions but the massing of artillery, flame-throwers, airmen, munitions, motor columns and numerous other necessities of war. Of these the Supreme Command had not enough available for the furnishing of a powerful diversion immediately before or at the time of the main attack, if this was delivered on the scale planned. A diversion was therefore only conceivable in the event of a reduction of area or material in the main attack. But any reduction of this sort would have lessened the chance of a great and rapid victory on the spot selected, the indispensable condition of the undertaking.

The conclusions are that not only was the application of Schlieffen's theoretical ideal form for an operative break-through—the attack on the whole front—out of the question for Ludendorff, but the attempt to conform to the underlying idea in a modified form by executing a diversion on a large scale was not to be recommended in the spring of 1918, since the forces were insufficient. In practice the disciple was forced by existing circumstances to fall short of the master's theoretical standard laid down in time of peace.

But is it, as Buat thinks, the fact that the idea of the operative break-through was doomed to failure? Strategy is a system of makeshifts. This fundamental saying of Moltke's was fully appreciated by Count Schlieffen. Ludendorff had to act in accordance with it. If the enemy's reserves could not be tied up in another place and kept away from the scene of the main battle, and if, therefore, they might be expected to turn up there sooner or later, the work of the battle and the execution of the operative scheme would certainly be made more difficult. Whether the attacker, in spite of this, would have the strength to achieve not only a tactical victory, but the complete strategical success, which involved the destruction of the enemy, was the supreme question which only the god of battles himself could answer. If the reward due to his passionate efforts was withheld, he would have to moderate those efforts and reconcile himself to closing down the offensive and accepting the battle of *matériel* and its attendant overstraining of his forces. The first great hammer-blow would then at least have had the effect of a diversion. It would have accomplished its aim according to the Schlieffen idea of operations by shattering and absorbing a large portion of the enemy fighting forces. It was then for the command to show its skill in launching, as quickly as possible, a new attack to bring about a decision with the yet unused forces from another well-selected and prepared position.

This then was the problem of the break-through as it presented itself to the German Supreme Command.

The Great Battle.—As the Germans had not the means for equipping all the divisions on the western front equally, and as the essential value of the different divisions also varied for reasons connected with drafting, they were forced to limit themselves to a certain number of those which seemed most suitable for the purpose of the attack. These were the so-called mobile divisions. Altogether 52 of these divisions were made available for the beginning of the Michael operation. Besides these there were 10 divisions in the line directly taking a part in the attack, making in all 62 divisions. They were distributed as follows: XVII. Army, 15 mobile divisions and 2 divisions in the line; II. Army, 15 mobile divisions and 3 divisions in the line; XVIII.

Army, 19 mobile divisions and 5 divisions in the line. The Supreme Command had kept 3 mobile divisions for the time being at its own direct disposal. These were brought up to the region of Douai shortly before the beginning of the offensive so as to be more readily available for carrying out the Mars attack, for which they were originally intended.

The bringing up of the attack formations that were destined at once for the offensive began at the end of Feb. and was completed according to plan. On March 10 the bringing up of munitions began. During the last few nights the artillery, flame-throwers and divisions were formed up for deployment. On the morning of March 21 came the attack, delivered simultaneously by all three armies on the whole front—over 47 m. wide—from Croisilles to La Fère. It came as a surprise to the British III. and V. Armies. Contrary to the expectations cherished, the offensive made less progress in the first days in the case of the XVII. Army and the right wing of the II. Army than on the left wing of the II. Army and particularly in the case of the XVIII. Army, on account of the powerful British resistance. The cutting-off of the Cambrai salient failed because of the enemy's timely evacuation. In consequence of this the Supreme Command on the afternoon of March 22 ordered the XVII. Army to extend the success of the II. Army by an attack aimed particularly in the direction of Bapaume, and to prepare for the attack on both sides of the Scarpe (Mars) with strong forces to the N. of it.

When it became evident, on the morning of March 23, that the XVIII. Army and the left wing of the II. Army were advancing unchecked towards the W. and would in all probability reach their nearest objective, the Somme, on that very day, an order was issued for continuing the operation, as soon as the line Bapaume-Péronne-Ham should have been won. "The XVII. Army will attack with strong pressure in the directions Arras-St. Pol, the left wing in the direction of Miraumont. The II. Army will take the direction Miraumont-Lihons; the XVIII. Army will take the direction Chaulnes-Noyon and will send strong advanced troops through Ham." The three divisions held in reserve were now given to the XVII. Army.

Through this order the whole operation was pushed a long way to the left. The XVIII. Army, which was originally to have extended its front northward to Péronne on reaching the Somme, thereby releasing forces from the II. Army to carry on the attack N. of the river, had now instead to cross the Somme and advance its right wing in a slightly S.W. direction toward Chaulnes. There were thus portions of the II. Army left S. of the Somme as well as the XVIII. Army. The Somme was therefore no longer used as a support against a French flank attack, for the offensive now took a N. direction along the whole front, N. and S. of the river, with the operative aim of separating British and French.

This most fateful decision of March 23 arose from the tactical consideration of exploiting the XVIII. Army's comparatively easy success to the benefit of the general battle situation, by making a rapid forward push. Had the XVIII. Army stopped at the Somme and the Crozat canal, as was originally intended, extending with its right wing only northward to Péronne, its fine initial success would have had no effect on the advance of the attack farther to the N., which had up till then not quite come up to expectation. If, on the other hand, it had carried its attack across the Somme and the canal toward the W., in conjunction with the S. wing of the II. Army, the enemy, who was still holding out against the XVII. Army and the N. wing of the II. Army, would have been threatened on his right flank. From the strategical standpoint the decision was even more difficult and more vital. The fundamental idea of the Michael operation had from the first always been that of beating the British and the British only. The French were only to be held off from intervention by flank action. To this end the whole of the XVII. and II. Armies were to find a field for operations to the N. of the Somme. The reinforcements sent by the Supreme Command were also to follow in this direction, being mainly disposed in echelon in rear of the II. Army's left wing for the purpose of taking over the flank protection down the Somme from Péronne. At a later stage there were probably some portions of the XVIII. Army similarly

engaged N. of the Somme. This whole strategical idea would have fallen to pieces if the strong natural obstacle of the Somme had been relinquished as a support at this point. It was clear that the left wing of the armies, entrusted with the offensive solution of its task on the far side of the Somme and the canal, would very soon not only draw upon itself considerable enemy forces, but would gradually have to prepare for a counter-offensive steadily increasing in strength. It had therefore to be reinforced from the reserves, which thus, as well as a portion of the II. Army, were no longer available for use in the direction followed by the main operation. But despite these apparent disadvantages the decision must be approved from the strategical standpoint also. The position of the XVII. Army and the north wing of the II. Army, as it was on the morning of March 23, made it doubtful whether the strong enemy resistance here could be broken in time to arrive at operations in the open field at all before the arrival of enemy reinforcements. There was a danger that not only the British but the French might throw strong forces on to the battlefield N. of the Somme, and so block the break-through in or close behind the British trench system. This was made easier by the contact with the positions E. of Arras, which had been maintained. The Somme—at Péronne or farther to the W.—would then serve the defender just as well for a safe support as the attacker had hoped it would serve him. It would also form an excellent obstacle for the front farther on up to Ham. As the direct intervention of the French, according to the way in which things turned out, had to be reckoned with, everything depended on hindering them from carrying it out systematically. The French must be caught up into the whirlpool of destruction. But this could only be done by forcing their Bray-Noyon front and attacking impetuously in the open.

In the days that followed Gen. Ludendorff held stubbornly to his operative aim of separating the British and French. The distribution of the reserves that had been brought up later was organized accordingly. The centre of gravity of the XVII. Army's advance, originally directed toward St. Pol, was now, on March 24, shifted more to the S. toward Doullens. The course of the battle on the whole front, up to March 25 inclusive, justified the expectation of achieving its ambitious aim. As the XVII. Army had pushed its way through the whole system of enemy positions and had advanced with its S. wing to beyond the Ancre, it too began to operate in the open field. The situation was now such as to warrant the attempt to dislodge the enemy front, both at Arras and farther to the N., by frontal attacks; and the Mars attack on both sides of the Scarpe was fixed for March 28.

The first faint doubts as to the possibility of carrying out the main operation to its full extent might have been aroused by the experiences of the XVII. Army on March 26. Its S. wing, on which everything depended, gained very little ground beyond the Ancre. As, however, in the meantime the II. Army's right wing had achieved the difficult crossing at Albert, there was hope that the XVII. Army's advance would also quickly get into its stride again. On all the rest of the front the brilliant progress of the offensive so far, particularly the impetuous forward push of the II. Army in the direction of Amiens and that of the XVIII. Army toward Montdidier, raised expectations of a continuation full of promise. Ludendorff proposed to bring about the separation of his opponents by a gradual concentration of the II. and XVIII. Armies against the French, and to this end the Somme below and at Amiens had to be reached and also the Avre. But the far-reaching aims of the Supreme Command were not to be realized. On March 27 the XVII. Army's offensive came to a standstill, and the next day brought the failure of the Mars attack on both sides of the Scarpe. At this point, therefore, the operation against the British was finally abandoned. Ludendorff decided to attack their front as soon as possible in a different place, and ordered the immediate preparation of an attack on the VI. Army's right wing on the Lys front in the direction of Hazebrouck. It would, however, probably be 8 or 10 days before this could begin. Otherwise the continuation of the Michael operation, as it had turned out, seemed to promise success only

in the direction where there was still movement, that is, on the S. wing of the II. Army and with the XVIII. Army. As the intervention of the French so far gave the impression of being precipitated, it was concluded that the opponent had not yet fully organized his forces. The point was to keep him from doing so now. The coöperation of the II. Army's N. wing, now held fast on the Ancre, in the forward wheel toward the Somme below Amiens, could indeed no longer be counted upon. It seemed, therefore, all the more urgent to get possession of Amiens, the strategically important railway junction, by the quickest means, and also to cross the Avre. The centre of gravity of the offensive was therefore laid exclusively on the inner wings of the II. and XVIII. Armies in the next few days, all reserves being switched off in that direction. However, no real progress could now be made in the direction of Amiens. A last attempt on April 4 broke down before the enemy resistance, which had visibly increased.

The close of the Great Battle left the Germans in possession of a narrow salient stretching far out toward Amiens. This position had its dangers, which necessitated perpetual watching, and kept strong forces tied to the spot. On April 24 the II. Army tried to improve its positions between the Somme and the Avre by a partial attack, which after a passing success at Villers-Bretonneux ended in a recoil. After this for a long time no important battle actions took place on this section of the front.

The Michael operation had not achieved the full operative success, but had nevertheless dealt the British a heavy blow and crippled their fighting power for a long time to come. More than 40 British divisions were seriously affected, and also about 20 divisions of the French army which had been drawn in.

In the light of subsequent criticism, the question arises whether General Ludendorff's leading idea would not have had more chance of being realized if the decision of March 26 had limited the objectives aimed at in one direction or the other. Persistence in the double intention of dividing the opponents and simultaneously dislodging the British at and N. of Arras by frontal shock had the effect of dissipating the still available attack energy of the reserves, and made it impossible to focus on a single object the largest possible part of the forces still capable of a great effort. In view of the general outlook the only limitation worth considering was one which would have facilitated the progress of the Michael operation by temporarily renouncing the Mars attack and the proposed frontal attacks farther N. which went with it. The danger then would have been that the British, not being threatened from the front, would throw all their available reserves on to the battle-field as it now stood, and also release forces from their front for the same purpose. It would be the task of the XVII. Army and the portion of the II. Army fighting on the Ancre to continue their attacks and so draw these forces upon themselves, preventing a flanking attack against the German main operation in the direction of Amiens. It was for the moment less important to gain much ground in the direction of Doullens, provided that the decisive blow on Amiens on both sides of the Somme were kept going. Supposing that the 5 divisions which had been put into the attack on both sides of the Scarpe had been used in the continuation of the Michael operation with the XVII. Army and on the right wing of the II. Army from March 27 on, it would have been possible by this time to shift a number of reserves toward the S. to the decisive wing. A portion of these reserves did gradually find their way to the wing S. of the Somme a few days later, together with a number of divisions which had been engaged in the previous fighting. But they arrived too late, and the offensive had meanwhile come to a standstill. The conclusion is that events might have shaped themselves more favourably, from an operative standpoint, if the decision of March 26 had limited itself to the separation idea, laying increased stress on this at the cost of the intention to break up the whole British front at the same time.

Finally, there is no doubt that the Germans, by their last attempt to get possession of Amiens, put too great a strain on their available forces. However strong the grounds for this, it should have been of supreme importance to the Germans to avoid the wearing effect on their fighting force of a battle of

material. This would have been easier to accomplish if a decision had been made by the end of March to close down the Michael operation. Instead, the attack on April 4 placed the inner wings of the II. and XVIII. Armies in the salient over against Amiens on both sides of the Avre in so difficult a fighting position that, whatever the result, the reserve strength which was still coming in had to be committed and was used up.

German Attacks—April, May, and June.—Closely connected with the Michael offensive, which came to a standstill on April 5, was the VII. Army's Archangel attack which followed. Between April 6-8 the right wing of this army threw back the enemy from its positions S. of the Oise through Amigny and Courcy le Château to beyond the Ailette. The ground gained made an improvement in the difficult rearward communications of the XVIII. Army's left wing. Following immediately upon this came the resumption of the great operations by the Georgette attack on the Lys front. General Ludendorff had had this attack in view since the end of March, and had prepared it at first as a diversion only. When it became clear in the beginning of April that the Michael offensive would not lead to a complete operative success, the Georgette attack was extended in its scope and aims to an operation for forcing a decision. It was proposed to break through the British-Portuguese front in the direction of Hazebrouck-St. Omer and then to continue the operation through St. Omer-Béthune and as far to the S. as possible. The VI. Army was to attack on the front Armentières and the La Bassée canal with its centre of gravity on Hazebrouck; the left wing at first only to wheel in on the general line Aire-Béthune-La Bassée canal; the centre to push through toward Hazebrouck and the heights W. of it and to seize the canal crossings between St. Omer and Aire; the right wing to take possession of the commanding heights to the E. and S. of Godewaersvelde and then to take the direction of the barrier of heights at Cassel. The IV. Army, attacking one day later from the line Hollebeke-Frelinghem, was to attach itself with a strong left wing. Armentières was to fall by envelopment. Beyond all these there was a proposal for the IV. Army to attack in Flanders from the Houthoult Forest in the direction of Poperinghe, with the object of cutting off the Ypres salient.

The enemy's situation seemed favourable to the Germans. The British had hardly any more fresh reserves to draw on, so that the only reserve to be considered consisted of divisions worn out by fighting. The Portuguese stationed on the Lys were not credited with any great power of resistance.

Seventeen divisions from the VI. Army and 4 from the IV. Army were placed in readiness, and the necessary artillery was brought up, some of it being obtained by regrouping from the Michael front. In the course of the operation 14 more divisions, mostly from the zones of the XVII. and II. Armies, were put in.

The attack by the VI. Army, beginning on April 9, took the opponent at first by surprise. On this same day the whole stretch of the Lys at Sailly was conquered. But the battles of the next few days, though successful, were obstinate and costly, and already it appeared doubtful whether the attack would develop into a break-through. The left wing had not succeeded in taking Festubert and Givenchy or in reaching the canal. On the other hand there could be no question of stopping the offensive immediately, as the inner wings of the VI. and IV. Armies were still fighting in a difficult tactical position. Their position improved, however, with the seizure of the Neuve Église and Baillcul heights, but in general the gains of ground were only local. The advantages of the initial surprise were forfeited and the opponent found time to organize his resistance more and more thoroughly. The hope of being able to set the interrupted operation in motion again by a surprise assault on the Belgian front, delivered by the IV. Army from the Houthoult Forest, vanished when it became known on April 16 that the enemy was eluding the carefully built-up attack from the Ypres salient by slipping away behind the Steenbeek. The IV. Army higher command considered that on account of the difficult ground the attack across the Steenbeek had no chance of success unless it were newly organized, and postponed

the execution from day to day. As since April 17 the French had been established at Wytchaete the arrival of further French reinforcements had to be reckoned with.

On April 20, therefore, General Ludendorff ordered the beginning of the offensive. With a view merely to improving the tactical situation of the inner wings of the VI. and IV. Armies the attack on Mt. Kemmel was carried out on April 25. The piecemeal capture of Festubert and Givenchy did not succeed.

On May 1 Ludendorff came to the decision to place Rupprecht's army group and also the XVIII. Army on the defensive for the time being. The Georgette operation had, apart from destroying the Portuguese, undoubtedly inflicted another heavy blow on the British army. Its losses in the defeats of March and April might be estimated at not less than half-a-million men. The fact that Foch was forced to send about 18 French divisions and 6 cavalry divisions to Flanders suggested that the British alone were not in a position to resist the pressure put upon them. It was also an important point for the German Supreme Command that it had for many weeks had the lead in the western theatre of war and had forced the opponent to stand on the defensive. Yet it could not record any operative success in this new place. Then, too, the Michael and Georgette offensives had used up a large number of forces—113 divisions—and this fact weighed heavily. Taken in conjunction with the difficulties about drafts there was no doubt that the balance of forces was gradually becoming unfavourable to the Germans.

It is indeed questionable whether the German command had it in its power to raise this strategically unsatisfactory result to the level of a striking success. With the forces actually available, and those that were put in, it would hardly have been possible, even if certain errors in the subordinate command had been avoided. The greater part of the divisions used did not belong to the mobile divisions, which had been trained and equipped for the attack, and others were worn out by fighting. There was, therefore, a certain lack of the necessary freshness and tenacity in attack. If the German Supreme Command had decided at the end of March to stop the Michael offensive and desist for the time being from the attack on the Archangel front, there would have been fourteen more unused divisions available at the beginning of the Georgette attack. With this additional strength considerably more pressure could have been exercised, particularly by the IV. Army, to the N. of Armentières and N.E. of Ypres.

With the situation as it stood at present the difficulties in the way of forcing the decision of the war before the Americans made themselves felt were growing. In spite of this Ludendorff remained unshaken in his aim, clearly recognizing that the Germans could now only achieve a success through their own initiative and by working against time. All the clever advice that subsequent criticism felt obliged to offer Ludendorff is met by the objection that by none of it could the victory of the Germans have been achieved. If the Allies were now allowed time, and were able at a self-chosen moment to use their fighting force, with its ever-growing superiority in personnel and material, for their own final blow, the war might be given up as lost at once.

The necessary forces were lacking for an immediate fresh German offensive. During the next few weeks it was imperative that the mobile divisions, some of which had been overtaxed, should be allowed to rest and freshen up again. By May 27 the German reserves had been brought up to 81 divisions again, exclusive of the transport movement from the east. Of these 58 had been resting.

The direction which the operations were to take had now to be decided. The French and British now formed a united front, and the former plan of beating each separately was no longer in question. At the end of April there were from 10 to 12 French infantry divisions and 6 cavalry divisions established in Flanders. In front of the German XVII. Army at Doullens was the French X. Army with from 5 to 6 divisions. At Amiens and S. of it stood a group of from 12 to 14 fresh French divisions. As Foch had also released about 20 divisions by putting in territorials and Americans and economizing on numerous sectors, he now had at his disposal a reserve of over 60 French divisions. About half of

these he kept to defend the coast and at Amiens, the other half being apparently distributed in readiness before the fronts of the remaining army groups. An offensive to force a decision against those sectors of the front held almost exclusively by the French from the Somme to the Swiss frontier promised the Germans a far-reaching operative success, at whatever point it might be attempted. The one sharply-defined objective in this connexion was Paris. But on the way there an encounter with the French army, prepared to defend it to the uttermost, was certain; and a defensive battle for them would have various advantages. On the other hand if a German attack should sooner or later find itself stuck fast on the way to Paris or in Champagne—as might almost certainly be predicted—the Germans would be in an unfavourable position for operating, with their line bent more or less far forward toward the S.W. or S. There seemed more prospect of success in resuming the offensive on the Michael—or Flanders—front, where the objectives were not fixed so far away. After all, the Germans had covered half the distance from St. Quentin to Abbeville in March well within a week. If they could succeed in doing this again with the same bulk and expansion, they would throw the enemy forces opposing them into the sea. But even with less success at first they might hope so to cramp their opponent's freedom of movement that his power of prolonged resistance would weaken, and he would be completely crushed by renewed hammer-like blows. The German Supreme Command therefore sought to gain their strategical aim as before in an attack on the northern part of the enemy's front. Clear on this point, it was again confronted, as in the spring offensive, with the choice between carrying out the operations in Flanders or farther S. against the Arras-Amiens front.

Acting on the suggestion of the Higher Command of Prince Rupprecht's army group, General Ludendorff in the beginning of May decided on the Flanders attack. The determining factor was the knowledge that an attack from the Michael front in the direction of Doullens would tactically be extremely difficult, depending for its success on a simultaneous side-attack from the region of Béthune, for which the forces were not adequate. But as there were still strong French reserves in Flanders at the time, Ludendorff decided not to lead the attack against Poperinghe-Hazebrouck until a diversion in another place had drawn off considerable portions of this reserve from the Flanders front, leaving it weakened in consequence. At the suggestion of the Higher Command of the German Crown Prince's army group, a diversion—offensive within a limited area from the VII. Army front on the Chemin des Dames across the Aisne as far as the Vesle—code name "Blücher" was given preference over an attack by the I. Army in Champagne, E. of Reims, because its clearly defined aim offered the promise of a line suited both to a prolonged defence and a continuation of the attack. The VII. Army's task was limited to carrying the offensive over the Aisne sector on both sides of Soissons and over the Vesle as far as the heights to the S.W. and S.E. of Soissons and S. of Fismes, while the right wing of the I. Army was to accompany the attack westwards past Reims and nearly up to the Ardre. There was also an idea of letting the XVIII. Army push forward its left wing across the Oise to split up the counter-offensive.

By choosing the Blücher attack Ludendorff was again faithful to his principles in selecting a markedly weak spot in the enemy's front. There were at this time in the front line only 6 French divisions—of which 2 were worn out and 1 weakened by illness—and 2 British divisions which had been defeated in March and April. As regards reserves, there were supposed to be 2 fresh French divisions and 2 that had previously been beaten in the region between Compiègne and Reims. As against these the VII. Army had 20 divisions, the I. Army 4 divisions at its disposal. The Supreme Command reserved the right of taking back strong artillery forces from Rupprecht's army group and the powerful fighting divisions drawn back behind their front. This time, too, the attack was to break out as a complete surprise, and be relieved by opportune feints on different parts of the other armies' fronts. Owing to the comprehensive preparations the Blücher attack could not be launched until nearly the end of May.

It began on May 27 and succeeded beyond all hopes. By the evening the VII. Army's centre had reached the Vesle on both sides of Fismes, the wings holding back somewhat. The morning of the 28th brought an emphatic reminder from Ludendorff that the object was to get possession as quickly as possible of the high ground W. of Braisne, S. of Fismes and Bazoches and N.W. of Reims. The right wing was to advance by means of a sharp attack to a line on the high ground between the Oise and Aisne canal and the Aisne in a W. direction. The successes of the 28th enabled fresh orders to be given for advancing the objectives of the centre and left wing to Fère en Tardenois—the heights S. of Coulanges—the S. front of Reims. If the opponent evacuated the territory between the Aisne and the Oise, the XVIII. Army was to draw up forces on the S. bank of the Oise about Noyon and to gain ground in the direction of Compiègne. On May 29 the successes on the VII. Army's front were spreading rapidly, and orders were given at noon for the attack by the left wing of the XVIII. Army and the VII. and I. Armies to be continued in the direction of Compiègne-Dormans-Epernay and the block of hills between the Vesle and the Marne, S. of Reims, taken as a protection against Chalons. The progress of the VII. Army corresponded to these instructions. The I. Army, which had had difficulties to contend with, received an order on the morning of May 30 to reinforce its right wing from the centre, and shoot out its fighting line to the S. and S.W., thereby facilitating the envelopment of Reims. The VII. Army meanwhile had reached the Marne on the 30th with its centre, and on the following day gained a good deal of ground in the direction of Villers Cotterêts, but the two wings of the attack did not seem able to make any further progress. The Supreme Command was for the moment inclined to send portions of the VII. Army over the Marne to push forward on Epernay, with the idea of getting the attack of the I. Army into swing again. But this scheme was dropped in consideration of the state of the troops and the strength of the enemy's resistance. The I. Army was to have a rest, and then be required only to undertake partial actions with limited objectives and to capture Reims. The Supreme Command was now anxious to get the centre of gravity fixed on the W. front of the VII. Army in the direction of Villers Cotterêts and La Forté Milon, in order to attract powerful French forces. Reinforcements were therefore sent up from the zones of the other army groups. But the VII. Army attack in a W. direction made no more progress to speak of in the beginning of June, as the French had established themselves here in great force by hurrying fresh troops on to the scene.

The continuation of the offensive now depended on the progress of the attack launched on June 9 from the S. front of the XVIII. Army on the Matz brook and the Aisne above Compiègne (code name, "Gneisenau"). But this attack by the XVIII. Army did not have the anticipated success, which would have justified the immediate opening of the Flanders offensive, but came to a standstill on April 11. A blow delivered by the VII. Army against Villers Cotterêts to the S.W. of Soissons on the following day also failed, and as the immediate continuance of partial actions by the I. Army did not look like succeeding either, a lull set in along the whole new front of the German Crown Prince's army group in the middle of June.

The Blücher attack was not looked upon as an operation to force a decision, but rather as a diversion. The fact that the original limited objectives were exceeded in consequence of the unexpectedly favourable course taken by the attack is not incompatible with the leading idea, which aimed at holding and destroying the greatest possible number of the enemy's forces. This aim was fulfilled. The total number of the French engaged in the defence against the Blücher offensive was estimated in the beginning of June at over 40 infantry and 3 cavalry divisions. On the Marne the wavering French lines were only saved by fresh American divisions. This time the Germans spared their troops by avoiding costly independent battles of only local importance. At the same time the development of the tactical success should not have brought about an unfavourable operative situation at the close of the offensive. But this was exactly what

happened. As the wings had not succeeded in getting the region of Compiègne and Reims, with its hilly country, under their control, a new sack-like bulge had been formed in the German position, with the flanks bent far back, to maintain which strong new forces would have to be put in. The rearward communications of the VII. Army were particularly unsatisfactory owing to the lack of railways. This unfavourable operative situation could perhaps have been avoided if from the beginning strong pressure had been used to push forward the right wing along the Oise to the Marne, and the I. Army to Reims, at the cost of some of the excessive amount of ground gained in the centre. Later attempts to work up the operation from the centre were impaired by the gradually failing fighting strength of the troops. According to Ludendorff a subordinate command also failed to carry out a swift and powerful advance through Soissons. The advance of the VII. Army's right wing along the Oise, which began later, was inadequately provided with the means of attack, and the Gneisenau attack by the XVIII. Army W. of the Oise, which followed, was apparently even less well prepared; neither could retrieve the results which could presumably have been obtained without much effort at the very beginning of the offensive, had the forces on the VII. Army's right wing been differently grouped. The disadvantageous strategic situation at the close of the attack corresponded with the tactically difficult fighting position in which the tired-out German divisions were confronted with the active defence offered henceforth by the French and Americans.

The German Offensive in July.—The effect of the Blücher attack very soon made itself felt on the front of Rupprecht's army group, where no little relief was felt. The enemy's fighting activity diminished, and a portion of French reserves intended for the support of the British vanished from the scene. All the same, this degree of slackness on the enemy's part did not seem to the German Supreme Command to warrant the carrying out of the planned and prepared attack on the Flanders front (code name "Hagen") for the present. They hoped first, by carrying out another of the diversions on the front of the German Crown Prince's army group, to rob the British of the last of their French support, and even in certain circumstances to force them to send direct help themselves to their hard-pressed ally.

On June 14 Ludendorff arranged for the German Crown Prince's army group to attack with the VII. Army across the Marne, E. of Château-Thierry and between the Marne and Reims (code name "Marneschutz"), and with the I. and III. Armies between Reims and the Argonne (code name "Reims"). July 10 was the date aimed at for the beginning of the offensive. About 10 days later, after a rapid regrouping of the necessary artillery and so on, the Hagen attack was to be executed by Rupprecht's army group in Flanders. Ludendorff in his *Memoirs* gives the reasons for selecting new points of attack on the French front as follows: "The greater part of the enemy's reserves were to be found within the curve formed by the XVIII. and VII. Armies in the direction of Paris, only weak forces being left between Château-Thierry and Verdun. The Supreme Command intended this time also to attack the enemy where he was weakest."

The underlying idea of the VII. Army's far from simple operation on both sides of the Marne toward Epernay was inspired by the desire to escape from the tactically constrained position brought about by the pocket on the Marne. By flattening out the left flank of the pocket by eastward pressure, not only would the army's rearward communications be widened, but the danger which perpetually threatened the right flank would be diminished. While the necessity of supporting this flank on the sector from Villers Cotterêts to the Marne during the attack was pointed out to the VII. Army, the forces needed for such support were not placed at its disposal. It is not by any means clear on what grounds the decision was taken to extend the diversion very considerably toward the east by calling in the III. Army. It was probably in the hope mainly of splitting up the enemy defences along as wide a front as possible. General Buat points out that the offensive, if successful, would have opened up brilliant strategic possibilities, such as extending the successful advance in the direction of Bar le Duc and rolling up

the whole defensive position in the Argonne and toward Verdun. A shortening of the German position from Château-Thierry through Chalons to St. Mihiel would have been infinitely valuable.

On the other hand the 44-m. front required such large forces to occupy it that, contrary to the original intention, it was necessary to fall back on some of the divisions set aside for the Hagen attack in rear of the Rupprecht group's front. The inevitable consequence was the postponement of the date provisionally fixed for the Flanders attack to the beginning of August. Also the preparations for the combined Marneschutz-Reims attack proved so extensive and took up so much time that the date had to be put forward to July 15 at the cost of preserving secrecy. Once more the execution depended upon surprise.

Through carelessness and treachery the German plans became known to Foch to a great extent during the first half of July. He had found time for adequate preparation of his defence, which was skilfully adapted to meet the German conduct of the attack. In this way the offensive in the case of the I. and III. Armies came to a standstill everywhere in front of the French main position. The VII. Army succeeded, after a successful crossing of the Marne, in shattering the main line of defence in several places. But here, too, far-reaching results were unobtainable. On July 15 the German Supreme Command ordered the cessation of the attack for the III. Army, and on the 16th refused to allow the I. Army to continue after an attempt had proved vain. The VII. Army continued to advance with great difficulty until July 17 in some places. The offensive blow had in fact completely failed, because it fell upon an enemy who was not taken by surprise but was prepared to offer a resistance as obstinate as it was skilled.

Ludendorff lost no time in drawing his conclusions from the unexpected turn in the general situation, and immediately ordered the withdrawal of the right attacking wing of the VII. Army behind the Marne. He was determined to regroup his forces with all possible speed for the Hagen attack in Flanders. Hardly had the necessary steps been taken, however, when, on the morning of July 18, Foch's flank attack fell on the insufficiently supported W. front of the VII. and IX. Armies. Owing to the disproportionate initial success of this attack, the execution of the Hagen attack had to give place to the pressing necessity of putting fresh forces into the VII. Army and bringing it back behind the Vesle. This was the turning point in the conduct of the war in 1918, and at the same time in the whole of the World War. The German offensive had met first with a sudden interruption, then with its final close, owing to the initiative of the opponent. From this time onward the German Supreme Army Command was subject to the strategical law of the enemy.

If we pass in review the many plans of attack entertained by the German Supreme Command—the Flanders attack, for instance, was, if circumstances permitted, to be followed by an offensive on Paris or Amiens—the impression is easily formed that the leader of the German operations was no longer pursuing a definite operative aim, as at the beginning of the spring offensive and for some time afterward, but had as his sole object the shattering of the enemy by independent hammer-blows delivered one after another at tactically advantageous points. But all these hammer-blows represented not the end but the means by which the final decisive operation should be prepared, facilitated and brought to a successful issue with the highest degree of certainty and the least effort. One misgiving undeniably arises in considering this method. The limitation of the available attacking forces and fighting material made it impossible to make the individual blows follow each other so quickly that the enemy would have no time to recover between each, to a certain extent, to make good the losses he had suffered, to prepare his defence against fresh blows, or even recover so far as to proceed to counter blows himself. The question is therefore whether a different procedure, after the close of the May-June offensive at latest, might have had more chance.

Possibly the necessary forces for the Hagen attack in Flanders, which was to have been the decisive operation, might have been mobilized by the middle of July if it had been decided to sacrifice

the whole of the territorial gains, which were exhausting and difficult to maintain permanently, made up till then in the Michael and Blücher offensives, by a retreat movement on a large scale by which the fronts of the XVII., II., XVIII. and VII. Armies would return to their starting positions. With these forces a new and overwhelming surprise attack in a totally different form might have been sprung on the enemy, which would prevent his throwing his released forces straight on to the Flanders front and there avoiding a crash. What Hindenburg and Ludendorff had achieved with unexampled skill in Nov. 1914, immediately after the great retiring movement through S. Poland, by advancing from a newly selected position to a flank attack on the right wing of the Russian main army, could have been repeated in the summer of 1918 on French-Belgian soil when the general situation was strategically favourable.

In view of the complete failure from the outset of the attempt to realize their daring and far-reaching projects, there has been too much of a tendency to accuse the German Supreme Command of misjudging the situation, overestimating the working value of their own instrument of war and underestimating the enemy. Yet it was under no illusions as to the difficulties that it was essential to overcome. It was clearly recognized that time was now, more than ever before, a factor on the side of their enemies. The British had regained their strength, the French were not yet sufficiently shaken, and the Americans were bringing unexpectedly large masses of troops to France with amazing rapidity. To set against these factors the German commander-in-chief could count on no more reinforcements of any kind. No additional force for attacking purposes could be extracted from the divisions left in Russia and Rumania, which had already given up all their men under the age of 32. The drafting reserve from home was becoming more and more meagre, bringing in only 28,000 men for the infantry in June as against 44,000 in May. It was composed mainly of returned lightly wounded men, and those who had recovered from sickness. The average strength of the German battalion in the field had sunk by the middle of July from the original 850 men to 660. The actual front strength was even considerably lower than this number. The process of disintegration within the army caused by the prevalence of revolutionarily minded elements, did not escape the notice of the Supreme Command. Taking all in all, there was no doubt that the fighting value of the troops was no longer on the same level as at the beginning of the spring battle.

In spite of this there was no compelling reason to doubt the adequate striking power of the jagged though not blunted weapon of the German army, so long as its intentions and plans were kept absolutely secret, as before, and the blow was once again aimed at one of the enemy's weak spots.

Unfortunately for the Germans, their method of attack had now lost its magic effect on the enemy, who had found times and means to organize his resistance accordingly. The July offensive had been made with the greatest circumspection and thoroughness of preparation, just as before; and the attacking forces were certainly not deficient in courage or endurance. But an essential factor in the success of the undertaking was lacking—no commander-in-chief can do without luck. Hitherto the luck had been generally with Ludendorff. Now, at the decisive moment of the World War, it deserted him, and went over to his opponent—his equal in determination and will-power, and now his superior too in strength. If Ludendorff had had the luck at Reims in July 1918 which attended him at Tannenberg, history might have acclaimed him the greatest commander of all time, because he had remained true in spite of everything to himself and his belief in his star. But this was not to be. (W. F.)

IV. THE ALLIED OFFENSIVES OF 1918

The fourth and last phase of the war was ushered in by the failure of the German Champagne-Marne attack of July 15 and the success of the Allied counter-attack at Soissons on July 18, the results and far-reaching consequences of which came as a surprise to German and Allied commanders alike. Von Hertling, the German Chancellor, has written: "We expected grave events

WESTERN FRONT CAMPAIGNS

in Paris for the end of July. That was on the 15th. On the 18th even the most optimistic among us understood that all was lost." To make clear the significance of that statement it is necessary to review briefly the condition of the opposing armies previous to the Soissons attack.

It was indeed well known to both sides that the German army was nearing the end of its offensive strength, but just how nearly German *moral* had been drained neither side fully appreciated until later for, superficially, it was good. The French army, on the other hand, was well known to be at its lowest ebb of *moral*. The French soldier, since April 1917, had ceased to be a war machine unit who could be depended on blindly to follow his leader and had assumed a certain independent thinking rôle. Discipline had slackened and orders to attack or defend stubbornly had lost their force unless the soldier wished to attack or defend stubbornly. Pétain considered, early in July, that, although he had a number of rested divisions in reserve, he had not a single division which could be relied upon to push home and exploit an attack successfully. Of such as he had the Moroccan Div. was rated the best. The superiority of the British *moral* had been offset by the numerical weakness of their battalions, and, although they were holding their own doggedly, their confidence in their allies had suffered a severe strain and grew still further impaired as the lower units became intermingled. The American army was, of course, as yet an undetermined factor.

It was therefore with a certain amount of reasoned justification that Ludendorff, aware of these conditions, to which moreover he added an amazing underestimate of the strength of the American effectives in France, conceived that one more push directed against the French army would put it into headlong flight and thus pave the way for a similar stroke against the British. The adverse factors in the Champagne-Marne project were, first, that the method of attack, the so-called "Riga model," now lacked the element of surprise, since the methods of concentration for it were now too well known to make concealment possible, and its success was further discounted because Pétain had discovered the tactical means of effectively stopping such an attack; second, that Ludendorff had overcentralized his command. No army group commander or army commander was called on or permitted to exercise judgment or decision; he could only carry out the plans devised by Ludendorff and his staff by methods similarly devised and prescribed. In the lower ranks of officers this benumbing influence was, if anything, still more strongly felt. Meanwhile, synchronously with his success in thus centring the power of decision in his own hands, Ludendorff had become preoccupied with a multiplicity of problems which had no immediate relation to the conduct of the army on the western front. Germany's allies, her own internal questions, the Russian and Near East situations, were all constantly taking his time and distracting his attention from the western front, although nothing on that front could be done without his dictation. A further cause of weakness was that propaganda, among soldiers and civilians alike, had been overdone. Although the soldier indeed still responded to propaganda, it was only to the most extreme statements. Therefore in order to stiffen in the men the will to fight more resolutely in the attack planned for July 15 they were told that the French were already beaten and exhausted; that the British were ready to go out of the war; that the American army could not get to France, and that, even if it could, it could not fight; that the Champagne-Marne attack was to be the "peace-assault" which would end the war if successful, although as a matter of fact the utmost which Ludendorff really expected of it was that it would pave the way for a similar attack on the Lys. When therefore this attack of July 15 failed, and the French army showed itself anything but a beaten force, and when, three days later, the supposedly non-existent Americans established alike their presence and their fighting ability by marching through the German lines S. of Soissons in a fashion which compelled the evacuation of the whole Marne salient, the scales dropped from the eyes of the German soldier. To him the war was now lost; it was time to go

home. Thereafter, curiously enough, while no longer crediting his own official propaganda, the German soldier became most receptive to Allied propaganda, and looked to it for the truth.

On the Allied side conditions and conceptions were in general more correctly adjusted. The French leaders knew the weaknesses of their opponents, but were also cognizant of their own, and they were more successful psychologists in dealing with their own men. The British army, having again been recruited up to fighting strength, felt that it had nothing further to fear from the worn-down German army so long as the French line held. The American army, supremely confident in every rank, longed only for the opportunity to disprove the belittling judgments of its opponents and to remove the doubts of its allies as to its fighting capacity. Further, the Allied High Command had the supreme merit of being not only in capable hands but, to a rare degree, decentralized. The attention of its leaders was not distracted from its own field by the necessity of solving distant problems in politics or diplomacy, and was backed in all the principal Allied countries by statesmen who in every way supported and aided the military chieftains, without, on the whole, unduly interfering with the conduct of the armies. Although the Supreme Command was nominally in the hands of Marshal Foch, he was a coördinator of efforts rather than a dominant military commander; and in fact he lacked the staff which would have been necessary for such a control as that exercised by Ludendorff over the German armies.

The plan for the Soissons counter-attack of July 18 was not a new one. As early as the German offensive on the Aisne (May 27), it had been proposed by a member of Gen. Pétain's staff, had been approved by his chief, and its details had been worked out. Marshal Foch had likewise favoured it, although hesitatingly, because of the attitude of the authorities in Paris. The difficulties of execution at that time lay in finding divisions of "attack-class" for the spear head at the crucial point. By the middle of July, with the increasing number of American divisions, which had gained and were gaining battle experience, that difficulty disappeared. On July 11 Pétain, on Pershing's insistence, again urged this plan upon Marshal Foch, purposing now to make it immediately after the long-awaited German Marne attack. Foch gave it his approval, not indeed with any hope of gaining thereby any decisive advantage, but rather regarding it as a desirable counter-stroke to the German assault.

The striking success of this counter-attack, which in two days gained and held control of the German communications in the Marne salient, and thereby compelled its evacuation, brought to the Allied leaders, as it did to many in Germany, the discovery that the tide of victory had already turned. On July 24 Foch arranged a meeting of the commanders-in-chief at Bombon, to discuss the means of following up this success and of preserving to the Allies the initiative thus unexpectedly gained.

The chief misgiving of the French Government at this time, now that Paris had been rendered secure through the driving of the Germans back from the Marne, was the lingering apprehension that the enemy might still drive a wedge between the French and the British armies at Amiens. It was therefore particularly welcome that Field-Marshal Haig should propose an attack on the Amiens salient to be made by the newly formed Australian corps, now in that sector and desirous of making the attack, together with the Canadian corps, which had not yet been engaged in the year's battles. At this meeting also it was decided to assign to the American army the reduction of the St. Mihiel salient as its first distinctive operation, but meanwhile to employ this new army in completing the reduction of the Marne salient. All the commanders-in-chief at this meeting expressed themselves as favouring a continuation of offensive action, yet still with the idea of keeping the German army busy, of wearing it down, of seizing favourable occasions and localities for attacks to gain prisoners and material and reconquer useful bits of territory, rather than with any thought of a systematic plan for ending the war by victory before winter.

During the two weeks following this conference the German army was forced back slowly from the Marne salient, now become

mere pocket, which was, however, held stubbornly because in this area there had been captured from the French, in May, vast quantities of munitions and military supplies of all kinds and of materials which were urgently needed in Germany, but which there had not been time or facilities for removing. In addition a vast amount of German material had been brought up for the maintenance of the army on the Marne front, and for the July 15 attack. Much of this was irreplaceable, and the German army had to fight to gain time to remove as much of it as possible.

Ludendorff, who had been present with his army during the Champagne-Marne drive, was not especially disheartened at its result and had gone to Flanders hoping to recoup his failure in Champagne by hastening the preparations for his offensive next in contemplation in the Lys salient. It was there that he received news of the Soissons reverse. He immediately realized the threatening consequences to his armies of this Allied counter-thrust, and returned to Avesnes to arrange the necessary withdrawal from the salient.

Materially this retrograde movement did not seriously compromise the German army, since, except during the penetration by the three assault divisions (two American and one Moroccan) S. of Soissons on July 18 and 19, the withdrawal was made slowly and in good order, inflicting as heavy losses on the attackers as the Germans themselves suffered. But Ludendorff soon recognized that the Lys offensive would have to be indefinitely postponed and the troops destined for it used in easing the situation in the Marne salient, where the Allied forces—French, British, American and Italian troops—were now pressing vigorously from all points. What Ludendorff apparently failed to gauge correctly at this time was the resultant damage to the *moral* of the German army; neither did he yet, seemingly, share the conviction, which had now been brought home to the German people and to Germany's allies, that all hope of ending the war by a German victory was gone, and that the only question left impending was whether it would end by a compromise or by the utter defeat of the Central Powers. Had the German High Command faced at this time the logic of the situation and made a decision to do, after the "Second Marne," what most German officers have since agreed should have been done after the first battle of the Marne, namely, to retire to the line of the Meuse and re-form, subsequent history might have differed materially from the actual events.

As proposed by Haig on July 24, the Australian and Canadian corps on Aug. 8 attacked side by side the German salient facing Amiens, supported by a French corps on their right and a British corps on the left. This attack was one of the most brilliant and tactically interesting episodes of the war, and showed Ludendorff again that the much disparaged tanks were, on ground suitable for their employment, a potent factor in a surprise attack. Although the sector against which the assault was launched was held by first-class troops, the German divisions were overrun and virtually annihilated as organized units. This attack dealt a stunning blow to the pride of the German High Command, a deadly one to the weak *moral* of the troops, and produced a corresponding exhilaration in the British ranks, all ranks of which could now clearly see that a complete and final inversion of rôles had taken place.

The shock was felt throughout Germany and reacted strongly upon the Government. The unsuccessful Marne attack, with the subsequent withdrawal from the Marne salient, although manifestly a lost battle, had, nevertheless, been one initiated by the German High Command on a battle-field of its own choice. The battle of Amiens could not be so interpreted. The Allies had here initiated the attack and it had been completely successful. Ludendorff correctly names Aug. 8 as the "Black Day" of the German army in the war. So grave was the crisis felt to be that a conference of army leaders and members of the German Cabinet was called to meet at Spa on Aug. 13. It was there agreed that further prosecution of Germany's war aims was hopeless, and that a peace would have to be negotiated at the first favourable opportunity, that is, at the first turn in the

military situation even temporarily favourable to Germany. That looked-for turn never came. Under the persistent Allied attacks the German army reserves steadily dwindled, munitions and supplies lessened, and *moral* evaporated.

The day following the Amiens success Foch decided not to put the American army—which now had some 1,250,000 men in France—in on the Vesle, where the situation was virtually stabilized, but to assign it at once the task of reducing the St. Mihiel salient (*see WOËVRE, BATTLES IN*).

The battle of Amiens was followed up by a French attack between the Oise and the Aisne on Aug. 20, which forced the German line back on Chauny. Still more serious for the enemy was the attack by the British III. Army, on Aug. 21, N. of the Somme, on the line Bapaume-Péronne, which brought another crisis. By the end of Aug. the military situation had become sufficiently defined to enable the Allied leaders to look beyond a mere driving of the German army back to its strongly fortified lines of the previous winter, popularly known as the Hindenburg line, and to make plans for its rupture in a way to reap the largest strategical as well as tactical fruits of victory.

For this the British army, now fully restored in man-power and in high *moral*, and the American army, untouched by war weariness or reverses, inspired by an almost religious fervour of belief in the righteousness of the cause in which it was fighting, were of necessity regarded as the chief Allied weapons. The French army was tactically a trained and skilled army, but could no longer count on any large reserves of man-power to replace losses, and the general feeling among the French that their country had already been "bled white" in the war led to the not unreasonable contention by Government and people that, while France must still do her share to the end, her army must from now on be spared as much as possible, since in any event French losses in man-power would far exceed that of any other nation in the war.

Foch, therefore, determined on two main offensives: the British, supported on their right by the French, were to break the Hindenburg line in the direction of Cambrai-St. Quentin; the Americans, after completing the reduction of the St. Mihiel salient, which had been assigned as their first task, were to break through the German lines of defence N. of Verdun, supported on their left by French armies, and to advance in the direction of Mézières. In other words, the German line in northern France, constituting as it did a huge salient, was to be attacked in the simple orthodox manner by pinching in the two flanks. Of these two the Americans had possibly the harder task, for the Verdun front was well adapted to and thoroughly organized for stubborn defence, and, inasmuch as the railway communications through Sedan-Mézières were essential to the German army so long as its front lay W. of the Meuse river, the Verdun front, only 50 m. in front of this railway line, was bound to be defended with all the vigour and skill still remaining in the German army. Connecting these two attacks, the French army was to continue its operations to throw back the Germans beyond the Aisne and the Ailette. Such was the Allied plan formulated in Foch's directives of Sept. 3.

By the end of Aug. the German High Command ordered the evacuation of the Lys salient, and it was completed Sept. 6.

On Sept. 2 the attack of the British III. Army N. of the Somme was extended northward, E. of Arras, to include the I. Army reinforced by the Canadian corps; and as a result the whole German army fell back to the so-called Hindenburg line, which the Germans themselves designated the *Siegfried Stellung*. There they hoped to gain time to reorganize the depleted units.

This withdrawal, and the accumulating evidences of increasing demoralization in the German army, made it evident to Allied military leaders that offensive operations on a still larger scale could be safely initiated; and Marshal Foch, in a conference with the British and Belgian commanders-in-chief at Cassel Sept. 9, arranged for a fourth offensive, on the extreme northern part of the western front, to force the Germans back towards Ghent.

On Sept. 12 the American I. Army, as previously agreed upon, attacked and captured the St. Mihiel salient.

During the latter part of Sept. German H.Q., harassed and preoccupied by the crucial events which were taking place in other theatres, either gave insufficient heed to the precariousness and difficulties of the German military situation on the western front or were too stunned by their sudden and general reversal of fortune everywhere to be able to grasp and cope with them. Ludendorff, it is true, had two lines in rear reconnoitred: one from the Dutch frontier-Bruges-Valenciennes; the other Antwerp-Brussels-Namur-the line of the Meuse; but neither line solved the problem, nor could it be held in the face of a victorious pursuing enemy. The desideratum was to find a secure position for the army's winter respite from active operations, and time for the resting, reorganization and recruitment of the armies. It was possible to accomplish this only by a timely withdrawal, to the line of the Meuse at least, if not to the frontier. But Ludendorff still clung to the idea of holding every foot of French territory until the last possible moment.

On Sept. 26 the final Allied offensive, prepared by the directives of Foch, began. The American army under Pershing and the French IV. Army under Gouraud attacked on the Verdun and Champagne fronts (see MEUSE-ARGONNE, BATTLE OF). On Sept. 28 the Belgians, supported by a French army under Degoutte and the British II. Army under Plumer, attacked the line from the coast southward beyond Ypres (see YPRES AND THE YSER, BATTLES OF, Part iv.). On Sept. 27 the British III. and I. Armies, including the Canadian corps, had attacked on a front of 13 m. in the direction of Cambrai, and on the 20th the British IV. Army under Gen. Rawlinson, after a heavy bombardment lasting two days, attacked the St. Quentin sector.

The American and Belgian attacks had the advantage of coming as a complete strategic surprise; but, in the case of the Meuse-Argonne front, the depth of the fortified zone behind the front lines enabled the German reserves to be brought up and increasingly strong resistance to be made. Both British attacks were made against strongly organized positions held by the best troops the Germans still had; but on the front of the British I., III. and IV. Armies the enemy was already virtually on his rearmost prepared line, the attack was not unexpected, and both opposing armies appreciated thoroughly the consequences of victory and defeat. If driven from the Hindenburg line the weakened German army must thereafter fight in the open. The contest was therefore bitter to the point of desperation, but, even with the aid of the elaborate system for defence afforded by the long-prepared Hindenburg line, the struggle proved unequal, and the German army was forced back with heavy losses, to begin its retreat through the open country.

The German High Command had not appreciated the risk of accepting battle on the Hindenburg line, or else had overestimated either the strength of the position or the remaining fighting capacity of the troops. Once the line was broken, however, they awoke to the situation. On Sept. 28 Ludendorff and Hindenburg agreed that the end had come; on the 29th the Foreign Minister was informed of the army's desperate plight; on Oct. 1 Hindenburg and the Kaiser went together to Berlin, and on Oct. 4 the first peace offer was sent to President Wilson.

On the battle-front the Allies were not permitting events to lag, and this same day renewed efforts were made on all fronts. The French V. Army under Berthelot had advanced from the Aisne and on Oct. 6 reached the Suippe. On Oct. 7 Foch ordered the attack on the right flank, extended to include the heights E. of the Meuse. On Oct. 8 the British I. and III. Armies renewed their attacks, and in three days drove the Germans back beyond the line of the Selle river-Le Cateau.

Between the two sectors of the Allied main right and left flank offensives lay the strong defensive German positions W. and S. of Laon. On Oct. 9 these positions were abandoned by the enemy, and the whole German line between the Scheldt and the Aisne began its retreat. By Oct. 10 the American I. Army had penetrated to the last line of German defences on its front, the *Kriemhilde Stellung*, and cleared the Argonne forest, while on its left the French IV. Army reached the Aisne.

On Oct. 10 a directive of Foch gave more distant objec-

tives to the armies; the Northern Flanders Group was to advance toward Belgium; the British armies, debouching from the front Solesne-Vassigny, were to push both in the direction of Mons and toward Avesnes; on their right the French I. Army was to push up the Oise; while the French and American armies between the Aisne and the Meuse were to continue their northward movement. The Marshal defined the purposes of these converging attacks to be to force the Germans back on the rough Ardenne forest, where communications were lacking and a modern army would have difficulty in maintaining itself.

On Oct. 12 the French X. Army of Mangin, on the left of the V., reinforced by an Italian corps, passed the Aisne and occupied the Chemin des Dames. On Oct. 14 the army group under King Albert renewed its attack on the front from the Lys to Dixmude. The Germans were unable to hold; Lille had to be abandoned, and, under the combined pressure of this and the British attack, the whole German line N. of Cambrai rolled backward in disorder, toward the Scheldt, closely pursued. The Americans also attacked on the 14th, with important gains W. of the Meuse.

On Oct. 17 the British IV. Army and the French I. Army attacked the hastily improvised German line between Le Cateau and the Oise. On the 20th the III. Army attacked the line of the Selle, supported by the I. Army astride the Scheldt. Both attacks succeeded.

The conditions of the fighting are best understood by referring to the German reserves. From 60 divisions in reserve when the attack of Sept. 26 was begun the German army had been reduced by Oct. 15 to 26 divisions in reserve, of which only 9 were rested. Of the divisions in line many were unfit for combat, but could not be replaced.

Toward the end of Oct. the dissatisfaction in Berlin and elsewhere with the Government had become intense. The people felt that the war had been mismanaged and that they had been deceived. In an attempt to appease them Ludendorff was dismissed on Oct. 25, and his place as quartermaster-general was taken by Gen. Groener. But it was too late to save either the Cabinet or the Monarchy, for with the disaster to the army from the vigorous Allied attacks of Nov. 1 and following days the Kaiser was forced to abdicate on Nov. 9.

On Nov. 1 the Allied armies began their final drive. On the right the American I. Army on the Meuse-Argonne front effected a clean break through the German lines, and began an active pursuit which was only stopped by the Armistice on Nov. 11. On the left of the American armies the French IV. Army was equally successful. Farther N. the British I. Army attacked the line of the Rhônelle river and completed the evacuation of Valenciennes. This attack was followed on Nov. 4 by a general attack by the British I., III. and IV. Armies, on a 30-m. front, from Valenciennes to the Sambre, N. of Oisy. In spite of serious natural obstacles, having to force the crossings of the Sambre on the right and to penetrate the forest of Mormal in the centre, the line was advanced 5 m. on Nov. 4. This battle finally broke the German power of resistance, and the German army began a retreat along the entire northern front, though it still offered stiff resistance to the British I. Army on Nov. 5 and 6.

On Nov. 9 the important railway centre and fortress of Maubeuge was taken and the II. Army crossed the Scheldt on its entire front. On Nov. 11 the Canadian 3rd Div. captured Mons. Farther N. the Belgian army stood before Ghent.

On Nov. 9 Foch had telegraphed all commanders-in-chief: "The enemy, disorganized by our repeated attacks, yields on the entire front. I appeal to the energy and initiative of the commanders-in-chief and of their armies to render decisive the results gained." On the same day the German delegates presented themselves at Rethondes to ask terms for an armistice, which were accepted on Nov. 11.

During the last week's fighting the outbreak of the revolution in Germany, interrupting as it did the service of communication and the forwarding of supplies, had combined, with the pressure on the front, the depleted and disorganized condition of the troops, and the absence of any available reserves to replace broken and worn combat units, to render further resistance on

the part of the Germans an impossibility. Had the Armistice not been concluded a great *débâcle* would have been the result.

Preparations had been made to extend the attack on Nov. 14 to include the Lorraine front E. of Metz, an attack which the German army was as little prepared to meet as it was to resist the advance of the whole Allied line to the north. But this proved unnecessary to secure the Allied war aims. (A. L. C.)

WESTER WEMYSS, ROSSLYN ERSKINE WEMYSS, 1ST BARON (1864—), British admiral, was born in London April 12 1864, the 3rd and posthumous son of James Hay Erskine Wemyss of Wemyss Castle, Fife. He entered the navy in 1877, was promoted lieutenant 1887, commander 1898, captain 1901, rear-admiral of 2nd Battle Squadron 1912-3, and of the 3rd fleet 1914, vice-admiral 1916 and admiral of the fleet 1919. He commanded a squadron during the landing of the British troops in Gallipoli (1915), was commander-in-chief in the East Indies and Egypt (1916-7), Second, and shortly afterward First Sea Lord of the Admiralty (1917-8), and member of the War Cabinet (1918). He was created K.C.B. (1916), G.C.B. (1918), and raised to the peerage (1919).

WEST INDIES, BRITISH (see 4.607* and separate articles on the various islands).—For administrative purposes, British Guiana and British Honduras are usually regarded as an integral part of the British West Indies, with which they have much in common. These two colonies are, therefore, included here. The area of the group remained unchanged in 1921, no new possessions having been acquired by Great Britain in the Caribbean and no territory alienated. The total pop., according to the latest estimates available in 1921, was:—Bahamas, 50,049; Barbados, 200,368; Jamaica, 801,040; Turks and Caicos Is., 5,615; Cayman Is., 5,564; Antigua, 32,865; St. Kitts, 22,415; Nevis, 11,596; Anguilla, 4,230; Dominica, 40,315; Montserrat, 10,182; Virgin Is., 5,557; Trinidad and Tobago, 386,707; Grenada, 74,400; St. Vincent, 53,210; St. Lucia, 51,505; British Guiana, 305,991; British Honduras, 43,586.

The Supply of Labour.—Though Barbados has a redundant population, the labour supply in the rest of the West Indies was insufficient for agricultural requirements, and the position had been aggravated by the emigration of British West Indians to Cuba, to which island they were tempted by the promise of higher wages, which did not, however, always materialize. Toward the end of 1919 this form of emigration began to assume serious proportions, no fewer than 21,573 labourers leaving Jamaica for Cuba, whilst only 6,457 returned. Recruiting for Cuba was also actively carried on in Barbados. With the slump in prices in 1921, however, the tide set in to some extent in the opposite direction, many labourers returning to their homes. In the British West Indies it was beginning to be realized that it is only by the payment of suitable wages, improved housing conditions and the offer of other amenities, that labourers can be induced to remain in their island homes. In British Guiana the shortage of labour was particularly acute, and with a population averaging only 3.3 to the square mile, no development of the hinterland on a large scale was possible.

In 1913, Mr. James McNeil and Mr. Chimman Lall visited the British West Indies to report on the system of indentured immigration prevailing in British Guiana, Jamaica and Trinidad, and though their report was favourable, Lord Hardinge, the then Viceroy of India, announced in the Indian Legislative Council in April 1916 the determination of the Government to abolish the indenture system. It was at first proposed to terminate the system gradually in order that the colonies might have time to adjust themselves to the change; but in practice emigration from India was completely suspended in the same year. In 1919, the need for labour having become acute in British Guiana, a deputation comprising representatives of all classes of the agricultural and commercial communities visited England to urge upon the India Office and leaders of Indian public opinion, who were then in London, the desirability of the resumption of Indian immigration on a free colonization basis. Representatives of the deputation and of the West India Committee subsequently visited India, where they interviewed prom-

inent leaders and the members of the Government, who agreed to send a commission to British Guiana to report on the suitability of that country for receiving immigrants. The appointment of this commission was, however, delayed, it being felt desirable to await the views of the public in India regarding the proposals for dealing with the Indian question in Kenya Colony before proceeding further with the matter. In July 1921 an offer of the Indian Government to send a deputation to British Guiana was under consideration.

Government and Administration.—The question of political federation of these scattered colonies, which was discussed periodically, had failed up to 1921 to awaken any marked degree of enthusiasm in the several communities. Indications were not wanting, however, to show that a better understanding was being gradually brought about, in spite of the continued difficulties of communication. This was no doubt attributable to the work of a series of intercolonial conferences from 1899 to 1921, the main object of which had been to bring about a greater degree of uniformity in all matters of common interest concerning the British West Indies. All proved eminently successful, the Customs Conference in 1910, for example, having resulted in the adoption of uniformity of definition and arrangement of the West Indian tariffs, whilst the conference on law in 1916 was followed by the establishment of a West Indian court of appeal for the colonies lying to windward of the Caribbean. A further step in the direction of closer union has been the formation of an Associated West Indian Chamber of Commerce, which held conferences in Trinidad in 1917 and Barbados in 1920. In 1920-1 Grenada, St. Lucia, and St. Vincent individually petitioned the King for the substitution of representative government for the crown colony system. In the case of Grenada, the Secretary of State for the Colonies, to whom the matter was referred, consented to advise the King to approve of the introduction of the elective system into the constitution, the council to consist of the governor, as president, six official, three nominated unofficial and four elected unofficial members, the electives to be chosen by the people on the basis of the system of elected representation, already operative throughout the island in municipal affairs in the case of the district boards. The petitions of St. Lucia and St. Vincent, on the other hand, were rejected on the grounds that the signatories were not sufficiently representative in character.

In 1920 the Prince of Wales made Barbados his first port of call in his empire tour in H.M.S. "Renown," and visited in succession Trinidad, British Guiana, Grenada, St. Lucia, Dominica, Montserrat, Antigua and Bermuda on his homeward voyage. His Royal Highness, who was received with manifestations of the greatest loyalty wherever he went, took the opportunity of refuting the suggestion that Great Britain might be willing to dispose of her West Indian possessions to a foreign country in part settlement of her debt.

The World War.—The British West Indies contributed generously in men, money and produce toward the prosecution of the World War. Many hundreds of West Indians came over to England independently to enlist, and a contingent comprising 15,601 officers and men was recruited voluntarily for active service. The numbers of men recruited in the various islands, British Guiana and British Honduras, were:—

	Officers	Men
Barbados	20	811
Bahamas	2	439
British Guiana	14	686
British Honduras	5	528
Jamaica	303	9,977
Trinidad and Tobago	40	1,438
Grenada	4	441
St. Lucia	5	354
St. Vincent	305
The Leeward Is.	4	225
	397	15,204

The men were embodied in the British West Indies Regt., which served with distinction in France and Flanders, and also

* These figures indicate the volume and page number of the previous article.

in Egypt and Palestine, where they participated in the victorious advance to Amman. The total casualties were: Killed or died of wounds, 185; died of sickness, 1,071; wounded, 697. Private contingents were also sent over for enlistment by the Trinidad Merchants' and Planters' Contingent Committee and the Barbados Citizens' Contingent Committee for recruitment in the United Kingdom. In order to provide for the welfare of the West India and Bermuda military contingents, and of men coming over independently to serve in His Majesty's forces during the war, the West Indian Contingent Committee was formed in London at the instance of Mr. Bonar Law, the then Secretary of State for the Colonies, in 1915. The total contributions made by the British West Indies toward the cost of the war, relief funds, etc., amounted to over £3,250,000, the most notable amount included in that figure being the annual contribution of £60,000 for 40 years voted by the Jamaica Legislature.

Trade.—The war brought about a remarkable revival of prosperity to the British West Indies, the total trade of those colonies rising from £25,809,884 in 1913 to £43,637,324 in 1919. The chief staples, sugar, rum, molasses, cacao, cotton and arrowroot, all commanded greatly enhanced prices, the only industry, indeed, that reaped no benefit being that of the production of lime and lime products in Dominica, which was adversely affected by the lack of shipping facilities and by import restrictions in the United States. Some anxiety was caused in 1912 by the decision of the Imperial Government to withdraw from the international convention for the suppression of sugar bounties and cartels, but the remaining high contracting Powers, having decided to adhere to that agreement, no ill effects resulted. Though Great Britain withdrew from the convention she decided to adhere to the principles of it and not to give a preference to sugar produced within the Empire or to cane over beet. In Aug. 1918 she gave to the signatories of the convention six months' notice of her intention to resume complete liberty of action in respect of her policy with regard to sugar, and the Finance Act of 1918 provided for the granting of a preference of one-sixth off the duties on sugar, molasses, tobacco, coffee, cacao and other products imported from within the Empire into the United Kingdom, and a preference of 2s. 6d. per gal. on rum.

Following an inquiry by a royal commission, of which the late Lord Balfour of Burleigh was chairman, in 1909, a conference was held at Ottawa in 1912 between representatives of the Dominion and the British West Indian colonies, the Bahamas, British Honduras and Jamaica excepted, to consider the question of closer trade between Canada and the West Indies, and on April 9 in that year an agreement was signed providing for a reciprocal trade agreement, the basis of which was a mutual preference of 20% on the chief products of the countries concerned, with a minimum preference on flour in favour of Canada, of 12 cents per 100 lb. and 15 cents on 96° test sugar not over No. 16 Dutch Standard in colour in favour of the British West Indies. Certain concessions which the Canadian refiners had enjoyed of importing foreign sugar at the British preferential rates were withdrawn. The agreement came into force on June 2 1913, and Grenada gave her adhesion to it in the same year.

In 1920 a further conference was held at Ottawa at which all the West Indian colonies, and also the Imperial Government, were represented. A new agreement was signed on June 18 1920 and brought into force in May 1921, under which Canada agreed to give to British West Indian products a tariff preference of 50%, whilst the British West Indies similarly agreed to extend to Canadian products tariff preferences of 50% in the case of Barbados, British Guiana and Trinidad, 33½% in that of British Honduras, the Leeward Is. and the Windward Is., 25% in Jamaica, and 10% in Bahamas, the Legislature of which colony afterwards voluntarily increased the preference to one of 25%. Certain products were again specifically dealt with, the preference on Canadian flour entering the West Indies being not less than 1s. per 196 lb. and that on West Indian sugar being not less than 83.712 cents per 100 lb. on 96° test. The Government of Canada further agreed to endeavour to arrange for a weekly freight, mail and passenger service, with steamers of 5,000 to 6,000 tons burthen, capable of steaming 12 knots per hour, between St. John (New Brunswick) or Halifax (Nova Scotia), down the islands lying to windward, British Guiana and back, the colonies contributing £27,000 per annum; also a service of freight, mail and passenger steamers of 3,500 tons burthen, capable of steaming 10 knots, from Canada to Nassau (Bahamas), Jamaica, Belize (British Honduras), and back, fortnightly, the colonies concerned contributing at the rate of £13,000 per annum toward any loss involved in the event of the service proving unremunerative. The Canada-British Honduras service was inaugurated in Jan. 1921. A declaration appended to the agreement recommended for favourable consideration the laying of British-owned and British-controlled cables as soon as possible, to connect Bermuda with Barbados, Trinidad, British Guiana, the Windward Is., the Leeward Is., and Turks Is. or Jamaica.

Communications.—In the matter of shore-to-shore communication the British West Indies were decidedly worse off after the war than be-

fore it. In 1915 the Royal Mail Steam Packet Co. terminated the transatlantic contract steamer service on the ground that they had been precluded from using their terminal port at Southampton. In the same year the fortnightly intercolonial contract service was also terminated by mutual agreement between the company and the colonies concerned. For some time thereafter the company continued to berth small passenger steamers for the West Indies at irregular intervals; but this service was also brought to an end in 1920, and passengers between the West Indies and the mother country were afterwards compelled to travel by foreign steamers, cargo boats, or via Canada or the United States. An intercolonial service was performed in 1921 by direct steamers running between St. John (New Brunswick) and Halifax (Nova Scotia), down the islands, and back. Under the Canada-West Indies trade agreement referred to above this service was to become a weekly one. The British Government, toward the close of the year 1920, agreed to contribute two-thirds of the cost of a temporary transatlantic steamer service for three months if the West Indian colonies would provide one-third, but this proposal was not acceptable to all the colonies concerned, mainly because it was felt that the steamers which it was proposed to use were unsuitable. In 1921 the British Government further offered to contribute £90,000 per annum toward a subsidy for a transatlantic steamer service, and proposals were made for the invitation of tenders. This proposal was, however, rejected by Trinidad, which in 1921 enjoyed a fortnightly mail and passenger service provided by the Royal Netherlands West India Mail, free of expense to the colony. The Dutch line agreed in June 1921 to allow their steamers to call at Barbados as well as Trinidad.

Agriculture.—In 1919 Visct. Milner appointed a committee to consider the desirability of establishing a tropical agricultural college in the West Indies, and in the event of their decision being favourable to report on the subject generally. The committee issued their report in 1920, favouring the establishment of a West Indian agricultural college in Trinidad. The proposals having commended themselves to the majority of the West Indian colonies, the agricultural college committee was called together again in the autumn of 1920 with a view to making the necessary arrangements for the incorporation of the college and for carrying out the plans generally. The objects for which the college was established are to afford to young men opportunities for instruction in the principles of agriculture and in the cultivation and preparation for market of tropical produce of every kind, including especially sugar and its by-products, rum and molasses, cacao, coffee, cotton, coco-nuts, rice, citrus and other fruits (notably bananas), and dyewoods, many of which commodities constitute the raw materials employed in the manufactures of the mother country; for the training of scientific investigators in matters pertaining to tropical agriculture amid suitable surroundings; for creating a body of British expert agriculturists well versed in the knowledge of the cultivation of land in the tropics, and of scientific advisers possessing an intimate knowledge of the means of combating pests and diseases, the control of which is fundamentally essential to the successful development of agriculture in the tropics. Attached to the college will be a model sugar factory, the various units of which have been contributed by the principal British sugar machinery manufacturing and allied firms.

Industries.—Sugar remained the principal staple. This industry was developed by the extension of the central factory system, whereby the canes from the surrounding estates, as well as those grown by peasant farmers, are dealt with at a central base, the concentration thus effected permitting of the instalment of machinery by which the maximum amount of sugar can be extracted from the cane. Thanks to the devoted care given to cultivation, and to the assistance of the local agricultural scientists who make it their constant aim to combat insect pests, the cacao industry, which is mainly centred in Trinidad and Grenada, continued to prosper. The Jamaica banana industry suffered from a succession of hurricanes in 1915, 1916 and 1917, but afterwards showed rapid recovery. The cultivation of citrus fruit on the other hand made little progress—except in Dominica, where the lime industry continued steadily to increase after the war—owing to the prohibitive import duties in the United States and the inadequacy of shipping facilities for fruit between the West Indies and Canada and the United Kingdom. The Sea Island cotton industry, which owed its development in the West Indies to the ravages of the boll-weevil in the United States, received a check in 1920, through the appearance of the still more dreaded boll-worm in St. Kitts and Montserrat, to which it was brought by a Brazilian vessel. A comparatively new industry, which made rapid progress, was that of rice. Formerly rice was imported into British Guiana in large quantities for the consumption of East Indian immigrants. Now that colony not only produces enough rice for its own requirements but also a substantial surplus which is available for export to the neighbouring colonies. The exports of rice from British Guiana rose from 45,223 lb. in 1905, to 18,110,400 lb., besides 4,390,951 lb. of paddy, in 1920.

Almost as rapid has been the development of the petroleum industry in Trinidad. The existence of petroleum deposits in Trinidad has long been recognised. As far back as 1864 the Trinidad Petroleum Co., promoted by Mr. H. B. Sheridan and the 11th Earl of Dundonald, started drilling for oil at La Brea. Oil was struck, but competition with the new oilfields in the United States proved too

formidable, and this and other causes forced the company into liquidation. Two years later, a civil engineer, named Derwent, started boring at Aripere. He, too, struck oil, but failed to make a financial success of the venture. No further steps were taken toward winning oil until about 1900, when Mr. Randolph Rust, a local resident (Mayor of Port of Spain in 1921), imported modern oil-boring machinery and successfully struck oil at Aripere in 1901. Other prospectors came on the scene, and in 1910 followed the successful flotation of the Trinidad oilfields, and Trinidad enjoyed such a boom as no West Indian colony had experienced, at any rate for many a long day. On April 27 in the following year Sir George Le Munte, the then governor, opened the valve at the end of the pipe line on Brighton pier, thus inaugurating the new industry, which has since been developed at a rapid rate. With many new wells being drilled it was certain that the production of oil, which in 1920 amounted to 72,905,947 gal., would undergo material expansion.

(A. E. A.)

WESTINGHOUSE, GEORGE (1846-1914), American inventor and manufacturer, was born at Central Bridge, N.Y., Oct. 6 1846. In 1856 his father moved to Schenectady, N.Y., and began to manufacture farm implements. The boy early displayed inventive talent and when 13 designed and constructed a rotary engine. He entered the Union army in the Civil War in 1863 but in 1864 was appointed third assistant engineer in the navy. At the close of the war he resigned and entered Union College, but in his sophomore year, on the advice of the president, he withdrew to devote his time to mechanical invention. In 1865 he had invented a device for replacing derailed cars and also a reversible steel railway frog, but from lack of capital was unable to develop a business in Schenectady. In 1868 he went to Pittsburgh and arranged for the manufacture of his devices, which he himself sold to the railways. In 1869 he patented his air-brake and organized the Westinghouse Air Brake Co. In 1872 he invented the automatic air-brake (see 4.414). This brake was quickly adopted by railways in America and gradually in Europe. He also developed a system of railway signals, operated by compressed air with the assistance of electrical contrivances. In 1885 he acquired certain patents for alternating current machinery. In June 1912 he received the Edison gold medal for "meritorious achievement in connexion with the development of the alternating current system for light and power." In 1893 this system was installed at the Chicago Exposition. Later his Pittsburgh establishment built dynamos for the power plants at Niagara Falls, for the rapid transit systems of New York City, and for the London Metropolitan railway. Westinghouse also devised a method for conveying gas through long-distance pipes thus making it a practicable fuel. In 1910 he was elected president of the American Society of Mechanical Engineers. He died in New York March 12 1914. He was president of some 30 corporations with a capital of about \$200,000,000, employing more than 50,000 persons.

WESTLAKE, JOHN (1828-1913), English jurist, was born at Lostwithiel, Cornwall, Feb. 4 1828. He was educated at Trinity College, Cambridge, where he graduated in 1850. He was called to the bar in 1854, and attained a great reputation as an authority on international law. In 1874 he became a Q.C. and bencher of Lincoln's Inn, and in 1885 successfully contested the Romford division of Essex in the Liberal interest. In 1888 he became professor of international law at the university of Cambridge, a position which he held until 1908. He was also an hon. president of the Institute of International Law, and from 1900 to 1906 a member of the Hague arbitration court. He died at Chelsea April 14 1913.

His works include *A Treatise on Private International Law, or the Conflict of Laws* (1858; 5th ed. 1912); *Chapters on the Principles of International Law* (1894); *International Law, Part I., Peace* (1904; 2nd ed. 1910); *Part II., War* (1907).

WESTON, AGNES (1840-1918), English philanthropic worker, was born in London March 26 1840. In 1868 she took up hospital visiting and parish work in Bath, and through beginning a correspondence with a seaman who asked her to write to him, developed into the devoted friend of sailors, superintendent of the Royal Naval Temperance Society and founder of the Royal Naval Sailors' Rests, or clubs for sailors, at Devonport and Portsmouth. She published *Life Among the Bluejackets* in

1909. She died at Devonport Oct. 23 1918. Shortly before her death her work for the navy had been recognized by the bestowal of the G.B.E.

See S. G. Wintz, *Our Bluejackets, Miss Weston's Work* (1894).

WEST POINT (see 28.558).—The following important buildings were completed at West Point after 1910: the Administration Building, East Academic Building, Riding Hall, two new cadet barracks, cadet chapel and chaplain's quarters, artillery barracks and artillery stable, cavalry barracks and cavalry stable, eight sets of officers' quarters, two apartment buildings each containing eight sets of officers' quarters, and a cadet laundry. By Act of May 4 1916, the number of cadetships authorized at the academy was increased to 1,332. By authority of the War Department, April 1915, candidates were permitted, in lieu of passing the regular entrance examination, to qualify for admission upon the presentation of satisfactory certificate of previous academic work in accredited institutions. By Acts of 1919 and 1920, the pay of cadets was fixed at \$7.80 per annum and one ration per day or commutation thereof at the rate of \$1.08 per day. The World War and the demand for trained officers led the War Department to direct the graduation of the First or Upper Class April 20 1917, and of the Second Class Aug. 30 1917. The next year the need for officers resulted in the graduation of three classes, the first, June 12 1918, and the second and third together, Nov. 1 1918. A class of new cadets was admitted at an irregular time, Nov. 2 1918, and provision was made for a temporary one-year course. After the Armistice the War Department directed, May 12 1919, that the course of instruction be fixed for three years, but the following year Congress specified that the course should be four years. The academic authorities thereupon reorganized the curriculum in the light of the most recent military and educational experience.

The new schedule contained the following salient features: (1) The upper classes on duty undergo military training June 15 to Aug. 30 at a regular army cantonment away from West Point; (2) The new Fourth Class enter the academy July 1 and receive at West Point preliminary military training until Aug. 30; (3) During the academic year, extending from Sept. 1 to June 15, tactical drills and supervised athletics alternate daily (except Wednesdays and Saturdays) after 4 P.M. for all cadets; (4) Academic instruction be given during periods between 8 A.M. and 4 P.M. in the following subjects to the respective classes—*Fourth Class*, mathematics, English, French and surveying; *Third Class*, mathematics, English, French, political history, drawing and theoretical tactics; *Second Class*, natural and experimental philosophy, chemistry and electricity, Spanish, military hygiene; *First Class*, military engineering, law, military art and history, ordnance and gunnery, economics and government. Ten Saturdays throughout the year were set apart for lectures to the whole corps by eminent men.

The number of graduates of the academy 1910 to 1920 inclusive was 1,959. The superintendents since 1910 have been: T. H. Barry (b. 1855) 1910-2; C. P. Townsley (b. 1855) 1912-5; John Biddle (b. 1859) 1916-7; S. E. Tillman (b. 1847) 1917-9; Douglas McArthur (b. 1880) 1919-22.

WEST VIRGINIA (see 28.560).—In 1920 the pop. was 1,463,701, as against 1,221,119 in 1910, an increase of 242,582 or 19.9%. The urban pop. (for places of 2,500 or more) increased from 18.7% in 1910 to 25.2% in 1920. The density of pop. was 60.9 in 1920; 50.8 in 1910. The following table shows the growth of the ten largest cities for the decade 1910-20:—

	1920	1910	Percentage increase
Wheeling	56,208	41,641	34.9
Huntington	50,177	31,161	61.0
Charleston	39,608	22,996	72.2
Clarksburg	27,869	9,201	202.9
Parkersburg	20,050	17,842	12.4
Fairmont	17,851	9,711	83.8
Bluefield	15,282	11,188	36.6
Martinsburg	12,515	10,698	17.0
Morgantown	12,127	9,150	32.3

Agriculture.—Of the land area of the state 62.2% in 1920 was in farms and 57.7% was improved. The number of farms, which was 96,685 in 1910, decreased to 87,289 in 1920 (9.7%). The total farm acreage decreased from 10,026,442 to 9,569,790 (4.6%), but the total value of all farm property increased from \$314,738,540 in 1910 to \$496,439,617 in 1920 (57.7%). The value of farm lands and buildings increased from \$264,390,954 to \$410,783,406; implements

and machinery from \$7,011,513 to \$18,395,058; and live stock from \$43,336,073 to \$67,261,153. The number of farms reported as being mortgaged grew from 9,525 in 1910 to 10,274 in 1920. Of these 7,878 in 1910 and 9,031 in 1920 reported the amounts represented by the mortgages—\$5,592,533 and \$11,205,953 respectively. The average debt per mortgaged farm was \$1,241 in 1920 and the average rate of interest 5.9%. Native-born white farmers predominate in the state. Of the 87,289 farms in the state in 1920 86,785 were operated by white farmers, of whom only 752 were foreign-born, and there were only 504 coloured farmers, compared with 708 in 1910. Of the native white farmers 71,181 were owners, 1,071 managers and 13,781 tenants. The number of horses on farms in 1920 was 169,148, compared with 176,530 in 1910. Mules increased from 11,577 to 14,981; cattle from 560,770 to 587,462; and chickens from 3,106,907 to 4,027,510; while sheep decreased from 566,952 to 509,831; and hives of bees from 111,673 to 89,873.

The value of all crops for West Virginia in 1919 was \$96,537,459, compared with \$36,167,014 in 1909. The 1919 value of the corn crop was \$29,768,131; oats \$3,054,668; wheat \$8,395,097; hay and forage \$23,746,574; potatoes \$6,461,619; tobacco \$2,731,338; apples \$7,540,491; peaches \$1,518,784. The variations in production of the chief crops in 1909 and 1919 is shown in the following table:—

	1919		1909	
	Ac.	Bus.	Ac.	Bus.
Corn	568,219	17,010,357	676,311	17,119,097
Oats	169,915	3,054,668	103,758	1,728,806
Wheat	298,036	3,747,812	209,315	2,575,996
Buckwheat	31,095	537,883	33,323	533,670
Potatoes	34,526	2,809,398	42,621	4,077,066

The extension of agricultural teaching, which was established at the West Virginia University in 1913, has been an important factor in the development of scientific agricultural methods.

Mining.—In mineral productions West Virginia ranks second among the states of the Union. The total value was \$125,111,280 in 1913 and \$133,633,229 in 1914. Oil production, which in 1900 was 16,195,675 bar., declined to 9,095,296 in 1907. It increased again to 12,128,962 bar. in 1912, but steadily declined thereafter. The production in 1916 was 8,731,184 bar., valued at \$21,914,080. In 1918 it was only 7,866,628 bar. (the lowest since 1893), but in 1920 it reached 8,173,000 barrels. In the production of natural gas West Virginia since 1906 has ranked first among all the states. The production, which had reached 119,100,392 thousand cub. ft. in 1906, steadily increased (except in 1908 and 1914) to 308,617,101 thousand cub. ft., (valued at \$57,389,161) in 1917; but in 1918 declined to 265,160,917 thousand (valued at \$41,324,365), and in 1919 to approximately 201,500,000 thousand (valued at \$40,304,500).

In 1909 West Virginia, overtaking Illinois, became the second coal-producing state of the Union, but in 1920 dropped to third. Coal production in West Virginia, which had reached 22,647,207 short (net) tons in 1900, and 61,671,019 in 1910, continued to increase steadily, reaching in 1914 71,707,626 short tons, valued at \$71,391,408, and furnishing employment to 78,363 persons. The industry became especially active when the United States entered the World War. In 1916 the production increased to 86,460,127 short tons, valued at \$102,366,092, and in 1918 to 89,935,839 short tons, valued at \$230,508,846. In 1919 it was 75,500,000 short tons, and, together with coke production 1,454,000 short tons, gave employment to 91,566 persons. In 1920 it was 87,500,000 tons. The production of coke, which steadily increased until 1910, when it reached 14,217,380 short tons, valued at \$7,525,922, thereafter steadily diminished to 1,391,446 short tons in 1915, again increased to 3,349,761 in 1917, and in 1919 decreased to 1,454,000 short tons. The increase of coal production after 1910 was partly due to strikes in Ohio and other middle-western states. The determination of the United Mine Workers to unionize the mines of West Virginia led to a bitter and prolonged labour war, which began in 1912 in the Cabin Creek and Paint Creek collieries of the Kanawha valley, and resulted in losses aggregating nearly \$6,000,000. This secured for the union a foothold in West Virginia. In Sept. and Nov. 1919 organized miners from the Kanawha region threatened an armed invasion of Logan County to force the unionization of that field. In order to prevent possible disturbance Gov. Cornwell asked for and obtained a regiment of Federal troops. In 1920 an attempt to unionize the miners along the Norfolk & Western railway finally precipitated an armed conflict between detectives and union miners at Matewan, in Mingo county, resulting in the death of seven detectives and the mayor and the terrorization of the community, and necessitating a call for Federal troops and the establishment of military control.

Manufactures.—In 1914 West Virginia was in importance of manufactures the 28th state. The number of establishments was 2,749, with an invested capital of \$175,995,011, and a production valued at \$193,511,782. The number of persons employed was 79,353 (10% more than 1909), earning \$51,377,760. The leading industries were lumber and timber, steelworks, rolling-mills, tinplate and sheet-plate, glass, leather, railway cars and shop construction, flour milling and the manufacturing of clay products. The state ranked second in the production of glass, and also in the production of tinplate and sheet-plate, and eighth in the value of clay products.

The Federal Government constructed on the Kanawha in 1918 two large plants, a projectile plant at Charleston and a high-explosive plant at Nitro, at an expenditure of over \$60,000,000.

Transportation.—Transportation facilities continued to improve after 1909. The railway mileage, which in 1912 reached 3,557 m. by the completion of the Virginia railway (139.6 m.), by the construction of the coal and coke railway from Elkins to Charleston (196.75 m., recently acquired by the Baltimore & Ohio Railway Co.), and by the completion of the Hampshire-Southern branch of the Baltimore & Ohio to Moorefield and Petersburg, was further increased in 1913 by the extension of the Monongahela River railway southward to Fairmont (1913) and by several shorter branches. The railway mileage in 1919 was 3,892.

Banks and Banking.—The condition of the banks in West Virginia in 1920-1 was as follows:—

	National Banks, 1920	State Banks, 1920-1
Number	122	227
Capital	\$11,573,000	\$17,597,932
Surplus	\$7,739,000	\$11,047,231
Loans	\$100,545,000	\$130,617,886
Deposits	\$134,436,000	\$170,370,924

Education.—In 1920 the total school pop. was 448,670, the total school enrolment 341,977, the average daily attendance 253,395. The *per capita* cost of education was \$25.18 based on enumeration, \$44.57 based on average daily attendance. The total number of teachers was 11,406. The average annual salary paid teachers in all grades was \$581. The total number of school-houses was 6,956. The expenditure for all common schools was \$11,291,563 and for state educational institutions \$1,850,906, making a total of \$13,141,469 for the educational system of the state. The value of all public school property was estimated at \$25,639,697, and the value of state educational institutions at \$2,775,000. In 1920 a compulsory school law was enacted. The development of the high schools has been a prominent feature of recent educational growth. This was partly due to the appointment of a state high school supervisor in 1909 to direct the establishment and standardization of the high schools. In 1921 the state had 172 classified high schools with 1,129 teachers, and an enrolment of 20,000 (about 3,000 graduating each year), and high school property valued at \$10,000,000. In 1920 the high schools received state aid amounting to \$118,000. The enrolment of candidates for degrees in West Virginia University increased from 800 in 1909-10 to 1,596 in 1919-20, and the total enrolment for the same period increased from 1,200 to 2,800, or 1,992 exclusive of short-course students. The members of the faculty increased from 62 to 141, of whom 56 were full professors, 17 were associate professors and 27 were assistant professors. The total number of women students increased from 619 to 975 in the same period. Under the Act of 1919 the control of all educational affairs of the state, from the lowest school to the university, was vested in a state board of education composed of the state superintendent (as executive officer) and six members appointed by the governor. The board has an advisory council of three coloured citizens.

Finance.—The receipts of the state for the fiscal year June 30 1920 was \$19,901,931, the disbursements \$19,570,122. The total bonded indebtedness Jan. 1 1921 was \$11,663,700. In 1919 the total assessed value of real estate (\$769,648,033), personal property (\$371,602,428) and public utility property (\$349,522,672) was \$1,490,773,133. In 1909 the Legislature enacted a business licence tax which by July 1920 produced \$226,204. In 1915 it placed on corporations and companies a special excise tax, which was increased by an additional excise tax in 1919. The two Acts produced for 1919-20 approximately \$600,000.

Constitutional Amendments.—An amendment providing for prohibition was ratified in 1912 by a majority of 92,342. Another amendment proposed in 1917 and ratified in Nov. 1918 provides that an itemized and classified budget shall be prepared by the board of public works, and presented to the Legislature for its guidance in determining appropriations. A third amendment ratified in Nov. 1920 provided for two periods of every regular session of the Legislature—one of 15 days in Jan., primarily for presentation of bills, and another of 45 days in March-April, primarily for consideration and action on bills. The same amendment increased the salaries of members of the Legislature to \$500 a year. A fourth amendment, ratified in Nov. 1920, authorized the Legislature to provide for a system of state roads under control and supervision of state officers, and to bond the state to a maximum of \$50,000,000, if necessary.

Administrative Changes.—By Act of 1911 a state Department of Agriculture was created in 1913 and placed under the Direction of the commissioner of agriculture, an elective officer who is also a member of the board of public works. The office of highway inspector, created in 1907, was abolished in 1911; and a state bureau of roads (four members) was created in 1913. By Act of 1913 a public service commission of four members (reduced to three by Act of 1915) was created. At first it had jurisdiction over the newly established workmen's compensation fund, which later was administered by a state commissioner. Under the Yobet law of 1913 the state tax commissioner is *ex officio* state commissioner of prohibition.

By Act of 1919 a department of public safety (state police) was established to relieve the military arm of the state and to aid in establishing the system of private peace officers. By Act of 1915 the membership of the House of Delegates (previously 86) was increased to 94.

Welfare Legislation.—A state tuberculosis sanatorium established by Act of 1911 was opened for patients in 1913 at Terra Alta. A similar institution for coloured people was opened in 1919. Revision of laws relating to medicine and health in 1913 marked the beginning of a new era in sanitary legislation. In 1914 a hygiene laboratory was established. In 1915 a state department of health was created, with a commissioner as executive officer, two new divisions, vital statistics and child welfare, were added by Act of 1919.

History.—Apart from the economic and educational movements above described, the outstanding event of the decade ending 1920 was the adjustment of the long-standing "Virginia debt question." It arose from the formation of West Virginia as a separate state in 1863 and at various times had been a prominent issue in state politics. A U.S. Supreme Court decision of 1911 tentatively fixed West Virginia's share of the old debt at \$7,182,507.48 (leaving the question of interest for later adjustment), and by a later judgment of 1915 against West Virginia fixed the total obligations at \$12,393,920.50 (\$4,215,622.28 and accrued interest from Jan. 1 1861), with a decree that this total amount should draw interest at 5% until paid. In Feb. 1917 Virginia filed application for a writ of *mandamus* against the Legislature of West Virginia to compel the levy of a tax to pay the judgment; but the court deferred action in order to give West Virginia a reasonable opportunity to act without compulsion. The total amount of principal and interest on Jan. 1 1910 was \$14,562,867.16. Of this amount West Virginia, by Act of March 31 1919, arranged to pay \$1,062,867.16 in cash and the balance by an issue of "listable" 3½% bonds in favour of Virginia, payable in 1930 (or earlier). Bonds amounting to \$12,366,500 were delivered to the Virginia debt commission at Richmond, Va., on July 3 1919. The remaining bonds (\$1,133,500) were held in escrow pending the filing of remaining outstanding Virginia debt certificates.

The state continued Republican in politics, but party division resulted in the election of a Democrat to the governor's office in 1916. The governors since 1900 have been: William F. Glasscock, 1900-13; Henry D. Hatfield, 1913-17; John J. Cornwell, 1917-21; Ephraim F. Morgan, 1921-.

BIBLIOGRAPHY.—J. M. Callahan, *Semi-Centennial History of West Virginia* (1913); Thos. C. Miller and Hu. Maxwell, *History of West Virginia and its People* (1913); John T. Harris, *West Virginia Legislative Handbook* (1920). (J. M. C.)*

WHARTON, EDITH [NEUBOLD JONES] (1862-), American writer, was born in New York City in 1862. She lived much in Italy and France. She married Edward Wharton, a Boston banker, in 1885. She began her literary career as a writer of short stories, her first story, "Mrs. Manstey's View," appearing in *Scribner's Magazine* in 1891. Her first long novel, *The Valley of Decision*, appeared in 1902, the scene being Italy toward the close of the seventeenth century. Her novel, *The House of Mirth*, appeared in 1905 and was highly successful. In 1908 it was translated into French by Paul Bourget, who called it the greatest American novel. It was dramatized with the help of Clyde Fitch, but had slight success. After the outbreak of the World War she edited in 1915 *The Book of the Homeless*, sold for the benefit of Belgian refugees; and later for services she was made a chevalier of the Legion of Honour of France. Her works include *The Greater Inclination* (1899); *The Touchstone* (1900); *Crucial Instances* (1901); *Madame de Treymes* (1907); *The Fruit of the Tree* (1907); *The Hermit and the Wild Woman* (1908); *Tales of Men and Ghosts* (1910); *Elhan Frome* (1911); *The Custom of the Country* (1913); *The Age of Innocence* (1920).

WHITBREAD, SAMUEL (1830-1915), English politician, was born at Cardington, Beds., May 5 1830, the son of Samuel Charles Whitbread, M.P. for Middlesex and grandson of Samuel Whitbread, M.P. for Beds. (see 28.597). He carried on the family tradition both in brewing and in politics, controlling the brewery founded by his great-grandfather from 1867 to 1889, and then becoming chairman of the company to which it was

transferred. Like his father and grandfather he sat in the House of Commons as a Liberal, representing Bedford from 1852 to 1895. He died at Biggleswade Dec. 25 1915.

WHITE, ANDREW DICKSON (1832-1918), American educationalist (see 28.599), died at Ithaca, N.Y., Nov. 4 1918. His later works included *Seven Great Statesmen in the Warfare of Humanity With Unreason* (1910) and *The Work of Benjamin Hale* (1911). In 1913 he published a new edition of *The Warfare of Science and Theology in Christendom*.

WHITE, EDWARD DOUGLASS (1845-1921), American jurist, was born on a plantation in the parish of Lafourche, La., Nov. 3 1845. His father was seventh governor of Louisiana. He was educated at Mount St. Mary's, Md., Georgetown (D.C.) College, and, after the outbreak of the Civil War, at the Jesuit College in New Orleans. During the latter part of the war he served as a private in the Confederate army. He studied law in the office of Edward Bermudez, later chief justice of Louisiana, was admitted to the bar in 1868, and practised law in New Orleans. In 1874 he was elected to the state Senate, and four years later was appointed associate justice of the Louisiana Supreme Court. In 1891 he was elected to the U.S. Senate, and before completing his term was appointed, in 1894, associate justice of the U.S. Supreme Court by President Cleveland. In 1910 he was appointed chief justice by President Taft. Many of his notable opinions were delivered in connexion with the Sherman anti-trust law. Of special importance were his opinions requiring the dissolution of the Standard Oil Co. and the American Tobacco Co. in 1911. As chief justice he administered the oath of office to President Wilson in 1913 and 1917, and to President Harding in 1921. He died at Washington, D.C., May 19 1921.

WHITE, SIR GEORGE STUART (1835-1912), British field-marshal (see 28.599), died in London June 24 1912.

WHITE, SIR WILLIAM HENRY (1845-1913), English naval architect (see 28.602), died in London Feb. 27 1913.

WHITEAVES, JOSEPH FREDERICK (1835-1909), British palacontologist (see 28.602), died at Ottawa Aug. 9 1909.

WHITLOCK, BRAND (1860-), American diplomat and writer, was born at Urbana, O., Mar. 4 1860. He was educated in the public schools, became a newspaper reporter in Toledo, O., in 1887, and was appointed political correspondent on the *Chicago Herald* in 1890. Three years later he accepted a clerkship in the office of the Secretary of State of Illinois, where he remained until 1897. Meanwhile he read law and was admitted to the bar (1894). In 1897 he returned to Toledo and practised law until 1905, when he was elected mayor. He was reelected for three succeeding terms, but in 1911 declined the nomination for a fifth term. In 1913 he was appointed by President Wilson minister to Belgium and in 1919 his post was raised to ambassador. This office he continued to hold under President Harding until the close of 1921. Before he had been in Belgium a year the World War broke out and the German invasion took place. Although the other diplomatic bodies followed the Belgian court to Havre, Whitlock insisted on remaining in Brussels in order to render any possible aid to the oppressed people. It was largely due to his urgent advice that Brussels did not resist and thus escaped even more ruthless devastation. In the early days of the war he gave protection to many German residents who had been unable to leave the country. By his firm attitude toward the German military officials he saved many innocent Belgians from death; but his activities in behalf of Edith Cavell were unavailing as he was misled at the last moment by false promises by the Germans. After the formation of the Commission for Relief in Belgium, its operations were placed wholly under his direction. Food and clothing were provided for destitute civilians whose means of sustenance had been destroyed. His ceaseless work in their behalf won the gratitude of all the Belgians; and although worn out by the physical strain he refused to quit his post until the signing of the Armistice in Nov. 1918, when he returned to America for a short rest. He was decorated with the Grand Cordon of the Order of Leopold by King Albert (1917), and was made burgher of Brussels (1918) and of Liège (1919) and Honorary Citizen of Antwerp (1919).

The Belgian Government awarded him the Civic Cross of the First Class (1919). He was elected a member of the American Academy of Arts and Letters.

An excellent account of the German occupation is given in his *Belgium; a Personal Narrative* (1919). His other writings include *The 13th District: a Story of a Candidate* (1902); *Her Infinite Variety* (1904); *The Happy Average* (1904); *The Turn of the Balance* (1907); *Abraham Lincoln* (1909, in the *Beacon Biographies*); *The Gold Brick* (1910); *On the Enforcement of Law in Cities* (1910; enlarged form, 1913); *The Full Guy* (1912); *Forty Years of It* (1914, a description of "democracy's progress in a mid-western city") and *Wall Whitman: How to Know Him* (1920).

WHYMPER, EDWARD (1840-1911), British explorer and mountaineer (see 28.617), died at Chamonix Sept. 16 1911.

WHYTE, ALEXANDER (1837-1921), British divine (see 28.617), retired from the ministry of Free St. George's in 1916, and from his position as principal of New College, Edinburgh, in 1918. He published *The Apostle Paul* (1903) and *Thirteen Appreciations* (1915). He died at Hampstead Jan. 6 1921.

WILBERFORCE, ALBERT BASIL ORME (1841-1916), English divine (see 28.630), died May 13 1916.

WILBRANDT, ADOLF (1837-1911), German novelist and dramatist (see 28.631), died at Rostock June 10 1911.

See F. Scharrer-Santen, *Adolf Wilbrandt als Dramatiker* (1912), and *Jahrbuch und Deutscher Nekrolog*, XVI., Totenliste 1911, p. 84.

WILEY, HARVEY WASHINGTON (1844-), American chemist, was born in Kent, Ind., Oct. 18 1844. He was educated at Hanover (Ind.) College (A.B. 1867; A.M. 1870), Indiana Medical College (M.D. 1871), and Harvard (B.S. 1873). He was professor of Greek and Latin at Butler College, Indianapolis, (1868-70); state chemist of Indiana and professor of Chemistry at Purdue University (1874-83); and chief chemist of the U.S. Department of Agriculture (1883-1912). He was elected president of the American Chemical Society in 1893, and from 1899 was professor of Agricultural Chemistry at the George Washington University. He frequently represented the United States in scientific meetings abroad. He was specially interested in preventing food adulteration, and antagonized many food packers by opposing the use of benzoate of soda as a preservative. In 1911 his enemies urged his dismissal from the Department of Agriculture on the technical charge that an expert in his department had received recompense exceeding the legal rate. Later in the year President Taft wrote a letter wholly exonerating Dr. Wiley, but failed to take the obviously proper steps to remove from the Department a hostile member, with whom Dr. Wiley had to come into constant contact. Accordingly, Dr. Wiley resigned in 1912. Henceforth, he devoted himself largely to the cause of pure food by lecturing and writing.

His numerous publications include *The Sugar Industry of the United States* (1885); *Principles and Practice of Agricultural Analysis* (1894-7; revised edition, 1906-14); *Foods and Their Adulterations* (1907; third edition, 1917); *Influence of Food Preservatives and Artificial Colors on Digestion and Health* (1904-7, with several collaborators); *1001 Tests of Foods, Beverages, and Toilet Accessories, Good and Otherwise* (1914); *The Lure of the Land* (1915), and *Beverages and Their Adulteration* (1919). He also edited a series of *Health Readers for Schools* in 1919.

WILLARD, DANIEL (1861-), American railway official, was born at North Hartland, Vt., Jan. 28 1861. He graduated from the Windsor (Vt.) high school in 1878, studied for a year at the Mass. Agricultural College, Amherst, and in 1879 began his railway career as track labourer in Vermont. He rose to fireman, then to engineer, and for twenty years held various positions on several roads, including the Minneapolis, St. Paul and Sault Ste. Marie in its early days. In 1899 he was made assistant manager of the Baltimore and Ohio R.R., and two years later assistant to the president of the Erie R.R., of which he soon became first vice-president and general manager. From 1904 to 1910 he was second vice-president of the Chicago, Burlington and Quincy R.R., and after 1909 was also president of the Colorado Midland and vice-president of the Colorado and Southern. In 1910 he was elected president of the Baltimore and Ohio. In Oct. 1916 he was appointed a member of the Advisory Commission of the Council of National Defense, and the following March chairman of the commission. After

America's entrance into the World War, he was appointed in July 1917 a member of the special committee of the Council of National Defense to secure mediation in case of strikes on war contracts. In Nov. 1917 he was appointed by President Wilson chairman of the War Industries Board, charged with devising and expediting means of producing the Government's industrial requirements for effective warfare. In Jan. 1918 he resigned in order to devote personal attention to the Baltimore and Ohio Railroad. After the Government had taken over the railways as a war measure a Federal manager displaced him as operating head of his road, but he remained president in charge of its corporate affairs, in which position he continued when the U.S. Government gave up control of the railways.

WILLARD, EDWARD SMITH (1853-1915), British actor, was born at Brighton Jan. 9 1853 and first appeared in *The Lady of Lyons* at Weymouth at the age of sixteen. He toured first with E. H. Sothorn and then joined various stock companies, coming to London in 1875 and playing Antonio in *The Merchant of Venice* with Charles Rice in 1876. After a varied experience in Shakespearean and other plays he was engaged by Wilson Barrett in 1881 for the Princess's theatre, London, and until 1886 played leading parts in many melodramas, the most notable amongst them being "The Spider" in Henry Arthur Jones's *The Silver King*. In 1889 he produced Jones's *The Middleman* at the Shaftesbury theatre, London, afterward taking it to America. He played Professor Goodwillie in Barrie's *The Professor's Love Story* in 1894 at the Comedy theatre, London. After 1903 he acted only in America, repeating these and other roles; but in 1911 he played Brutus at the Gala performance of scenes from Julius Caesar at His Majesty's theatre, London. He died in London Nov. 9 1915.

WILCOCKS, SIR WILLIAM (1852-), British engineer, was born in India in 1852 and educated at Roorkee College, India. From 1872 to 1897 he was engaged successively in the Indian and Egyptian Public Works Departments. He designed and carried through the Assuan Dam in 1898, and for this work the C.M.G. was conferred upon him, followed by the K.C.M.G. in 1902. His most important undertaking, however, was the irrigation of Mesopotamia, begun in 1911 at an estimated cost of £26,195,000. The scheme provided for the irrigation of 3,500,000 acres. His published works include *Egyptian Irrigation* (1880); *The Irrigation of Mesopotamia* (1905) and *From the Garden of Eden to the Crossing of the Jordan* (1918). In Jan. 1921 he was put on trial before the Supreme Consular Court of Egypt on a charge of sedition and criminal libel, on account of statements made by him impugning the trustworthiness of the data concerning the Nile irrigation published by Sir Murdoch Macdonald, adviser of the Egyptian Ministry of Public Works. He was found guilty March 11, and on April 16 he was bound over to be of good behaviour for one year.

WILLETT, WILLIAM (1856-1915), English builder, was born at Farnham, Surrey, in Sept. 1856. He made a name for himself in London as a designer of beautiful houses; but his chief claim to fame was his conception and promotion of the system of "daylight saving." Though scoffed at in his lifetime, his idea was taken up and put into practice in 1916, and honour has been paid to Willett's memory, which was denied to him in life. He died at Chislehurst March 4 1915.

WILLIAM II. OF HOHENZOLLERN (1859-), German ex-Emperor and ex-King of Prussia (see 28.667). When the hour of the downfall of the German Empire and the Prussian dynasty, following upon the military collapse of Germany, arrived in Nov. 1918, the ex-Emperor's flight to Holland bore in the eyes of his countrymen the aspect of a pitiable incident, rather than of a tragic climax. For a considerable portion of the rest of the world, which had frequently overestimated his personal, as distinguished from his official, significance, his conduct and bearing on the eve of the war, throughout its course, and at the moment of his country's disaster, may indeed have come as something of a revelation. There followed a series of disclosures as to his exploits in previous years, above all that piece of personal diplomacy, the Treaty into which he tricked the still

more inadequate Emperor of Russia at their meeting at Björkö on the Russian Imperial yacht (July 23, 24, 1905), and the equally characteristic "Willy-Nicky" correspondence (mainly in 1904-5), so-called on account of the signatures which the two Imperial correspondents appended to their letters. Only the Kaiser's share in that correspondence has (1920) been published.

The Björkö Treaty, which was signed by the Tsar without consultation with the minister responsible for the foreign policy of Russia, represented an attempt by William II. to imitate Bismarck's Treaty of Reinsurance with Russia (1887-1890), which the great Chancellor had concluded behind the back of his ally Austria-Hungary, and which was allowed by his successor, Caprivi, to lapse in 1890 as being "too complicated"—i.e. too full of duplicity.

In William II.'s Treaty of Björkö, Russia and Germany engaged "to make foreign disturbers of the peace quiet, and in case of necessity to stand by one another with their armed strength." Count Lamsdorff, then Russian Minister for Foreign Affairs, was "profoundly excited and upset" when he read the document, since, as it stood, it imposed upon Russia the obligation of fighting on Germany's side if Germany were involved in war with Russia's ally, France. It is true that Russia also pledged herself to make every effort to gain France over to this new alliance, the object of William II. being to organize a continental coalition against Great Britain. When Count Witte, on his return from signing peace with Japan at Portsmouth (U.S.A.), was informed by Count Lamsdorff of the terms of the Treaty, he asked: "Does not his Majesty (Nicholas II.) know that we have a treaty with France?" "Of course his Majesty knows that," Count Lamsdorff replied, "but the fact must have slipped from his mind, or, what is more probable, he was befogged by William's verbiage, and he failed to grasp the substance of the matter" (Count Witte's *Memoirs*, English ed. 1921). Count Witte and Count Lamsdorff were afterward able to obtain the abandonment of the Treaty, while Prince Bülow and the German Foreign Office, conscious of the absurdity of their master's achievement, were content to let the Imperial agreement be treated as *non avenue*. In the Willy-Nicky correspondence, which he conducted in bad English, William had endeavoured to hold Nicholas to the bargain by adjuring him, "God is our testator" (*sic*). The correspondence represents an attempt on the part of William to exercise a kind of tutorship over Nicholas even in Russian home affairs and to instill into his mind suspicions both of France and of Great Britain.

During the years immediately preceding the World War William II. was only gradually recovering from the *contretemps* which overtook him in 1908, when Prince Bülow, then Chancellor, repudiated the utterances published on William's behalf in the *Daily Telegraph* (Oct. 28 1908) and exacted from him by the threat of resignation a public promise that he would in future abstain from such personal incursions into the realm of foreign policy. The Emperor nevertheless continued when he visited foreign courts to impress upon those with whom he came into contact his conviction that he was an autocrat in the conduct of Germany's foreign relations.

At the end of Oct. 1910 he visited the Belgian court, accompanied by the Empress, and addressing the King of the Belgians said: "May our relations of confidence and friendly neighbourliness be drawn ever closer! May welfare and blessing be shed by Your Majesty's reign upon your Royal house and upon your people! That is my desire, which springs from the depths of my heart." At the Hotel de Ville he addressed the Mayor, M. Max, who four years later was to be sent to a German prison by the invaders of his country, and spoke of the "sober and industrious" Belgian people, expressing at the same time "our profound gratitude and our warmest wishes for the prosperity of Brussels and for a happy future." When the Emperor delivered these speeches he knew that Count von Schlieffen's plan for violating Belgian neutrality in the event of war with France lay cut and dried in the pigeon-holes of the German General Staff, and it was a plan which he himself had endorsed. In May 1911 he paid his last visit to England, and was present

as the guest of King George V. at the unveiling of the monument to Queen Victoria in front of Buckingham Palace, when the King, whose advisers remained ignorant of certain of the Emperor's wilder intrigues and schemes, referred to "the strong and living ties of friendship between the thrones and persons of the two sovereigns."

In Feb. 1912 Lord Haldane visited Berlin in order to discuss proposals for a concurrent limitation in the increase of British and German naval armaments. As Lord Haldane states in his book *Before the War*, the visit was the sequel of a personal initiative of William II. through the medium of Sir Ernest Cassel. The Emperor had been concerned at the state of tension, dangerous to peace, which had attended the Morocco negotiations with France in the previous year. That critical episode had arisen out of the despatch of the German gunboat *Panther* on July 11 1911 to Agadir, not long after William II.'s return from his visit to England. In the meetings of German ministers with Lord Haldane, at one of which (between Lord Haldane and Adml. von Tirpitz) the Emperor was present in the self-imposed capacity of audience or chorus, he manifestly endeavoured for Lord Haldane's benefit to play for the time being the part of a constitutional monarch, exhibiting the balance of the ministerial advice from one side (Tirpitz) and from the other (Bethmann Hollweg) by which he had to guide his course. Lord Haldane's conclusion was that William II., and with him Germany, suffered from the lack of a constitutional system with a responsible government, the ministers being chosen more or less arbitrarily by the Emperor "and chosen in varying moods as to policy. . . . Thus the Kaiser was constantly being pulled at from different sides, and whichever minister had the most powerful combination at his back generally got the best of the argument. He had constantly to fix one eye on public opinion in Germany, and another on public opinion abroad. It is therefore not surprising that Germany seemed to foreigners a strange and unintelligible country." Lord Haldane's opinion gives one aspect of the situation, but hardly takes sufficient account of the wayward personal initiative of William II., springing either from his own conceptions (as at Björkö) or from casual outside influences which his ministers were unable to control. Incidentally it may be mentioned that except, perhaps, for the Eulenburg episode in 1905-7 there was no so-called Court party, although military influences were frequently at work. As Prince Bülow said, the mischief which was done by sudden personal interventions of the Emperor was manifest, but nothing was known of the mischief which had been prevented.

In home affairs there was a fresh Imperial outburst about Alsace-Lorraine in May 1912, when the Emperor threatened the Burgomaster of Strassburg with the withdrawal of the new constitution of the Reichsland, which had been granted in the previous year. The threat was ill-considered, but Bethmann Hollweg defended it in the Reichstag.

In March 1912 William II. paid a visit to the Emperor Francis Joseph at Schönbrunn, and in April he met King Victor Emanuel at Venice by way of preparing for the renewal of the Triple Alliance, which took place on the following Dec. 5. There was a visit of King Ferdinand of Bulgaria to Berlin in June, and in July the Emperor met the Tsar at Baltic Port. An incident which excited considerable attention was the presence of William II. for the first time at manoeuvres of the Swiss army, and the favourable popular reception of the Imperial visitor at Berne, Basle and Zürich (Sept. 3-7 1912). A good number of German-Swiss officers had studied military affairs in Germany, and William II., for obvious reasons, seized every opportunity of encouraging the professional sympathies between the two armies, which bore fruit during the World War in the partiality of the Swiss General Staff.

It is noteworthy that during the critical years of the Balkan wars and negotiations, particularly in 1913, William II. kept more than usually in the background. His government was co-operating at the London Ambassadors' Conference for the localisation of the conflict and the restoration of peace. He

was, nevertheless, cultivating close personal relations, afterward to bear fruit during the World War, with his brother-in-law, Constantine, who had succeeded his assassinated father on the throne of Greece in March 1913. He sent Constantine flattering telegrams on his military prowess, and was consequently able in Aug. 1913 to induce the King of Greece to remove the last obstacle to the Peace of Bucharest (Aug. 10) by withdrawing the Greek claims, as against the Bulgarian, to the Thracian *Hinterland* of Kavala. King Carol of Rumania, at whose request the intervention had taken place, telegraphed to his kinsman, "thanks to you, the peace will be final."

King George V., with Queen Mary, and likewise the Tsar Nicholas II., were present in Berlin at the marriage on May 24 1913 of William II.'s only daughter, Princess Victoria Louise, with Prince Ernest Augustus of Cumberland, at last acknowledged as Duke of Brunswick, a marriage which was described as marking the reconciliation between the Guelphs of Hanover and the Hohenzollerns after the feud which had lasted since the conquest of Hanover by Prussia and the expulsion of the dynasty in 1866. These festivities were followed on June 16 and 17 by brilliant celebrations of the 25th anniversary of the accession of William II., with copious references by German sovereigns and official personages to the military strength of the German Empire under his sway as the guarantee of European peace.

A curious incident occurred in the same month. The Emperor disclosed the fact that one of his predecessors on the Prussian throne, Frederick William IV., had in a political testament recommended his successor, if opportunity arose, to annul the Prussian Constitution which he had granted, or rather imposed, in 1848. William II. announced that he had magnanimously burned this document.

A visit which excited considerable speculation at a later date, when, during the World War, the future of the Russian borderlands became a question of practical politics, was that which William II. paid on June 12 1914 to the ill-fated heir to the Austro-Hungarian monarchy, Francis Ferdinand, and his wife, the Duchess of Hohenberg, at Konopisht Castle in Bohemia. The Emperor was accompanied by Adml. von Tirpitz. It is most probable that, apart from the sustained and ultimately successful efforts of William II. to win the reluctant personal sympathies of Francis Ferdinand (partly by encouraging his ambition to make his wife—who was not of royal birth—Empress when he should succeed to the throne), the object of the visit was to enlist his host's support for the extension of Austrian and inferentially of German naval power and influence in the Mediterranean. The story that the Emperor broached vast schemes for providing, after a contemplated European war, kingdoms for Francis Ferdinand's two sons by resuscitating the Greater Poland of the Jagiellons and by creating a great South-Slav State stretching to Salonika, seems entirely fanciful. A main feature of these alleged schemes was that the hereditary Austrian dominions should politically come into the confederated German Empire. Such an idea was never entertained by any sovereign or government during the Hohenzollern epoch. It had been, indeed, the so-called "Great German" policy of the German Liberals in 1848, but it was rejected by Bismarck and by the ruling classes of Prussia. Its realization, apart from other considerations, would have entailed a diminution of the influence of the Prussian Throne and Government, and an immense strengthening of German Catholicism. It again became, of course, the cherished aspiration of republican Germany and republican Austria after the World War. But it never was an old-Prussian or a Hohenzollern policy.

The news of the assassination of the Archduke Francis Ferdinand and his wife at Serajevo on June 28 1914 reached William II. on his yacht at Kiel during the regatta. His first exclamation, "Now I must begin all over again, my work of years is undone," showed that he had reckoned upon the Archduke as an instrument of German policy when he should ascend the throne of the dual monarchy. William II. returned from Kiel to Potsdam for a week, and the laying of the mines which caused the world-explosion began. On July 5 Count Hoyos arrived at

Potsdam with a letter from the Emperor Francis Joseph containing a memorandum, written before the Serajevo assassination, describing the situation in the Balkans, the menace of the Pan-Slavist agitation, particularly in Serbia, and the changed attitude of Rumania. It was only by cultivating friendship with Bulgaria and by isolating and diminishing Serbia as a factor in the Balkans that these dangers could be averted. The crime of Serajevo, it was added, had only confirmed this estimate of the situation. William II. gave Count Hoyos a reply in which he said that any contemplated action against Serbia ought to be taken without delay, that Russia would certainly be hostile, but that he had long reckoned upon this eventuality. If it came to war between Austria and Russia, Germany would loyally take her stand by her ally. A conference (not, as erroneously reported, a Crown Council, which would have meant the presence of the whole Prussian Ministry) afterwards took place, and was attended by the Chancellor (Bethmann Hollweg), the War Minister (Gen. von Falkenhayn), the Under-Secretary for Foreign Affairs (Zimmermann) and the Chief of the Emperor's personal Military Cabinet (von Lyncker). And on the following day, July 6, there was a conference with Adml. von Kapelle, Tirpitz's right hand man at the Admiralty (Tirpitz was on leave), and with representatives of the War Ministry and the General Staff. It was resolved to take measures of preparation for the event of war, and orders in this sense were issued. At the same time it was arranged that all appearance of unusual excitement or activity should be avoided, and that the Emperor should, according to programme, proceed upon his annual cruise in northern waters. He left for Kiel on the same day, and joined the fleet during its summer manoeuvres off Norway. He was constantly kept informed by telegraph of the progress of events. And now began the famous series of his marginal notes, afterward published under the German Republican Government, upon the despatches he received. He was at first enthusiastic for the most energetic measures against Serbia. He suggested that Austria should reoccupy the Sandjak, so as to sever the union of Serbia and Montenegro and prevent Serbian access to the sea. Then "there will be a row at once," he wrote. He deprecated war councils and conferences at Vienna, "because," as Frederick the Great had said, "the timid party always gets the upper hand." On July 19 he ordered the German battle-fleet not to disperse, so that it could at a moment's notice be recalled to Kiel. His chief anxiety at this stage was for the safety of the Baltic, and he wrote an angry marginal note because "the civilian Chancellor (Bethmann Hollweg) had not yet grasped his meaning." He (William II.) must "concentrate his forces on land and sea."

The text of the Austrian note to Serbia was communicated officially to the German Foreign Office on July 22, but the German ambassador in Vienna, Tschirschky, had had it on the previous day, and had probably telegraphed it direct to the German Emperor. It was presented at Belgrade on July 23.

The Kaiser at first exulted over a firmness of which he had thought Austria incapable, and expressed the belief that all Slav states were hollow. "Just tread firmly on the feet of this rabble!"—he added. On hearing that Count Berchtold, the Austrian Foreign Minister, did not desire to take any territory from Serbia he wrote, "Donkey! Austria must retake the Sandjak. . . . Austria must become preponderant over the smaller states at the expense of Russia, else there will be no peace." On the report of Serbian mobilization he recalled the German fleet from the North Sea to Kiel. "If Russia mobilizes, our fleet must be ready in the Baltic, and so it is going home." The chancellor had suggested on July 26 that the Emperor should calm European anxiety by remaining in Norwegian waters, but he was now thoroughly aroused, and on the following day he returned to Potsdam. There he received the text of the Serbian reply, and at first thought it "a great moral success." No doubt the Serbians were liars and orientals, and Austria, he said in a letter to his chancellor, might do well to claim a "*satisfaction d'honneur*" and to exercise "*une douce violence*" by a temporary occupation of Serbian territory as a guarantee.

Anxiety about the attitude of Great Britain was now beginning to influence the Kaiser's mind, and his rage was sudden and great when his ambassador in London reported that Sir Edward Grey regarded the situation as serious and had suggested mediation. He described this as a piece of English pharisaism, and Sir Edward Grey as a "base deceiver, arch-base and Mephistophelian. Great Britain ought to put pressure upon Russia," etc. On July 29 began the rapid interchange of telegrams between the Kaiser and the Tsar, which was to be continued up to and even immediately after the German declaration of war, and in which the object of the Kaiser's frequently rhetorical appeals was to induce Russia to reverse her measures of mobilization against Austria and to refrain from mobilization toward the German frontier. He hoped to score over Russia, by a policy of menace, a diplomatic victory in the Serbian question similar to, but far greater than, that which he had obtained in 1909, when, as he boasted, he had appeared beside his Austrian ally "in shining armour." On July 29 a "Kronrat" with the whole body of the Kaiser's military and political advisers was held at Potsdam, and from Bethmann Hollweg's interview the same evening with the British ambassador (Sir Edward Goschen) and his bid for British neutrality it seems clear that the decision had fallen in favour of war.

After the proclamation of the state of "danger of war" (*drohende Kriegsfuhr*) on July 31, and the delivery of an ultimatum on the same day at St. Petersburg, and after a public mobilization order on the afternoon of August 1, a previously prepared declaration of war against Russia was delivered by the German ambassador at St. Petersburg on the evening of August 1.

Throughout the final episode of the German attempts to secure British neutrality the Kaiser was in a state of violent rage and disappointment, and he gave vent to his feelings in a memorandum to his chancellor on July 30 which may well be the wildest outburst of political passion that a monarch ever committed to paper. He declared that Great Britain had caught Germany in the trap of her loyalty to her Austrian alliance, that this was the crowning success of the policy of King Edward VII., who "though he is dead, is still stronger than I am"; and, finally, he exhorted the chancellor to inflame the Mahomedan world, for "if we are to bleed to death, England shall at least lose India." William II.'s brief exchange of telegrams with King George V., based, as the Emperor's assumptions were, on a false report by his brother, Prince Henry, and on a mistaken account by the German ambassador in London of a telephonic conversation with Sir Edward Grey, may be mentioned in passing. If King George's Government would assure the neutrality of France, the Kaiser was prepared to "employ elsewhere" his troops then moving against her. After Sir Edward Goschen had asked for his passports, a Berlin mob broke the windows of the British embassy. The Kaiser sent an aide-de-camp to the ambassador with an unkingly message, truculently delivered, expressing his regret, but telling Sir E. Goschen that he would "gather from these occurrences an idea of the feelings of the German people respecting the action of Great Britain in joining with other nations against her old allies of Waterloo."

On August 4, William II. opened the session of the last Reichstag of his reign by a war speech, to which he added a personal appeal to the deputies (the Social Democrats alone were absent) to support him "through thick and thin," and individually to shake hands with him in token of their promise to do this. To one of the deputies he said, "Now we will give them (his enemies) a good thrashing."

If during the World War William II. ever attempted to interfere in military dispositions, it is clear that the leaders of the army were successful in preventing his effective intervention. He paid the inevitable visits to the fighting lines at critical moments, especially when a German success was believed to be impending, but there is no reason to believe that he was ever, in accordance with the traditions of his house, under fire. He once or twice narrowly escaped aeroplane attacks, but this was accidental. He lived in his comfortable Imperial train or in a portable asbestos hut, or at Supreme Headquarters at Pless

Castle in Silesia, and afterward at Spa. He took no practical military part in the war. His crude rhetoric was from time to time employed in firing the ardour of his troops, as when he exhorted them in Oct. 1914 to destroy French's "contemptible little army," or when in the last year of the war he celebrated the 30th anniversary (June 15 1918) of his accession by describing the struggle as a mortal combat between Anglo-Saxon and Prusso-German ideals. In the eyes of his people his personal prestige did not increase; it distinctly diminished, even before the last phase of open aversion from him. He formally retained the final decision in military as in political affairs. There was a long and bitter struggle between three successive chancellors (Michaelis may be left out of account) and the higher military command on a variety of questions—hypothetical terms of peace, the Brest Litovsk negotiations, the armistice question, and, throughout the war, the best method of maintaining the war-spirit of the population. More than once Hindenburg and Ludendorff threatened to resign, and it was between them and Bethmann Hollweg that William II. had to choose when he parted (July 14 1917) with his first war chancellor. "The Government," as Ludendorff says, "had itself to blame, as it frequently appealed to its agreement with the chief military command, and dismissed proposals and demands on the ground that the military leaders objected."

In naval matters the Kaiser had greater success in resisting the authoritative methods of Grand Adml. von Tirpitz, and carrying out his own policy and Bethmann Hollweg's of holding the High Seas Fleet in reserve, or (as he called it in his order of Aug. 6 1914) "on the defensive." For a long time Bethmann, and perhaps also William II., seem to have hoped that Great Britain might be detached from the Allies, if the struggle for naval ascendancy were not too keenly pressed. This hope was chimerical, but Bethmann was not a far-seeing statesman, and the views of the Kaiser, who reckoned upon an intact fleet as a valuable political asset for peace negotiations, were seldom based on sound calculations. Tirpitz found himself compelled to resign on March 16 1916.

William II.'s reputation in peace-time had been largely based upon the spectacular setting which he gave to his policy and upon his rhetorical speeches. All effects of that kind gradually failed him during the World War, and some of them lent themselves to ridicule. In Jan. 1916 he had a meeting with his Balkan ally, King Ferdinand of Bulgaria, at Nisch, when Ferdinand at a banquet addressed him in obsequious terms and exclaimed in unconsciously ambiguous Latin, "*Tu es Caesar et gloriosus!*" The Emperor's part in the attempts to secure a "German Peace" in 1916 and 1917 was singularly unfortunate. The declaration issued on Dec. 12 1916 by Germany and the powers associated with her was manifestly a manoeuvre to anticipate President Wilson's peace action, to represent the Allies as blood-thirsty and unconciliatory, and to hearten the German working-classes for the fight. It gave no information as to terms, and it contained no reference to the crucial question of the future of Belgium. What the Kaiser's ideas of peace terms at that date may have been is a matter of inference from what has since become known regarding his attitude some six months later. After the Reichstag's so-called "Peace Resolution" of July 1917, efforts were made to induce the Vatican to interest itself in the question of peace, and ultimately a papal note on the subject was issued. In a document addressed on behalf of William II. to Mgr. Pacelli, the Papal Nuncio at Munich, the Kaiser's peace terms were described as including an indemnity of 30 milliard dollars from the United States and 40 milliard dollars from France. Longwy and Briey, rich mineral districts on the French frontier, were to go to Germany, and Great Britain was to give up Malta. The disclosure of these items in the Imperial document was made in the Reichstag on April 27 1921, by the Independent Socialist, Dr. Breitscheid, Chairman of the Reichstag Committee for investigating responsibility for the origin and prolongation of the World War. In 1917 as in 1916, the only peace which William II. and his military and political backers contemplated was a peace with victory (*Siegfrieden*).

The events which led up to the collapse of Germany and flight of William II. in Nov. 1918 were political as well as military. Even so stout a Catholic conservative as the Chancellor, Count Hertling, had described the Prussian franchise question, for example, as "a matter of life and death for the dynasty." Internal reforms were long overdue, and this one had been promised in the Kaiser's edicts of April and July 1917, though only as a result of the apprehensions excited by the revolution in Russia. The obstinacy of the Prussian reactionary Chamber of Deputies and the Upper House delayed the reform until the monarchy fell. In the Reichstag the Imperial prerogatives—especially the right in certain circumstances to make war and peace—were being dealt with by a committee on the Constitution. Prince Max of Baden's Coalition Government, which included several Social Democrats, was avowedly installed for the purpose of introducing Parliamentary Government as well as for making peace. Here again reform came too late.

On Aug. 14 1918, the alarm which Ludendorff had communicated to the Kaiser regarding events in the field and the *moral* of the German troops had induced William II. and his political advisers to contemplate applying to Queen Wilhelmina of Holland for mediation, but nothing was done for some weeks. In the middle of Sept. the Kaiser addressed to the workmen at Krupp's an appealing speech which showed that he recognized the military situation and the internal conditions of Germany to be almost desperate. He returned at the beginning of Oct. from headquarters at Spa to Berlin.

Meanwhile an urgent appeal by Hindenburg and Ludendorff to the German Government to open negotiations at once for an armistice had revealed the desperate state of affairs at the front to the members of the Government, including the Social Democrats. Shortly after the Emperor's return, the constitutional changes limiting his prerogatives had been adopted by the Reichstag, and the bill was awaiting his signature. On Oct. 28 he accepted the constitutional law in a letter to Prince Max, in which he avowed sentiments with regard to the rights and duties of the representatives of the people which might have saved his dynasty if he had expressed them years or perhaps even some months earlier. The question of his abdication had now definitely arisen, and was being ventilated toward the end of Oct. in the Socialist and the Democratic press. President Wilson's frank declaration that he could not trust the word of the existing rulers of Germany gave a great impetus to the discussion. William II. on the throne, whatever might be his revised sentiments, was regarded in Germany as an obstacle to peace. The Independent Socialists had gone further than the other parties of the Left and, through the mouth of their leader, Haase, had declared in the Reichstag that it was no longer a question of the Kaiser alone, but of the Prussian and other German dynasties. The Majority Socialists, who at that stage would have been satisfied with the abdication of William II. and the renunciation of the Crown Prince's rights to the succession, were forced by the attitude of the Socialist left wing to make at least the Kaiser question most urgent. Scheidemann, in his book *Der Zusammenbruch* (1920), gives an account of the reception of the members of the Imperial Government by the Emperor on Oct. 30 1918 at Bellevue Castle in Berlin. It was the first time (with the exception of a parliamentary soirée at the residence of Dr. Helfferich in July 1917, at the time of the so-called Peace Resolution) that William II. had met the new Social Democratic Secretaries of State, men whom he had formerly described in public speeches as "fellows without a country." Scheidemann says that the Emperor, in uniform, advanced holding in his hand a piece of cardboard, on both sides of which on typewritten sheets the words he was to address to his new ministers were pasted. William II. wore a forced smile and moved the cardboard sheet to and fro as if he meant to say "You know how these things are made up." He read the address with a loud voice, and "it would have made an excellent impression," Scheidemann says, "if it had been delivered some years earlier." It expressed the intention that nowhere in the world should there be freer institutions than in Germany. It

concluded, however, with a reference to "the last breath and the last blow"—a phrase which was singularly out of place in view of the desperate efforts to obtain an armistice. The Kaiser afterward affably conversed with the Socialists who were presented to him. After he had departed, it was decided by the Ministry that the speech should not be published, as the situation was so far advanced that it would have made a ridiculous impression.

William II. knew what was in the air, and on Oct. 30 he quietly left Berlin for the western front. The revolution now broke out in the navy at Kiel and on Nov. 7 at Munich. Everything had been prepared by the Independent Socialists for the Berlin outbreak which came on the 9th, although another date had originally been contemplated. The Governmental Socialists, unable to control the movement, felt themselves constrained to address an ultimatum on the abdication question to the Chancellor, Prince Max. Emissaries from the Government had been at Spa from Nov. 3 urging the Emperor to abdicate, but he was stubborn and considered that it was his duty to remain and save Germany from Bolshevism. "Moreover," he said, "I should willingly work with the new order and the new Government; various gentlemen in it whom I have met are very sympathetic to me." On the morning of Nov. 9 Hindenburg was early at the Villa Fraincuse, the Emperor's quarters at Spa. The field-marshal had had a thorough discussion of the situation with representatives of the different army commanders, and at one o'clock he sent a final report to the Villa Fraincuse stating that, in the fairly unanimous opinion of the generals, the troops could still be relied upon to fight against the enemy, but would never fight against their own comrades, *i.e.* in defence of the Kaiser and the Prussian dynasty. Meanwhile, abdication was constantly being urged by telephone from Berlin. About two o'clock a precise answer was sent to Berlin that the Kaiser abdicated as German Emperor but not as King of Prussia. The reply came by telephone: "Too late: we have already published his abdication." To the Crown Prince, who had arrived for luncheon, the Emperor said as he departed about three: "Tell the soldiers that it is not true that I have abdicated as King of Prussia." Later, Hindenburg arrived at the Villa with Gen. Groener and Adml. Scheer. It was then "put in the Kaiser's mouth" to abdicate as King of Prussia also. When he left the conference he said to Count Dohna-Schlodien, his aide-de-camp, "You have no longer any Supreme War Lord."

All the afternoon and evening his suite urged him, in view of the feeling among the troops, to escape to Holland. He at first refused, but consented to go and dine in the Imperial train. On the way he said: "I am so awfully ashamed. I cannot find it in my heart to do this. I cannot go away. If there be but one faithful battalion here, I shall remain at Spa." He thus was contemplating a fratricidal war in defence of his crown. In the train one alarming message after another arrived regarding disorder on the lines of communication and concerning the approach of retreating troops to Spa. To those around him the Kaiser said: "At other times I have always known what to do, now I am at a loss." At 10 p.m. Adml. von Hintze urged him to start, for "in an hour it might be too late." The Kaiser finally said: "To facilitate peace for the nation I shall go to Holland. If I went to Germany, it would be supposed that I wanted to rally a new party to help me to make a *coup d'état*." He now considered himself relieved from any duties toward the army, as it had left him in the lurch; nor did he recognize any duty toward the Government which, on its own responsibility, had announced his abdication.

At 5 o'clock next morning, Nov. 10, the Emperor left his train and, with a small suite, fled in motor-cars across the Dutch frontier to Eysden, where he arrived about 8 a.m. According to one account (Lady Nozah Bentinck's *The ex-Kaiser in Exile*), he had walked up to a Dutch soldier at the frontier, saying, "I am the German Emperor," and had offered his sword; but no one knew what to do. At 10 a.m. his railway train arrived at Eysden, and he took refuge in it and there

¹According to some accounts he departed during the night.

spent that day and the following night. Arrangements had meanwhile been made, apparently through the Dutch authorities, with Count Godard Bentinck, who with some reluctance consented to receive him as a guest "for a few days" in his castle at Amerongen. The Imperial train left Eysden at 9 A.M. and at 3 P.M. reached Maarn where Count Bentinck and Count Lynden, governor of the province of Utrecht, were awaiting the ex-Kaiser on the platform. There was a considerable suite in the train, who remained to unpack large quantities of food and wine which they had brought with them. Count Bentinck arrived at Amerongen in his motor-car with the Emperor as evening was falling, and, as the guest entered the house, his first words were "now give me a cup of real good English tea." On Nov. 28 William II. signed his formal abdication at Amerongen, renouncing his rights to the Crown of Prussia and his consequential rights to the German Imperial Crown. On the same day the Empress Augusta Victoria arrived from Wilhelmshöhe Castle to join her husband. His personal suite, which had been a burden to his host, was soon reduced to two officials, a master of ceremonies and an aide-de-camp, but he retained a number of his servants. He seldom ventured, save for motor-car drives, beyond the precincts of the castle, which is surrounded by a moat. He spent most of his time in sawing logs of wood, an occupation in which he was so diligent that he provided the castle with firewood for the whole winter. As souvenirs, instead of autographs, he used to give away small blocks of wood on which he had inscribed his monogram. In June 1920 the ex-Kaiser and the ex-Kaiserin left Amerongen for Doorn, a property which the ex-Kaiser had just purchased, and which is situated near the main road between Utrecht and Arnheim. The house and grounds were henceforth watched by Dutch soldiers. Up to March 1920 the Allies' demand for his extradition was an open question, and notes were exchanged on the subject with the Dutch Government, which officially regarded him as a German refugee but undertook to prevent any political activities on his part. He was believed to have ample means, although it was reported toward the close of 1921 that he had been compelled further to reduce his establishment. In the autumn he managed to send a rhetorical message to a royalist demonstration in Berlin at which Ludendorff was present.

The prevailing German verdict upon William II. after the war was that he had been entirely unequal, by temperament, by capacity and by education, to the task of guiding the destinies of the German nation. His training before his accession had been almost entirely in the school of Prussian militarism, and, notwithstanding his subsequent travels and his intercourse with statesmen and men of affairs in his own and other countries, he retained in many matters the narrow outlook and the modes of expression of the average Prussian officer. In his cosmogony sovereigns and dynasties occupied a place entirely apart, and he regarded himself and a certain number of other sovereigns as occupying their positions by the grace of God, and as endowed with something like infallibility in home affairs. In his public speeches he affected the rhetoric of the Prussian officers' mess-room banquets and seemed quite unable to measure the effect of his words upon international relations. He aspired to guide the art, the intellect, the industry and commerce and even the theology of his country. He never realized that the age had moved beyond him in spheres in which he was essentially a dilettante. He had a lax conception of truth and honour in his personal diplomacy, and was accustomed to shift his standpoint in foreign affairs according to the nationality of the person with whom he was conversing. Dr. Hamann,¹ however, testifies that there were almost inexplicable lacunae in the Kaiser's memory. One of the German verdicts upon him, which does not appear to be far from the truth, was that his intellect and character had never matured.

The Empress AUGUSTA VICTORIA (see 28.669), who was at the castle of Wilhelmshöhe (the place of Napoleon III.'s internment in 1870-71) at the time of the Emperor's flight, joined him at Amerongen on Nov. 28 1918. She was already suffering from

¹ *Um den Kaiser* (1921).

a heart complaint, and anxiety with regard to her husband and the possibility of his extradition weighed upon her more than upon him. She died at Doorn Castle on April 11 1921. Her remains were conveyed to Potsdam and placed in a temporary mausoleum in the park of the New Palace. The funeral furnished an occasion for some royalist demonstrations in Berlin. The Empress, although she accompanied William II. on many of his political journeys, confined her interests mainly to her family duties and to works of charity. She had been active in promoting Christian enterprises, particularly the building of churches in Berlin. She was regarded as the model of a German housewife and of a *Landesmutter*, as the Germans used to call the consorts of their sovereigns.

Interesting sidelights on the ex-Kaiser's character, reign and education may be found in such books as Bismarck's *Reflections and Reminiscences* (English ed. 2 vols., 1898). The third vol. of these *Gedanken und Erinnerungen* appeared in Germany in 1921, though it is dated 1919, having long been held up by an interdict given in favour of the ex-Kaiser on the ground that the volume contained the text of confidential letters written by him. In 1921 he withdrew the interdict, as most of the obnoxious material had found its way into the newspapers. See also Prince Hohenlohe's *Memoirs* (1906). Recently published books bearing on the subject are Dr. Otto Hamann's *Der Neue Kurs* (1918), *Um den Kaiser* (1919), which contains perhaps the best character sketch of William II., and *Der Missverständene Bismarck* (1921), also Baron von Eckhardstein's *Lebenserinnerungen*, 3 vols. (1919-21). For the last phase Scheide-mann's *Der Zusammenbruch* (1921) and *Die Deutsche Revolution* by Ferdinand Runkel (1919) are useful, and there is a remarkable, if rather highly coloured, short character sketch by Walter Kathanau, *Der Kaiser* (1919). Lady Norah Bentinck wrote a book of some interest, *The ex-Kaiser in Exile* (1921). (G. S.)

WILLIAM, German Crown Prince up to 1918 (1882-), eldest child of William II. of Germany, was born at the Marble Palace, Potsdam, on May 6 1882. He was educated at the Military Cadets School at Ploen in Holstein and at the university of Bonn. After visits to the courts of Vienna and St. Petersburg and an unofficial visit to Scotland he went on a tour with his brother Prince Eitel Friedrich to Constantinople and to the Nile. On his return to Germany he began his military career by serving in the 1st Foot Guards, and accompanied the Kaiser to England (Jan. 10-Feb. 5 1901) on the occasion of the funeral of Queen Victoria. On June 6 1903 he married the Duchess Cecilia, sister of the Grand Duke of Mecklenburg-Schwerin. There were five children, four sons and one daughter, of the marriage. His political and personal interventions in public affairs gave some trouble in the years preceding the war. He was credited with pan-German sympathies, and on one occasion (Nov. 9 1911) he appeared in the royal box in the Reichstag during the debate on the Morocco settlement and demonstratively applauded speakers who were attacking Great Britain and the Imperial Chancellor, Bethmann Hollweg. He was afterward compelled by the Emperor to make amends to the Chancellor. Other ill-advised interventions were in connexion with the Brunswick settlement, in regard to which he questioned (1914) the adequacy of his brother-in-law Prince Ernest Augustus of Cumberland's renunciation of all claim to the throne of Hanover, and again, on the occasion of the conflict in Dec. 1913 at Zabern in Alsace between officers of the garrison and the civilian population, when he despatched telegrams encouraging the officers in their truculent attitude. He had, nevertheless, done a public service in 1907 by calling the attention of the Emperor to the disreputable morals of the court *camerilla*, headed by Prince Philip Eulenburg, which was being denounced in the *Zukunft* by Maximilian Harden. In 1910-1 he paid a visit to Ceylon, India and Egypt, and he published some account of his experiences in his *Jagdtagbuch*. On the outbreak of the World War he was promoted to the rank of Lt.-General and appointed to the command of the V. Army in the west, where his troops were successful in the battles of Longwy and Longuyon on Aug. 22 and 24 1914. In Sept. 1915 he received the command of an army group, and he was nominally in charge of the German operations against Verdun. After the Armistice he represented himself in newspaper interviews as having been sceptical, since the battle of the Marne, regarding the possibility of the ultimate success of

the German arms. His flight to Holland speedily followed that of the Emperor in Nov. 1918, and he went to Wieringen, an island in the Zuider Zee. He formally renounced on Dec. 1 1918 his rights of succession to the crowns of Prussia and the German Empire. The ex-Crown Princess and her children continued to reside at Potsdam, where she enjoyed considerable popularity among all classes of the population.

WILLY, the pen-name adopted by the French novelist **HENRI GAUTHIER-VILLARS** (1859–), born at Villiers-sur-Orge Aug. 10 1859. He was educated at the Lycée Condorcet and the Collège Stanislas, and afterward adopted a literary career. His early works include a *Recueil des Sonnets* (1878), and various volumes of essays and criticism, including *Essais sur Mark Twain et les Parnassiens* (1882), but he is best known for his novels, many of which were written in collaboration with the actress and authoress Colette Willy. The most famous of these is *Claudine à l'École* (1900), with its sequels *Claudine à Paris* (1901), *Claudine en Ménage* (1902) and *Claudine s'en va* (1903). Willy contributed largely to leading reviews, and also published various plays, including a theatrical version of *Claudine à Paris*, produced in 1902.

WILSON, SIR ARTHUR KNYVET, 3RD BART. (1842–1921), English admiral, was born at Swaffham, Norfolk, March 4 1842, the son of Rear-Adml. George Knyvet Wilson. He entered the navy in 1855, and served in the naval operations of the Crimean War and the Chinese campaign of 1857–8. In 1876 he was appointed to the "Vernon," the torpedo school-ship at Portsmouth. Having reached the rank of captain in 1880, he took part in 1881 in the operations against Alexandria and in 1884 won the Victoria Cross for bravery at El Teb. He became rear-admiral in 1895, was appointed Third Sea Lord and Controller of the Navy in 1897, and in 1901 became Vice-Admiral, receiving the K.C.B. in 1902. From 1901 to 1903 he commanded the Channel Squadron, and from 1903 to 1907 was Commander-in-chief of the Home and Channel Fleets. In 1907 he was promoted by Order in Council to the rank of Admiral of the Fleet, and in 1909 was appointed First Sea Lord in succession to Lord Fisher. He retired in 1912, and received the Order of Merit. He died at Swaffham May 25 1921.

Wilson was from the early 'nineties till practically the end of his life the most universally respected figure in the British navy. Himself the most unassuming man, careless of honours (he refused a peerage) and indeed of his personal appearance, he was a scientific sailor of the highest type, and a recognized master of strategy and tactics, whose advice, in and out of office, carried the greatest weight. He had no party, no favourites, and did not advertise. He was a silent man, whom everyone trusted; and during the World War he was still a power behind the Admiralty, and the ungrudging servant of his country.

WILSON, SIR CHARLES RIVERS (1831–1916), English public official, son of Melvil Wilson, was born in 1831, and educated at Eton and Balliol College, Oxford. He entered the Treasury in 1856, was private secretary to the Chancellor of the Exchequer (Robert Lowe) 1868–73, and was Royal Commissioner for the Paris Exhibition of 1878, having been already appointed Comptroller General of Office for Reduction of National Debt in 1874. Whilst holding this position, he visited Egypt in 1876 and early in 1878 was selected as vice-president of the Commission to enquire into the Egyptian financial situation. Some months later he was nominated Financial Minister in Egypt and, in 1879, he and the Prime Minister, Nubar Pasha, were the victims of a serious outrage by the mob in the streets of Cairo—an incident which was the direct precursor of the Arabi revolt and the British occupation of Egypt in 1882. In April 1880, on the fall of the Khedive Ismail and the inauguration of his son Tewfik as Khedive, Rivers Wilson was appointed president of the Commission for the Liquidation of the Egyptian Debt, with full powers to regulate the financial position of Egypt. On the conclusion of this duty he returned to his post in London, and in March 1885 he became Joint British Representative on the Suez Canal Board. On retiring from his post as Comptroller General of the National Debt Office in 1894, he became in 1895

president of the Grand Trunk Railway of Canada. He was created a K.C.M.G. in 1880 and was promoted G.C.M.G. in 1895. He died on Feb. 9 1916.

WILSON, SIR HENRY HUGHES, BART. (1864–), British Field-Marshal, was born in Ireland May 5 1864, and joined the army in 1884. He served in the field in Burma between 1886 and 1888, and was wounded. After some years on the staff at home he went out with the expeditionary force to S. Africa in 1899, and he served there, first with the Natal army, and afterward at headquarters till the end of 1900. The period from 1901 to 1906 he spent at the War Office, and after 1904, in which year he was promoted colonel, he had much to do with working out the organization of the newly created general staff. He then became commandant of the Staff College, a position which he occupied until 1910, when he was appointed Director of Military Operations. In this latter capacity he got into close touch with high French military authorities, and gave special attention to the study of strategical possibilities in the event of war with Germany. He was promoted Major-General in 1913.

On mobilization in Aug. 1914 he was appointed deputy-chief of the general staff to the expeditionary force, and he served in that position for the first five months of the struggle, after which he became principal liaison officer between British and French headquarters in the field. He was given the K.C.B., and at the end of 1915 he took up command of the IV. Army Corps; this he held until the opening of 1917 when he went out as head of a military mission to Russia, returning just before the revolution. He was promoted Lt.-General on his return and was then in charge of the eastern command until Nov., when he was sent to Versailles to act as British Military Representative on the newly established Supreme War Council. In the following Feb. he succeeded Sir W. Robertson as Chief of the Imperial General Staff. The great German offensive of March took place almost immediately after his taking up this high appointment, and he played a prominent part in the steps taken to strengthen Sir D. Haig's forces. The friendly terms on which he stood with the French supreme authorities, no less than with the Home Government, contributed materially to ensure that coöperation between the Allies which so greatly assisted in giving victory to their cause. He had been promoted General soon after taking up the appointment, and on the final distribution of honours for the war he was promoted Field-Marshal, was given a baronetcy, and received a grant of £10,000. In December 1921, however, he resigned his position at the War Office (being succeeded by Lord Cavan); and soon afterwards he ranged himself with the supporters of the Northern Irish Parliament in Ulster of which he was elected a member.

WILSON, JOHN COOK (1840–1915), English philosopher, was born at Nottingham June 6 1840. He was educated at Derby and at Balliol College, Oxford, and in 1874 was elected to a fellowship at Oriel College. After graduating, he studied logic under Hermann Lotze at Göttingen. Returning to Oxford, he became well-known as a lecturer and in 1880 was appointed Wykeham professor of Logic. He died at Oxford Aug. 11 1915. Among his publications were *Aristotelian Studies* (1879, republished 1912); lectures on *Axioms*, on Plato's *Timæus* (1889) and on the *Traversing of Geometrical Figures* (1905).

WILSON, WOODROW (1856–), twenty-eighth president of the United States, was born in Staunton, Va., Dec. 28 1856. He was baptized with the name of Thomas Woodrow Wilson. The Scotch strain predominated in his ancestry, for his paternal grandfather came from county Down, in Ulster, and his maternal grandfather, Thomas Woodrow, a graduate of Glasgow University, from Scotland. The stern Presbyterianism of his father, a minister of small means but marked capacity as a theologian, early influenced him and left an indelible mark upon his character. His early years were spent in Georgia and South Carolina, where he was deeply affected by the sufferings of the South during the reconstruction period. In 1875 he entered Princeton, graduating four years later. His record for scholarship in college was not remarkable, but he was prominent in debating and literary circles, and became student director of athletic sport.

His most notable achievement was an article written in his senior year, and published in the *International Review*, which analyzed unfavourably the procedure of Congress and formed the basis of his more mature political principles. After studying law in the University of Virginia and following a brief attempt to practice in Atlanta, he decided to pursue his studies in government and history at Johns Hopkins University, where he received the degree of Ph.D. in 1886. His thesis, entitled *Congressional Government* and published in 1885, was a development of the attack upon Congressional methods, and because of its clear and felicitous expression has been reprinted many times. In that year¹ he began his teaching career at Bryn Mawr College, where he was associate professor of History and Political Economy until 1888; after two years as professor of the same at Wesleyan, he entered the Princeton Faculty in 1890 as professor of Jurisprudence and Political Economy. With slight changes in title he served in this capacity until 1902, when he became president of Princeton. As professor he rapidly achieved distinction. His lectures were remarkable for clarity of presentation and brilliancy of phrasing, and the same qualities characterized both his addresses and his published writings. His gift was for generalization rather than plodding scholarship, and after the publication of his thesis his happiest literary efforts were in essay form. They display keen critical capacity, but are not remarkable either for erudition or for striking creative power. As president of Princeton, Mr. Wilson devoted himself to serious reforms of the educational and social habits of the undergraduates. In the hope of elevating the standards of scholarship and of increasing the efficiency of instruction, he inaugurated in 1905 the "preceptorial system," designed through small classes to bring teachers and students into the most intimate relationship. In his endeavours to democratize the social life of the university he met determined opposition. Further difficulties developed from a disagreement with the dean of the Graduate College. Mr. Wilson's policies aroused warm controversy among alumni, faculty, and undergraduates.

While at Princeton, both as professor and as president, Mr. Wilson displayed great interest in political questions of the day, and through his addresses and articles speedily won a national reputation. In Sept. 1910 he was tendered the Democratic nomination for governor of New Jersey. The offer coming at the moment when the prospects for success of his policy at Princeton seemed most discouraging, secured his ready acceptance. Resigning his academic position he entered upon an active electoral campaign which won him the support of progressive elements throughout the state, despite the fact that his candidacy had been inaugurated largely under the auspices of the conservative Col. George Harvey (afterwards U.S. ambassador to Great Britain) and the Democratic state boss, Senator James Smith. In Nov. he was elected by a plurality of 40,000 votes. He at once made it plain that he intended, regardless of the protests of machine leaders, to fulfil his liberal pledges and would assume the leadership of the party for this purpose. As governor he successfully carried through a series of reform measures. Of these the most significant were: a Direct Primaries Law, which, supplemented by an effective Corrupt Practices Act, did much to purify the political atmosphere of New Jersey; an Employers' Liability Act; the creation of a Public Utilities Commission; reform in municipal administration, making possible the adoption of the commission form of government. Elections to the state Senate and Assembly in 1911 gave the Republicans a majority in both Houses and the legislative output was curtailed. Nevertheless his final activities as governor were characterized by the impetus which he gave to the passage of a series of bills, known as the Seven Sisters, directed to the protection of the public from exploitation by trusts.

When in June 1912 the Democratic National Convention met at Baltimore to choose a candidate for President, Mr. Wilson's reputation as an effective reformer had brought his name prom-

inently before the delegates. The convention was apparently controlled by conservative elements and there seemed little chance of the nomination of an anti-machine progressive. But as the struggle to secure the necessary two-thirds vote proceeded, with the conservative forces divided between Champ Clark, Harmon, and Underwood, Mr. W. J. Bryan, leader of the progressive elements threw his dominating influence in favour of Mr. Wilson. It proved decisive, and on the 46th ballot he was nominated, July 2 1912. In the campaign that followed he voiced popular discontent with the conservatism of the Republican administration, which he believed to have been too closely allied with the interests of "privileged big business." His campaign speeches, characterized by a striking phraseology, won much applause, but were remarkable for their high moral tone rather than for originality of thought or policy. Like Roosevelt he demanded a national renaissance of ideals. In matters of immediate concern, such as the tariff, trust regulation, currency, the interests of labour, he insisted that the "rule of justice and right" must be set up. As regarded the future, in matters of conservation and trade, he asserted that great opportunities had been lost through the interlacing of privilege and private advantage with the framework of existing laws: "we must effect a great readjustment and get the forces of the whole people once more into play." His radicalism was of a mild sort and he insisted that "we need no revolution, we need no excited change; we need only a new point of view and a new method and spirit of counsel." The popular temper was responsive to such a tone, but success in large measure could hardly have come to him except for the division of Republican forces through the campaign of Theodore Roosevelt as Progressive candidate. In the Nov. election Mr. Wilson received 435 electoral votes as against 88 for Roosevelt and 8 for Taft; but his popular vote was a million less than that of his two chief opponents, and in only 14 states (all in the South) did he receive a clear majority.

Despite the fact that he was the choice of a minority of the whole people, Mr. Wilson's political position when he assumed office on March 4 1913 was one of remarkable strength. He was supported by a Democratic majority in both Houses of Congress, the Republicans were at loggerheads, and he might expect support from the Progressives for much of his reforming legislative programme. His Cabinet was not distinguished, but it contained certain elements of political and administrative strength, which proved advantageous for the moment, although later it was to become the mark for bitter criticism. The President soon made it plain that he was determined, as in his governorship of New Jersey, to exercise his personal influence and his position as head of the party to initiate and carry through the legislation he had advocated in his campaign. His ascendancy in Congress was soon established. After convoking both Houses in special session on April 7 1913, he delivered his first message in person, reviving the custom that had lapsed since the administration (1797) of the elder Adams. He intervened constantly during this and later sessions, to further the legislation in which he was especially interested.

The first important piece of legislation that resulted from the special session was the Underwood Tariff Act, which was passed in Sept. and signed by the President Oct. 3 1913. It provided for a notable downward revision and naturally met strong opposition from varied industrial interests. Such opposition was overcome largely through the personal efforts of Mr. Wilson, who appealed constantly to public sentiment, notably in an attack upon the activities of hostile lobbyists. The Tariff Act, in addition to lower duties and important administrative changes, introduced an income tax—long advocated by Democrats—which was destined in later developments to counterbalance the loss of revenue resulting from the lowering of the tariff; it weighed heavily upon the industrial interests of the North and increased the growing unpopularity of the President in that region. The Tariff Act was followed by a broad measure of currency reform, the Federal Reserve Act, signed Decr. 23 1913; it is generally regarded as the administration's second great legislative triumph. Mr. Wilson's purpose was to

¹ In 1885 he married Ellen Louise Axson of Savannah, Ga., who died in 1914, leaving three daughters. On Dec. 18 1915, he married Edith Bolling Galt of Washington, D.C.

supplant the dictatorship of private banking institutions by a reorganization that should provide funds available to meet extraordinary demands and a currency that would expand and contract automatically. Early in 1914 the President called upon Congress to continue its labours of reform by the regulation of the trusts. After long debate and warm opposition, his appeal was answered by the passing of the Federal Trade Commission Act and the Clayton Anti-trust Act. The latter, besides perfecting anti-trust legislation in several ways, met the demands of labour by declaring that labour was not a commodity, by prohibiting injunctions in labour disputes unless necessary to prevent irreparable injury, and by proclaiming that strikes and boycotts were not violations of Federal law. It further exempted labour associations from the anti-trust laws.

Mr. Wilson's policy of domestic social reform had thus been developed with surprising legislative success during the first year of his administration. His foreign policy was not so clear-cut and aroused little enthusiasm. It was characterized by an evident desire to concede the rights of other nations to the limit and to avoid any stressing of the power of the United States for the material advantage of its citizens. Definite steps were taken to prepare the Filipinos for self-government. Pressure was brought to bear upon the California state Government to mitigate the severity of its anti-Japanese legislation. The "dollar diplomacy" of the preceding administration was repudiated and American bankers effectively discouraged from participating in the international Chinese loans. As a result of the President's personal demand, Congress repealed the law exempting American coastwise shipping from Panama Canal tolls. Mr. Wilson, however, failed to secure the Senate's ratification of a treaty with Colombia, which contained a virtual apology on the part of the United States and an offer to pay \$25,000,000 as reparation for the alleged grievances of Colombia in connexion with the establishment of Panama as an independent country. In the Caribbean, Mr. Wilson's policy differed in principle rather than practice from that of his predecessors; in Nicaragua and Haiti the customs were taken over by U.S. officials. By a treaty signed Sept. 16 1915, a virtual protectorate of Haiti was assumed; in Santo Domingo the precautionary visits of American cruisers were followed in the summer of 1916 by the landing of marines, and in Nov. of that year by the proclamation of a military government under American auspices.

Mr. Wilson's Mexican policy aroused heated criticism. Following the accession of Gen. Huerta to power and the President's failure to arrange a settlement providing for his elimination as dictator, Mr. Wilson resigned himself to what he called a policy of "watchful waiting." Conditions in Mexico were anarchical, and intervention was strongly urged by both American and European commercial interests. To formal intervention the President was definitely opposed, but in April 1914 he was compelled to authorize the occupation of Vera Cruz in retaliation for affronts to American blue-jackets. The proffered mediation of Argentina, Brazil and Chile he gladly accepted, but the resulting protocol of Niagara Falls (June 24 1914) did not provide a basis for peace. Although Huerta fled from Mexico in July, the country continued to be torn by rival factions. American troops were withdrawn from Vera Cruz in Nov. 1914, but it was not until Oct. 1915 that the Government of Carranza was recognized by Mr. Wilson, in company with eight South and Central American Governments. Further complications ensued. The raid into American territory of Gen. Villa, March 9 1916, led Mr. Wilson to authorize a punitive expedition, which soon aroused the protests of Carranza. In May and June the President mobilized the National Guard and sent a force of about 100,000 to patrol the Mexican border. The crisis was tided over by a joint Mexican-American commission sitting at New London, Conn., which brought no definite settlement, but at least postponed hasty action on either side. In Jan. 1917, the last American troops were withdrawn from Mexican soil. The President's policy had not led to stable conditions in Mexico, and the sole advantage secured seemed to be the emphasis laid by the U.S. Government on the principle

that it would not take advantage of the misfortunes of a weak neighbour for its own selfish profit.

Foreign affairs after July 1914 were naturally dominated by the World War. President Wilson insisted upon a policy of strict neutrality. This he emphasized not merely by formal proclamation on Aug. 4, but by an address to the American people of Aug. 18, in which he adjured them, in view of the mixture of nationalities in the United States, to be impartial in thought as well as action. His offer of mediation, made on Aug. 5, remained without response, and further attempts at mediation in early autumn proved fruitless. His determination to remain absolutely aloof from European quarrels was underlined in several addresses, in which he insisted that the United States was in no way concerned, and was further emphasized by his opposition to any change in its military policy. America's vital interest in the struggle, however, soon became plain and resulted in diplomatic controversies with the belligerents. Great Britain's attempt to control indirect importation of goods into Germany, by an enlargement of contraband schedules and an extension of the doctrine of "continuous voyage" to conditional contraband, was vigorously opposed by President Wilson, who authorized Mr. Bryan, his Secretary of State, to protest in strong terms. A lengthy interchange of notes followed, which led to no settlement (*see INTERNATIONAL LAW*). The diplomatic controversy with Germany proved more serious. The proclamation of a "war zone" about the British Isles, in which German submarines threatened to destroy enemy merchant vessels with consequent danger to the lives and property of neutrals, was met by a note of Feb. 10 1915, which warned Germany that she would be held to "strict accountability" for the lawless acts of submarine commanders. Mr. Wilson further attempted to find a compromise, based upon a relaxation of the British food blockade and an abandonment of the German submarine campaign. The effort failed and was followed by a series of submarine attacks, which culminated in the sinking of the "Lusitania," May 7 1915, with the loss of over 100 American lives. The President, while he disappointed opinion in the eastern states by a speech in which he reaffirmed his pacific determination, stating that a man might be "too proud to fight," at once set out to win from Germany a disavowal and a promise that merchant ships should not be torpedoed without warning and the saving of the lives of passengers. A lengthy exchange of notes ensued; the pacific Mr. Bryan, Secretary of State, regarding the President's language as too strong, resigned; on the other hand Mr. Wilson's patience with the evasions of the German Government and the continued sinkings by submarines led to bitter attacks upon the President's policy of conciliation, which was stigmatized as anemic or even cowardly. Mr. Wilson succeeded, however, in securing from Germany a promise not to sink liners without warning (Sept. 1 1915), and continued his efforts to induce Germany to abandon the submarine campaign completely. He was hampered by an attempted revolt of Congressional leaders, who blurred the issue with Germany by introducing resolutions designed to prevent Americans from travelling upon belligerent ships. The President, through his personal influence, secured the defeat of these resolutions in Feb. 1916, insisting that he would not consent "to any abridgment of the rights of American citizens in any respect." Shortly afterwards the issue with Germany was brought to a head by the sinking of the "Sussex," March 24 1916. Mr. Wilson waited three weeks before sending a formal note of protest to Germany (April 19 1916) but couched it in the form of an ultimatum, stating that unless Germany should immediately declare and effect an abandonment of its present methods of submarine warfare, the United States would be compelled to sever diplomatic relations. The German answer, while attempting to make acceptance conditional upon Great Britain's relaxation of the blockade, was in effect a promise not to sink merchant ships without warning and without saving human lives. The submarine issue now seemed less critical.

The diplomatic victory thus apparently secured by Mr. Wilson was utilized in his behalf during the electoral campaign

of 1916, in which he was inevitably the Democratic candidate. It enabled his supporters to declare that he had vindicated the rights of the United States successfully, and at the same time had "kept us out of war." The slogan made a strong appeal, especially in the districts of the Middle West. The Republicans, on the other hand, who had nominated Charles E. Hughes, criticized the whole foreign policy of the President. They insisted that he had failed to take prompt action for the protection of American lives and honour, alike in his dealings with Germany and in his handling of the Mexican crisis. They characterized his domestic policy as demagogic, instancing the Clayton Act and the Adamson Act; the latter had been urged on Congress by Mr. Wilson to avert a railroad strike in Sept. 1916, and many citizens regarded it as an untimely surrender to labour threats. They also criticized his attitude on "preparedness," to which the President had been opposed until the close of 1915, and ridiculed the cautious expansion of military and naval forces provided for in the National Defense Act of 1916. In the east and in most industrial centres of the middle west, Mr. Wilson was unpopular, but the election showed his strength in the farming districts west of the Mississippi and on the Pacific coast; in spite of Mr. Roosevelt's return to the Republican fold the President drew largely from the Progressives, and on election day received a slight electoral majority over Mr. Hughes (277 to 254) and a popular plurality of 9,120,606 to 8,538,221.

His re-election enabled Mr. Wilson to proceed with plans for peace proposals to the European belligerents. These he had been preparing since the early summer of 1916, and, regardless of the German peace balloon of Dec. 12 1916, he sent on Dec. 18 identical notes to the belligerents, asking them to state the terms upon which they would consider peace. Informed of the undercurrents of German military circles, he evidently feared that if the war continued, the United States would necessarily become involved; he also hoped that a clear definition of war aims would strengthen pacific elements in both belligerent camps. The German reply was evasive; that of the Allies refused to consider peace until Germany should offer "complete restitution, full reparation, and effectual guarantees." The replies gave the President opportunity to expound what he had come to believe was the only sure basis of an enduring peace. This he did in a speech of Jan. 22 1917, in which he insisted that the peace must be organized by the major force of mankind, thus emphasizing the need of a League of Nations; that no nation should extend its policy over another nation; that no one Power should dominate the land or the sea. There must be a limitation of armaments. As a guarantee of future peace and justice, the ending of the existing war must not be the violation of the rights of one side or the other: it must be "a peace without victory." Further efforts to secure a peaceful arrangement were frustrated by the determination of the German militarist clique to renew the submarine warfare, regardless of the effect on the United States. On Jan. 31, the German ambassador, von Bernstorff, delivered a note to this effect, and four days later the President handed him his papers. He still, however, avoided formal war with Germany, and on Feb. 26 asked for a resolution of armed neutrality, which would permit the arming of American merchant ships for entrance into the barred sea zone. The resolution was blocked by a filibuster. Finally, in view of continued sinking of American ships, the President came to Congress on April 2 1917, and asked for a declaration that a state of warfare existed with Germany. The resolution was passed by the Senate on April 4, by the House on April 6.

President Wilson had always abhorred the exercise of force in international relations, and the war which he at last regarded as necessary was, in his mind, a war to ensure peace. Nevertheless he was determined that it should be waged efficiently and that the mistakes of previous wars should not be repeated. Those mistakes, he believed, had resulted chiefly from the intermixture of politics in military affairs, and from the decentralization of the American military machine. He opposed a coalition war cabinet, as leading to divided responsibility. Military policy was handed over to the military experts. He approved

the immediate development of the general staff as the centralizing military organ, and it was upon the recommendation of that body that he urged, against the wish of Congressional leaders, the Selective Service Act. On the advice of the general staff he appointed Gen. John J. Pershing commander of the expeditionary force to France, and, also following that advice, he refused to authorize a volunteer force under Mr. Roosevelt. Similarly the plans for the development of a large army in France were inaugurated and translated into fact by the military experts. As regards conduct of operations the President gave to Gen. Pershing complete authority, and permitted no interference by politicians. In the building of the new army, the President took no direct part, but he used his authority consistently to favour centralization under the general staff. He followed a similar policy in the mobilization of the industrial resources of the nation. He encouraged the centralizing efforts of the Council of National Defense and its committees, and sought always to secure for them executive rather than the merely advisory powers which they at first possessed. He urged the Lever Act, which in Aug. 1917 created a Food and a Fuel Administration, and advocated the taking over of the railroads by the Government in Dec. His policy of economic centralization was ultimately assisted by the many protests against his war policies which were made in the winter, and which centred round the demand for a non-partisan war cabinet or ministry of munitions; for his supporters were able to insist that the more effective handling of war problems demanded not new machinery but greater efficiency of the existing mechanism. The President asked for powers to cut through red tape and rearrange bureaux without reference to Congress. His demands were embodied in the Overman Act, which was passed in May 1918, and which enabled him to grant executive powers to the various boards that had been created. The War Industries Board, released from its dependence upon the Council of National Defense, at once became the centralizing organ of the economic activities of the country. In his war appointments Mr. Wilson disregarded party lines, a notable fact since in political appointments he always showed himself strictly a party man. Republicans such as Hoover, Stettinius, Goethals, Schwab, Vanderbilt, were chosen because of their administrative qualities and regardless of political affiliations.

During the war President Wilson consistently developed his ideals of a new international system which should perpetuate peace and assure justice and security to every nation regardless of its material strength. He hoped thus not merely to construct a basis for just peace when the war should end, but to hasten the end of the war by appealing to the peoples of the enemy states against their Governments. The most notable of his speeches was that of Jan. 8 1918, in which he stated 14 points necessary to a just and lasting peace. This, with his later addresses, was ultimately accepted as the basis of the final settlement. Their effect in Germany and Austria-Hungary was not apparent until the military defeat of those empires, but his words acted continually as a corroding factor, weakening the enemy's determination to fight. When in the autumn of 1918 they faced military defeat, they turned to Mr. Wilson offering to accept his Fourteen Points as the basis of peace. The President's insistence upon justice as an essential to a lasting settlement had brought him great prestige in Allied countries, but the chiefs of the Allied Governments hesitated to accept the Fourteen Points in the fear that the material advantages of the victory might be thrown away. They yielded, however, to the persuasive diplomacy of Col. House, who represented the President at Paris, and it was on the understanding that the Fourteen Points (reservation made of "Freedom of the Seas" and inclusion of Germany's promise to make full reparation) should be the basis of the peace that the Armistice was granted to Germany.¹ The President realized, however, that it would be difficult to translate his principles into the actual treaty. Aside from the opposition he might expect from selfish nationalistic interests among the

¹ The Fourteen Points are set forth in full in the article *WORLD WAR*, under the subhead *Political History*.

Allies, he lacked unified support at home, where his political opponents called for a "strong peace" that would annihilate Germany; there was little enthusiasm for a League of Nations, which the President regarded as essential to a just and lasting settlement. Furthermore he had weakened his political position at home by a series of tactical mistakes. Of these, the most important was an appeal issued immediately before the Congressional election of Nov., in which Mr. Wilson asked the voters to cast their ballots for Democratic candidates, on the ground that a Republican Congress would divide the leadership at the moment of international crisis. Such an appeal would have been comprehensible if it had been made by a prime minister in a parliamentary country, but Wilson had proclaimed himself the leader of the nation and could not logically also play the rôle of party leader. The Republicans seemed to have some ground for complaining that although they had submerged partizan quarrels during the war, President Wilson was now attempting to capitalize the war and foreign affairs in order to win a partizan advantage. Many voters were antagonized by the appeal, and the elections went in favour of the Republicans. The President thus lost command of the Senate in the next Congress and its Foreign Relations Committee was to be controlled by his political and other opponents. Believing that his presence at the Peace Conference was necessary, if it was not to be dominated by old-style diplomatic practices, Mr. Wilson decided himself to go to Paris, and on Dec. 4, 1918 sailed with the other members of the American Commission on the "George Washington." He arrived at Brest on Dec. 13, and was received at Paris, in England, and at Rome with tremendous enthusiasm. For the moment he was the popular hero, both in Allied and enemy countries. But his prestige rested on a precarious footing, and must inevitably diminish when he came to oppose the national aspirations of any people. He was anxious, therefore, to strike off a quick general peace, leaving details for later settlement; but this proved impossible, and formal conversations at Paris began only in Jan. 1919. The President succeeded in winning an early victory when he persuaded the conference to accept the principle of the League of Nations as the basis of the peace, and when, on Feb. 14, he won unanimous approval of the preliminary draft of the covenant. On returning to the United States, however, he found Republican opposition to the league strongly manifested in the Senate, although he had the support of Mr. Taft's influence in that party and in the country. Public opinion seemed to be uninstructed and apathetic as to the President's policies. Going back to Paris in March, he was able to secure the insertion in the covenant of certain amendments required by American sentiment, and the approval by the conference of the final draft of the covenant. But he was confronted by the demands of the French, Italians and Japanese for territorial and economic concessions from the enemy, which he regarded as excessive. Long discussions followed, culminating in Mr. Wilson's acceptance of a portion of the Allied demands, notably the granting of Shantung to the Japanese, of much of the frontier line promised by the Treaty of London to Italy, and the exaction from Germany of what amounted to a blank cheque in the matter of reparations. Such concessions aroused the opposition of liberals in England and America, who insisted that the President had surrendered his principles. Mr. Wilson, on the other hand, acknowledging that certain aspects of the settlement were not ideal, believed that he had won his main contention in securing the League of Nations, which provided the mechanism for eradicating the vices contained in the treaties. In this belief he was supported by another liberal protagonist, Gen. Smuts. On June 29, 1919, the day following the signing of the Versailles Treaty, the President sailed for America. His international prestige had suffered from his opposition to national claims, especially that of the Italians to Fiume and of the French to the left bank of the Rhine. Nevertheless, as the bitterness of the moment passed, the magnitude of his accomplishment at Paris became more fully recognized. When the veil of secrecy surrounding the negotiations was gradually lifted, it was then that the belief that

he had been outmanœuvred by Lloyd George and Clemenceau was hardly justified by the facts. Lacking the negotiating ability of Lloyd George and the political experience of Clemenceau, he refused to enter the diplomatic lists with them, but by his manifest candour and sincerity early disarmed his opponents in argument. He said exactly what was in his mind, and was careful that his statements should be fortified by the documents and statistics furnished by his expert advisers.

The strain of the conference had told upon Mr. Wilson's physical and nervous strength. He was thus not well equipped to wage the struggle with his Republican opponents in the Senate which developed upon his presentation of the treaty. Had the President been willing to compromise and accept reservations to the covenant of the league, it is possible that the two-thirds necessary to ratification might have been secured. This course he refused to follow, and it soon became clear that the Foreign Relations Committee would not recommend ratification without serious reservations or amendments. In the hope of winning popular support, the President set forth upon a tour of the country and along the Pacific coast aroused enthusiasm in marked contrast to the coldness of the east. The effort, however, overtaxed his strength, and on Sept. 26 at Wichita, Kan., the President was compelled to give over his tour and return to Washington, where he suffered a complete nervous collapse. The exact nature of his illness was not made public and few realized how serious it would prove to be. Many, however, felt that in view of his inevitable abstention from active work, it would have been wiser for him to retire at least temporarily. As it was, his system had provided for no understudy and the administration was left without a leader. Entirely apart from the confusion thus caused in the conduct of the public business, Mr. Wilson's illness led directly to the defeat of the treaty. There was no one else capable either of leading the fight for ratification without reservations, or with sufficient authority to arrange a compromise. On Nov. 14 the Senate adopted reservations which Mr. Wilson declared would "nullify" (etc., etc.) the treaty; for this reason he urged the Democrats to refuse to vote for the ratifying resolution, which was accordingly defeated on Nov. 19, 1919. During the succeeding weeks efforts were made to arrange a compromise. The Republican leaders agreed to soften the language of certain reservations, and the President intimated that he would accept a mild reservation on Article X. of the covenant, which had aroused the chief opposition. Neither side would yield enough, and when on March 19, 1920, the final vote was taken on the ratifying resolution, which contained a strong reservation on Article X., Mr. Wilson again urged Democratic senators not to accept. The resolution thus failed of the necessary two-thirds by a margin of seven votes, 57-37. The President appealed to the autumn presidential election in 1920 as the decisive plebiscite. Although he had lost his former control of the party, and the Democratic presidential nominee at San Francisco was not his choice, the Wilsonian policies, including approval of the League of Nations, were inevitably the issue of the elections. In the electioneering campaign, however, the President himself could take no active part, for his physical collapse proved so serious as to confine him to the White House. For the overwhelming victory won by the Republicans, see UNITED STATES (*History*). After his defeat Mr. Wilson kept close silence on public matters, and his annual message of Dec. 1920, while it sounded the note of national duty, made no reference to that which lay nearest his heart—the League of Nations. This silence, indeed, he preserved until the close of his administration, March 4, 1921. In Dec. 1920 he had been awarded the Nobel Peace prize.

The failure of President Wilson to win the approval of the United States for his peace policies presents one of the most interesting problems of American history. He had led the country through the difficult period of a war unsurpassed in magnitude and culminating in complete victory; in the face of serious obstacles he had forced European statesmen to accept the major item in his programme; he returned home only to be repudiated by his own people. Personal and partizan factors

unquestionably contributed to his defeat. In private intercourse Mr. Wilson displayed a personal magnetism, a breadth of culture, and a genial cordiality that are amply attested by his intimates. But in public life he proved unable to capitalize such advantages, possibly because of natural shyness, possibly because physical delicacy restricted his social activities. Roosevelt's capacity for "mixing" with all political and human types he totally lacked. In the formation of his policies he isolated himself and was unable to establish close relations with Congressional leaders. This gave rise to the impression that the President disliked advice, was an ego-centric autocrat, and immediately dispensed with anyone who disagreed with him. Such criticism, by no means a novelty in the case of strong-willed presidents, was utilized by his political opponents and intensified his unpopularity in the industrial centres, especially of the east, an unpopularity which, except for a few months during the opening months of the war, was an outstanding factor in the political situation. Broadly speaking, the criticism does not seem to be fully justified. In matters of what he regarded as principle he was adamant, and he distrusted the judgment of those whose basic point of view was different from his own; but the evidence of those who worked with him, including that of Republican advisers at Paris, is almost unanimous to the effect that he was anxious to secure advice, was tolerant of opinions, and glad to delegate responsibility. The contrary belief was doubtless fostered by Mr. Wilson's inability to build up an efficient secretarial organization, and his incapacity, rather than unwillingness, to apportion effectively the details of administrative labour. His handling of war problems shows clearly his desire to delegate responsibility; once an appointment was made he refused to interfere and consistently protected his appointee from the importunities of politicians.

Political responsibility in general, he believed, should rest with the President. From conviction, rather than from egotism, he sought to emancipate the presidential office from the control of Congressional committees, a control which he earnestly deplored in his earliest writings. The President, he felt, should be the real leader of the nation, and not a mere executive superintendent. The Cabinet he looked on as an executive and not as a political council, and it was always strictly subordinated to his policies. So long as the Democrats held the majority in Congress he was able to translate such ideas into fact, and effectively disposed of all attempted Congressional revolts. This attitude naturally did not allay the political resentments which were inevitably aroused and which were intensified by Mr. Wilson's tendency to regard political opposition as tantamount to personal hostility; when the Democratic majority disappeared he faced uncompromising hostility. He was intensely impatient of partizan obstruction of his idealistic plans, and there is much of the Calvinist in his refusal to temporize or deviate from the path which he believed himself appointed to tread. While in matters of detail he showed at times some capacity for compromise, in matters of principle he displayed the unswerving determination characteristic of the prophet, a trait that is not always conducive to success in the exigencies of modern party warfare. Indeed it is as a prophet, rather than as a statesman that Mr. Wilson should be regarded. No one has preached more effectively the necessity of introducing a moral standard into international politics.

The following are the most important writings of President Wilson: *Congressional Government, a Study in American Politics* (1885); *The State—Elements of Historical and Practical Politics* (1889); *Division and Reunion, 1829-1889* (1893); *An Old Master and Other Political Essays* (1893); *Mere Literature and Other Essays* (1893); *George Washington* (1896); *A History of the American People* (1902); *Constitutional Government in the United States* (1908); *The New Freedom* (1913); *On Being Human* (1916); *International Ideals* (1919). Personal and political biographies of President Wilson have been written by H. J. Ford, *Woodrow Wilson: The Man and His Work* (1916); by H. W. Harris, *President Wilson: His Problems and His Policy* (1917); by W. E. Dodd, *Woodrow Wilson and His Work* (1920); and by his private secretary, Joseph P. Tumulty, *Woodrow Wilson as I Know Him* (1921). All four are eulogistic, especially the last two named. General surveys of Wilson's foreign policy are to be found in E. E. Robinson and V. J. West's *The Foreign*

Policy of President Wilson, 1913-1917 (1917); and in Charles Seymour's *Woodrow Wilson and the World War* (1921). Editions of President Wilson's State papers have been made by Albert Shaw, *President Wilson's State Papers and Addresses* (1917); by J. B. Scott, *President Wilson's Foreign Policy; and Messages, Addresses, Papers.* (C. Sev.)

WIMBORNE, IVOR BERTIE GUEST, 1ST BARON (1835-1914), British politician, was born at Dowlais Aug. 20 1835, the eldest son of Sir Josiah John Guest, 1st bart., of the firm of Guest, Keen & Nettlefold (the Dowlais Iron Works). He was educated at Harrow and Trinity College, Cambridge, and afterwards devoted himself to the management of his large property. He succeeded his father as 2nd bart. in 1852. He stood for Parliament as a Conservative several times between 1874 and 1880, and in the latter year was raised to the peerage. During the Tariff Reform controversy he seceded from the Conservative party, and afterwards sat in the House of Lords as a Liberal. He died at Canford Manor, Dorset, Feb. 22 1914. Lord Wimborne married in 1868 Lady Cornelia Spencer Churchill, eldest daughter of the 7th Duke of Marlborough.

Lord Wimborne's eldest son, **IVOR CHURCHILL GUEST**, was born Jan. 16 1873, and was educated at Eton and Trinity College, Cambridge. He unsuccessfully contested Plymouth in the Liberal interest in 1898 and served in S. Africa with the Dorsetshire yeomanry in 1900. In 1900 he was elected for Plymouth, holding the seat until 1906, and from 1906 to 1910 sat for Cardiff. In 1910 he was raised to the peerage as Baron Ashby St. Ledgers and sworn of the privy council, while from 1910 to 1912 he was paymaster-general. He became Lord-in-waiting to King George V. in 1913, and in 1914 succeeded his father as 2nd Baron Wimborne. In 1915 he became lord lieutenant of Ireland, but resigned in May 1916, after the Irish rebellion. He was, however, reappointed in Aug. 1916, and remained in Ireland till May 1918, when he was on his retirement created a viscount. He was well known as an enthusiastic sportsman and polo player, and to him was due the organization of the polo team which defeated the U.S.A. in the international match at Meadowbrook, Long Island, in June 1914.

WINCHESTER, England (see 28.704).—The pop. increased from 23,378 in 1911 to 23,701 in 1912. In 1912 the necessary work for preserving the cathedral by underpinning the walls and laying new foundations (undertaken in 1905) was completed, and on July 15 of that year the King and Queen attended a great Thanksgiving Service at the cathedral. The total cost of restoration was £113,000, raised by voluntary subscriptions. As much of the work had to be carried out under water varying in depth from 6 to 20 ft., a diver was employed continuously for 5½ years to lay down cement concrete at the base of the new foundations. The work was carried out by Sir Thomas Jackson and Sir Francis Fox. During 1910-21 a large part of the ancient stained glass in the cathedral was also restored.

In 1918 a find of iron currency bars of the early iron age was made on Worthy Down, near Winchester, and, in excavations near the same spot in 1920, some "pit dwellings" were located, the area appearing to be the site of a settlement of that age. The objects found were placed in the city museum. A number of other objects of archaeological interest have been unearthed, including a portion of a stone column with its capital and dedication stone to Carinus (A.D. 283-4), the only inscription to that Emperor as yet found in Great Britain. In 1919 the valuable Dale collection of prehistoric and Roman antiquities was purchased and placed in the museum, and the Roschill collection of prehistoric remains was transferred to the Tudor House museum at Southampton. A map of ancient Winchester, indicating all existing ancient and historic buildings and the sites of those no longer in existence, was issued by the Ordnance Survey in 1920.

A site of 100 ac. in the St. Cross district of the city has been planned on self-contained garden city lines, on which 560 houses were in course of erection in 1921. New county council offices for the county of Hampshire, on Castle Hill, were opened in 1911. The Guildhall was extended in 1914, and the old Tudor Guildhall restored in 1915. A chamber of commerce was established in 1919. During the World War Winchester was a prominent military centre, and some 50,000 troops, including Canadians and Americans, were continually in training there.

WINGATE, SIR FRANCIS REGINALD (1861—), British general and administrator in the Sudan (see 28.729). In Dec. 1916 he was appointed High Commissioner for Egypt and relinquished the governorship of the Anglo-Egyptian Sudan, after a successful administration during 16 years. At the beginning of 1919 Sir Reginald Wingate was summoned to London to report on the situation which had arisen in Egypt, and he remained there many months at the disposal of the Government until his resignation in Oct. 1919. He had received the G.B.E. in Jan. 1918, and was created a baronet in June 1920.

WINNIPEG (see 28.731), the capital of the Canadian province of Manitoba, had a pop. at the close of 1920 estimated at 198,000 (271,958 including suburbs). The Dominion census of 1911 gave a pop. of 136,035. Winnipeg is the great commercial metropolis of western Canada, its importance having been enhanced since 1911 by the completion of the Grand Trunk Pacific Railway (which later became a part of the Canadian National Railways system). The Hudson Bay railway, intended to link Winnipeg with Port Nelson on Hudson Bay and thus to provide an outlet by sea through the summer months for the produce of the west, was still under construction in 1921. Begun as a private enterprise, it had been taken over by the Canadian National Railways system: its completion was expected to improve further Winnipeg's position as the trade outlet of the west. As the wholesale centre for the prairie provinces Winnipeg housed in 1920 5,000 commercial travellers representing an annual wholesale turnover that exceeded \$300,000,000. The assessed value of property in the city that year was \$259,419,520. After 1911 Winnipeg grew in importance as a manufacturing centre, and in 1920 had 513 factories and industrial plants, including flour mills, packing houses, structural steel works, rolling mills, tanneries, sugar refineries, clothing, harness, soap, jewellery and dye factories, etc. The output of its industries in 1917 amounted to \$98,101,632. The almost unlimited power resources of the Winnipeg river, 100 m. away, led to a scheme for an extensive hydro-electric system, to develop 175,000 H.P., which was in course of construction in 1921. The Civic Power Electric Co. had developed 60,000 H.P., and the Winnipeg Electric Railways had developed 30,000 and had 50,000 under construction in 1921. The building of the Grand Trunk Pacific Railway, Canada's third trans-continental railway, in the years following 1911, opened an important phase in Winnipeg's history. The company's extensive railway shops were located at Winnipeg, and the Fort Garry Hotel was erected by the railway in the heart of the city.

WINTER, JOHN STRANGE (Mrs. ARTHUR STANNARD) (1856—1911), English writer (see 28.734), died in London Dec. 13 1911.

WIRELESS TELEGRAPHY AND TELEPHONY (see 26.529).—Wireless telegraphy and telephony (also called radiotelegraphy and radiotelephony) made enormous progress between 1910 and 1921. This was due chiefly to the improvements and advances, effected in three great inventions, viz.: the three-electrode thermionic tube developed out of the Fleming oscillation rectifying valve, the high frequency alternator, and the Poulsen arc generator of continuous waves. The first of these has given a means of detecting electric waves of immense sensitivity, and also a most effective and easily managed generator of continuous electric waves. The second has provided machines for creating high frequency electric currents, and therefore electric waves, of great power, enabling large long-distance radio stations to be equipped which can signal to any part of the world by day or night. The third has also given an alternative method of generating high-power continuous waves. These generating and receiving appliances quite revolutionized wireless telegraphy and made wireless telephony possible not merely as an experimental feat, but as a practically useful art. In addition to these inventions there have been others such as directive radiotelegraphy, and wire-guided high frequency telegraphy and telephony of immense utility. The application of the thermionic valve in ordinary wire telephony as a repeater is also bringing about improvements of very great importance. And contemporaneously with these achievements in telegraphy and telephony have been made of a more scientific

character arising out of the study of the nature of electric wave propagation round our globe and of the causes of atmospheric disturbances, called "strays," which have always been the great obstacle to practical radiotelegraphy.

We shall consider briefly the nature of these improvements in turn.

High Frequency Alternators.—It had become clear by 1904 or 1905 that the use of continuous waves in radiotelegraphy would have marked advantages over the then employed damped wave trains produced by condenser discharges, and would be essential for the accomplishment of radiotelephony. The most obvious method of producing such continuous waves (C.W.) was by some form of high frequency alternator. At that time, when wave lengths of 300 to 3,000 metres or 1,000 to 10,000 ft. were mostly in use, this meant the design of machines giving alternating currents having a frequency of 1,000,000 to 100,000,000, and such frequencies seemed unattainable by any ordinary alternator construction as long as the revolving part of the alternator had to carry coils of wire. In low frequency alternating current dynamos, generating currents, reversed 50 to 200 times a second, there is an electromagnet which provides a constant magnetic field through which field coils of wire are moved so as to generate in the latter an alternating current. Either the field coils or the armature coils may be the rotating portion. In the case of alternators required to produce high frequency currents (20,000 to 100,000) it is impossible to rotate coil-wound armatures or fields at the necessary speed, and the most usual solution of the problem is to construct inductor alternators in which the moving part consists merely of a disk or drum of steel with teeth or ridges on its edge or surface, which serve to change the magnetic flux through stationary armature coils, the field coil also being fixed. We can then balance such a drum or disk and so fashion its edge that it can be rotated at a high speed safely. With the increase in capacity and wave length of the aerial wires or antennae requisite for long distance power stations, frequencies between 20,000 and 100,000 came into use, and attention was again directed to the design of alternators giving such frequencies.

M. Latour has classified these machines into: (1) alternators in cascade, (2) internal cascade alternators, (3) homopolar or inductor alternators, (4) variable reluctance alternators, and (5) alternators with partial utilization of periphery. Although B  thenod in France constructed in 1912 a small machine of type (1), the first alternators of type (2) of 100 kilowatt output, or so, were constructed by R. Goldschmidt about 1912.

In machines of types (1) and (2) we start with the production of a single-phase alternating current of some moderate frequency, say 10,000, and multiply it up to much higher frequencies by taking advantage of a well-known principle called Fresnel's theorem. If there be two equal vectors represented by lines of equal length, which are pivoted to one point and revolve with equal angular velocities in opposite directions, their resultant is a line of constant direction but periodically varying magnitude with amplitude twice the size of that of the revolving vectors. Hence an alternating magnetic field of constant direction may be resolved into two fields of constant magnitude but rotating in opposite directions, each of half the maximum amplitude of the alternating field. If then we pass a direct electric current through the field coils of an alternator and induce in the revolving armature an alternating current say of 10,000 frequency the field due to this armature current may be resolved into two oppositely rotating fields, one of which is stationary as regards the field magnets and the other cuts them with twice the angular velocity of the rotor. This gives rise to a current of twice the frequency in the field coils. The field due to this latter current can again be resolved into two oppositely rotating fields and these induce currents of still higher frequency in the rotor coils. We can so build up currents of frequencies in the ratio of 1, 2, 4, etc. The currents of intermediate frequency can be taken up in circuits comprising capacity and inductance tuned to these frequencies respectively. The current of the highest frequency can be put into an aerial wire and employed to radiate long electric waves of corresponding wave length.

High frequency alternators of the above description were built for the radio station established at Tuckerton, N.J., in correspondence with a similarly equipped one at Eilvesee, near Hanover in Germany, and used for trans-Atlantic transmission from about 1912 up to the time of the entrance of the United States into the World War.

The third type of high frequency (H.F.) alternator, called the homopolar inductor alternator, is represented by the machines of E.F.W. Alexanderson with disk rotor, and Béthénod-Latour and the Société Française Radio-Electrique with drum rotor.

The principle of these alternators is as follows: a fixed ring-shaped frame or stator has inwardly projecting teeth of laminated iron, and a ring-shaped magnetizing coil traversed by a direct exciting current causes magnetic flux to spring across from the teeth on one side (N. poles) to the teeth on the other side (S. poles). This flux traverses the air gap. Over these teeth is a zig-zag armature winding. Between the teeth in the Alexanderson machine revolves a steel disk with teeth cut in the periphery (see fig. 1 and fig. 1a).

parallel, thus giving to the aerial 500 or 600 kilowatts of electric power. Also similar machines are employed in the large French radio station at Croix-d'Hins near Bordeaux, and are installed in the very large French radio station at St. Assise, near Melun, which began to be erected in 1921. Alexanderson alternators of 200 kilowatt power are installed at the American naval radio station at New Brunswick, N.J. This station communicates with Stavanger radio station in Norway (3,554 m.) with Lyons (3,845 m.) and Nauen, near Berlin (3,958 m.) (see fig. 1).

The Arc Generator.—We must next mention the improvements made in connexion with the Duddell-Poulsen arc generator. In this appliance an electric arc is formed with a direct current

FIGS. 1 (left hand) and 1a (right hand).—FIG. 1, 200 kilowatt Alexanderson high frequency alternator, driven by an electric motor. FIG. 1a.—Half section of the Alexanderson high frequency alternator; showing the inductor disk which revolves between the stator poles. (By permission of *The Wireless Press*.)

The number of teeth in the rotor is half the number of teeth on each side of the stator. These rotor teeth as they pass between the stator teeth decrease the reluctance of the air gap and increase the magnetic flux passing. Hence as the rotor revolves the magnetic flux linked with the armature circuit is alternately increased and decreased. This creates an electromotive force and a high frequency current in the armature circuit. The only revolving part of the machine is thus a well-balanced rigid steel disk. The field exciting coil and the armature coil are both stationary. Such machines are called in English inductor alternators and in French homopolar alternators.

In the Béthénod-Latour machines the inductor is in the form of a steel drum with exterior of laminated iron in which longitudinal grooves are ploughed out. The stator ring has inward radially pointing laminated iron teeth on both edges, and the magnetic flux, leaving one set of teeth (N. poles), passes down through the drum teeth and up again into the other set of stator teeth (S. poles). The ridges on the drum serve to increase and decrease the flux through the armature wire which is wound zig-zag on both sets of stator teeth.

The peculiarity of the French machine is that the rotor or drum has many more ridges or teeth on it than the stator ring. By this we can obtain the necessary high frequency without dangerous peripheral speed in the rotor, and yet leave plenty of space for the armature winding placed on the stator teeth.

On account of the few turns in the armature such machines give a small electromotive force, but this can be raised by suitable static transformers, one secondary terminal of which is connected to the radiating antennae and the other to the earth plates. The aerial wire is then tuned to the frequency of the alternator and the necessary wave length. A point of importance is the exact regulation of the speed of the machines which must be kept constant to within 0.1% of the normal. This is achieved by the use of very sensitive governors which control the speed of the direct coupled electric motor which drives the alternator. The signals are made in the case of the Alexanderson machines by varying the inductance of a tertiary coil on the transformer which transfers the energy from the aerial to a non-radiative circuit. By placing condensers in series with the H.F. alternators it has been found possible to run them in parallel, that is two or more together just as in the case of low frequency alternators in electric lighting and power stations.

High frequency homopolar alternators of the Béthénod-Latour type have been built by the Société Française Radio-Electrique up to 220 kilowatts size for the French military radio station at La Doua, near Lyons. To avoid loss of power by air churning these machines are enclosed in an air-tight case in which a partial vacuum is maintained. The speed of the machines is controlled by a Thury governor, and signals are made by short circuiting the armature coils in sections. Two or more machines can be run in

between a water-cooled copper electrode (the positive terminal) and a carbon negative electrode. The arc is inclosed in a chamber filled with coal-gas or kerosene or alcohol vapour, and a powerful transverse magnetic field is made across it (see fig. 2). If the

FIG. 2.—25 kilowatt Poulsen arc generator of electric oscillations; showing the electromagnet and arrangement for dropping alcohol into the arc box. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

arc terminals are shunted by a circuit containing a condenser and an inductance coil, high frequency oscillatory currents will be set up in this latter circuit under certain conditions. Their

energy can be inductively transferred to an aerial wire so as to radiate continuous electric waves from it. The arc must be in a certain *active* condition determined by its length and the strength of the magnetic field in order to produce oscillations. Many investigations have been made to elucidate the working of this oscillation-producing arc.

A fairly complete list of these papers is given by P. O. Pedersen in the *Proceedings of the Institute of Radio Engineers* (United States), vol. v, p. 255, Aug. 1917.

In order that the arc may be active, *i.e.* produce oscillations in the condenser circuit, it must be drawn out to a certain length, and the transverse magnetic field must have a certain optimum value, which depends upon the density of the gas in which it is immersed and on the frequency of the oscillations and the strength of the direct current feeding the arc.

Under best conditions the effective or root mean square value of the oscillatory current is $1/\sqrt{2} = 0.7$ of the strength of the direct feeding current. Thus, if the arc is fed with 100 amperes (D.C.), it should give 70 amperes (A.C.) in the oscillation circuit under best conditions: the possibility of this transformation is the result of the negative slope of the characteristic curve of the direct current arc, viz. that an increase in arc current is accompanied by a decrease in electric potential difference and vice versa. Also the necessity for maintaining round the arc a non-oxygenic atmosphere, or one consisting of hydrogen or carbon hydrides or oxides, is due to the fact that in these gases the arc characteristic has a steeper downward slope than in air (see W. L. Upson, *Phil. Mag.* July 1907). The transverse magnetic field is requisite suddenly to extinguish the arc at each oscillation, and so produce an electromotive force in the inductance coil which recharges the condenser in the reverse direction. Broadly speaking then, the operation which takes place is as follows:—If the arc is burning steadily and the condenser is shunted across the electrodes, the result is to rob the arc of some current. Hence the potential difference (P.D.) of the arc electrodes increases. This, however, continues the charging of the condenser in the same direction. Then the latter discharges back through the arc and this lowers the P.D. of the electrodes.

The study of the oscillatory arc by means of the oscillograph by H. Th. Simon, H. Barkhausen, A. Blondel, and P. O. Pedersen has shown clearly the nature of the operations taking place. If no magnetic field, or a weak one is employed, and if the arc is in air only, feeble oscillations are set up in the condenser circuit, and the current through the arc is a pulsatory unidirectional current. This is the case of the Duddell or musical arc which has no use in wireless telegraphy. If a stronger magnetic field is used and if the arc is in a hydrogen or coal gas atmosphere, then much more powerful oscillations are produced, and when the R. M. S. value of the condenser current is equal to, or greater than 70% of the direct current the arc current just falls to zero, or is extinguished at each oscillation. The function of the transverse magnetic field is then to blow out the arc by forcing the stream of electrons outward, and the effect of this sudden rupture is to create a strong adjacent or assisting induced electromotive force in the inductance coil in the condenser circuit. This continues the arc current in the same direction, and the condenser thus becomes charged in the opposite direction. The process then repeats itself and we have powerful oscillations produced in the condenser circuit.

Although the condenser current is a sinusoidal current, and the arc current has the same form, yet owing to the shape of the dynamic characteristic curve, the potential difference of the arc electrodes is an irregular curve with sharp peaks corresponding to the instants of cessation and recommencement of the arc current.

The practical construction of a Pedersen arc generator involves therefore a large electromagnet having poles which project into a box which can be kept full of alcohol, or kerosene vapour or else coal-gas. Into this box project the two electrodes, one of copper, through which water circulates to keep it cool, and one of hard carbon which is kept in slow rotation by a motor. The poles of the magnet are shaped bluntly conical so as to concentrate a powerful magnetic field transversely to the electric arc which springs from the copper (+) to the carbon (-) electrode. The arc is created by a direct current dynamo giving a voltage of 500 or more (see fig. 2). A separate shunt-wound dynamo is often employed to excite the electromagnet. In the circuit of the arc supply dynamo choking coils are inserted, and a circuit comprising a condenser of capacity C and an inductance (L) is connected as a shunt to the arc. If the capacity C is measured in farads and the inductance in henrys then the ratio \sqrt{L}/\sqrt{C} is a function of the dimensions of a resistance reckoned in ohms, and should have some value of about 500 ohms or so.

Means must be provided for adjusting the magnetic field to its optimum value (H_0) which depends on the frequency (n) of the oscillations produced, where n is nearly equal to $1/2\pi\sqrt{LC}$, or upon the radiated wave length λ (in metres) where $n\lambda = 300$ million metres.

P. O. Pedersen states that $H_0 = a/\lambda - b$ where a and b are certain constants (see

Institute Radio Engineers, United States, vol. v, p. 255, Aug. 1917).

L. F. Fuller states that $H_0 = \frac{K\sqrt{P}}{\lambda}$ where P is the power furnished to the arc and K is a constant depending on the surrounding gas or vapour. For kerosene $K = 4.23$; for ethylic alcohol $K = 8.5$. For a power of 50 kilowatts and a wave length of 7,000 metres the arc in alcohol requires a field of 8,300 C.G.S. units and for a wave length of 20,000 metres and a power of 1,000 kilowatts the field must be 13,500 C.G.S. units. Hence as the air gap is large (generally several centimetres) extremely large magnets are required. For the 1,000 kilowatts arc plant the magnets weigh 80 tons and for the 500 kilowatts plant 65 tons. For smaller sizes of plant the magnet is of the open circuit type and for the larger of the closed circuit type. The arc chamber and magnets have to be cooled by water or oil circulation. From 100 kilowatts size and upwards this arc generator is very widely used in long distance radio stations. It labours, however, under the disadvantage that the signalling cannot be conducted by starting and stopping the arc but only by throwing the aerial out of tune or by deflecting the energy into a non-radioactive circuit. Hence power is equally consumed whether message signals are being sent out or only spacing waves.

FIG. 3.—Modern thermionic generating valve; showing the cylindrical anode and metal gauze grid, as made by the Marconi-Osram Valve Company. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

The Thermionic Valve.—The third type of high frequency electric oscillation generator which has become of great importance in the last five years is the thermionic valve, which is a development of the Fleming valve (see 26.537).

The Fleming valve comprises a glass bulb, highly exhausted of its air, and contains a carbon or metal filament which can be rendered incandescent by an electric current. Around the filament is placed a metal cylinder carried on a wire sealed through the bulb. The peculiar property of it is that, when the filament is incandescent, the space between the filament and cylinder will conduct negative electricity from the filament to the cylinder but not in the opposite direction. Hence the name "valve" given to it. It can, therefore, be used to separate out the two constituents of a high frequency alternating current and "rectify" them into a direct current. This valve was extensively used as a detector of electric waves in wireless telegraphy from 1904 onward as described later. In 1907, Lee de Forest in the United States, after he had become acquainted with Fleming's invention of the valve and its use in wireless telegraphy, added to it an additional element in the form of a grid or zig-zag of wire placed between the cylinder and the filament but carried on a separate terminal. He thus made a so-called three-electrode thermionic valve, a name sometimes shortened into *triode*.

In its modern form a thermionic valve of the latter type comprises a highly exhausted glass bulb having in it a filament of tungsten, or thoriated tungsten or of platinum wire coated with oxides of barium and strontium (see fig. 3). This is rendered incandescent by electric current from a storage battery. Around the filament is a spiral of nickel wire or else a cylinder of nickel wire gauze. This is technically called the grid. Around that again is a cylinder of sheet nickel called the plate. The plate and the grid are carried on separate wire stems sealed through the wall of the bulb. Although the three-electrode valve was originally devised as a detector of electric oscillations as described below yet about 1913, or before, it was found that both the two-electrode valve and also the three-electrode valve can produce electric oscillations as well as rectify or detect them. When the filament is rendered incandescent torrents of electrons or particles of negative electricity are emitted from it. If the plate is given a positive potential relatively to the filament by means of a battery called a plate battery, these electrons are attracted to it, and this creates a movement of negative electricity called a thermionic current. If the bulb is highly exhausted and has a grid in it between the filament and plate, the electrons can only reach the latter by passing through the holes in the grid. If the grid is given a negative potential it reduces or stops the thermionic current. If it is given a positive potential it increases the current. The relation between thermionic current and grid potential can therefore be represented by a characteristic curve as shown in fig. 4.

FIG. 4.—Characteristic curve of a three electrode thermionic valve.

The three variables, viz. plate and grid potential (v_p and v_g) and the thermionic current (i_p), may be regarded as three rectangular coordinates which define a characteristic surface, and sections of this, parallel to the $i_p v_g$ axes or $i_p v_p$ axes, delineate the principal characteristic curves. The central portion of this surface, corresponding to zero grid potential, is nearly a plane and has therefore the equation $i_p = av_p + bv_g$, where a and b are certain constants or coefficients.

If we pass a current by means of a high voltage battery from the filament to the plate and send this current also through the primary coil of an oscillation transformer, the secondary circuit of which is connected to the filament and grid, we have an arrangement by which continuous electric oscillations are produced and maintained. For, if properly connected, any variation of the grid potential will increase or decrease the plate current; and this acting through the transformer will in turn create the changes of grid potential which act to sustain the variations of plate current. The action is just like the well-known experiment of the singing telephone. If a magneto-telephone receiver is in series with a carbon transmitter and with a battery, then, when the transmitter is held near the receiver, the latter emits a shrill note. The sound given out by the receiver acts on the transmitter and this in turn actuates the receiver. The energy is drawn in both cases from the battery.

The three-electrode valve so used is called a transmitting valve, and the sustained electric oscillations it can produce, as above described, can be transferred to an aerial wire and cause it to radiate continuous electric waves.

Very large thermionic valves are now made with glass or silica bulbs, a foot or more in diameter, for use as transmitting valves, and numbers of these can be associated together to form a thermionic generator of large power. In this case the high voltage required to pass the plate current through the valve is obtained by the use of a battery of Fleming two-electrode valves which rectify a high tension alternating current of low frequency. A complete valve panel, as it is called, comprises the battery of rectifying valves, and three-electrode valves and also the necessary transformers, induction coils and condensers (see fig. 5). Large valve panels are now constructed to transform electric power from 1 kilowatt to 50 kilowatts or more into high frequency electric oscillations of great energy.

Such valve generators are extensively used by Marconi's Wireless Telegraph Co. and others for the production of continuous waves, and are employed at Clifden Station in Ireland for the transmission of wireless messages across the Atlantic Ocean.

XXXII.—33.

Detectors.—We must in the next place notice the improvements which have taken place in means for detecting continuous waves (C.W.) as used in wireless telegraphy. The reader may refer to the earlier article on Wireless Telegraphy (see 26.535) for an account of the principal appliances used in connexion with spark or damped wave telegraphy for the detection of electric oscillations, and especially to the section on the oscillation valve or two-electrode thermionic detector, from which other types of improved thermionic detector have been developed. Subsequently to the introduction of the two-electrode, but prior to the advent of the three-electrode thermionic detector, much use was made of crystal or rectifying detectors.

It will be remembered that the electric waves sent out from the transmitting aerial wire, which are identical in nature with light waves except for their much greater wave length, fall upon an aerial wire at the receiving station, and create in this latter extremely feeble, high frequency electric currents or oscillations which are a copy on a very reduced scale of the electric oscillations established in the transmitting aerial. The strength of these feeble received currents reckoned in amperes (I_r) can be approximately computed from the strength of the currents in the sending aerial (I_s) reckoned in amperes by means of an empirical formula valid up to about 2,000 m. due to L. W. Austin and L. Cohen which is as follows:—

$$I_r = I_s \frac{377 h_s h_r}{\lambda d R} - 0.0045d/\sqrt{\lambda}$$

where h_s and h_r are the heights of the sending and receiving aerial wires in kilometres, d is the distance apart of the stations in kilometres, λ is the wave length in metres, s the base of the Napierian logarithms, and R the total resistance of the receiving circuits in ohms.¹

The received currents may be something of the order of 5-10 microamperes more or less in the case of long distance working. To detect these feeble oscillations special appliances called detectors are in use. The so-called rectifying detectors do this by converting the received oscillations into feeble unidirectional currents, which in the case of damped waves are equivalent to short gushes of electricity in one direction corresponding in frequency to the condenser discharges in the transmitter. These can then be detected by a telephone, as they create in the latter a musical sound agreeing in pitch with the wave group frequency, and this, by the action of the key in the transmitter is cut up into dot and dash audible Morse signals. One of the first rectifying crystal detectors was carborundum discovered in 1906 by H. H. C. Dunwoody in the United States. This material is a crystalline carbide of silicon produced in electric furnaces, and, in certain specimens, as shown by G. W. Pierce, has an electric conductivity 40 or 50 times greater in one direction than in the opposite along one crystalline axis.

FIG. 5.—Valve panel for generating high frequency oscillations in the transmitters for wireless telegraphy, as made by Marconi's Wireless Telegraph Co., Ltd. (By permission.)

The same properties are exhibited by hessite and anatase as well as by molybdenite and other native sulphides. Furthermore, it was found by L. W. Austin and G. W. Pickard that contacts between certain pairs of substances such as tellurium and aluminium, or zincite and chalcophyrite, also plumbago and galena, have the same kind of unilateral conductivity and can be employed for "rectify-

¹ The problem of predetermining the electric and magnetic force at any point on a conducting sphere due to a Hertzian oscillator at some point on it is a very difficult one. The reader will find references to the work of Macdonald, Nicholson, Love, Rybczynski, and others in *The Principles of Electric Wave Telegraphy*, Fleming, 4th ed. chap. ix., and also in a paper by Balh van der Pol in *Phil. Mag.*, vol. xxxviii. (Sept. 1919). The final result is that diffraction alone will not account for long distance radiotelegraphy.

ing" high frequency oscillations. These crystal and rectifying detectors came at one time into great use in wireless telegraphy.

The limitation in the power of these crystal or rectifying detectors lay in the fact that the energy used in making the signal is only a portion of that captured by the receiving aerial from the incident waves. An immense improvement was therefore effected by the introduction of the three-electrode thermionic valve, which can act in the manner of a telegraphic relay and employs the received power merely to release a much larger amount of electric power from a local battery, which latter creates the signal in the telephone or other instrument. Moreover, this type of detector is capable of being used in series so as to amplify or magnify enormously the signal-making power.

FIG. 6.—Thermionic amplifying and detecting valve of the type usually called the "French" valve with cylinder anode and spiral wire grid surrounding a straight filament.

FIG. 7.—Views of various types of three-electrode thermionic valves; (a) detecting and amplifying valve; (b) transmitting or generating valve; (c) amplifying valve of a type made by Marconi's Wireless Telegraph Co.; (d) small transmitting valve with gauze grid.

The modern hard or high vacuum thermionic valve as used for reception and amplification is now generally constructed as follows:—a small glass bulb or tube, a few inches in diameter, has sealed into it a filament which can be rendered brightly incandescent by current from a 2-to 3-cell storage battery (4-6 volts). This filament is of drawn tungsten wire, or else platinum coated with oxides of barium and strontium. The bulb is highly exhausted. Around the filament and close to it is coiled a spiral of nickel wire called the grid, and outside that a cylinder of nickel called the plate. The plate and grid are carried on wires sealed through the bulb, and connections to the grid, plate and filament are brought to four terminal pins at the base fixed to a brass collar (see figs. 6 and 7). These pins fit into a suitable socket. A battery of 30 to 200 volts E.M.F. has its negative terminal connected to the filament and positive to the plate, and when the filament is incandescent a stream

of electrons (atoms of negative electricity), called the plate current, flows from the filament to the plate through the apertures in the grid wires. This current completes its circuit through a coil of wire in the external plate filament circuit which may be one coil of a transformer. If the grid has a small negative charge given to it the plate current decreases, and, if a positive one, the plate current increases. The relation of plate current to grid potential can be delineated by a characteristic curve (see fig. 4). For a certain positive grid potential the plate current becomes saturated and ceases to increase. If the grid and filament are connected to the terminals of the receiving condenser in a wireless telegraph aerial, the incidence of electric waves on the aerial will create alternations of potential in the grid and alternations of plate current, and the amplitude of the plate potential may be five to ten times greater than that of the grid. The thermionic tube is then said to have an amplifying power of five to ten.

If the coil in the plate circuit forms the primary coil of a two-coil transformer the secondary circuit of the latter may be connected to the grid and filament of a second valve, and a second amplification of potential may take place. We can thus employ a series of valves in cascade and the total amplification increases as the n th power of the number of valves (n) in cascade. Thus if one valve amplifies potential ten times, three valves will amplify 1,000 times and so on.

This use of thermionic valves in cascade has given us detectors of enormous sensitivity. In order to detect damped oscillations we can adopt one of two methods. If we place a small condenser with a leak across its terminals in the grid circuit then the side of this condenser next the grid becomes negatively charged, and the plate circuit of the valve is reduced. This charge leaks away almost instantly and the plate current of the valve rises again. Hence if the incident waves are in "damped trains" a telephone receiver inserted in the plate circuit of the valve will give a sound of the pitch of the train frequency, and this can be cut up into signals. In this case the valve is used as a rectifier as in the case of the Fleming valve. The second mode of use depends upon the form of the characteristic curve. If we employ a small battery of cells to give the grid a certain positive potential we can operate the valve at a point on the curve near to the saturation point so that a small reduction in the potential of the grid lowers the plate current, but a small increment of potential does not increase it. Hence if the grid is connected to one terminal of the tuning condenser of a receiving aerial it will oscillate in potential when a train of electric waves falls on the aerial. This, however, will cause a drop in the plate current and hence a sound in a telephone receiver included in that circuit. If the incident waves are damped or intermittent trains the result is to make a steady musical sound in the telephone of the pitch of the train frequency. Accordingly, by interrupting the groups by the sending key, audible Morse signals can be received.

The above described methods of reception are however only applicable in the case of damped or intermittent trains of waves. If the electric waves are continuous as sent out by an alternator, arc, or valve transmitter, then we can only detect signals made with them by converting the continuous waves into the equivalent of a series of damped trains. This is done by generating in the receiving aerial electric oscillations by a local valve generator which have a frequency differing from that of the incident waves by about 300 to 1,000. The result is to create in the receiving aerial resultant electrical oscillations which fluctuate periodically in amplitude just as "beats" in musical sounds are produced when two organ pipes slightly out of tune are sounded together. The number of beats per second is equal to the difference in the frequency of the two separate oscillations. In the aerial wire these electrical beats can then be detected by any of the types of detector and receiver used in spark wireless telegraphy. This method is therefore called "beat reception." The beats disappear when the signal bringing waves are interrupted at the sending station in making the spaces between the Morse code signals.

One great use of the three-electrode valve, or triode, as it is sometimes called, is in amplifying feeble signals. It has been explained already that when the grid of the valve is electrified positively or negatively it increases or decreases the plate current and, therefore, the plate potential. The amplitude of the plate potential variations may however be five or ten times or more that of the grid potential variations. Hence the valve acts as a relay or magnifier of potential. Again we can interconnect a number of such triodes in series by induction coils so that the variations in plate current of one valve are made to vary the grid potential of the next. Hence by using a series of valves in cascade we can multiply potential variations of the grid of the first valve in a geometric progression and enormously magnify them. The remarkable achievements of modern long distance wireless telegraphy are chiefly due to the use of such cascade amplifiers. In fig. 8 is shown a view of such a detector made by Marconi's Wireless Telegraph Co. in which six valves are used as amplifiers and a seventh valve as a detector. So sensitive are these cascade receivers that it is not necessary to employ any long aerial wire to receive wireless signals from distant stations. It suffices to construct a large rectangle of a few dozen turns of insulated wire called a frame aerial and connect this in series with a condenser of suitable variable capacity and tune the arrangement

A fuller description of these rectifying detectors is given in *The Principles of Electric Wave Telegraphy and Telephony* by J. A. Fleming, 4th ed. chapter vi. (1919).

to the wave length of the wave to be received. This frame is then placed with its plane vertical and in the direction of the sending station. As the incident electric waves sweep over it they set up in the wire very feeble electric oscillations. If a cascade thermionic amplifier is then connected to the terminals of the receiving condenser and appropriate tuning carried out the signals will be heard in the receiving telephone. It is possible to make one small storage battery of three cells provide the electric current for incandescing the filaments, and one battery of 40-50 cells provide the plate currents for all the valves. Very compact and portable multiple valve receivers of this type have been constructed for use in aircraft and for reception of time signals from distant radio stations.

FIG. 8.—Marconi Co.'s type 55; thermionic amplifier with six amplifying valves and one detector as used in wireless telegraphy and telephony. (By permission of Marconi's Wireless Telegraphy Co., Ltd.)

Directional Wireless.—The frame aerial has the important quality of being directive; that is, it tells us the direction in which the incident waves are travelling. Hence if two receiving stations at a known distance apart are provided with directive aërials, and if they simultaneously observe the direction of the arriving waves from one transmitting station, which may be on an aircraft or ship, these observations laid down on a chart will enable them to fix the position of the source of the signals. In this manner the position of aeroplanes lost in the clouds or ships in the fog may be found and their exact position communicated to them. There was a considerable development of this directive radiotelephony during the World War of 1914-8.¹ It has been found that there are peculiar difficulties in practising this direction finding at or about the times of sunrise and sunset.

In place of employing a movable frame aerial two fixed nearly closed circuit triangular aërials can be erected with their planes at right angles, and a resonant receiving circuit can be arranged to have a coil which is capable of rotation round a vertical axis but so as to be coupled inductively to both the fixed aërials by coils in the two aerial circuits. If electric waves fall on the aërials and if the movable coil of the receiving circuit is rotated into the azimuth in which it receives signals most loudly the direction of the plane of that coil will determine the line of direction of the transmitting station. It is possible by special arrangements to determine the direction along this line in which the electric waves are travelling. Many coast radio stations are now provided with direction finding aërials, and ships can call up these stations by wireless when in proximity, in case of fog, and have their bearings and exact position given to them. In another method of direction finding the coast station sends out a revolving beam of radiation which has a sharply marked point of zero radiation. The time of revolution of this beam is known, and also the instants when the zero radiation is in the true north and south direction at the sending station. Hence by observing the instants at which the zero radiation is observed at the ship, the ship's bearing with regard to the station can be determined. The station sends out time signals by which to correct the ship's chronometer.

¹ See "Direction and Position Finding," by H. J. Round, *Journal Inst. Elec. Eng.* London 1920, vol. lviii, p. 224; also J. J. Bennett, *Nature*, May 1921, vol. cvii, p. 363.

Another ingenious application of radiotelegraphy has been made by Prof. J. Joly to enable ships to find their position in fog and avoid collisions. For details the reader must be referred to his paper in the *Proceedings of the Royal Society of London*, vol. xcii, A, 1915-6, pp. 170, 176, 232, and also to a paper by H. C. Plummer on p. 377 in the same volume. See also J. Joly, *Proc. Roy. Soc. Lond.*, vol. xciv, A, 1918, p. 547.

Wireless Telephony.—The above described improvements in the production and detection of continuous electric waves had by 1921, within a few years, placed wireless telephony on a thoroughly practical basis. It is unnecessary to describe various experimental feats which had been achieved at intervals in this art of radiotelephony, in which the Poulsen arc or some modification was employed to generate the continuous waves (C.W.). All practical radiotelephony now involves the use of the thermionic valve both as a generator of C.W. and as detector.

The general principles of this method are as follows:—one or more three-electrode valves are employed in which the plate and grid circuits are inductively coupled so as to generate continuous oscillations. The plate circuit is also coupled inductively to a radiating aerial wire and continuous waves sent off. The amplitude of these waves has then to be modulated in accordance with the wave form of a speech sound. This is done by means of another three-electrode valve called the control valve. The latter has the secondary circuit of an induction coil connected between its grid and filament, and in the primary circuit is a microphone transmitter and a voltaic cell or two. Hence if speech is made to the transmitter the potential of the grid is varied in accordance with the wave form of the speech. The plate current of this control valve is caused to act upon the plate current or grid potential of the oscillating valve so as to modulate the resulting high frequency oscillations also in accordance with the wave form of the speech made. At the receiving end the received oscillations are amplified by a series of valves and then rectified and passed through a Bell magneto-telephone. The speech sounds are then reproduced by the receiving telephone.

The advantage of this method is that only the ordinary standard telephone transmitter and receiver as used in telephony with wires are employed. To obtain the necessary high plate potentials in the oscillating valves we can either use voltaic batteries (dry cells) or else a small high tension direct current dynamo (1,000-2,000 volts), or else we can rectify a low frequency high tension alternating current by one or more Fleming valves. For aeroplane wireless telephony the plate voltage is supplied by a small dynamo driven by a wind screw which is set in action when the aeroplane flies. A large number of schemes for valve circuits for wireless telephone have been devised. During the war a great amount of ingenuity was expended in devising compact light weight sets of radiotelephone transmitters and receivers for use in aircraft and in the field (see figs. 9 and 9a). A problem of practical importance is that of two-way radiotelephony enabling two communicators to speak and hear simultaneously or to "cut in" or interrupt each other as can be done in ordinary telephony. If a single aerial wire has to be switched over from transmitter to receiver there is always risk of confusion owing to both operators trying to speak or listen at the same moment.

In the case of ground stations a practical solution is to use two wave lengths differing say by 5%. At each station there is a transmitter and a receiver say 100 yd. apart. One transmitter is tuned to the distant receiver but the wave length of the home receiver, which is tuned to the distant transmitter, differs by 5%. Each operator then speaks and listens on a different wave length and can "cut in" as he likes.

This method is, however, not applicable in the case of aeroplanes or ships for want of space. One suggested solution is that called the "quiescent aerial." The plate voltage of the oscillating valve is not supplied by a high voltage battery but at most by a few cells, and the remainder of the plate voltage is created by the rectification by the valve of the speech currents induced in the secondary circuit of the microphone transformer. In this case continuous waves are not thrown off from the aerial except in the act of speech to the microphone, and the receiver can then

FIGS. 9 (left hand) and 9a (right hand).—The wireless equipment of an aeroplane for wireless telegraphy and telephony. The generator is fixed to the outside of the hull of the aeroplane and driven by a wind screw. Fig. 9a shows the general interior arrangement. (By permission of Marconi's Wireless Telegraph Co., Ltd.)

remain connected with the aerial. The arrangements will be understood from the diagram in fig. 9. The method is, however, not very successful and it cannot be said that two-way radiotelephony with a single aerial wire is a solved problem. On the other hand radio communication to and from aeroplanes up to 150 or 200 m. is now a thoroughly practical matter. The aerial is a wire about 230 ft. in length with a weight at the end which is unwound from a winch when the pilot wishes to communicate. The pilot generally wears a helmet with microphone transmitter opposite his mouth and two receivers over the ears. The transmission of speech from the aeroplane is more easy than reception owing to the great engine and propeller noises; nevertheless it is of immense use in connexion with air traffic as by it aircraft can be guided through the clouds to their destination, and the pilot informed of the conditions as regards fog or cloud at the landing station.

In May 1921 Marconi's Wireless Telegraph Co. carried out very successful demonstrations of practical radiotelephony on the two-wave system between Southwold in England and Zandvoort in Holland—a distance of 125 m. over the North Sea. The wave lengths used were 120 and 125 metres.

A very important use of the three-electrode valve is that of repeating speech currents from ordinary telephone wire circuits to wireless circuits and vice versa. Also this is perhaps the place to point out its extremely valuable qualities as a telephone repeater or relay for long wire circuits. Since the characteristic curve of the triode is nearly flat at the central part it follows that any irregular variations of grid potential are exactly copied by the corresponding variations of plate current. Hence if we connect the secondary terminals of a telephone transformer to the grid and filament of a valve and the primary terminals of another transformer to the plate and filament with plate battery inserted we shall have an arrangement called a *thermionic repeater*, which repeats and amplifies telephonic speech currents. If one or more such repeaters are inserted in a telephone line at intervals they will operate to neutralize the attenuation of the speech currents due to the resistance of the line and enable telephonic speech to be transmitted over larger distances without greater expenditure on the copper line conductors. Thus in the United States the long transcontinental telephone line from New York to San Francisco and Los Angeles has 13 such repeater stations in it, and speech is thus rendered possible over 4,000 m. of line.

In Oct. 1920 a remarkable feat was carried out in telephonic transmission by the aid of thermionic repeaters. A ship four hours out in the Atlantic spoke by wireless telephony to the mainland of the United States. The speech was then repeated

into the transcontinental line from New York to Los Angeles and again repeated on to a radio circuit and delivered at Santa Catalina I. about 30 m. out in the Pacific. The speech transmission over this 4,000 m. was as perfect as over any exchange circuit in a large city. It is possible in this manner to speak to flying aeroplanes from the ordinary wire telephone of a town.

Long Distance Stations.—The above improvements in generation and detection of electric waves have not only made radiotelegraphy from ship to ship and ship to shore a certain and indispensable aid to navigation, but have enabled a multitude of long distance radio stations to be established which can maintain communication over distances of several thousand miles. It is now generally agreed that this possibility is due not to true diffraction of these long electric waves round the earth but to the fact that the higher levels of the earth's atmosphere are in a state of permanent ionization due to sunlight or extra-terrestrial causes. This creates a high level reflecting layer which guides the wave round the earth. There are, however, peculiar difficulties and effects at times of sunrise and sunset. In the United Kingdom the Marconi Co. have a large station at Carnarvon, Wales, near Snowdon, which is in correspondence with another at Marion, N.J., United States, for transatlantic working. The British receiving station is at Towyn, about 60 m. from Carnarvon, to enable reception and transmission to be carried out simultaneously. The direct effect of the Carnarvon radiation on the Towyn receiving aerial is neutralized by a balancing aerial (see British Patent Specification No. 13020 of 1911 of G. Marconi). The aerial at Carnarvon is a Marconi directional one, 3,600 ft. in length and 400 ft. vertical height supported on 10 tubular steel masts. The wave length of the radiation is 14,000 metres. The system of wave generation is the so-called timed-spark of Marconi. A direct current high voltage dynamo keeps two sets of condensers charged, and by means of a pair of rotating wheels with studs on their peripheries these condensers are discharged alternately through the primary coil of a transformer, the secondary coil of which is inserted between the aerial and the earth. These two sets of oscillatory discharges are made to follow each other in step and in close sequence by means of a trigger disk discharger which times two discharges so as to constitute in effect a continuous oscillation. The signalling is conducted by switches worked by compressed air which are operated through a relay by electric currents from Towyn. The same company have also a radio station at Clifden in Ireland which corresponds with another at Glace Bay, Nova Scotia. The Clifden station employs large thermionic valves as generators of continuous waves.

The Imperial Wireless Telegraph Committee which reported to Parliament in June 1920 recommended the thermionic valve generator for the imperial stations of the British Empire on the ground that the capital outlay would be less than for arc or alternator stations.

The high power radio stations in the United States comprise one at New Brunswick, N.J. which is equipped with Alexander-son alternators of 200 kilowatts capacity working on a wave length of 13,500 metres. The signals are made by means of a magnetic amplifier which is an inductance coil, the impedance of which is varied by means of a small direct current which changes the per-

meability of the iron core (see *Proc. of the Institute of Radio Engineers*, United States, vol. iv, April 1916, p. 101; a magnetic amplifier for radiotelephony).

The Radio Corporation of America began to build in 1921 a very large wireless station on Long Island which was to have 12 directive aerials, each 1½ m. long, arranged radially around the station. The waves were to be generated by high frequency alternators. The station would cover an area of nearly 10 sq. m. and be the most powerful in the world (see *The Engineering Supplement of The Times*, Aug. 1920). Another large U.S. radio station is that at Tuckerton, N. J., containing a Goldschmidt 200 kilowatts high frequency alternator. The radio frequency machine is driven by an electric motor supplied from two direct current generators in with one near Hanover, Germany. In France there are four very large radio stations; one at Croix d'Hins near Bordeaux, which was erected by the U.S. army during the war to maintain communications with Washington, contained originally 400-500 kilowatts Poulsen arc generators but is now partly converted to an alternator station. The aerial is carried on 8 lattice towers 800 ft. high (see fig. 10).

FIG. 10.—View of the large French radio station at Bordeaux erected by the American army during the World War for direct communication with the United States.

Another large French radio station at La Doua, near Lyons, with wave length of 12,000 metres is an arc station; a third exists at Nantes and a fourth is in Paris and employs the Eiffel tower to support its aerial wire.

The French Government began to erect in 1921 two large radio stations at St. Asaise, near Paris, for European and world wide radiotelegraphy. These were to be equipped with Béthenod-Latour high frequency alternators and would have 1,500 kilowatts output.

In Germany there is a station at Nauen, near Berlin, which has a range of several thousand miles and wave length of 12,600 metres. This station like that at the Eiffel tower, Paris, sends out time signals at certain hours.

Broadly speaking, we may say that there were in 1921 about a dozen long distance radio stations in the world, which could signal to any part of the world by day or night, making use of wave lengths between 12,000 and 20,000 metres.

BIBLIOGRAPHY.—For the full discussion the reader must be referred to special treatises on radiotelegraphy as mentioned below. J. A. Weagant in the *Proc. Inst. Radio Engineers*, United States, 1919, vol. vii, 207, "Reception through Static and Interference." (J. A. F.)

WIRTH, KARL JOSEPH (1879—), German statesman, fourth chancellor of the post-war republican Reich, was born at Freiburg in Baden in 1879. The son of a working engineer, he was educated at the university of Freiburg. In 1908 he was appointed to the chair of Economics at the Technical College of that city; and after his election as a municipal councillor in 1911 he devoted himself to financial questions. In 1913 he obtained a seat as a member of the Catholic Centre party in the diet of Baden, and in 1918 was appointed Minister of Finance. In Jan. 1919 he was elected a member of the Constituent Assembly of the Reich which sat at Weimar. In March 1920, when the Ministry of the Reich was reconstructed after the Kapp Putsch, he received the portfolio of Finance, which he continued to hold in subsequent ministries. His task was to carry out the system of increased national taxation which one of his predecessors, Erzberger, had induced the Reichstag to adopt. When in May 1921 the Allied ultimatum on Reparation was presented to Germany and the "Sanctions" enforced on the Rhine, the Fehrenbach-Simons Ministry, which had rejected the London terms, resigned, and Dr. Wirth was called upon to form a new Cabinet. He succeeded in obtaining the coöperation of a number of able Democrats, Catholics and Socialists, including the prominent industrialist and economist, Dr. Walther Rathenau, as Minister of Reconstructions. Wirth himself retained the portfolio of Finance. The new Ministry then accepted the Allies' Reparation terms—132 milliard marks (£6,600,000,000) payable in yearly instalments of £100,000,000 plus the proceeds of a 25% duty on German exports. By Aug. 31 1921 Germany had paid the first half-yearly instalment of £50,000,000; and in the following Oct. Dr. Rathenau succeeded in concluding a comprehensive agreement with France for paying reparations in kind for the reconstruction of the devastated regions.

After the assassination of Erzberger on Aug. 26 1921 the conflict between the Government of the Reich and the reactionary Bavarian Ministry of von Kahr came to a head, von Kahr showing the same recalcitrancy against carrying out the special ordinances of the Reich against reactionary plots as he had previously exhibited in regard to the dissolution of the illegal volunteer force, the *Einwohnerwehr*. Dr. Wirth stood his ground, and ultimately von Kahr was compelled by his own party in Bavaria to resign and make way for a more conciliatory minister-president. The strife which arose out of this acute internal crisis had hardly abated when the announcement in mid-Oct. of the decision of the League of Nations on the partition of Upper Silesia between Germany and Poland aroused wild excitement throughout Germany, and, among other consequences, sent the exchange value of the mark down (Oct. 17) to 750 to the £. Dr. Wirth had not concealed his conviction that the severance from Germany of the rich industrial district of Upper Silesia would fatally affect Germany's capacity to pay further reparation instalments, and the political tension in Berlin again became acute. Eventually Dr. Wirth resigned, but nobody was found able to form a ministry in his place and he resumed office.

WISCONSIN (see 28,740).—In 1920 the pop. was 2,632,067, as compared with 2,333,860, in 1910, an increase of 298,207, or 12.8%, the state holding its rank of thirteenth. The density of pop. in 1920 was 47.6 per sq. m.; in 1910 it was 42.2. The proportion of urban pop. increased from 43% in 1910 to 47.3% in 1920. The following table shows the growth of pop. of those cities having 25,000 inhabitants:—

	1920	1910	Percentage increase
Milwaukee	457,147	373,857	22.3
Racine	58,593	38,002	54.2
Kenosha	40,472	21,371	89.4
Superior	39,671	40,384	-1.8
Madison	38,378	25,531	50.3
Oshkosh	33,162	33,062	0.3
Green Bay	31,017	25,236	22.9
Sheboygan	30,955	26,398	17.3
La Crosse	30,421	30,417	—

Agriculture.—The cultivated acreage was in 1919 8,979,000; in 1909 7,980,000. The number of farms in 1920 was 189,295; in 1900 169,795. These increases were due mostly to frontier advance. In the older part of the state, farms tended to become larger and fewer. Of the farms 84.3% were in 1920 in the hands of their owners. These farms produced in 1909 crops worth \$138,000,000 and live-stock products worth \$260,922,000; in 1919 \$445,000,000 and \$371,791,000, respectively. The food product per acre increased since 1885 37% as contrasted with 21% for the United States as a whole. The statistics of special crops year by year are meaningless if taken individually, as there is great yearly fluctuation owing largely to the confidence felt by the farmers in the market forecasts furnished in the *Bulletins* of the University of Wisconsin. For instance, in 1917 the university had advised increased tobacco acreage. When war was declared wheat was advised instead, and an unusual amount planted. This wheat acreage was later returned to other crops. There were in 1920 more silos than in any other state, Wisconsin seed had acquired a reputation and a market, and canning factories, creameries, etc., situated near the point of production, fitted raw products for the market. Relatively the leading feature was dairying, in which Wisconsin stood first among the states. The increase in dairy cows from 1,474,000 in 1910 to 2,180,000 in 1920 was attended by great improvement in quality.

Manufactures.—The total value of manufactured products (\$695,172,002 in 1914) was not much below that of farm products, but the value added by manufacture was only \$277,756,928. The number of establishments rose from 8,558 in 1904 to 9,104 in 1914. Between the same years the number of workers rose from 173,572 to 230,272. The Lake Michigan region showed the greatest growth, owing to the greater cheapness of coal, which is all brought into the state. The great increase in the use of water-power was chiefly for lighting and transportation. In certain industries closely related to agriculture there was a tendency toward decentralization. The manufacture of farm products took first place, although flour decreased, and beet-sugar remained stationary. This position was due chiefly to the expansion of the dairy interests, butter, cheese, condensed and malted milk, etc. In 1880 the lumber cut was 1,342,021,000 ft., mostly white pine; in 1918 1,275,000,000 ft., largely hard wood. The value of lumber products in 1914 was \$55,363,000; 473,840 tons of wood pulp for paper, worth \$22,049,498, was produced. In 1914 Wisconsin ranked fifth among the states in the value of furniture produced, its value being \$22,586,531. Leather remained in 1914 the fourth industry in the state, with a product of \$55,362,511. Foundry and machine-shop products were in 1914 \$60,698,000, a 12.1% increase over 1909.

Mines and Quarries.—The output of iron ore grew steadily, reaching 1,167,640 tons in 1918. The production of pig-iron increased rapidly, being in 1900 184,794 tons, and in 1919 605,619 tons.

Forests.—The forests still constituted in 1920 one of the great resources of the state, but of decreasing importance both absolute and relative. Measures for fire protection were increasingly effective. Surveys were in progress to determine what of the cut-over region should be reforested and what turned to farm land. The earliest Wisconsin industry, the fur trade, still produced, in 1918, a value of \$669,005.20.

Fisheries.—The development of the fisheries was constant. New hatcheries were established at Spooner for pike, at Sturgeon Bay for white fish, and at Sheboygan for blue fin. In 1918 247,079,876 eggs were distributed. The commercial fishing was mostly in the Great Lakes where the catch in 1918 was valued at \$792,040. This was less important than the sport fishing under licence in the rivers and streams.

Transportation and Commerce.—The railway mileage in 1917 was 7,667. It varied from year to year owing to the laying and taking up of logging lines. The main system had been complete for years, the state standing fourteenth in the proportion of mileage to area. About 1900 there began a movement for interurban electric lines, and a system was developed extending from the southern boundary to Janesville and to Milwaukee, and up the Fox river valley. In 1919 the mileage of all electric roads, urban and interurban, was 760. There was no recent extension of the interurban system, and suburban extension was less after 1910 than before, owing to the increased use of automobiles. In 1920 there were 277,093 automobiles, and 16,205 motor-trucks in the state. This development of automobile traffic occasioned a demand for better roads, and extensive plans were in process of completion. In the years 1912-8 \$23,086,154 was voted for highway construction by local, county

and state authorities. Concrete roads proved successful where the foundation was placed below the frost line.

Government.—A constitutional amendment in 1910 granted the state power to acquire and develop water powers and forests; one in 1912 regulated the borrowing capacity of cities and incorporated villages; another in 1912 gave the state powers for creating a park system; and one in 1920 for the enforcement of the prohibition amendment to the U.S. Constitution. In 1911 the salaries of justices of the Supreme Court were increased to \$7,500. A law of 1915 allowed voting by absentee electors under certain circumstances, and one of 1918 arranged for voting by enlisted soldiers. The following state boards and commissions were created in or after 1905; Accountancy (1913), Compensation Insurance (1917), Conservation (1915), Engineering Department (1915), Grain and Warehouse (1905), Health (reconstituted 1913), Highways (1911), Industrial (1911), besides boards of examination for licences for architects, boxers, barbers, plumbers, etc., and *ex-officio* boards.

Miscellaneous Laws.—The cigarette prohibition law was repealed (1915), and the laws directed against out-of-the-state insurance companies were modified. A workmen's compensation law was passed in 1911. A law of 1917 provided for the sterilization of defectives and laws of 1913, 1915, 1917 provided for an antenatal physical examination for men.

Finance.—In 1918 there was raised for general state purposes \$14,281,216, the largest item of income being \$5,370,305 from the railway companies; of the total, \$5,986,661 was returned to the counties in aid of schools, tuberculosis sanatoriums, highways, etc. The tax levy of 1918 produced \$12,142,121 for the use of counties, \$22,580,567 for cities, towns and villages, and \$16,444,671 were school and school district rates. The state income taxes of 1916, paid in 1917, amounted to \$9,482,595, of which \$603,762 went to the state and the rest to localities in lieu of the general property tax.

Education.—In 1915 a State Board of Education was provided to correlate the educational undertakings of the state. The most important new departure was with reference to vocational education, for which a Board was provided in 1915. A law of 1917 increased the effectiveness of compulsory education for these between 9 and 14; in 1915 aid in transportation was provided for those attending school at a distance from home; 32 cities in 1920 maintained continuation schools. In 1920 the total educational expense by the state and localities was \$25,901,282; \$2,779,072 for the university, \$1,427,959 for normal schools, \$10,024,095 for city schools, and \$11,361,692 for town and country schools, toward which a great effort at improvement was being made.

History.—Gov. McGovern, elected in 1911, continued the progressive policy inaugurated by Gov. La Follette. The activities of the state Government were increased, their administration being given to commissions composed in part at least of recognized experts, and similar commissions were given power of supervision and control over private activities. The extension of this policy led to a reaction in 1914 and Emanuel Phillip was elected governor on a somewhat reactionary programme. The break, however, proved to be less violent than many expected, and the main features of the legislation of the preceding 10 years were continued. The outbreak of the World War divided sentiment in the state perhaps more than elsewhere in the country. In the 'fifties some German leaders had hoped to make the state essentially German and a centre in America for the development of German culture, as New England was for English Puritanism, but turned to liberalism. This project had failed, but a large element in the state was German-born or of German parentage, and many communities retained German habits and language, and educated their children in Catholic or Lutheran schools conducted in German. While this element was by no means solid in sentiment, the majority sympathized with Germany as opposed to Great Britain and her Allies. When the question arose of the entrance of the United States into the war, this element was opposed to it, and was reinforced by a powerful sentiment in favour of peace. The national representation of the state was divided. Senator La Follette voiced the peace sentiments, and was one of those characterized by President Wilson as "a little group of wilful men." Senator Husting, a Democrat, supported the Wilson administration. The death of Senator Husting necessitated a senatorial election in the spring of 1918, which attracted wide attention as a test of public opinion in the state which was thought least likely to support the war. An active campaign of education was conducted, by means of pamphlets, speeches and organization. The result was the choice in the Republican primaries of Irvine L. Lenroot, who was pledged to support the Administration in its war policy, and who defeated

the Democratic candidate in the election which followed. Later Senator Lenroot broke with President Wilson on his peace policy, taking a stand for moderate reservations in the plan for a League of Nations. This stand was endorsed by his reelection for the regular senatorial term in 1920, when the state gave a large majority also to Harding. In the gubernatorial election of that year, the successful candidate, Mr. Blaine, represented in general the La Follette views, maintaining that the stand taken by that senator was not disloyal, but legitimate opposition. Although many regretted the necessity of fighting Germany, the number who failed to support the United States was negligible.

Gov. Phillip proved an efficient war administrator, working in harmony with the national officials and organizing extremely effective state and local machinery to handle the problems that constantly arose. The state met and exceeded every demand made upon it, for men and for money; the draft was put into operation with success; the administrative effectiveness which had been developed in the preceding 10 years was everywhere in evidence. Wisconsin troops repeated the record they had made in the Civil War. A war history commission planned to put the war record in substantial shape for the future. The Wisconsin National Guard served on the Mexican frontier, 1916-7, and was called into national service for the World War in 1917; its aggregate strength, Aug. 4 1917 was 25,266. The losses of troops from Wisconsin in France were given as 5,735; 71,790 were accepted at camp under the draft laws. To the five Liberty loans \$471,194,250 was subscribed. The United War Work Campaign of 1918 produced \$4,546,706. Besides this a million had been raised for the Y.M.C.A., nine millions and a quarter for the Red Cross; 8,503 French orphans were adopted, and generous contributions made to all causes of war aid and relief.

The governors of Wisconsin after 1911 were: F. C. McGovern, Republican, 1911-5; Emanuel Phillip, Republican, 1915-21; John J. Blaine, Republican, 1921- .

WISE, BERNHARD RINGROSE (1858-1916), Australian lawyer, was born at Sydney Feb. 10 1858, the second son of Edward Wise, Judge of the Supreme Court of N.S.W. He was educated in England at Rugby and Queen's College, Oxford, where he won the Cobden prize and was *proxime* for the Lothian Historical Essay, finally graduating 1st-class in law. He was also a prominent athlete, and represented Oxford in the mile race against Cambridge. He was called to the bar at the Middle Temple (1883), then returned to Australia, was elected to the N.S.W. legislature and became Attorney-General of N.S.W. 1887-8, and Q.C. in 1898, being again Attorney-General from 1899 to 1904 and, in addition, Minister of Justice 1901-4. For part of 1903-4 he was Acting-Premier of N.S.W. He did distinguished service to the cause of Federation but was defeated in the elections for the first Commonwealth Parliament, and his abilities therefore were never called upon for Federal service. From 1915 until his death, Sept. 19 1916, he was acting as Agent-General for N.S.W. in London.

WISTER, OWEN (1860-), American writer, was born in Philadelphia July 14 1860. He was a grandson of Frances Anne Kemble (see 15,724). On graduating from Harvard in 1882 he intended to devote himself to music. He went abroad for study; but ill-health forced him to return to America, and he spent several years in Arizona and New Mexico. He then entered the Harvard law school, graduating in 1888, was admitted to the bar in 1889 and for two years practised law in Philadelphia. Thereafter he gave his time to literary work. As an undergraduate he had contributed a poem, *Beethoven*, to the *Atlantic Monthly* in 1882. His subsequent publications include the *Modern Swiss Family Robinson* (1883); *The Dragon of Wantley: His Tail* (1892); *Lin McLean* (1898); *The Virginian: a Horseman of the Plains* (1902); *Philosophy 4: a Story of Harvard*

University (1903); *Lady Baltimore* (1906); *The Seven Ages of Washington: a Biography* (1907); *Members of the Family* (1911); *The Pentecost of Calamity* (1915, a condemnation of Germany for the World War), and *A Straight Deal: or the Ancient Grudge* (1920). His novels, *The Virginian* and *Lady Baltimore* in particular, established his position as one of the foremost of contemporary American writers. He became a member of the National Institute of Arts and Letters and of the Société des Gens de Lettres de France, and in 1912 was elected a member of the Board of Overseers of Harvard.

WITTE, SERGE JULIEVICH, COUNT (1849-1915), Russian statesman (see 28,762), died in Petrograd March 12 1915. His diaries were posthumously published by the Soviet in Pravda in 1918, and a study of his career as Minister of Finance during 1892-1903, by D. A. Lutokhin, appeared in 1915. The *Memoirs of Count Witte*, translated from the original Russian MS. and edited by Abraham Garmolinsky, were also published in New York and in London in 1921.

WOËVRE, BATTLES IN THE, 1914-8.—The military importance of the great plain which separates the Metz ridges from the line of heights along the Meuse was evident as soon as the frontier of 1871 was drawn. On its N. side, a strip of bold undulating country, the axis of which may be taken as Montmédy-Thionville, skirts the Belgian and Luxemburg border, while at the S. it narrows, as the Meuse and Moselle converge toward Toul, to a blunted end facing the Haye Plateau and Toul. Along the Meuse (Verdun-Toul) and along the Moselle (Thionville-Metz) both sides gradually crowned the heights with permanent fortifications. The plain itself, through which the frontier ran along no very well defined line, was not fortified, each side treating it as a sort of foreground or glacis. Generally speaking, this frontier line left the plain to France, but the French ground immediately adjacent to the frontier was practically under the fire of the Metz guns. Hence the war outpost line, which was to protect the concentration of the French main armies, was drawn well back—almost to the verge of the Meuse heights—and no attempt was made to hold the frontier region itself.

This proved, in the sequel, to be of enormous importance. For, from about the end of the 19th century, vast mineral resources had been discovered in the Briey basin or Eastern Woëvre; this lay on both sides of the frontier, and was at the outbreak of war being developed by a Franco-German syndicate. From the military point of view—a short, purely military war being in prospect—no great importance was attached by the French to the evacuation of an untenable stretch of country, but when the war became a prolonged, and largely an economic, struggle, the German occupation and exploitation of the Briey area became a most important asset to the Central Powers.

Nevertheless, after the battle of the Marne and its concomitant fighting on the Meuse died away in Sept. 1914, no major offensive took place in this area until the American attack of Sept. 1918. The reasons for this quiescence on the French side were not allowed to appear during the war, and are still rather obscure.

In the following article are described (1) the bitter trench-warfare fighting which—without ever becoming a major offensive—went on continually in 1914-5, around the salient of St. Mihiel—the base of which was the Woëvre plain—and (2) the American operations, which, carried out on a large scale and without reserve, reduced the salient in two days in 1918. (C. F. A.)

(I.) HAUTS DE MEUSE AND WOËVRE, 1914-6

On Sept. 19 1914 the right wing of the French III. Army was carrying out an offensive advance from the Hauts de Meuse in the direction of Mars-la-Tour when the VIII. Corps encountered at Woël an advanced guard of the German army which was being led toward the Hauts de Meuse by Gen. von Strautz. Before the engagement at Woël had assumed any great importance it was suspended by the arrival of an order from Gen. Joffre to the effect that the VIII. Corps was to proceed immediately to Ste. Meneshould, where it was to remain in general reserve. Consequently the Germans found themselves confronted only by re-

serve troops, not yet inured to war, and dispersed over a wide front, when they launched their attacks against the Meuse heights on the 20th and following days.

At Vigneulles Gen. Grand d'Esnon of the 75th Res. Div. was killed and the enemy surmounted the Hauts de Meuse. Before long the German heavy artillery was bombarding the forts of Lionville and Geronville toward the S. and Camp des Romains in front. On Sept. 24 St. Mihiel was in the hands of the Germans, who tried to gain ground W. of the Meuse but could not get beyond Chauvencourt. In the N. von Strantz's army was held by Gen. Pol Durand's group of reserve divisions which had come to the assistance of the VI. Corps. Toward the S. it was attacked by the XVI. Army Corps at St. Baussant and by the VII. Cav. Div.

The region of Léronville-Marbotte was without defenders, but the Germans did not advance in the direction of Commercy, as their aim was to encircle Verdun. To this end the German Crown Prince attacked to the S. of Varennes and in Argonne simultaneously and the French III. Army thus found itself threatened both to the N. W. and to the S. of Verdun.

The 15th Div. of the VIII. Corps was brought back to Chaumont-sur-Aire to the III. Army Reserve, ready to hasten either to the aid of the V. Corps in the Argonne or toward Chauvencourt to help the 75th Res. Div.

The 16th Div. was transported by train from St. Menchould to Léronville-Sampigny and placed under the orders of the I. Army headquarters, for the purpose of covering Commercy, and was reinforced on Sept. 28 by the Belfort Brigade. From this moment von Strantz's army, which was composed of Bavarians, had its III. Army Corps bottled up at St. Mihiel and so the "Hernia," called also the "Wedge," came into being. From Les Eparges to the Meuse S. of St. Mihiel, the III. Army put in line the VI. Corps and part of Gen. Pol Durand's group. The Bislée peninsula and the front Kœur-la-Grande-Brasseitte-St. Agnant were held by the VIII. Corps with the 16th Inf. Div. and the Belfort Bde. To the E., in the region of the Bouconville ponds in Woëvre, was the 7th Cav. Div. Still farther eastward the XVI. Corps was attacking fiercely at St. Baussant, urged on by the determined commander of the I. Army.

The zone S. of the St. Mihiel wedge and Woëvre and N. of Toul was assigned to the I. Army. The point of liaison between the I. and III. Armies was on the Meuse below Bislée. Before long the III. Army was put under the command of the I. Army and it was therefore Gen. Dubail who was matched against Gen. von Strantz.

At first the Germans tried to debouch from Chauvencourt, but without success. Elsewhere, both in the S. and the N., they made every effort to enlarge the wedge while the French attacks were directed toward diminishing it. Hence there resulted partial engagements at Chauvencourt, in front of Les Paroches, at Les Eparges near the Hauts de Meuse, in the Bois d'Ailly, in the Bois Brulé, near Apremont, and at St. Baussant.

For the beginning of April 1915, Gen. Dubail ordered an attack on a large scale from the N. and the S. to be delivered by several army corps. A force designated the army detachment Gérard, including the I. and II. Army Corps, the Verdun Provisional Div., and the I. Cav. Corps, opened the attack on April 5 and took possession of Fromezey, Gussanville and l'Hôpital farm (in the region of Étain), but broke down before the intact German wire—for in the marshy ground the artillery projectiles buried themselves deeply.

In conjunction with the attack by Gérard's force an attack was launched by the XII. Corps and VIII. Corps which, however, had no particular results. The fighting lasted from the 5th to the 22nd without achieving anything but the exhaustion of both attackers and defenders.

From that time forward the struggle resolved itself into a series of partial combats. The names Les Eparges, the Tranchée de Calonne, Chauvencourt, Bois d'Ailly, Bois Brulé, Seicheprey, Bois le Prêtre recur day by day in the *communiqués* of 1915.

On May 5 1915 the VIII. Corps lost in one morning all the ground which it had taken several months to gain in the Ailly

wood. There was even a moment when a gap in the line seemed to be broken through and the way opened to Commercy; but the counter-attacks came in time to regain part of the Bois d'Ailly, and restore the situation. In the course of one of these counter-attacks in the woods, a company of the 172nd, led by Commandant d'André, crossed five lines of German trenches in succession and came within sight of St. Mihiel. But here they were confronted by German reserves and surrounded. For three days these heroes resisted all attacks, having nothing but their rifles and the German grenades picked up in the fifth line of trenches. They finally succumbed to hunger and thirst. Justly indeed was this trench named "the thirst trench." When Gen. von Strantz saw Commandant d'André on the day after the fighting was over, he said, "*Vous avez été deux fois blessé, vous êtes au Bois d'Ailly, vous êtes un brave.*"

At Bois le Prêtre, near the Moselle, the fighting was incessant and for the most part to the advantage of the French.

At Les Eparges it was mine warfare. In this the Germans had generally the upper hand, but, as at the Bois d'Ailly and the Bois le Prêtre, the upper hand did not imply the gain of ground desired. In mine warfare the Germans had a very considerable advantage over their opponents in the matter of equipment and especially of boring tools. At the outset the galleries they made in the Crete des Eparges and the colossal dimensions of their mine chambers astonished even the men of the II. Corps, recruited though many of them were from the mining country of the Nord. But, though astonished, they were not dismayed, and feeble as their implements were, they often took their revenge for the mine attacks to which they were subjected.

The characteristic of the army of 1915 was the poverty of its material in comparison to that at the disposal of the enemy. In it was learned the lesson that a nation poor in coal and iron must shed much blood to save itself from slavery.

When in Sept. 1915 the Champagne offensive was launched, quiet set in on the front Les Eparges-Chauvencourt-Bois d'Ailly-Bois le Prêtre. On both sides, the forces on this front were milked to obtain quality and quantity on the field of the great battle. When it died down, the battered formations came back to rest and recruit—and also to fight, for activity began again in Nov. and Dec. 1915.

In Feb. 1916 the storm burst at Verdun, and in July the other storm on the Somme. Then the front with which we are concerned became so calm that the commander of the VIII. Corps called the Wedge of St. Mihiel a convalescent home.

Here and there, now and then there was a *coup de main*, but the only result was to show both sides the necessity of not relaxing vigilance. The year 1917 came and went without changing either the positions or the attitude of the two parties. The great British offensive of Arras, the great French offensive on the Aisne, the Franco-British battles of Ypres absorbed all the offensive power of the adversaries on the western front. Not till 1918 did the sector Les Eparges-Chauvencourt-Bois d'Ailly-Bois le Prêtre become again the scene of victory.

In concluding this survey of operations on the front between Les Eparges and the Moselle, it is necessary to underline again the poverty of material and munitions under which the French army laboured. Not only did it possess little heavy artillery, but even the 75's, excellent for barrages, diminished daily and were replaced by B.L. guns of 90 and 95 mm., obsolete since 1900. Track for light railways could not be had. Boring tools were so short that mine warfare in the Forest of Apremont had to be waged with pick, chisel and crowbar. Ammunition was served out by spoonfuls, and at one moment the commander of the eastern group of armies had only 350 rounds per gun for his 75's—half an hour's battle allowance.

These conditions were, of course, not peculiar to the front under consideration, and are introduced here to enable the reader to see how the Higher Command was obliged to apply the great Napoleonic principle of economy of force; to show how it was possible for the Crown Prince to break in the Verdun front or, for that matter, the whole front from the Meuse to Switzerland, for the defenders were few, their guns few, and their shell very few.

Reproduced by permission from the map of France on the scale of 1:200,000, published by the Service Géographique de l'Armée

But it may be seen, too, how a German success was bound always to remain without a sequel, for it was through this conception of the economy of forces that Joffre was able always to keep in hand strong, rested reserves, free guns and unallotted ammunition.

(V. L. E. C.)

(II.) BATTLE OF ST. MIHIEL (SEPT. 12 TO 14 1918)

For four years the St. Mihiel salient had projected 28 km. deep into the French line, constituting alike a menace and an invitation to attack. Its original purpose, to serve as one of the jaws of a nutcracker attack on Verdun, having failed, it was used in 1916 as the anvil against which von Falkenhayn sought in vain to drive home his hammer-blows against Verdun from the north. In 1918 Ludendorff again hoped through its possession to gain Verdun and much more by the wider encircling attack in Champagne of July 15, but again the attack failed. During all these years also it had remained not only a threat of further German aggression but a serious interruption of French railway communication with Verdun and also with the Lorraine front. In 1915 the French army had twice attacked to compel evacuation of the salient but both attacks had failed, the first, made in April at Les Eparges, with serious losses.

Tactically, the salient afforded a strong defensive position. The Côte de Meuse, a range of hills rising abruptly 500 metres above the Meuse valley on the W. and the Woëvre plain on the E., afforded strong supporting points on the western face of the salient, while Mont Sec and the lower-lying hills S. of the Rupt de Mad were well adapted to a strong defensive organization.

To the general staff of the American Expeditionary Forces the reduction of the St. Mihiel salient had appealed strongly as a favourable initial or try-out operation for the American army as soon as sufficient forces should have arrived to undertake it. The reason for this selection was not so much the material gain to be reaped from it as the consideration that the fresh and eventually preponderant American force should preferably be employed against a part of the line where it could strike a vital blow to the Germans. Metz, the centre of important railway communications and surrounded by coal and iron fields, obviously presented itself as such a region, and, in addition, while the American forces were being gathered for the later major operations, the same installations and lines of communication needed for them could be utilized by the earlier arriving troops to gain an initial success on a smaller scale, mainly for moral effect though it was a factor in troop training.

General Pershing had discussed this view with General Pétain in June 1917, and, after further study of the front, port facilities and railway lines, this had been adopted as the working plan. However, the slowness of the transportation of troops to France during the first year of American participation in the war, and the exigencies caused by the success of the German offensive operations in the spring of 1918, caused the plan to be temporarily laid aside, and, during both spring and summer of that year, American troops in France and arriving were scattered along the western front to meet needs of the moment.

By the end of July the situation had stabilized sufficiently in favour of the Allies to enable the question of reuniting the troops of the American army to be taken up. On July 24 Marshal Foch confirmed the understanding arrived at the previous year, that the first American operation should be the reduction of the St. Mihiel salient, and, a few weeks later, he authorized the transfer to the I. American Army of that sector of the Allied front facing the salient. This transfer occurred on Aug. 30.

By this time the American army consisted of forces far beyond the number requisite for the mere reduction of the salient and the question of their subsequent employment arose. General Pershing desired to exploit the St. Mihiel attack to the utmost; Foch, however, with other plans and considerations in mind (see MEUSE-ARGONNE, BATTLE OF), limited the attack strictly to the forcing of the salient, although Pétain, in a conference on Sept. 2, sided with Pershing in desiring the American army to gain at least the German "Michael" position across the mouth of the salient.

By Marshal Foch's direction, Pétain, on Sept. 2, issued the directive for the operation which called for a main attack on the S., to debouch from the plateau Seicheprey-Limey toward the objective Vigneulles-Thiaucourt, and a secondary attack, to debouch from the vicinity Eparges-Mouilly toward the S.E., and in connexion with the main attack, to effect the cutting off of the German forces in the salient. To the main attack there were assigned eight American divisions; to the secondary, one American and one French; the French troops occupying the intermediate sector were to exercise "pressure" against the enemy forces on their front. The wording and the date of this directive and the disproportionate number of American divisions assigned to the main attack, which alone could hope speedily to reach the *Michel Stellung*, suggest that it was originally drafted to carry out Pétain's conception of at least a partial exploitation of the attack, to include the seizure of the *Michel* position, and that, in a subsequent alteration to conform to Foch's insistence on a more limited scope, only the names of the objectives were changed.

General Pershing's order for the attack assigned the main attack to the I. and IV. Corps with two regular divisions to each corps; the secondary attack, on the Côte de Meuse, to the V. Corps, the attacking troops to consist of one American National Guard Div. and one French division; the French II. Colonial Corps in the centre was to guard the adjacent flanks of the main and secondary attacks, to execute deep raids and to be prepared to follow up a withdrawal. At the disposal of the American I. Army for the operation were 2,071 guns, mostly French artillery. The I. Army also had a marked superiority in aviation, thanks to French coöperation and the assistance of the British Independent Air Force.

On the German side the salient was held by Army Detachment C, under Gen. von Fuchs and comprising, on Sept. 12, the date of the attack, eight divisions on the line, organized as three corps groups, and three in reserve.

As early as Sept. 1 a deserter had given the Germans warning of the impending attack, and Ludendorff had at the time seriously considered ordering a withdrawal from the salient, but was deterred by the representations of the army detachment and army group commanders who were confident of their ability to hold, and also by reports from Duke Albrecht's army group in the Vosges region, of American preparations for attack farther south. These feints which General Pershing had caused to be made in the vicinity of Belfort had led to German uncertainty as to the real intentions of the American commander. By Sept. 8, however, the evidences of a coming attack on the salient had become unmistakable and Army Detachment C was ordered to withdraw to the *Michel Stellung*. No need for haste was felt and the preparations were deliberate and methodical. The night preceding the attack the dismounted batteries were being withdrawn and consequently could not be used in the battle.

Preceded by a four-hour bombardment the main attack was launched at 5 A.M., Sept. 12; the secondary attack at 8:30. Deprived of artillery support the German infantry though ordered to hold, made virtually no resistance. The American I. Corps on the right made its objectives in a few hours, and, in spite of German counter-attacks brought by two divisions against it and against the right of the IV. Corps but beaten off, begged permission to continue its advance; but, because of the precise instructions by which the American staff felt itself bound, this permission was refused. The IV. and V. Corps also made their objectives and halted, awaiting orders.

Army H.Q. in this battle, as also in the earlier part of the Meuse-Argonne battle, appears to have had little conception of the difficulty and time required in the transmission of orders on the battlefield and in consequence to have left but little initiative in the hands of subordinates. The result was that the orders for the troops of the IV. and V. Corps to move forward to Vigneulles and effect the cutting off of the salient did not reach the troops concerned until after dark on the 12th so that the connexion, though unopposed, was not effected until the morning of the 13th. Meanwhile the German commander, realizing his

hopeless situation, had ordered the evacuation of the tip of the salient, which had not been attacked, and during the night the movement was successfully carried out except for the loss of about 1,000 stragglers.

In the course of Sept. 13 and 14 the troops of the American IV. and V., and French II. Colonial Corps moved forward without serious opposition to the line designated by Marshal Foch facing the German *Michel* position and which the I. Corps had already reached on the 12th.

On the German side the attack showed a complete demoralization in the Higher Command and a lack of initiative in the lower officers. The men showed little will to fight. The advance of the left division of the IV. Corps with one flank uncovered and of the American division of the V. Corps with both flanks uncovered was nowhere taken advantage of.

In regard to the halting of the American offensive the German general staff, in a study of the St. Mihiel attack published for the information of the armies shortly after its occurrence, while giving high praise to the dash and fearlessness of the American soldier, added that the army H.Q., which showed itself so unable to reap the advantages so clearly afforded by its striking initial success, was not to be feared. It is not impossible that Foch, had he himself been in immediate command of the I. Army on the morning of the 12th, or had he been present, might, in view of the manifest military advantages, have felt justified in permitting the Americans to grasp the opportunity offered to complete the destruction of Army Detachment C and to seize and hold the *Michel Stellung*. Indeed Pétain, on the night of the 13th, learning that the German army behind the sector was in great disorder and that the American troops on the right had reached and in some instances gone beyond their objectives, did send an authorization to take the *Michel* position; but by the time this permission was received the opportunity of taking the position cheaply and completing the German rout had passed. Tactically, Foch's avowed purpose would have been better served had Pétain, as long as he was going to prescribe dispositions in detail for the American army, originally called for two main attacks from the two faces of the salient to meet in the centre the first day, advances which the Soissons attack had already shown could be easily made by American regular troops.

Of the troops engaged on the Allied side the Americans aggregated 550,000, the French 120,000. American losses were 7,511, of which considerably more than half were borne by the I. Corps which received the brunt of the counter-attack; French losses were 597. The captures included over 15,000 prisoners and 443 guns. (A. L. C.)

WOLFE-BARRY, SIR JOHN WOLFE (1836-1918), English engineer, was born in London Dec. 7 1836, the youngest son of Sir Charles Barry (see 3.443), architect of the Houses of Parliament. He was educated at Trinity College, Glencolmond, and King's College, London, and became a pupil of Sir John Hawkshaw, whom he assisted in the building of Charing Cross and Cannon St. stations and railway bridges. In 1867 he set up for himself, becoming well-known as a railway engineer and traffic expert. Through his initiative and energy the British Engineering Standards Committee was established in 1901, a great step forward in effecting railroad economy. He was made a K.C.B. in 1897. He died in London Jan. 22 1918.

WOLSELEY, GARNET JOSEPH WOLSELEY, VISC. (1833-1913), British field-marshal (see 28.777). The closing years of Lord Wolseley's life were spent in virtual retirement. His health gradually failed, and on March 25 1913 he died at Mentone, the title going by special remainder to his only daughter, Frances. His eminent service to the State had not been forgotten, for he was accorded an imposing public funeral and was buried at St. Paul's; an equestrian statue of him on the Horse Guards Parade was unveiled in 1920. It had not been Lord Wolseley's good fortune to hold responsible positions in the conduct of warfare on a great scale, but he was undoubtedly a brilliant commander in the field. His campaign in Ashanti and his overthrow of Arabi Pasha were model operations of their kind, while the failure to save Gordon and Khartoum in 1895 was attributable to delays in

starting the expedition, for which he was not responsible. His labours in modernizing the organization and developing the efficiency of the British army—often in face of strong opposition—were of incalculable value to the country. He proved himself at the War Office to be an energetic, far-seeing and able administrator. His insistence upon officers fitting themselves for the duties that they would have to perform in war, and upon their taking their profession seriously, was to bear rich fruit in days when he had retired into the background. An excellent judge of men and of character, he was extraordinarily successful in his choice of subordinates. Cultured, possessing varied interests, well read and of wide experience in many lands, he was in private life a man of unusual charm.

WOLVERHAMPTON, HENRY HARTLEY FOWLER, VISC. (1830-1911), English statesman, (see 28.781), died at Woodthorne, Wolverhampton, Feb. 25 1911.

WOMAN SUFFRAGE.—In the earlier article (under WOMEN, 28.786), the story of the movement for woman suffrage was brought down to 1910. The narrative may here be continued for the United Kingdom up to the passing of the Representation of the People Act in 1918, with some estimate of its results up to 1920, followed by accounts of the growth of woman suffrage in other countries.

UNITED KINGDOM

In the later years of the agitation in Great Britain the constitutional suffragists concentrated their efforts on the formation of public opinion: they sought to form a non-party, non-militant suffrage society in every parliamentary constituency and brought local influence to bear in contested elections to obtain promises of support from candidates of all political parties. They were so far successful as to secure a majority of members pledged to their support in every House of Commons elected since 1886: and in that year, and also in 1897, 1908, 1909, 1910 and 1911, woman suffrage bills passed their second reading, but made no further progress, each successive Government declining to give facilities for the passage of the bills into law. At this period the movement was receiving very valuable support from platform, press and pulpit, besides remarkable help from the theatre in plays by leading dramatists of the day.

In Parliament for several years important support had been given to woman suffrage by leaders of the Conservative party. Among them may be mentioned three successive Conservative Prime Ministers—Lord Beaconsfield, Lord Salisbury, and Mr. Arthur Balfour—besides the 7th Duke of Rutland and Lord Iddesleigh, while the younger generation were ably represented by the Earl of Lytton, Lord Robert and Lord Hugh Cecil, and Mr. Alfred Lyttelton. On the Liberal side the leaders, with a few important exceptions (which included Sir H. Campbell-Bannerman, Mr. Lloyd George and Sir Edward Grey), were against it. Among the strongest Liberal opponents during the generation before the World War were to be found Mr. Gladstone, Mr. John Bright, Mr. Joseph Chamberlain, Sir W. Harcourt, Mr. Labouchere, and Mr. Asquith.

In 1908 the death of the suffragist Sir H. Campbell-Bannerman and the succession of the anti-suffragist Mr. Asquith to the Liberal premiership were very disadvantageous to suffrage prospects in the House of Commons. This misfortune was, however, partly counteracted by the emergence of the Labour party, the leading members of which were convinced suffragists; in a short time they induced the party to make woman suffrage a plank in their platform.

The question of "militancy" on the part of a section of the woman suffragists was mishandled from the first, by the Liberal Government which came into power in 1906. The Women's Social and Political Union, led by Mrs. Pankhurst and her daughter Christabel, which came into existence about this time, confined its activities to asking inconvenient questions of members of the Government at public meetings. This was in itself a perfectly legitimate method of propaganda. Instead of meeting it by giving reasonable answers, the questions put were in many instances met only by shouts of anger and disapproval or, when written on paper, were contemptuously torn and thrown on the

ground. Later, if persisted in, those who asked them were treated with shameful violence. A man at Bradford in 1911, brutally thrown out of a meeting by Liberal stewards, had his leg broken. Women were "frogmarched" out of meetings, and while thus absolutely helpless were violently struck on the face with fists or umbrellas by men in the audience. It should always be remembered that between 1905 and 1908 the militants never answered violence by violence; they suffered violence, but used none. In 1908 they definitely abandoned this policy of non-retaliation; to the last, however, they set limits for themselves, and never shed one drop of blood of either man or beast. But they smashed windows, set fire to churches and country mansions when they were empty; burnt down the refreshment pavilion at Kew Gardens when no one was in it, destroyed the contents of letter-boxes and in one instance of a ballot-box at an election; slashed and cut the Rokeby Venus by Velasquez in the National Gallery and the portrait of Henry James by Sargent in the Royal Academy, and destroyed a case of pottery in the British Museum. On June 4 1913 Emily Wilding Davison tried to upset the Derby favourite during the race at Epsom, and died four days later from her injuries. Her funeral on June 14 was made the occasion of an imposing procession through London.

These and similar actions were intensely irritating, and the punishments meted out were correspondingly severe. But long before violence had been attempted groups of women had been sentenced to three months' imprisonment for nothing worse than making speeches in the lobby of the House of Commons, or shouting in the street. The severe sentences passed upon those who had been guilty of real violence were in the later stages rarely carried into effect; for the militants adopted the hunger strike, and after an interval of, in some cases, only a few days were released because public opinion would not have exonerated the Government if these women had died in their hands. Parliament then passed a piece of panic legislation called Prisoners (Temporary Discharge for Ill Health) Act 1912, immediately nicknamed the "Cat-and-Mouse Act," which enabled the Government to rearrest the hunger strikers when they gave signs of restored vitality. The principal result of this Act was the ridicule which it created at the expense of the Government. Public opinion was greatly excited by all these proceedings. Suffrage was a universal subject of conversation. Anti-suffragists had believed that "militancy" would kill the suffrage movement, and therefore the utmost publicity had been given to every act of violence and to every intemperate speech. But so far from killing the suffrage movement the all-pervading discussion stimulated it as nothing else had ever done. Everyone, high and low, was talking about woman suffrage, arguing either for or against it with vehemence and conviction.

It was a difficult time for the law-abiding suffragists. They objected to "militancy" because they believed the use of physical force as political propaganda was invariably mischievous. They were firmly determined to roast their pig, but not to do it by burning down their house. Over and over again the National Union of Women's Suffrage Societies issued strongly-worded protests against "militancy," and they excluded militants from membership of their societies. They deprecated the use of "frightfulness," whether used by the militants or against them, and urged repeatedly that the real cure for violence was the redress of the grievances which had given rise to it. The fact that men under somewhat similar circumstances had been much more violent and destructive did not create the desire to imitate them. Serious differences thus naturally arose between the two branches of the suffrage movement. Each held firmly to its own view of the case. The militants bitterly resented criticism and made organized efforts to prevent its expression by trying to break up the meetings of the law-abiding suffragists. One effect of this situation was that for the first time since 1886 woman suffrage bills were defeated in the House of Commons, once in 1912 and once in 1913. But other circumstances had contributed to these defeats. There were two general elections in 1910—in Jan. and December. Mr. Asquith and his party emerged victorious from each of them, but in the second his majority was

greatly reduced, having fallen from 334 to 124. He had promised at a public meeting in Dec. 1909, if returned to power, to bring in a Reform bill and to allow a woman suffrage amendment to the bill to be an open question for the House to decide. At a later date, in answer to a question in the House, he said, just before the second general election of 1910, that, if his Government were still in power, it "would give facilities for proceeding effectively with a woman suffrage bill, if so framed as to admit of free amendment." The *Times* parliamentary correspondent said that this made woman suffrage an issue before the country at the coming election, and that a majority for the Government would mean that Parliament had received a mandate to carry a measure to that effect. Mr. Asquith was again returned to power, and shortly after these two general elections, i.e. in July 1910 and in May 1911, the House of Commons carried by immense majorities second readings of the measure known as the Conciliation bill.

This bill was of a very limited character, proposing to enfranchise only about one million women householders, and it was from the outset opposed by Mr. Lloyd George on the ground that it was not sufficiently democratic. The second reading in 1910 was, however, carried in spite of his opposition. After the general election in 1911 suffrage prospects seemed particularly bright; militancy had been suspended in order to give the Conciliation bill a chance; all the suffrage societies were working harmoniously together, and were relying on Mr. Asquith's promise that, if the bill were given a second reading, opportunities should be afforded in the following session for "proceeding effectively" with its further stages. A bombshell from Mr. Asquith shattered these favourable prospects. He announced on Nov. 7 1911, to a deputation from the People's Suffrage Federation, his intention of introducing during the session of 1912 the electoral Reform bill he had foreshadowed in 1908. He said that this bill would sweep away all existing franchises: that the new franchise would be based on citizenship, and votes were to be given to "citizens of full age and competent understanding," but no mention was made of women. Mr. Asquith, on being asked what his bill would do for them, dismissed the inquiry with the curt remark that his opinions on the subject were well known and had suffered no change; but he reiterated his promises of "facilities" for the Conciliation bill in the session of 1912. If he intended to provoke a return to militancy nothing could have been better calculated to do so. A violent outbreak at once took place. Windows were smashed in the principal shopping streets of London, and personal assaults were made on members of the Government. The constitutional suffragists were as angry as the militants, but had a different way of showing it. Many strong suffragists in the Women's Liberal Federation broke away from their party and gave all their energies to the suffrage cause. Some knowledge of this may have reached Mr. Asquith, for before mid-Nov. he took the unusual course of inviting representatives of the whole woman suffrage movement, militant and non-militant, to attend in a deputation to him: this unprecedented invitation was at once accepted for Nov. 18. The N.U.W.S.S. prepared a series of four questions to put before him:—

1. Was it the intention of the Government that the Reform bill should be passed through all its stages in the session of 1912?
2. Will the bill be drafted in such a manner as to admit of amendments introducing women on other terms than men?
3. Will the Government undertake not to oppose them?
4. Will the Government regard any amendment enfranchising women which is carried in the House of Commons as an integral part of the bill, to be defended by the Government in all its stages?

To each of these questions Mr. Asquith gave the answer, absolutely unqualified: "Certainly." He further said, referring to his own position:—

"It is perfectly consistent with the self-respect and the best traditions of our public life that, in relation to a question which divides parties, not only the head of the Government but the Government itself should say that, if the House of Commons on its responsibility is prepared to transform or extend a measure which we are agreed in thinking necessary—a measure for the franchise as regards men—and to confer the franchise on women, we shall not only acquiesce in that proposal, but we shall treat it as the considered judgment of Parliament and shall make ourselves responsible for carrying it out."

Twenty-six days after this Mr. Asquith received a deputation of anti-suffragists to whom he gave free rein to an expression of his entire sympathy with their position, and to whom he declared that he regarded "the grant of the parliamentary franchise to women as a political mistake of a very disastrous kind." It was never disclosed how he could reconcile his promise to the suffragists to make himself and his Government responsible, if the House so desired, for carrying woman suffrage, with his belief that it would prove a political mistake of a disastrous kind. His words to the second deputation went far to make his promises to the first worthless; many of his followers interpreted his meaning to be that he relied on them to deliver him, as one of them expressed it, from "the humiliation" of having to keep his word. The first step in his deliverance would be the defeat of the Conciliation bill, and the usual parliamentary devices were employed to secure this end. One of these was to detach from the support of the bill the members of the Irish Nationalist party. This was done by making them believe that the success of woman suffrage would break up the Government and thus prevent the third ratification by the Commons of the Home Rule bill necessary to secure (under the Parliament Act) its passage into law notwithstanding its rejection by the House of Lords. These tactics, aided by a coal strike which caused the absence of 13 Labour members in their constituencies, were successful, and the Conciliation bill, which had been carried on second reading on May 5 1911 by 255 to 88, was defeated on March 28 1912 by 222 to 208. It was a heavy blow to the women's cause, and the most perturbing feature to suffragists in this defeat was the conviction that the same unscrupulous tactics which had secured it would be put into operation against the woman suffrage amendments to the Government Reform bill.

When this was produced it was called a Franchise and Registration bill. It came on for second reading on July 12 1912. In his speech Mr. Asquith took full advantage of the recent defeat of the Conciliation bill. He said: "This bill does not propose to confer the franchise on women; whatever extensions of the franchise it makes are to male persons only." He then referred to the defeat of woman suffrage in March as the "considered judgment of the House," and he dismissed as "an altogether improbable hypothesis the possibility that the House would stultify itself by reversing this judgment during the same session." Notwithstanding this ominous warning Mr. Lloyd George and Sir Edward (afterwards Viscount) Grey continued to be confident that amendments to the Government bill gave suffragists the best chance they had ever had of parliamentary victory. The bill itself, however, made no further progress during 1912; the protracted session lasted all through that year and overflowed into 1913; it was officially announced that committee stage would be taken on Jan. 24. All possible plans were elaborated by the real friends of woman suffrage both inside and outside Parliament to ensure the success of one or other of the suffrage amendments. But the parliamentary air was still thick with intrigue, and many and circumstantial were the rumours that the success of any of the woman suffrage amendments would mean the resignation of anti-suffrage ministers and the break-up of the Government. No official contradiction was given to these rumours until the day before the House was expected to go into committee on the bill.

But the defeat of the bill did not proceed from this source. Three days from Jan. 24 had been allotted for the discussion of the woman suffrage amendments. This stage was, however, never reached. On Jan. 23 Mr. Bonar Law asked the Speaker to give a ruling on the point whether the Government's own amendments, regarding the occupation franchise for men, did not so far alter the bill from that which had received a second reading in July as to make it a new measure and necessitate its withdrawal and reintroduction in its new form. In his reply the Speaker intimated that this was his view, and added that there were "other amendments regarding female suffrage which of course would make a huge difference to the bill if they were inserted." The bill was killed by this ruling. Mr. Asquith did not mend the situation by his statement of the suffragists' from whom he

refused to receive a deputation, and they were more incensed against him than ever when, in lieu of what he himself called "the best chance they ever had," he only offered parliamentary time for the discussion of yet another private member's bill. All the suffrage societies repudiated this offer and did nothing to support the bill, which was brought forward in May 1913 and defeated by 266 votes to 219.

These events, the defeat of the Conciliation bill in March 1912 and the fiasco of the Government bill in Jan. 1913, convinced the N.U.W.S.S. that nothing would now be of any use but a Government bill with the whole weight of the party behind it. They accordingly gave a new interpretation to their election policy. This was, and continued to be, to support the best friend of woman suffrage; but events had proved that a suffrage candidate who belonged to a suffrage party was a better friend than a suffrage candidate whose party was either hostile or neutral. The council governing the N.U.W.S.S. therefore resolved "that in judging which of the two pro-suffrage candidates should be supported in an election, the official attitude of the party to which the candidate belongs should be taken into consideration." An analysis of the division when the Conciliation bill had been defeated showed that 42 members who had been supported by the N.U.W.S.S. as "best friends of woman suffrage" (mostly followers of Mr. Asquith) had voted against it. When party pulled one way and voteless women pulled the other, party proved the stronger. As Labour was the only party which had definitely made suffrage part of its programme, this change threw the influence of the N.U.W.S.S. in elections definitely on the side of Labour; and a special fund, called the election fighting fund, was formed for the support of Labour candidates. The N.U.W.S.S. further resolved under no circumstances to support Government candidates, and to endeavour by all legitimate means to strengthen any party which adopted woman suffrage as part of its programme. By the adoption of this policy they succeeded in 16 months in defeating six Government candidates in by-elections, making a difference of 12 in divisions. They had also succeeded in each of the elections concerned in making the whole place ring with the suffrage agitation. Public opinion moved rapidly and strongly in the suffrage direction, the general view being that suffragists had received less than fair play at the hands of Mr. Asquith and his Government.

A "pilgrimage" organized by the N.U.W.S.S. in 1913 received a remarkable degree of support from the towns and villages traversed on the seven routes by which it approached London. But the N.U.W.S.S. were convinced that a free vote of the House of Commons on their question was an impossibility as long as there was a Prime Minister who was ardently opposed to his own principles when applied to women. They were therefore determined to do everything in their power to reduce Mr. Asquith's majority. They believed that their election-fighting policy gave them an effective and constitutional method of doing this, and looked forward to helping to defeat his party in the general election which, but for the World War, must have taken place not later than 1915. They were full of work in preparation for this, when on Aug. 4 1914 the overwhelming catastrophe of the World War broke out, not only destroying all opportunity of suffrage work but jeopardizing the very existence of representative institutions in Europe.

Suffragists shared to the full in the solemn national consciousness that every ounce of strength would be needed in the gigantic effort which the successful prosecution of the war demanded. Indeed, suffragists realized this more quickly than the Government, which for many months seemed to believe that the war could be carried on solely by the efforts of the male half of the nation, without disturbance of the domestic calm which they believed to be the only legitimate role of the female half: for offers of help from women to provide, and staff hospitals to supply, women for work in public offices, thus leaving an additional number of young men free for military service, were plentifully drenched with cold water.

Nevertheless suffragists, whether militant or non-militant, quickly faced the facts and clearly saw what their duty was. The

militants instantly abandoned every sort of violence and organized themselves for public service. They formed a Women's Emergency Corps, ready to undertake all kinds of national work which the exigencies of the time required. Others, both militant and non-militant, in spite of official discouragement undertook the organization of hospital units entirely officered by women (see WOMEN'S WAR WORK). The N.U.W.S.S. committee on Aug. 3 resolved to suspend immediately all political propaganda and to use their staff and organizing power in mitigating the distress caused by the war. These societies, numbering over 500, were consulted by post, and all but two approved this course.

No one claims for suffrage women that they were in any degree singular in the devoted work which they gave to their country during the war. The suffragists were earliest in the field because they were already organized and accustomed to team-work. Women of all classes and all parties threw themselves with zeal and efficiency into every kind of useful patriotic work. Industrial women were beyond all praise, working as they had never worked before, early and late, Sundays and weekdays, to supply the armies with every kind of military equipment. Everyone who came into contact with them bore testimony to their splendid efficiency in departments of skilled work from which before the war they had been rigidly excluded. In March 1915 the Government concluded an Agreement with the trade unions, known as the Treasury agreement, to suspend during the war, in face of the national emergency, the rules excluding women from most of the skilled trades. The Treasury on its part gave a promise not to use the women as a reservoir of cheap labour, and agreed to give women the same wages as men for the same output. This gave an important stimulus to the principle of equal pay for equal work, and went some way also in the direction of establishing industrial freedom for women. The courage of the women in the dangerous trades was as marked as their efficiency. On one occasion 26 women were killed and 30 injured by an explosion; those who remained uninjured displayed the greatest coolness and discipline, and were prompt both in helping the wounded and in continuing the work of the factory. The legend of the innate timidity of women was thus undermined. The tide in this direction rose so high that even Mr. Asquith was floated by it, and in speaking in Oct. 1915 in the House of the heroic death of Edith Cavell, he said: "She has taught the bravest man among us a supreme lesson of courage; yes, and there are thousands of such women, but a year ago we did not know it."

All through 1916 evidence of the conversion of former opponents of women's enfranchisement poured into the suffrage offices. Many of these conversions were of M.P.s, eminent leaders of the press, railway managers, commercial and financial magnates. Liberals very often pleaded militancy as an excuse for their former blindness; Conservatives, in the main, said simply: "I formerly opposed the granting of the vote to women; I thought men by themselves maintained the state; I was wrong; the women have served their country so magnificently that henceforth I shall support their having the vote."

There is no doubt that by 1915-6 the country was by a great majority favourable to the enfranchisement of women. Nevertheless it would have been impossible to induce Parliament to pass a great Reform bill during the war if it had not been that the electoral position of millions of men, caused by their services to their country, was so anomalous as to amount to a public scandal. The parliamentary register, by the direct orders of the Government, had not been revised since 1913. By 1916 it was completely out of date. By-elections had proved its unrepresentative character and it would have been a moral impossibility to take a general election upon it. There were at this time the names of about 8,000,000 men on the register. Of these nearly 7,000,000 qualified as occupiers. The occupation franchise necessitated that the qualifying premises should have been continuously "occupied" by the voter for 12 months since the last 15th July. This meant that a large proportion of the 5,000,000 young men who had voluntarily joined the New Armies since Aug. 4 1914 would, in consequence of their patriotic services, have lost their claim to the parliamentary vote. The men facing death daily,

the very men to whom the country was most indebted, would be voteless, whilst those who had evaded similar sacrifices retained their electoral qualification. The position was intolerable, but it was not at first clear how best to amend it. Proposals were made by some M.P.s to create a new franchise based on naval or military service. But this received little general support. The questions: "Why exclude industrial service?" and "What about the services of women?" received no satisfactory answer. Mr. Asquith's Government repeatedly tried to deal with the situation by Special Register bills. These efforts were unsuccessful. Each successive proposal was rejected by the House of Commons with growing symptoms of exasperation. The House wanted a Reform bill; it demanded a new electorate on democratic lines. The Government wanted a Reform bill too, but appeared to believe they could get one to their liking by calling it a Special Register bill. It was long before they abandoned their efforts to get one thing by calling it another. On Aug. 14 1916 Mr. Asquith, on introducing yet another Special Register bill, announced his conversion to woman suffrage; he based it on the ground that when the war was over it would be necessary to revise industrial conditions and that in his view women had a special claim to be heard on the many questions which would directly affect their interests. It was obvious that this was no new condition. Ever since Parliament existed measures had come before it vitally affecting the well-being of women, but on which they had no constitutional means of making their claims heard. But it was not the business of suffragists to point this out. The main difficulty at the moment arose from the plausible plea that, however desirable parliamentary reform might be, it was not the time during the greatest war in history, with the issue still hanging in the balance, to recast the representative system of the country. The reply has just been indicated. The new register and the new qualifications were needed at once unless millions of the most desirable male citizens were to be disfranchised. A good deal of iteration was needed to hammer this into people's heads, and to the end, "This is not the time," continued to be the only effective weapon used against women's enfranchisement.

Mr. Walter (later Lord) Long found a way out of the impasse. He suggested the appointment of a non-party conference, consisting of members of both Houses, selected and presided over by the Speaker, to consider the whole subject of electoral reform including woman suffrage. Mr. Asquith concurred and the House agreed. The conference began its sitting in Oct. 1916 and handed in its report on Jan. 28 1917. In the interval Mr. Lloyd George had succeeded Mr. Asquith as Prime Minister, a change very favourable to immediate action in the direction of woman suffrage. The Speaker's conference unanimously recommended a new franchise for men amounting practically to manhood suffrage; for women it recommended, but not unanimously, household suffrage, including wives of householders, a higher age-limit for women and their admission to the university franchise. This was the scheme subsequently adopted by Parliament. The object of the high age-limit (30) for women was to produce a constituency in which male voters were in a substantial majority. It was believed by suffrage members of the conference that the acceptance of this was essential to success. The anticipated proportion of women to men in the new electorate was as 2 to 3. This expectation proved practically correct. The new register published in 1919 gave the exact numbers: men 12,913,160; women 8,479,156. It may here be mentioned that the United Kingdom is the only country, out of the 28 where women are enfranchised, which created a difference in the qualifications for men and women.

The parliamentary history of the measure based on the recommendations of the Speaker's conference may, as regards woman suffrage, be here sketched. Within a fortnight of his becoming Prime Minister, Mr. Lloyd George intimated to the leaders of the N.U.W.S.S. that he was keen to go forward at once in the direction of women's enfranchisement. This was a month before the Speaker's conference handed in its report. The object was to get an agreed measure supported by every party in the House. This was achieved. On March 28 1917 Mr. Asquith moved a

resolution in Parliament calling on the Government to introduce a Representation of the People bill based on the recommendations of the Speaker's conference. Woman franchise was the subject of all the speeches, and the leader of every party supported the enfranchisement of women; the opposition was of the feeblest, and the motion was carried by 341 to 62.

When the bill (*see WOMEN, LEGAL STATUS OF*) was debated, the second reading was carried by 329 to 40, and Clause 4 (enfranchising women) was passed by 385 to 55, or 7 to 1, with a majority within each party into which the House was divided; and again in the last trial of strength the anti-suffrage Die-hards were reduced to a mere handful, the numbers being 214 to 17. After this the N.U.W.S.S. felt the ground sufficiently solid beneath their feet to place a new weight upon it, and, in conjunction with many other women's societies, they urged that the local government franchise for women should be amended on the same principle which the House had already accepted for the parliamentary franchise—namely, to include not only householders but wives of householders. This was at first resisted by the Government, but suffragists outside the House and even many anti-suffragists worked vigorously for it and prevailed. The Government gave way, and the amended clause was accepted on Nov. 14 without a division.

The anti-suffragists in the Lords were a more formidable group than in the Commons. Lord Curzon, president of the Anti-Suffrage Society, was the leader of the House and chief representative of the Government. The inclusion of women in the bill was vigorously resisted in the early stages of the bill by Lord Bryce and Lord Balfour of Burleigh; but there was no real fight upon it until the committee stage was reached and the women's clauses came on. After various skirmishes the battle was joined, an anti-suffrage amendment was moved, and there was a full-dress debate on Jan. 8, 9 and 10, 1918. Lord Curzon wound up the discussion. His speech, for the first five-sixths of it, was a tolerably familiar anti-suffrage oration, but the last sixth was cast in a different mould. He reminded the peers that the House of Commons was the sole constitutional representative of the feelings of the country; that in the Commons woman suffrage had been supported by large majorities of every party, "including the one to which most of your lordships belong." He invited them to contemplate what would happen if they came into collision with the other House on such a question as the representation of the people. He elaborated this point with skill, and ended by saying that to reject the clause would be to embark upon a conflict in which the Lords were certain to be worsted. He declined to be responsible for such a catastrophe, and announced his intention of not voting either for or against the amendment. This was the supreme moment for all suffragists present. They felt at once they were safe without disastrous conflict. The division was: for the clause, 134; against, 71. Thus ended the 50-years' struggle of British women for political liberty. The royal assent was given on Feb. 6 1918. The women's task had been a long one, but they were able to look back upon it with satisfaction. They had accomplished it without one scintilla of direct political power and without appeals to party passion. Their appeal had been to common sense and experience. They challenged their opponents to produce one instance of disastrous consequences following upon the women's vote. Moreover, they had not split the country into rival factions, for the bill was carried by the consent and coöperation of all parties.

Those who had worked for woman suffrage quickly perceived the difference it had made in the attitude of Parliament on almost every proposal which came before it. The parliamentary atmosphere completely changed. Measures for which women's societies had been working unsuccessfully for years, such as the Nurses' Registration bill, and an amended Midwives' bill, were taken up as Government measures, and passed through all their stages without difficulty. The grille in front of the ladies' gallery was removed, and women were admitted to the strangers' gallery. By the spontaneous action of the Government a bill was passed in Nov. 1918 to render women eligible to sit in Parliament. It was not in time to be of much use at the general election which

followed in about a fortnight, but Viscountess Astor was returned for Plymouth in Nov. 1919 and Mrs. George Wintingham (widow of the previous member) for the Louth division of Lincs. in Sept. 1921. The increased number of women local electors gave a great impulse to the election of women as town and county councillors and the number of women chosen as mayors steadily increased.

The report of the Lambeth Conference 1920 showed that the Anglican communion was breathing the new atmosphere created by the women's vote. It acknowledged that in the past the Church had undervalued women and had too thanklessly used their work. It stated the belief of the Conference that the Church would be strengthened by making freer use of the spiritual gifts of women, and recommended the opening to them of the diaconate, definitely affirming that the diaconate is an "order," though a minor one, and that a woman appointed to it is not merely "set apart" but "ordained."

These changes vary in importance, but they are significant in that they all point in one direction—giving wider scope to the powers and responsibilities of women and recognizing the use of women's work in every well-ordered state.

Before the general election of Dec. 1918 Mr. Lloyd George and Mr. Bonar Law had given a public promise, if returned to power, "to remove all the existing inequalities in the law between men and women"; but when the new Parliament opened there was no indication in the King's speech of proposed legislation in fulfilment of this pledge. The Labour party, therefore, in the session of 1919 introduced a measure called the Women's Emancipation bill, completely removing every legal inequality between men and women and giving women the vote on the same terms as men. This they carried, notwithstanding Government opposition, through all its stages in the House of Commons; the Government, however, defeated it in the Lords, but not without providing a substitute—the Sex Disqualification Removal Act. This did not reopen the franchise question, but it gave women the right to study and practice law in both its branches, to act as magistrates and to sit on juries. It also made it clear to the universities of Oxford and Cambridge that they had the power to admit women to degrees and membership. Oxford availed itself of these powers without delay, but Cambridge in Dec. 1920 declined to take a similar step by 904 votes to 712, and repeated the refusal twice in 1921.

BRITISH DOMINIONS OVERSEAS

The granting of woman suffrage in Canada was almost simultaneous with its victory in England. It was first adopted in the provinces (except Quebec) in 1916, and by the Dominion in 1917. Canada was well in front of the mother country in the matter of the eligibility of women. Miss MacAdams was elected to the Legislature of Alberta entirely by the votes of soldiers on duty in England and France in July 1917. The first Woman Suffrage Act for the Dominion limited the vote to women who had near relatives serving overseas. Full woman suffrage followed very quickly and almost without opposition in March 1918. In Feb. 1921 Mrs. Mary Ellen Smith of Vancouver was chosen as Speaker of the British Columbian legislature. She, however, declined the speakership, but took office as a member of the Cabinet.

New Zealand had enfranchised its women in 1893, and enfranchisement followed in the Commonwealth of Australia in 1902; therefore, with the exception of S. Africa, all the great self-governing overseas dominions of Britain have given political freedom to women. In March 1921 Mrs. Cowan was elected to the Parliament of Western Australia, the first woman M.P. to be elected in Australia.

Jamaica, S. Rhodesia and British East Africa gave votes to women in 1919 and 1920.

A strong effort was made by Indian women, supported by the Aga Khan and the Begum of Bhopal, to induce Parliament to incorporate in the Government of India Act the principle of woman suffrage. This effort was unsuccessful but not fruitless; important support was given in the House of Commons, and the Act, as finally passed, specifically left the question of woman suf-

frage to be decided, province by province, by the elected Legislatures of India herself. The newly created constituencies therefore have the power, when they choose to use it, of recognizing the full citizenship of women.

UNITED STATES

American women had been the earliest to make a definite organized struggle for political freedom, having started in 1848, but they were among the last to win. This was in part due to the U.S. Constitution, which can only be amended by a two-thirds majority in both chambers of Congress, and even then the amendment does not become operative until it has been ratified by three-fourths of the 48 states. American suffragists used to say to friends in Europe, "You have to convert one Parliament: we have to convert at least 37 Parliaments." The suffragists worked state by state until there were some 20 suffrage states. The greatest victory thus gained was that in the state of New York in 1917, after America had joined in the war. To win in the "Empire" state was a turning point in the whole struggle. After this, ultimate victory was certain, and the suffragists concentrated on carrying suffrage by constitutional amendment. Theodore Roosevelt in 1912 was the first important presidential candidate who supported woman suffrage. In 1916 and 1920 all the presidential candidates were suffragists. President Wilson during his second term aided the movement by taking the unprecedented course of himself twice urging the Federal amendment upon the attention of Congress. The necessary two-thirds majority was secured in the House of Representatives in Jan. 1918, but there was not a single vote to spare, and the narrow margin weakened the position, especially as the Senate had yet to be won; but in May 1919 the amendment was again brought up in the House and was carried by 304 to 48; and victory in the Senate followed almost immediately. Then came the battle for ratification in 36 states. The first stages were easy and rapid, 11 states giving a unanimous vote in both Houses, and seven more in one or other of their chambers. After this the victories came more slowly until, in May 1920, 35 states had ratified and only one more was needed. The issue was much obscured by the impending presidential election. Both candidates were, as in 1916, suffragists. Both parties probably believed they would gain an advantage if they could plausibly claim that their efforts had given the final victory to women. Tennessee, a Democratic state, voted for the amendment by the necessary majorities in Aug. 1920; legal objections to its validity were, however, raised, but not in time to prevent the proclamation by the Secretary of State in Washington that the 19th Amendment to the U.S. Constitution had been carried. The legal points, however, awaited decision in the High Court. This gave an opportunity for a Republican state, Connecticut, to come to the rescue; a special session was called and the 19th Amendment was ratified on Sept. 21 1920. This made the Tennessee objections negligible for, valid or invalid, the 36th state had now ratified and the following article was added to the Constitution: "The right of citizens of the United States shall not be denied or abridged by the United States or by any state on account of sex." Thus after a struggle of 70 years the women's victory in America was completed.

OTHER COUNTRIES

Before the World War there were only four countries in the world where women exercised the political franchise; by the end of 1920 there were 28—namely, the United Kingdom, Canada, Australia, New Zealand, British East Africa, Rhodesia, Jamaica, Denmark, Norway, Sweden, Finland, Iceland, Holland, Rumania, Serbia, Luxemburg, Germany, Austria, Hungary, the United States; and, among the states newly formed by the peace treaties of 1919, Poland, Estonia, Lithuania, Latvia, Czechoslovakia, the Ukraine and Palestine.

The charter of the League of Nations contains a clause rendering women eligible for all appointments, including the secretariat. This clause did not remain a dead letter. Besides a large number of women in less responsible positions, Dame Rachel Crowley was made Director of the Section of National Health, to deal

with the white-slave and opium traffic and with the anti-typhus campaign. At the first assembly of the League (Geneva, Nov., Dec. 1920) Sweden appointed Mrs. Wicksell and Norway Dr. Kristine Bonnevie as alternate representatives of their respective countries; while Miss Forchhammer of Denmark brought forward in the full assembly the subject of the white-slave traffic and was successful in carrying her proposal to appoint a commission of three persons, one of whom must be a woman, to prosecute a special inquiry on the subject in the Near East. Miss Sophie Sanger was made head of the Legal Section of the International Labour Bureau. In Jan. 1921 Mrs. Wicksell was appointed a member of the Permanent Mandates Commission.

In seeking a cause for so great a development of principles for which comparatively small groups of women, without any direct political power, had worked in some countries for more than half a century, it may probably be found in one circumstance common to them all. In each country a national crisis had arisen on the issue of which the whole fate of the nation depended. National feeling in each had been stirred to its utmost depths. Under its pressure class feeling was minimized; all sorts and conditions of men and women had worked and suffered together for what each felt to be a cause of supreme importance. Men and women acted as friends and comrades when the issue was uncertain, and when the end came the men did not forget the work and the sacrifices of the women. In all countries, whether victors or vanquished, it was universally acknowledged that all through the anguish of the war the women had not been backward either in self-sacrifice, courage or capacity. It was this feeling which broke down the opposition to women's votes in nearly all the warring nations. It was felt also that men by themselves, as a well-known journalist expressed it, had made a mess of the world and needed helpers; men and women together being generally more successful than either men or women by themselves.

WOMEN (see 28.782).—The decade 1910-20 saw not only an advance in the position of women, unparalleled in any similar period, throughout the civilized world; it saw also an entire reversal of the public attitude towards their claim to equal citizenship. Yet this is true only of the second half of the period. From 1910-4 there was little or no progress; there was indeed retrogression. By 1910 the "Woman Movement" of the later 19th century had very largely resolved itself into a movement for obtaining the parliamentary franchise, a concentration upon a single object deplored by some but defended by others, who contended that the denial to women of the full rights of citizenship constituted an effective check upon their advance in any direction. The rise and progress of "militant" suffragism in England between 1910 and 1914 (see WOMAN SUFFRAGE) did much to alienate public sympathy. It was only the outbreak of the World War which brought about that great and sweeping reform in the position of women which had been accomplished by 1920.

(1) **UNITED KINGDOM.**—After 1914 changes in the United Kingdom were both numerous and rapid. The shortage of manpower during the war opened up a great diversity of fields of employment (see WOMEN'S WAR-WORK), and broke down barriers in the Civil Service and the learned professions, which had hitherto seemed impregnable. Nothing more was heard in the great war departments of those "structural" and other insuperable obstacles to the coemployment of men and women, which figured so largely in the evidence of practically every male civil servant before the Royal Commission on the Reform of the Civil Service, reporting in April 1914. When the institution of the two new orders of honour, the Companions of Honour and the Order of the British Empire, was announced in June 1917, it was declared that the bestowal of these decorations for war services would be irrespective of sex. In Aug. 1917 a resolution to remove the grille in front of the ladies' gallery of the House of Commons was passed by that House without debate. By the

Representation of the People Act (1918) women over 30 gained the parliamentary vote, and by a special Act passed in Nov. they were made eligible as members of Parliament, though the only woman elected at the general election of that year, Countess Markiewicz, refused, with the other Sinn Feiners, to take her seat. The Sex Disqualification (Removal) Act (Dec. 1919) gave women the right to hold practically every other public or professional position pertaining to civil life with the exception of membership of the House of Lords. Even this exception was subsequently removed: on March 2 1922 the Committee on Privileges of the House of Lords favourably passed upon a petition by Lady Rhondda holding that she and the 24 other peeresses in their own right were entitled to seats in the House of Lords.

As an immediate result of the Act women could be admitted to the degrees of any university, whatever the terms of its previous charter. The university of Oxford rose to the height of its opportunity; Cambridge, up to the close of 1921, still lagged behind. In the general election of Dec. 1918 women, who had qualified by residence and examination for degrees not yet conferred upon them, exercised the university franchise by reason of that qualification. The absurdity of such a position appealed to the more logical university. In Feb. 1920 Prof. Geldart introduced a statute into Congregation at Oxford, proposing to admit women to full membership of the university. Two amendments were moved on March 9, one to exclude women from university boards, the other from examinerships, but both were rejected by large majorities. On May 11 the statute was carried without alteration, and three subsidiary statutes, admitting women to all university offices, passed unopposed. Since Oct. 7 1920 the women students of Oxford have enjoyed the same advantages, and been subjected to the same university discipline, as the men. They even wear in slightly modified form the same academic dress at lectures and all university ceremonies. Moreover the gift was retrospective; every woman who had passed the examinations for the degree course and resided not less than 9 terms (three years) in Oxford as a member of a recognized Society of Women Students (such societies being the four women's colleges, or the Society of Oxford Home Students) became eligible for a degree, and on Oct. 14 the degree of B.A. was actually conferred upon a large number of qualified women, the principals of the various colleges and halls and the principal of the Oxford Home Students receiving the hon. degree of M.A. On March 11 1921 the hon. degree of D.C.L. was conferred on Queen Mary, on the occasion of a visit to Oxford in support of the appeal of the Oxford women's colleges for funds to meet the anticipated increase in the number of students anxious to matriculate at a university which offered them full privileges of membership. During the academic year 1920-1 the total number of degrees conferred upon women at Oxford was: B.A. 621; M.A. 345; B.Litt. 9; B.Sc. 3; B.C.L. 1; B.Mus. 2; D.Mus. 1; D.C.L. 1.

At Cambridge the position up to the summer of 1921 remained uncertain and, from the women's point of view, unsatisfactory. On Dec. 8 1920 a proposal to admit women to degrees was decisively rejected by the Senate, the figures being 712 for and 904 against. An alternative scheme to set up a separate university for women at Cambridge, conducting its own examinations and conferring its own degrees, met with no favour and was strongly opposed by the women concerned. When it came before the Senate (Feb. 12 1921) it was rejected by 146 votes to 50. A "compromise" scheme, giving membership of the university and full degrees and making women undergraduates eligible for professorships, lectureships, university boards and syndicates but not for the Senate, was again rejected on Oct. 20 when it was defeated by 908 votes to 694. An alternative scheme for conferring by diploma "titular" degrees on women, carrying with them no university membership, was passed by 1,012 votes to 370. This alternative, however, was unacceptable to the women.

Amongst the learned and academic distinctions won by women during the decade may be noted the presidency of the botanical section of the British Association held by Ethel Sargent (d. 1918) in 1913 and by E. R. Saunders in 1920. In Dec. 1920 Eugénie (Mrs. Arthur) Strong was appointed Rhind lecturer in archae-

ology and the first woman fellow of the Society of Antiquaries. In 1918 the Founder's Gold Medal of the Royal Geographical Society was bestowed upon Gertrude Margaret Lowthian Bell.

By Section 2 of the Sex Disqualification (Removal) Act women were permitted to become solicitors. Three years earlier (Jan. 1917) a proposal to admit women to the bar had been defeated at its annual general meeting by a large majority, though in Feb. 1917 a bill to permit them to qualify as solicitors obtained a second reading in the House of Lords. On Jan. 1 1920 Mrs. Gwyneth Marjory Thomson (Bebb), who died at the early age of 31, was admitted at Lincoln's Inn as the first woman student for the English bar. She had previously (1913) tested the legality of a woman practising as a solicitor by bringing (with others) a case against the Law Society. On May 7 1920 Miss Tata, a Parsi, was admitted, also at Lincoln's Inn, as a student preparing for the Indian bar. A few women presented themselves for the law examinations at the universities and passed with distinction, Mrs. Thomson obtaining a 1st class at Oxford, and Miss L. F. Nettlefold at Cambridge, and in June 1921 Miss K. Snell of Girton College was placed above No. 1 in Class I. of Part II. of the law tripos at Cambridge. In March 1921 five women passed the intermediate examination for the bar and on May 26 Olive Catherine Chapman passed the final examination.

Seven women (the Marchionesses of Crewe and of Londonderry, Mrs. Humphry Ward, Mrs. Lloyd George, Miss Elizabeth Haldane, Mrs. Sidney Webb and Miss Gertrude Tuckwell) were appointed justices of the peace on Jan. 1 1920. On Jan. 9 Mrs. Ada Summers, mayor of Stalybridge, took her seat as first woman chairman of the bench. In March of that year 24 women were appointed for the county of Lancaster, and in July a large number were appointed for the county of London; appointments were subsequently made throughout the United Kingdom.

On Aug. 6 1920 women jurors were for the first time empanelled, at Bristol. In Jan. 1921 women jurors were first summoned to the Central Criminal Court, London, and were also first called as "special jurors" in the Probate and Divorce Court. The first case which they had to try involved details of an unpleasant character, and some controversy subsequently arose as to the suitability of mixed juries in divorce and other cases. It was, however, generally held that the discretion left to the judge to make an order exempting women from service in cases of a certain kind was sufficient safeguard, and a bill, introduced into the House of Commons by Mr. G. Terrell on April 15 to amend the Sex Disqualification Act by providing that no women should be compelled to serve on a jury, failed to secure support, only 19 members being present when he introduced it.

Shortage of candidates for the medical profession during the World War encouraged a very large number of women students to present themselves. War conditions led to the admission of women students to several of the London general hospitals; before the war they were restricted to the Royal Free Hospital and the School of Medicine attached to it, or to the few hospitals for women, staffed by women. A notable advance was also made in placing the Endell Street (London) military hospital, opened Feb. 1915 by the R.A.M.C., under Dr. Louise Garrett Anderson and Dr. Flora Murray, and by the employment of other women surgeons and physicians under the R.A.M.C. in Malta, Salonika and elsewhere.

Progress in the Civil Service was rapid during the war, when women, as temporary civil servants, held many responsible posts, and were paid on a higher scale than had previously obtained. On May 19 1920 the House of Commons passed a resolution declaring that women employed in the service of the State should have equal opportunities and equal pay with men engaged on the same work. But the power to reserve to men certain departments of the service, given to the Treasury by Order in Council, was widely exercised, and the progress made fell short of the desires and expectations of the women affected (*see WOMEN'S EMPLOYMENT*). On Aug. 5 1921 a debate on the subject took place in the House of Commons on a resolution moved by a private member. A Government amendment to it was agreed to,

whereby for a provisional period of three years special conditions were to obtain both as to method of selection and rates of pay, but subsequent conditions were to be the same for both sexes.

No barriers now exist excluding women from any profession, except the army and navy, and ministry of the Church of England or the Roman Catholic Church. In Feb. 1920 Convocation passed a resolution against giving permission, even to accredited women "to preach and pray in congregations composed of women and children," but in July the Lambeth Conference recommended the admission of women to the diaconate and a wider use of their ministry in non-liturgical services. Permission was, however, refused to Miss Maude Royden to preach in a London church at a special Good Friday service in March 1921. The General Assembly of the English Presbyterian Church resolved in May 1921, by 156 votes to 124, to admit women as elders and deacons.

In practically all other directions the field lies open to women. Their achievements during the war proved that they but needed opportunity. The remaining struggle was not for permission to work but for adequate remuneration. "Equal pay for equal work" became their rallying cry. It was inscribed upon the banners of an imposing procession, demanding equality in the Civil Service, which paraded London on April 28 1920; it formed the basis of the protest of women teachers to the Minister of Education (May 1920) and of their demonstration in Trafalgar Square (Nov. 1920) against the proportion (four-fifths) of male salaries allowed them under the Burnham scale. In the industrial world the women's claim to an equal bonus prompted the successful strike of tramway and omnibus workers in London in Aug. 1918. Not inappropriately the National Union of Women Suffrage Societies renamed itself the National Union of Societies for Equal Citizenship.

The problem was no longer political, or even social; it was economic. The removal of the few remaining disabilities of women, such as their inferior share in the guardianship and control of their children, depends in the last resort upon the securing for them, whether in marriage or out of it, of economic independence. Otherwise freedom to control those whom she cannot maintain, or the right to leave a husband when she is incapable of maintaining herself, are illusory rights of little value to a woman. When the last traces of the legal theory that husband and wife are one person, and that the woman, as such, must be under the tutelage or guardianship of parent or husband, have been obliterated, there will still remain need for legislation securing to a woman freedom to work outside her home, or, as an alternative, wages for work within it going beyond bed and board, as well as a fair share of joint earnings. Not till this is accomplished will the theory of equal citizenship have been translated into fact. (J. E. C.)

(2) UNITED STATES.—The increase in interest in professional work for women in the United States, during the World War, was evidenced by the number of bureaux and associations for the exchange of information in this field. A book published in 1920 by the director of the Intercollegiate Vocational Guidance Association told the story of over 30 groups of professional occupations where women were already at work. An examination of the many branches under the main groups indicated that there was practically no profession women had not entered. The Bureau of Vocational Information published intensive studies of the leading professions, and the National Social Workers' Exchange was organized to place trained workers in professional positions throughout the country. During the World War increased opportunities came to women, both in the accustomed professions and also in new lines of endeavour. It is probably true, however, that most of the professional work, which was considered "new" to women, was "new" only in the sense that it was unknown to the general public. In the case of employment managers, personnel and welfare workers, for instance, women had been employed for some time, but the war increased the number and brought their work vividly before the public.

Industry.—Many of the women taking executive positions in industry had been forewomen and were promoted in the war emergency. In one investigation of 250 plants, 146 employed women executives other than forewomen. The more important positions included those of designers, office or factory managers, employment managers, welfare directors, nurses and occasionally doctors, matrons, lunchroom managers, production supervisors, depart-

ment heads, statisticians and saleswomen on the road. Later there developed a tendency to employ college women in these positions, and by 1920 at least three universities and a half-dozen schools had offered special training courses. One school alone graduated over 200 women whose salaries ranged from \$2,000 to \$5,000 a year.

Medicine.—Perhaps the most important demand among the already recognized professions was for an increased number of nurses and doctors. In 1920 there were registered about 40,000 nurses in private practice and about 10,000 in public health work. It was in the latter field where every effort was being made to increase the number to 30,000. The number of women physicians at the same time was about 6,000, and practically all of the American medical schools were open to women, although not always on quite the same terms as for men. Women were not only practising physicians but they also held important positions in surgery, dentistry, laboratory research, and on the staffs of hospitals and medical schools. In addition to the "regular" physician it was estimated that there were about seven or eight thousand women practising osteopathy.

Law.—Since 1869, when the first woman was admitted to the bar in Illinois, the profession of law has claimed an increasing number of women. By 1921 every state in the Union except Delaware had admitted both sexes, and at least 1,600 women were practising in various branches of both civil and criminal law. Out of 129 law schools only 27 then refused admittance to women students, but among those refusing were two of the leading schools, Harvard and Columbia. In many cases women who were graduate lawyers specialized in one phase of work such as corporation law, patent law, legal research or court work. Others did not enter the practice of law but engaged in work where their legal training became valuable background. Among the important Government positions held by women lawyers in 1921 were those of the U. S. probate attorney, judge of the juvenile court in the District of Columbia, city magistrate in New York City, deputy collector of customs, and county attorneys, treasurers, clerks, probate judges and justices of the peace in various states. Two states have had women assistant attorneys-general, and probably the most important position held by a legally trained woman was that of assistant attorney-general of the United States.

Education.—One of the few professions given over very largely to women was that of teaching. Women almost completely filled the ranks in the elementary public schools, and very nearly so in the higher grades. Men predominated in the colleges and universities, but women held many important positions as faculty members and occasionally as presidents of women's colleges. Many of the higher educational institutions employed women deans to supervise and advise the women students. Salaries for these positions were seldom above \$3,000 or \$4,000, but occasionally the dean of women held the rank of full professor and received a corresponding salary. Many smaller cities employed women as superintendents of schools, but in 1921 only one or two of the larger cities had engaged women in this position. An increasing number of women were employed in private schools either as teachers or principals, and often private schools were owned and managed by women. Since 1900 particular problems in education have been emphasized and women specialists developed in such fields as manual training, recreation, kindergarten, physical education, vocational training, and the education of the blind, feeble-minded or subnormal.

Immediately following the World War an acute shortage of teachers occurred, due to the large numbers drawn off into better-paid positions. This exodus amounted almost to an "invisible strike" for higher wages and became so serious that schools in many places either closed entirely or were open for only half-day sessions. A movement was started to establish a minimum salary of \$1,500 a year in order again to attract women to the profession, but the wave of economy which spread over the legislative bodies in 1921 greatly impeded the efforts to raise the standard of teaching and to secure better educational facilities.

Social Work.—Since 1900 a remarkable increase occurred in the numbers of women engaged in various forms of social service. Women have of course been the traditional bearers of charity and have long been connected with correctional work. But this was largely in the form of volunteer service. With the greater development of paid service, and the desire to treat causes rather than effects, there developed a wide field of work and a large number of workers. Social service was classified by the National Social Workers' Exchange as follows: (1) Social case work, dealing with individuals, as church visiting, family case work, medical social service, probation, protective and prison work, public health nursing and visiting, school visiting, and employment exchange work, both public and private. (2) Social group work, including community-centre work, Americanization boys' and girls' club work, playground and recreation work. (3) Social reform work dealing with people as a mass—as housing reform legislation, anti-tuberculosis work, and the promotion of child hygiene. (4) Social research, comprising special investigations, research and statistical work including surveys and exhibits. No fewer than 14 schools for the training of social workers had been established by 1921 and the demand for women with proper training usually exceeded the supply.

Civil Service.—Extensive opportunities for women are to be found in civil service positions offered by city, state, and Federal

governments. In 1920 about 200 cities, 11 states and the Federal Government had adopted the competitive civil service plan. The number of women employed in the civil service throughout the country could not be accurately ascertained but a conservative estimate of those in the Federal service in 1920 placed the number at about 50,000 in the District of Columbia alone. During the first half of the year 1919, examinations were held for 260 different types of service with positions varying from that of charwoman at \$240 a year to a Federal Trade Commissioner at \$10,000.

The plan of the classified civil service aims, on the whole, to give equal opportunity to both sexes. But in practice women are often discriminated against by the custom of excluding them from certain types of service and also by permitting the heads of departments to determine the sex qualifications both for examinations and for appointments. In the Federal Government service, where women were admitted by statute in 1870 at the discretion of the head of the department, the custom of giving preference to men had been so powerful that in the civil service examinations held between Jan. 1 and July 1 1919 women were excluded from over 64% of the positions in scientific and professional services, from 86% of the positions in the manufacturing and mechanical services and from 75% in the medical services. In the work of collecting information from original sources only 4 out of 16 different kinds of positions were open to women. Even the Federal Bureau of Efficiency and the Federal Board for Vocational Education closed its examinations to women.

This policy of discrimination was deeply affected by the shortage of labour during the World War, and the situation was partly remedied when the Civil Service Commission, after an investigation by the women's bureau of the Department of Labor, opened all examinations to both sexes, but with the reservation that heads of departments may specify which sex was desired. This latter provision will need to be modified before equal opportunity is completely secured. There also exists in the Federal service serious discrimination against women in the matter of salary levels and in the classification of grades. During the first two months of 1919, for instance, over 86% of all women appointed received salaries ranging between \$900 and \$1,300 a year, while only 36% of the men received those salaries. The number of women receiving probational and temporary appointments, in this same period, was about twice as great as the number of men in the same classes. But efforts to remedy this situation are increasingly successful.

Positions most commonly open to women include those of stenographer, secretary, librarian, statistician, editorial and clerical worker. Many departments, however, require women with expert technical training such as biologists, bacteriologists, chemists, dietitians, linguists, draftsmen, doctors, nurses, directors for playgrounds and recreation centres, and specialists in social welfare such as child hygienists and factory inspectors. Public institutions also offer opportunities for women in such positions as matrons, supervisors, inspectors and in the more technical positions as physicians or psychologists. Tenure of office based upon merit, often with a pension upon retirement, is probably one of the most alluring features in civil service work.

General.—The entrance of women into many other professions was given a special impetus during the war, including journalism, advertising, commercial art and banking, where women were employed both as clerks and as officers and directors. Architecture, interior decoration, landscape gardening and motion-picture work attracted an increasing number of women. In motion-pictures women were not only actresses but also title editors, research workers, readers and occasionally directors or even producers. The exceptionally large salaries of \$25,000 and \$50,000 were occasionally reported, and a rare motion-picture director or a play broker was said to earn \$100,000 a year. It is apparent that women have entered a very large number of professions exclusively held by men in earlier years, and their success indicates that they are certain to remain and to carry important responsibilities. (I. O. A.)

WOMEN, LEGAL STATUS OF (see 28.784*).—(1) **UNITED KINGDOM.**—The position of women in England was almost revolutionized between 1910 and 1921. Very little actual change in the law took place between 1882 and 1918, but beneath the surface inevitable changes were impending, and the World War brought about the outward change as probably nothing else could have done. The parliamentary suffrage (see **WOMAN SUFFRAGE**) was granted in the early summer of 1918 to all women over 30 years of age whether single, married or widows; and in Dec. 1919 they were declared eligible for any office.

¹ By the Representation of the People Act (1918) all the old franchises were swept away. There are now three qualifications for women as parliamentary electors under the Act: residential, university, and as the wife of a local government elector. In her own right a woman may qualify by residence in the electoral area and may in addition have one or more university votes. As the wife of a local government elector she may also have a parliamentary vote, but she may not vote more than once in the same election 1920 for more than one ordinary constituency in a general election.

It may be taken as a general proposition that from the beginning of the year 1920 onwards there has been no difference in the legal position of men and women on account of their sex throughout the United Kingdom, and since that time no woman has been under any civil disqualification by reason of sex or marriage. As far as property was concerned, even under the old law, the non-married woman, whether spinster or widow, held her property on the same terms as a man. She could buy and sell, go to law and make her will just as a man could. The married woman's position before the year 1882 was far different. It is well stated by one who, though born in the United States, became one of England's greatest lawyers, thus: "A married woman is absolutely incompetent to enter into contracts, and has in the contemplation of law no separate existence. She cannot make a valid purchase on her own account even for necessities, and when credit is given to her there is no remedy but an appeal to her honor" (*Benjamin on Sales*, 3rd ed., p. 32). All this has completely disappeared. The Married Woman's Property Act 1882 was a great step in advance, and the last remnant of the medieval doctrine that for every purpose husband and wife were one person (and that person the husband) disappeared in 1920 when they were made capable of stealing from one another except when living together. A married woman is now as capable of dealing with her own property as a man is.

Married women (and of course all spinsters and widows) can now make their wills and dispose of their property as they wish. In England neither the husband nor the children have a right to any part of it except in the absence of a will. In Scotland the children have a legal share, on which they can insist on their parent's death. A married woman is not obliged to ask her husband's leave to make a will, nor need she make him executor or leave him any part of her property, unless she wishes to do so. Among wealthy people the married woman's position as to property is often controlled by her marriage settlement. The provisions are almost invariably the same, viz. that the capital of the property is in the hands of trustees and the income goes to the wife, who cannot anticipate it. On the death of the wife the husband sometimes has the income for his life. If there are children the capital is divided among them, generally in equal shares. If there are no children or other descendants of the wife the property goes back to the wife's relations, unless she disposes of it by will as she can generally do.

It is, however, an irony that even in 1921, in respect of her motherhood and the custody of her own children, the woman was still inferior to man (see 14.514), and also as to inheritance she was still not in such a good position as her husband or brother. In case she does not make a will all her property except her land goes to her husband, whereas if he dies intestate she only gets a third of his property, or half if he has no children (see 14.568 and

In addition she has one university vote at a general election. To qualify as a local government elector she must have (a) attained the age of 21, be resident in the area on the last day of the qualifying period (Jan. 15 or July 15), have occupied some land or premises in the area for the whole of the qualifying period, or in the alternative (b) must have attained the age of 30 and be the wife of a man who is entitled to be registered as a local government elector in respect of the premises in which they both reside. To qualify as a parliamentary elector she must have attained the age of 30 and must be entitled to be registered as a local government elector in respect of the occupation in the electoral area of land or premises of the yearly value of not less than £5, or of a dwelling house, however small the value, or be the wife of a husband entitled to be so registered. This means that the husband must own land or premises in the area of the yearly value of not less than £5. In all the above cases the women must not be under any legal incapacity. A peeress in her own right can be an elector and also a peeress by marriage. There are certain offices, chiefly in Scotland, which if conferred on a woman would incapacitate her as a voter. She must not be a lunatic, an alien or a convict. The wife of a person serving in military or naval forces of the Crown, who would if he were not so serving be entitled to be registered as an elector, is not disqualified. The wife of a "conscientious objector" is not disqualified.

In the case of a university vote the woman elector must be 30 years of age, and fulfil the same local conditions as a man elector, or have passed the final examination and kept the period of residence necessary to qualify a man at the time when the university did not grant degrees to women.

* These figures indicate the volume and page number of the previous article.

14-714). A very elaborate bill was in 1921 before Parliament intended to give her an equal share with her brothers in her parents' landed property.

The Sex Disqualification (Removal) Act, 1919, provides that no person (whether man or woman) shall be disqualified by sex or marriage from the exercise of any public function, or from being appointed to or holding any civil or judicial office or post or from entering or assuming or carrying on any civil profession or vocation or for admission to any incorporated society (whether incorporated by Royal Charter or otherwise), and a person shall not be exempted by sex or marriage from liability to serve as a juror. The word "person" in English law includes woman as well as man. The Act further provides (a) that His Majesty may by order in Council authorize the admission of women to the Civil Service, and reserve to men any branch of, or posts in, the Civil Service in H.M. possessions overseas or in any foreign country; (b) that any judge or other person before whom a case is heard may in his discretion on application (in both civil and criminal cases) by either party or at his own instance make an order that the jury be composed of men or women only, or may on her application exempt a woman from service on a jury by reason of the nature of the evidence or issues to be tried. Rules of Court have been made as to summoning jurors, exempting women who are for medical reasons unfit to attend and as to procedure. Section 2 provides for the admission of women as solicitors. Section 3 enables any university to admit women to membership or any degree notwithstanding any statute or charter of such university. The Act overrides all previous statutes, orders in council, royal charters or other provisions inconsistent with it, and applies to the whole United Kingdom.¹

It will be observed that the qualification to hold office only applies to civil life. Military and ecclesiastical offices are not open to women. On the passing of the Act Viscountess Astor was almost immediately elected to the House of Commons and took her seat as a member, and women were appointed justices of the peace and began to serve on juries. The contrast between the position of women in 1921 and 50 years earlier is certainly very striking. The unmarried woman, both spinster and widow, was equally disqualified formerly from public functions and offices, but she was in the same legal position as a man for the purposes of contract and wrong-doing. In criminal law the married woman as well as the single one has now the same position as a man with some trifling exceptions. The recent Larceny Act, which codifies the law, finally makes it possible for the wife as well as the husband to steal from one another when they are living apart, or deserting, or intending to desert the other. Up to the last-mentioned date the medieval conception that the husband and wife were one person made it impossible for them to steal from each other, just as it formerly made it impossible for one of them to give or convey property to the other. All this is now abolished and, with the exceptions presently stated, a woman, even when married, must be treated in law as a man. This is not however the case with military or ecclesiastical law. A woman is not liable to serve in the forces of the Crown, and she cannot in the Church of England or the Church of Rome be a priest or hold such ecclesiastical offices as are held by men. She is also subject to her husband in ecclesiastical law, and they are regarded for many purposes as one person. She is also by the law of marriage regarded as under the authority of her husband. Her duty is obedience in all things not sinful. The husband has a right to her custody and control. She must live in the house he appoints and sleep with him if he wishes it. She has no remedy except to leave him, and if she does so for such a reason he is not bound to support her. He cannot however legally prevent her from leaving him (*Jackson v. Jackson* 1892). She cannot get damages from him for imprisonment (*Tinkley v. Tinkley* 1908).

The wife can obtain a maintenance order from a magistrate if she separates from her husband on the ground of his assault on her, or his desertion. Orders made abroad can now be enforced in England, and, if made in England, can be enforced against the husband abroad. Maintenance for the children can also be obtained up to 10s. per child (Married Woman Maintenance Act 1920).

In England until the Act of 1874 (36 and 37 Vict. c. 12) the father was the sole guardian of the children of any marriage and was entitled to the sole custody and control of them. The mother had no legal rights whatever. By an Act of Charles II. (1660) the father was given the sole right to appoint a guardian or guardians of his children to act after the father's death so long as they are under twenty-one. By the Guardianship of Infants Act (1886) the mother, if surviving, is the guardian of each child either alone, when no guardian has been appointed by the father, or jointly with the guardian appointed by him. The mother may also appoint a guardian to act after her own and the father's death. Subject to the confirmation by the Court she may also appoint a guardian to act with the guardians appointed by the father. By Section 3 the

Court may make such order as it thinks fit regarding the custody of the child and the right of access thereto by either parent "having regard (a) to the welfare of the child, (b) the conduct of the parents, and (c) the wishes as well of the father as of the mother." This statute however has been interpreted by the judges to mean that where the father's wishes and the mother's were opposed the father's wishes must prevail. By the Guardianship of Infants bill (1921) the above Act would be wholly repealed. The father and mother in future and for all purposes would be joint guardians, and have joint custody, and have "equal authority, rights and responsibility with regard to every legitimate child, any former rule of law or equity to the contrary notwithstanding." The father and mother would be jointly and severally liable for the maintenance and education of the child according to his or her means on the application of either the father or mother or any other person acting as next friend. Their executors would also be liable.

There is an old saying that lawyers are divided into two classes: those who think man is made for the law and those who think the law was made for man. It is the first class that makes the law unpopular; but it should be remembered that when husband and wife quarrel about their children the task of the judge is a very difficult one. The most difficult case is where they differ in religion. It has been laid down (*Agar-Ellis* case 1878) that the child must be brought up in the religion of the father. In this case he was a Roman Catholic and had not been guilty of misbehaviour. It was decided that the children must not be brought up by their mother on the ground that she might make them Protestants; if the father had been a Protestant and the mother a Roman Catholic she would have been deprived of her children on the same grounds. It was further laid down that no promise by the father before marriage as to the education of his children can be enforced after marriage, as he has a right to alter his mind. The last named decision might well be reversed by statute. In the case of property the husband's agreement before marriage can be enforced, and it seems unjust not to enforce his agreement as to the children. But in cases where the father and mother are of different religions and no promise has been given, it makes the judge's task a difficult one. Hard cases make bad law, and the difficulty lies, not with the judges, but in the real tragedy of these disagreements. (R. Th.)

(2) UNITED STATES.—Although the legal emancipation of women was far advanced in the United States at the end of the 19th century, three things were yet incomplete: (1) full recognition and securing of the individual interests of women in the domestic relations, which were often left unsecured legally because of survival of doctrines or institutions coming down from a state of society in which all women were dependents, and were normally under a sort of guardianship; (2) full logical development of the legal capacity of married women and doing away with the remnants of their common-law disabilities, already long abrogated for the most part in the United States, but surviving here and there in curious local anomalies; (3) legal taking account of the facts of women's physical constitution in their relation to wages and hours and conditions of labour in industry, and securing of the social interest in the individual life of women by adequately protecting them in these connexions.

With the progressive breaking down of the legal conception of the household as an entity ruled from within by a head, and as an agency of social control, it becomes necessary to give legal recognition and protection to individual interests of women in the domestic relations, which at common law were supposed to be secured through the internal economy of the household, or were left unsecured in view of a paramount social interest in the household as a social institution. Summarily, these may be put as *parental* interests—interests of women in the relation of parent and child, and *marital* interests—interests of women in the relation of husband and wife.

Parent and Child.—At common law the father was entitled to the custody of his minor child and the mother had a right to custody only after the father's death. In form this still stands in the books as law, but in substance there has been a complete change within a generation. Equity long ago refused to give effect to the father's common-law right of custody as against the interest of the child, and by taking the equitable doctrine of regard for the interest of the child over into the law, the courts have been able to put father and mother upon an equality for practical purposes in almost all jurisdictions. Yet the common-law doctrine remains theoretically in force in the absence of legislation, and legislation halts. One decision as late as 1905 holds that as between father and mother, the former has a legal right to control the religious training of the children. (*Hernandez v. Thomas*, 50 Florida Reports, 522, 536.)

Husband and Wife.—Marital interests of women include claims against the world at large growing out of the relation of husband and

¹ Women who wish to be solicitors should apply to the Incorporated Law Society, Chancery Lane, W. C. 2, or barristers to the Benches of the Temple, E. C. 4, or Gray's Inn or Lincoln's Inn, W. C. Nurses and midwives are under the Ministry of Health. There are penalties for using either title without registration.

governments. In 1920 about 200 cities, 11 states and the Federal Government had adopted the competitive civil service plan. The number of women employed in the civil service throughout the country could not be accurately ascertained but a conservative estimate of those in the Federal service in 1920 placed the number at about 50,000 in the District of Columbia alone. During the first half of the year 1919, examinations were held for 260 different types of service with positions varying from that of charwoman at \$240 a year to a Federal Trade Commissioner at \$10,000.

The plan of the classified civil service aims, on the whole, to give equal opportunity to both sexes. But in practice women are often discriminated against by the custom of excluding them from certain types of service and also by permitting the heads of departments to determine the sex qualifications both for examinations and for appointments. In the Federal Government service, where women were admitted by statute in 1870 at the discretion of the head of the department, the custom of giving preference to men had been so powerful that in the civil service examinations held between Jan. 1 and July 1 1919 women were excluded from over 64% of the positions in scientific and professional services, from 86% of the positions in the manufacturing and mechanical services and from 75% in the medical services. In the work of collecting information from original sources only 4 out of 16 different kinds of positions were open to women. Even the Federal Bureau of Efficiency and the Federal Board for Vocational Education closed its examinations to women.

This policy of discrimination was deeply affected by the shortage of labour during the World War, and the situation was partly remedied when the Civil Service Commission, after an investigation by the women's bureau of the Department of Labor, opened all examinations to both sexes, but with the reservation that heads of departments may specify which sex was desired. This latter provision will need to be modified before equal opportunity is completely secured. There also exists in the Federal service serious discrimination against women in the matter of salary levels and in the classification of grades. During the first two months of 1919, for instance, over 86% of all women appointed received salaries ranging between \$900 and \$1,300 a year, while only 36% of the men received those salaries. The number of women receiving probational and temporary appointments, in this same period, was about twice as great as the number of men in the same classes. But efforts to remedy this situation are increasingly successful.

Positions most commonly open to women include those of stenographer, secretary, librarian, statistician, editorial and clerical worker. Many departments, however, require women with expert technical training such as biologists, bacteriologists, chemists, dietitians, linguists, draftsmen, doctors, nurses, directors for playgrounds and recreation centres, and specialists in social welfare such as child hygienists and factory inspectors. Public institutions also offer opportunities for women in such positions as matrons, supervisors, inspectors and in the more technical positions as physicians or psychologists. Tenure of office based upon merit, often with a pension upon retirement, is probably one of the most alluring features in civil service work.

General.—The entrance of women into many other professions was given a special impetus during the war, including journalism, advertising, commercial art and banking, where women were employed both as clerks and as officers and directors. Architecture, interior decoration, landscape gardening and motion-picture work attracted an increasing number of women. In motion-pictures women were not only actresses but also title editors, research workers, readers and occasionally directors or even producers. The exceptionally large salaries of \$25,000 and \$50,000 were occasionally reported, and a rare motion-picture director or a play broker was said to earn \$100,000 a year. It is apparent that women have entered a very large number of professions exclusively held by men in earlier years, and their success indicates that they are certain to remain and to carry important responsibilities. (I. O. A.)

WOMEN, LEGAL STATUS OF (see 28.784*).—(1) **UNITED KINGDOM.**—The position of women in England was almost revolutionized between 1910 and 1921. Very little actual change in the law took place between 1882 and 1918, but beneath the surface inevitable changes were impending, and the World War brought about the outward change as probably nothing else could have done. The parliamentary suffrage (see **WOMAN SUFFRAGE**) was granted in the early summer of 1918 to all women over 30 years of age whether single, married or widows; and in Dec. 1919 they were declared eligible for any office.

¹ By the Representation of the People Act (1918) all the old franchises were swept away. There are now three qualifications for women as parliamentary electors under the Act: residential, university, and as the wife of a local government elector. In her own right a woman may qualify by residence in the electoral area and may in addition have one or more university votes. As the wife of a local government elector she may also have a parliamentary vote, but she may not vote more than once in the same election 1920 for more than one ordinary constituency in a general election.

It may be taken as a general proposition that from the beginning of the year 1920 onwards there has been no difference in the legal position of men and women on account of their sex throughout the United Kingdom, and since that time no woman has been under any civil disqualification by reason of sex or marriage. As far as property was concerned, even under the old law, the non-married woman, whether spinster or widow, held her property on the same terms as a man. She could buy and sell, go to law and make her will just as a man could. The married woman's position before the year 1882 was far different. It is well stated by one who, though born in the United States, became one of England's greatest lawyers, thus: "A married woman is absolutely incompetent to enter into contracts, and has in the contemplation of law no separate existence. She cannot make a valid purchase on her own account even for necessities, and when credit is given to her there is no remedy but an appeal to her honor" (*Benjamin on Sales*, 3rd ed., p. 32). All this has completely disappeared. The Married Woman's Property Act 1882 was a great step in advance, and the last remnant of the medieval doctrine that for every purpose husband and wife were one person (and that person the husband) disappeared in 1920 when they were made capable of stealing from one another except when living together. A married woman is now as capable of dealing with her own property as a man is.

Married women (and of course all spinsters and widows) can now make their wills and dispose of their property as they wish. In England neither the husband nor the children have a right to any part of it except in the absence of a will. In Scotland the children have a legal share, on which they can insist on their parent's death. A married woman is not obliged to ask her husband's leave to make a will, nor need she make him executor or leave him any part of her property, unless she wishes to do so. Among wealthy people the married woman's position as to property is often controlled by her marriage settlement. The provisions are almost invariably the same, viz. that the capital of the property is in the hands of trustees and the income goes to the wife, who cannot anticipate it. On the death of the wife the husband sometimes has the income for his life. If there are children the capital is divided among them, generally in equal shares. If there are no children or other descendants of the wife the property goes back to the wife's relations, unless she disposes of it by will as she can generally do.

It is, however, an irony that even in 1921, in respect of her motherhood and the custody of her own children, the woman was still inferior to man (see 14.514), and also as to inheritance she was still not in such a good position as her husband or brother. In case she does not make a will all her property except her land goes to her husband, whereas if he dies intestate she only gets a third of his property, or half if he has no children (see 14.568 and

In addition she has one university vote at a general election. To qualify as a local government elector she must have (a) attained the age of 21, be resident in the area on the last day of the qualifying period (Jan. 15 or July 15), have occupied some land or premises in the area for the whole of the qualifying period, or in the alternative (b) must have attained the age of 30 and be the wife of a man who is entitled to be registered as a local government elector in respect of the premises in which they both reside. To qualify as a parliamentary elector she must have attained the age of 30 and must be entitled to be registered as a local government elector in respect of the occupation in the electoral area of land or premises of the yearly value of not less than £5, or of a dwelling house, however small the value, or be the wife of a husband entitled to be so registered. This means that the husband must own land or premises in the area of the yearly value of not less than £5. In all the above cases the women must not be under any legal incapacity. A peeress in her own right can be an elector and also a peeress by marriage. There are certain offices, chiefly in Scotland, which if conferred on a woman would incapacitate her as a voter. She must not be a lunatic, an alien or a convict. The wife of a person serving in military or naval forces of the Crown, who would if he were not so serving be entitled to be registered as an elector, is not disqualified. The wife of a "conscientious objector" is not disqualified.

In the case of a university vote the woman elector must be 30 years of age, and fulfil the same local conditions as a man elector, or have passed the final examination and kept the period of residence necessary to qualify a man at the time when the university did not grant degrees to women.

* These figures indicate the volume and page number of the previous article.

conditions brought about by the formation of military camps and the movement of troops in training (see WOMEN'S WAR WORK).

The Women Patrols were organized by a special committee of the N.U.W.W., with Mrs. Carden as hon. sec. and chief organizer; and the Women's Police Volunteers were formed by Miss Nina Boyle and other members of the "militant" Women's Freedom League, and within a few weeks were reorganized by Margaret Damer Dawson (d. May 18 1920) as the Women Police Service. The latter was a paid force, dressed in a uniform closely resembling that of the regular male force; the former was mainly voluntary and wore no distinguishing mark except an armlet. The Women Patrols were, however, from the first recognized by the Chief Commissioner of the Metropolitan Police (Sir Edward Henry), who signed the passes authorizing them to patrol streets and public places, and by the Home Secretary (Mr. McKenna), who circularized the chief constables of borough and county police throughout the United Kingdom, inviting them to do the like in their own districts. The Women Police Service received no direct official recognition; but in 1916 they were requested by Sir Edward Henry to supply policewomen for the munition factories throughout the country. In Jan. 1917 the Women Police Service received a grant from the Ministry of Munitions for the expenses involved, and in the same year the Women Patrols received a subsidy of £400 from the Home Office, reduced the next year to £300. With these exceptions, both forces, which originated in private effort, were for long supported entirely by funds privately collected. They conducted their own training, the Women Police Service entirely at their London centre and the Women Patrols not only in London but also at the three schools which they established in Bristol, Liverpool and Glasgow. These combined in the autumn of 1918 to form the Federated Schools for Policewomen and Patrols and received a grant of £1,000 from the Carnegie U.K. Trust, followed by £250 in 1919-20.

In Oct. 1918 Gen. Sir Nevil Macready, who had become Chief Commissioner of Metropolitan Police when Sir Edward Henry resigned in consequence of the police strike in Aug. of that year, decided to form a force of 100 women police for London, to be drawn from the ranks of the Women Patrols. The force, afterwards known as the Women's Patrol of the Metropolitan Police Force, was organized and placed under Mrs. F. Stanley as superintendent, with one assistant superintendent and 10 sergeants, and its status and duties were defined by the Police Order of Dec. 23 1918. The women were not sworn in as constables and were not given the power of arrest. Similar limitations attached to most of the individual policewomen employed by the chief constables of boroughs or counties throughout the United Kingdom. These, in Sept. 1920, numbered 126 for England and Wales, of whom only 33 were appointed with the same status as men, and 14 for Scotland, none of whom were sworn in as constables. They were for the most part women trained by one or other of the two voluntary organizations. In Dec. 1920 certain members of the Women Police Service were engaged by the military authorities in Ireland to assist in searching women suspected of complicity in conspiracy.

The Committee on the Police Service appointed in March 1919 under the chairmanship of Lord Desborough did not deal with policewomen, and on the request of a deputation, which attended at the Home Office Aug. 8 1919, a Home Office departmental committee was appointed in Feb. 1920 to inquire into "the nature and limits of the assistance which can be given by women in the carrying out of police duties and as to what ought to be the status, pay and conditions of service of women employed on such duties." The committee, which included two women, Viscountess Astor and Dame Helen Gwynne-Vaughan, reported July 24 that "there is not only scope but urgent need for the employment of policewomen." They enumerate as "appropriate" duties: "investigations in cases of assault on women and children; investigations under the Children Act 1908, the Immoral Traffic Acts 1902-1912, and similar statutes; attendance at court when cases of female or juvenile offenders are being dealt with; inspection of common lodging-houses (where this falls on the police); supervision of parks and open spaces; visiting of licensed premises, cinemas, registry offices, etc.; prevention of offences by prostitutes; and, generally speaking, any work in connection with offences committed by and against women and children." They recommended: (1) that all policewomen should be sworn in, given full powers of arrest and ranked with the male

police, forming an integral part of the police force and being trained and appointed by the chief constables; (2) that their pay should be standardized and approximated to that of the men (60s. minimum as compared with the men's 70s.), and that their allowances should be the same; (3) that their hours should be seven daily; (4) that marriage should be no bar to service; (5) that pensions should be granted on a scale slightly lower than for men, but that gratuities for dependent children should be the same for both sexes.

Up to Feb. 1921 this report had not been translated into action except as regards the pay and allowances to Metropolitan policewomen, which were standardized from Jan. 1 1921. But on Feb. 28 a deputation from the Federated Schools was assured by the Home Secretary that he would advise chief constables throughout the country that, where policewomen were employed, their employment should be regulated by the terms of the departmental committee's report. He added that it was undesirable that the work should any longer be carried on under voluntary organizations. Under Section 10 of the Police Act 1919 the wearing of police uniform by members of unofficial bodies is an actionable offence, and in March 1921 thirteen summonses were taken out against five executive members of the Women Police Service, which resulted on May 4 in fines of 10s. each and £10 10s. costs against the commandant. The name of the service was subsequently changed to the Women's Auxiliary Service, and changes were made in the uniform differentiating it from that of the official policewomen. Its future function was defined as mainly that of training, in London and in Edinburgh.

See *Report of the Committee on the Employment of Women on Police Duties* (1920, Cmd. 887) and its *Minutes of Evidence* (1921, Cmd. 1,133). See also the annual reports of the Bristol, Liverpool and Scottish Training Schools for Policewomen and Patrols, and the annual reports of H. M. Inspector of Constabulary for England and Wales (1917 et seq.). (J. E. C.)*

UNITED STATES.—About 300 cities in the United States employed policewomen in 1921, either as single officers of the law or in connexion with special women's bureaus. In many cases positions were secured through civil-service examinations, and promotions were made on the same basis as for men. Probably the largest number of policewomen was found in the cities of Chicago and New York, where the women's bureaus each employed about 30 women, usually in the capacity of police and patrol officers. Their duties were varied but related largely to the welfare of women and children. In Chicago one woman was assigned to the Morals Court, where she assisted the woman bailiff and the probation officers. In New York the women's bureau had attached to its staff a number of men welfare workers. These were usually former policemen who for some reason became incapacitated for regular work and who were assigned to assist in caring for needy cases, particularly among widows and children of former policemen. One city in 1921 announced the appointment of a coloured woman as police officer.

In some cases this wide field for social service attracted high-class women; their duties included probation work, institutional commitments, supervision of dance-halls and places of amusement, juvenile court work and at times physical and psychopathic examinations. This work frequently merged into expert detective work and required a woman to be on duty almost any time of the day or night. The minimum salary seldom fell below \$1,000, while the highest was not often above \$2,000 a year, except by special legislation. Policewomen were eligible for the retirement pension, which was usually about 50 % of their salary. (I. O. A.)

WOMEN'S EMPLOYMENT.—UNITED KINGDOM.—Women have been employed outside their homes in the industries of Great Britain from at least the days of Edward II., when they appear to have washed ore in the Derbyshire lead mines for 1d. a day. During the following six centuries they found their way into one trade after another, until in 1914, at the outbreak of the World War, in spite of their having been in the 19th century almost driven out from their once considerable occupations of agriculture and coal-mining, the total number of women in commerce and industry in the United Kingdom was 3½ million, while another 2½ million were earning wages as hospital nurses, domestic servants, dress-makers in small workshops and outworkers of similar kinds.

The increase that took place during the war was only a million, and yet it probably attracted more discussion than the whole of the steady industrial development which had made the sudden extension possible. This was due partly to deliberate publicity designed to attract women into the factories, partly to the interesting nature of a small part of the work which they undertook;

but it also arose from public ignorance of the share that women were already taking in industry before the war. There was no great industrial group which did not at that time already employ thousands of women; in the building trades there were 7,000, and in mines and quarries nearly the same number. The metal trades held 170,000 women; there were even some hundreds in the Admiralty dockyards. The great exceptions were the shipyards, underground work in the mines, iron and steel foundries and rolling-mills, various branches of engineering and whisky distilling. Other important services, like the railways, used them only for clerical work and cleaning, except of course in posts which could only admit of women, such as those of attendants in women's cloakrooms. Others reserved certain processes for men and gave the rest to women: others were women's trades: others again used men and women interchangeably.

The demarcation that existed between men's and women's work was as a rule definite and well recognized in the trades concerned. The very heaviest types of work were done by men, and so in most cases was work that required any high degree of skill. Such work, moreover, was almost certain to be the subject of trade-union restrictions which effectively prevented employers from using women on it. But these criteria, except at the ends of the scale, were not absolute. Women in many occupations—for instance making chains or gramophone records—were accustomed to handle very heavy tools or lift very heavy weights. Many would not trouble to acquire skill, or were denied the opportunity; but the bad organization of women and their low rates of pay tended to conceal the fact that they were often employed on jobs which a man would have considered at least as semi-skilled, while a few women up and down the country were turning out work which required a considerable technical endowment. The Ministry of Munitions, to take an extreme instance, found optical lenses being ground by women in London which they considered equal to the finest German lenses, and this had been going on for a dozen years. Very few women had such an opening, but all along the middle line, where the work was neither too heavy nor took too long to learn, there were trades and sections of trades where the spheres of the two sexes overlapped, so that on certain parts of the work they were either used interchangeably or one or the other according to district custom.

The best known examples of this are probably the cotton, woollen and worsted weavers, and the machinists in the Birmingham brassware trade, clerks and shop-assistants. But in all such border-lands, as has been said, the tendency before the war was for the low-paid and restricted woman to replace the more mobile and unrestricted man. In most of these cases one type of labour or the other—by no means always that actually used—was probably more suited to the work and economically preferable; but even where employers were sensible of this, they found local customs and prejudices too strong to alter, and the problem was little thought about and never squarely faced.

During the World War.—British industry, therefore, when the war came, was not compelled to start afresh with totally untrained women workers. Less than a tenth of the 4,750,000 employed in Nov. 1918 in agricultural, commercial and industrial occupations, had been altogether ignorant when they entered on war work of at least the routine and discipline of an industrial life, and the majority had really useful experience. It is after all more difficult to learn to handle a power loom or a power-driven sewing machine than it is to change from one of these to a semi-automatic lathe. Employers stated that of the 3,000,000 women employed in industry alone 700,500—a number nearly equal to that of the new entrants into the same occupations—were directly replacing men. This did not mean however that they were necessarily engaged on work that before 1914 had always been done by men. In many instances the work itself was new. Gas-masks, depth-charges and anti-aircraft devices, for example, had not been made in the same way, if at all, before 1914. Sometimes the change made was only nominal, as when a shop full of girls who had been machining bicycle parts, was turned over to the manufacture of rifles, and the processes to be performed on the new object remained unaltered. Again the employment of

women on a particular job, though new to the factory in question or even to the district, might be customary in other parts of England or Scotland. The Midlands could show thousands of women pressing, stamping, drilling, milling, dressing castings, core-making, assembling, even working on capstan lathes, and some of these were turning out articles for use in war such as fuzes, adaptors and cartridge cases. Any of these processes, if performed in an engineering shop, was entirely forbidden to a woman or a girl. Finally, there were very great numbers of women who merely replaced men on duties which had formerly been undertaken by either men or women. Familiar examples of trades in which this occurred have already been given. It is not too much to say that the majority of the women war workers were employed on work familiar to their sex, and often not widely dissimilar—except in the conditions under which it was done—from their ordinary occupations.

There were, however, exceptions to this, so interesting that they obscured the true state of affairs. Women on buses, policewomen and landgirls, women teaching in boys' public schools, and perched on ladders washing windows, women in gas-works and steel foundries and marine-engineering shops produced a comprehensive effect which was increased by the uniforms and working-dresses they wore, and by the fact that many of the war-workers were drawn from social classes unused to connecting their women-folk with factory life. There were reasons, too, which led to the position being misrepresented. It was in the interest of each employer, anxious to retain the skeleton of his male staff, to emphasize the length to which he had already carried direct substitution, and the returns made by them were found to reflect this anxiety. Moreover, it was in some districts easier to attract women to work which they believed served the purpose of releasing a man for the Forces than to obtain them for uninspiring women's tasks, where the drudgery and hardship to be faced were not even tinted with glamour.

Numerically, the changes in the employment of women and girls took the following course. The outbreak of war produced immediate unemployment. By Sept. 1914 about 250,000 females (8.4% of those employed in Aug.) had already left their jobs. This was the lowest point. By Feb. 1915 only 1.5% of these were still without work; by April the figures showed a surplus of 2%, and by Oct. 1915 the increase already amounted to 150,000. So far, however, it was still almost entirely in trades recognized as women's, or in work performed by both men and women. Of the 429,000 women and girls who entered the metal trades during the war, only 29,000 had entered by July 1915, though the effect of the Government's efforts to achieve dilution, which was made possible by the conferences held that summer, was shown by the fact that another 20,000 joined during the next three months.

By Oct. 1917 the percentage of women and girls to the total number of workpeople employed in industry, commerce, agriculture, transport and Government establishments had risen from 24% to 36% and nearly 1,500,000 women had been drawn into these occupations. By Nov. 1918 there was a 50% increase in the number of females employed in the same callings, representing 1,750,000, though, as has been stated, the addition to the total number of employed women was only 1,000,000. This is accounted for by the fact that over half of the 750,000 which makes the difference were persons who had previously been employed as dressmakers or domestic servants, while the rest had been outworkers of other types who were drawn into munitions work either by patriotism or by the superior interest and rates of pay. At the same time very large transferences of labour were taking place within the framework of industry, for by no means all of the great trade groups shared in the general war expansion. Thus, while industry proper, on a balance of prosperous and declining sections, showed an increase of just under 800,000, the figures for the textile trades fell by over 50,000, for paper and printing by 7,000, and for clothing by 56,000.

After the War.—From Nov. 1918 the fall in numbers naturally begins, but up to July 1920—which is in some ways a better date for the purpose of comparison than Nov. 1920, though figures for that month will be found in the tables accompanying this

article—there were still 28,000 more women and girls in industry than there were in 1914, and 824,000 more women and girls in industry, commerce, the Civil Service, transport, hotels, theatres, etc., taken together. These figures amount to a loss of women for industry of 512,000, between the Armistice and July 1920, as compared with the 800,000 who entered during the war, and for the larger group of occupations already referred to a corresponding loss of 824,000 as against their gain of 1,648,000. On the other hand the 80,000 women in the women's services had all been demobilized, and so had most of the 60,000 women V.A.D.'s, who, however, being voluntary workers, have not been taken account of in these figures. In July 1918 1,458,000 women were stated to be directly replacing men and 1,874,000 were on Government work, including the Civil Service, the women's services and the land army, but not workers in hospitals. The last figure, however, must be accepted with caution, as many of the contracting firms were not in a position to make accurate returns, and others varied in their views of the basis on which their figures should be compiled. Firms accepting contracts to be filled from stock already in their warehouses could not tell, while the goods were in process of manufacture, which part would be bought by the Government and which by private firms, nor which of their private customers were purchasing the articles against Government orders. In addition to this, many work-people were engaged for part of a day or week on Government contracts, and for the rest of their time on the firm's normal work. Some firms returned all their munitions work—a far wider and vaguer term, and one made continually more wide and vague by various decisions of the Courts—as Government work, and generally there was a tendency, in view of the privileges it conferred, to bring as much under this head as possible, even when the figures were supplied for statistical use.

These increases in the numbers of women employed in 1920 as compared with 1914 are interesting because they seemed to show that the war might result in a permanent growth in the industrial use of women. The natural growth of the population explains a certain part of them, but it should be noted that whereas the number of males employed had grown during the same period by only 177,000 on a 1914 figure of nearly 10,000,000, women had increased by between four and five times that number on a pre-war figure of 3,250,000. This discrepancy cannot nearly be explained by the casualties. Moreover in commerce and finance, where the rise for women is 344,000, there is an actual decrease for men of 155,000. These figures may alter again to the detriment of women; but, except in so far as bad trade causes general unemployment, there is no obvious reason why they should alter much. The replacement of the temporary women workers has not been left to economic factors which might be thought not yet to have operated to their full extent. On the contrary, non-economic pressure has in many cases prevented employers from keeping women they would have wished to keep. Under the Munitions of War Acts certain trades have been compelled to discharge all women and girls brought in to do work formerly done by men or boys. Trade agreements have had the same wholesale effects in other cases, though in both groups of occupations the natural tendency may be deduced from the fact that new firms, not within the scope of the pledges, are making a large use of women. And in addition to this practically every employer of women has been confronted by a campaign, both sentimental and practical and in some cases bitter, against their continued employment. It has been carried on partly by, or on behalf of, the returning troops, and partly by the men in the industries in which women had been working, and has certainly resulted in the dismissal of large numbers of them who were performing their work to their employer's satisfaction. These causes, though effective, are for the most part temporary in their effect, but those that tend to the increased employment of women are more lasting in character. The war advertised the fact that women are suited for a wider range of occupations than most employers—who as a class tend to be ignorant of what is going on in industry outside their own affairs and those of their immediate friends—had realized. They are also on much work

very much cheaper than men. Before the war their average wages were about half those received by men for the same work. In many trades during the war this proportion rose to two-thirds. But even in 1921 in the work which women do well, this discrepancy was a good deal greater than the difference which would be warranted by the difference in their value to their employer; and wherever this is so the employment of men on that work, if women are available, must be regarded as a luxury. It is one of which many employers, for good and bad reasons, are most unwilling to deprive themselves, but falling prices and restricted demand will operate to increase the desirability of the women. Further, they themselves had learned to prefer a life outside the home, to employment within it, while the losses of the war and the diminished prosperity of the nation turned for many of them a matter of choice into one of necessity. It might therefore be thought probable that though the bulk of the work to which women were introduced during the war had by 1921 disappeared or been taken from them, their share of paid work outside private houses would remain considerably larger than it was before the war and also more varied, and it was likely that those new opportunities of employment would be large enough not only to absorb the new workers but also to draw upon the supply of those who would formerly have undertaken domestic service or employment in small workshops.

Number Employed.—The table on next page gives the figures of British women's employment for July 1914, Nov. 1918, and Nov. 1920; the numbers employed on Government work; and the numbers stated to be directly replacing men. It should be noticed that they do not include outworkers, or persons employed on their own account, or employers.

Workers Classified.—The first winter of the war did little more than absorb the workers who had been thrown out of employment during its opening months. They moved from one part of the clothing trades to another, from cottons on to woollens, and from cotton, too, on to metals, from little brass rings and tips and handles and discs and plates on to fuzes, from lace on to leather, and from the food trades into the filling factories. The conditions were more or less familiar, and as far as they could they chose work that was similar to their own, for at this stage no arrangements had been made for training any abnormal proportion of new workers. The supply lasted until the beginning of the next year, as is shown by the fact that of the 79,000 women who enrolled in March 1915 for the Women's War Register under 2,000 had been placed by June, as all vacancies were first offered to suitable applicants on the ordinary register of unemployed persons. When these came to an end industry could still be fed from the immense reserve of fit and experienced workers created by marriage. Former employees in the printing and paper trades, textile trades and boot and shoe trades, returned to the workshops in very large numbers, a few going straight on to munitions in the narrower sense, but most preferring to take up their former employment in order to replace men who had entered the army, or the younger women who were beginning to drift away to more enticing work. It was for the sake of the Lancastrian cotton weavers that the policy was adopted of scattering the new National Factories through the chief provincial towns of the north instead of erecting them in the old armament centres under the eyes of the great armament firms, and it was on their skill and experience that the Ministry of Munitions was able to base its new programme.

These married women perceptibly altered the type of woman munition worker. They increased the average age, and, being tied to their homes and so restricted in their field of possible employment, they reduced the amount of wastage. On the other hand they were in certain respects undisciplined—it was never found possible to apply to them, for instance, the provisions of the Munitions of War Act with regard to Leaving Certificates—and their bad time-keeping, due to the pressure of domestic duties, detracted from the value of their work.

Their movement into industry continued roughly all through the autumn and winter of 1915. They came partly as a result of the feelings that were aroused by their husbands' attesting or entering the army, and partly as a result of the appeals that the Government were now making to them. By the spring of 1916, however, the supply was falling short. Congestion was increasing in the munitions areas, and many married women, instead of themselves earning wages in the factories, were taking toll of the wages of others, by letting rooms for sums which were sometimes increased concurrently with every increase in wage rates. Demand for women's labour was rapidly growing, and in March 1916 the Central Committee on Women's War Employment (Industrial) was set up by the Home Office and the Ministry of Labour, and established local committees to superintend on the one hand the recruitment of suitable women and on the other their housing, reception and general well-being outside the factory.

WOMEN'S EMPLOYMENT

British Women's Employment, 1914, 1918, 1920.

Nature of Work	Women and Girls Employed				No. on Govern- ment work in July 1918	No. stated to be replacing males in July 1918
	July 1914	November 1918	July 1920	November 1920		
Building	7,000	31,000	9,900	9,900	18,000	11,900
Mines and Quarries	7,000	13,000	9,600	9,500	6,000	6,900
Metal Trades	170,000	597,000	305,000	287,000	534,000	194,200
Chemical Trades	40,000	103,000	71,000	68,000	66,000	33,700
Textile Trades	863,000	818,000	883,000	840,000	335,000	65,500
Clothing Trades	612,000	556,000	571,000	530,000	142,000	45,900
Food, Drink and Tobacco Trades	196,000	231,000	241,000	226,000	37,000	62,600
Paper and Printing Trades	148,000	141,000	165,000	162,000	40,000	21,200
Wood Trades	44,000	83,000	65,000	61,000	40,000	25,600
Other Trades (including Gas, Water, and Electricity under local Author- ities)	90,000	156,000	138,000	132,000	73,000 (private firms only)	46,000
Government Establishments (Arse- nals, National Factories, Dock- yards, etc.)	2,200	247,000	6,300	5,100	225,000	187,000
Total in Industries, including Muni- cipal and Government Establish- ments	2,179,000	2,976,000	2,464,000	2,330,000	1,516,000 (not including municipal)	700,500 (not including municipal)
Municipal Tramways	1,200	19,000	3,100	2,900
Tramways and Omnibus Services (other than municipal)	400	9,300	2,700	2,500
Railways	12,000	66,000	29,000	28,000
Docks and Wharves	Number of females employed insignificant.			
Other Transport	4,600	21,000	11,500	11,300
Total in Transport Work	18,000	115,000	46,000	45,000	..	79,500 (excluding mu- nicipal tram- ways)
Banking and Finance	9,500	75,000	56,000	55,000	..	59,500
Commerce	496,000	880,000	794,000	792,000	..	352,000
Total, Finance and Commerce	506,000	955,000	850,000	847,000	..	411,500
Hotels, Public Houses, Cinema Thea- tres, etc.	181,000	222,000	242,000	235,000	..	44,500
Teachers (under local Authorities)	142,000	154,000	140,000	152,000
Hospitals (Civil and Military)	33,000	80,000	37,000	37,000
Other Professions (persons employed by Accountants, Architects, Solici- tors, etc.)	18,000	40,000	38,000	38,000	..	22,500
Municipal Services, not covered above	54,000	75,000	74,000	75,000
Civil Service	66,000	228,000	120,000	112,000	230,000	153,000
Women's Services (Naval and Mili- tary)	80,000	80,000	80,000
Land Army	30,000	30,000
Grand Total	3,307,000	4,845,000	4,051,000	3,871,000	1,826,000	1,521,500

The new efforts tapped new sources of supply. Along with women from the normal industries of Great Britain totally unskilled workers had now to be engaged. They included dress-making hands, domestic servants, girls from school and married women unused to factory life. Of these the domestic servants, with their more adaptable intelligence, comparative readiness to take responsibility, and good physique, were perhaps the most valuable. They are stated by employers to have been much sought in marriage, and to have affected considerably the habits and outlook of the ordinary industrial workers with whom they were brought into contact. They certainly showed no eager desire to return to domestic service.

The married women were said to be less quick to learn, and less disciplined in the sense of observing regulations. On the other hand they were considered very hard workers, and in some cases—as was natural on the part of women, most of whom were soldiers' wives—formed a definitely anti-strike body during serious industrial disputes. The last class of married women to be touched were perhaps the village women, large numbers of whom were recruited by the land army, and taught afresh the agricultural work which had been familiar to their great-grandmothers. They were difficult to persuade, being shy and unwilling to defy village gossip, and further—as is so often the case with poor men's wives—they were chained to their houses by a lack of proper clothing, neither their coats, their skirts, nor their shoes being suitable or adequate for an outdoor life. It was only when outfits were provided, and the idea of women on the land had become commonplace, that it was possible to induce them to come forward.

The girls from schools perhaps suffered more than any other class

of women engaging in war work. They were particularly sought after by bad employers, for though quicker than any older woman to train, and often able to produce as much as an adult woman, their rates of pay were very much lower and they could be dismissed as soon as they demanded an adult wage. Even so, however, their pay was enormously more than the half-crown or five shillings they would have received as learners in pre-war days, and this, and the independence of spirit and habit which flowed from it, were supposed to exercise a widespread demoralizing effect. By the end of the war the output of the younger workers was said to have fallen, and great anxiety for their moral condition was felt by parents, officials and certain employers. It is, however, difficult to isolate this alleged fall in output from the general fall in output that was taking place in many industries, or to separate out the factors which caused exceptional demoralization, if any existed, in this particular class. It is certain that the end of the war found them in a more helpless position even than other women. Their training on munitions work was of little use to them when they sought to enter regular industry. It had been restricted as a rule to a few standardized operations on a particular garment or article, and employers refused to accept it as entitling the women to ordinary rates of pay on ordinary work. The learners' rates which they were prepared to give were in many cases little more than pocket money, and always quite inadequate to the support of adult women whose parents were as a rule no longer able or willing to maintain them. By lack of knowledge and of suitable clothing—here again a serious factor—by taste, associations and personal habits, they were disinclined to enter domestic service and unfitted for the life it offered, and at the time of the

Armistice they were acknowledged to constitute a serious problem and a grave responsibility for the Government which had recruited them. Efforts were made to deal with those still juveniles, but the large numbers who had reached the age of 18 during the course of the war were left outside them. At that date they were themselves very generally alarmed as to their industrial prospects, and it was agreed by all those watching the situation, including the trade-union officials, that if immediate training were offered under suitable conditions it would be possible to attract large numbers of them into domestic service, which was not only the one opening available but the direction in which their labours would be socially most beneficial. Schemes agreed to by the trade unions were put forward by the Ministries of Labour and Munitions, but the Treasury, though obliged to permit the payment of unemployment donation to women in idleness, were unwilling to allow the relatively small additional payment which would have coupled it with productive training. A restricted scheme was finally set up which provided training in occupations which had been recognized as women's work prior to the war, and within the limits imposed it was very successful. It was not, however, able to reach the bulk of the women who most needed it or to provide a satisfactory flow of recruits for domestic service.

The other great class which entered wage-earning occupations as a result of the war were the women from secondary schools and universities, who had looked forward to leading idle lives, or to entering the teaching profession. They flowed rather into commerce, finance, the Civil Service and the war services than into industry, but the comparatively small numbers who did enter the munitions factories exercised a disproportionate influence. It was they as a rule who made it possible to set up women foremen, supervisors, and charge hands, and it was generally those better educated women who were first placed on really skilled or technical work. The managing director of the one great marine-engineering shop which trained women to perform the whole of a skilled man's work done in that shop, i.e., to perform any operation of which their machines were capable, accepted only girls from the secondary schools. He stated that in his opinion this degree of intellectual training was essential if they were to learn the work in the time allowed—about six months—and said, too, that his men made far less objection to training them than women of the industrial type whom they regarded as potential black-legs. The Ministry of Munitions Training Department also laid great stress on the importance of general education, going so far as to select only girls with a secondary school education for training in fitting and turning. The educated women had also a good effect upon conditions. Bad employers were restrained by their intelligence and independence from taking advantage of their more helpless companions, and good employers and welfare officers found them a useful channel of communication with the staffs when introducing health services, canteens etc. It is also probably partly due to them that the number of women trade unionists doubled during the war. The figures are said to be 350,000 for 1914 and 660,000 for 1918, but they only pretend to being estimates, and it is probable, owing to the tendency of women to enter their names after a meeting and then to lose all interest and pay no further subscriptions, that they are a good deal too high.

Women of a superior general training were found especially useful in instructing, commanding and supervising other women who had often in the past resented the elevation to authority of one of themselves. In the women's services and the land army this aspect of their work was of the first importance. On the land, particularly, their comparative acquaintance with the country, and their relative indifference to dark and loneliness, persuaded the town recruits to endure the terrors and discomforts of winter, while vestiges of feudal feeling gave them authority with the country women. In fact, wherever the work ceased to be purely physical, and more and more as it took on an intellectual quality the extent of a woman's education was found to determine her aptitude for learning and performing new work. The university women especially, in spite of the fact that those available for war-work were still largely of a uniform type—that which had been preparing itself for the teaching profession—found that their training immensely increased their comparative value in almost every direction, even where their instruction had not led up to, or especially fitted them for, their war duties. It is hardly surprising, however, that the best work of all from a technical point of view was done by those who had been specifically trained for the jobs they undertook, like the women physicians and surgeons and the women employed on scientific research in the National Physical and Chemical Laboratories. It is more to be wondered at that so much could be done by women and girls divorced from familiar surroundings, and set to adapt themselves to entirely novel systems of ideas, and to compress the training time of years allotted to men into a few months or weeks. Not even the atmosphere of the army can have been so foreign to the new soldiers—who as a rule had some notion of its main structure and had often experienced some form of communal existence—as were industrial and even commercial life to the girls who entered them from their day schools and their middle-class homes. And yet they adapted themselves to these new values, not only from duty, but with an enthusiasm and a quickness which seemed to show that the labour, and the variety and the tension, were congenial to their natures.

Quality of Work.—It is not possible here to attempt a final estimate of the qualities their work revealed, but testimony seems to agree on certain points. Above all they were conscientious; they were devoted. As long as they retained interest in their work they endured degrading conditions through monotonous periods of overstrain without apparently accumulating the resentment which from time to time flared out among their male colleagues; instead their health suffered. This tenacity was perhaps due to their stronger imaginative hold on the purpose to which they were giving themselves up. In relation to their environment, on the other hand, they were docile and lacked imagination; as a body they acquiesced in the conditions they found and made no concerted effort to change them. When they felt that the life was intolerable they left it, and the active combative temper of the men roused no response in them. As individuals they were less disciplined than men, less calculable, less impressed by traditions and institutions, giving an effect, for all their high spirits and quickness of tongue, of greater detachment. In the mass they were difficult to organize, elusive, fatalistic, sceptical and inarticulate. If they did combine they were faithful to their leaders, whom they preferred of a sensible and reasoning rather than of an idealistic type. Policy too, to obtain their approval, must be direct, concrete, and likely to produce an immediate effect. They were fortunate in their representatives, and the knowledge, ability and public spirit of the women trade-union officials secured for them an influence to which the numerical proportion of organized women would not have entitled them. Women might well have been proud to support societies to which they owed so much. But they seem as a rule to have left them when they left munitions work. They went back each to her private anxieties and hardships, showing no desire to continue banded together either to protect their interests or to continue their relationship, and seeking no outlet for the sense of injustice which some of them felt. A few of the ex-service women formed clubs and groups under the leadership of their old officers, but not the hundreds of thousands of munition workers, clerks and civil servants whose service took a more democratic form.

Effect on Industry.—It was not without difficulty that trade and industry were adjusted to fit these feminine millions. From the winter of 1914 the Government had been anxious to extend the use of women for the production of munitions, and in the summer of 1915 agreements were signed with the engineering unions which removed in theory the main barrier to their employment on men's work in the metal trades; but it was not until the spring of 1916 that substitution made any real headway. The employers had first to be convinced that they would not cause more trouble than they were worth, the factories had to be prepared for them, the work adjusted to suit their strength and skill, and, hardest of all, the men in each shop persuaded not only to submit to their presence but to coöperate actively in helping them to learn and to carry on their work. The women themselves meanwhile had to be trained. From July 1915 onward the Ministry of Munitions, in conjunction with the Board of Education, was teaching women with great success in technical schools and instructional workshops—for the first year, simple repetition work on shells and fuzes; later, work on aeroplanes and for positions as tool-setters, inspectors or charge hands; and, finally, the really skilled work of fitting and turning.

In all the Government schools trained 45,000 women, and very large numbers were trained by those private firms who preferred to give their own instruction. Under both methods it was found that they were good material, and that the period required before they could be fitted into their niches in the new schemes of mass production was shorter than anyone had thought possible. But the teaching of the women was the least of the trouble. To the last a certain number of employers were hostile to their introduction, and by more or less overt collusion with their staffs could make it impracticable or unsuccessful. Where this was the case the only weapon of the Government was to create a shortage of labour in their works by removing their War Munitions Volunteers and adopting similar coercive measures. This could not always be done in the face of the representations which the firm were nearly always able to secure from the Supply Department with whom their contract was made, that upon its instant fulfilment depended the issue of the war. Employers anxious to support the Government as a rule found the carrying on of their work under war conditions sufficiently harassing with a competent male staff: they could not be expected to welcome a change which meant providing special new accommodation—a much more troublesome matter than might be supposed in town factories where every inch of space was already needed; reconsidering each one of the methods to which they were accustomed, and antagonizing their staffs, in order to bring in labour certain to be relatively inefficient for the time, and of unknown potential efficiency. Their grounds of objection were substantial and their position strong, and it is to the credit of industry that some of the larger firms forestalled the Government in their introduction of women's labour. To effect this it had been necessary to bring the bulk of the work—all of which in some firms had hitherto been carried on entirely by skilled men—within the average capacity of untried and almost unskilled persons. Of the three grades into which it could be roughly divided—skilled, semi-skilled (which included the repetition work), and unskilled and labouring work—the last required the most ad-

justment and was the least easy to adjust. Every device that was possible was provided, regardless of expense, to minimize the strength required in lifting, hauling, loading, stoking, scraping boilers, and the specially hot and heavy work done in foundries and retort-houses, chemical works and tanneries. At the end of it all, the employment of women on this work was costly and ineffectual. Three women were needed on an average to do the job of two men, and at special points one man's work would occupy two or even three women, while the hardest jobs had now to be performed continuously, instead of as part only of their task, by the remaining men.

On repetition work the sweeping changes that were made were due not so much to the sex of the new operators as to war conditions. The subdivision practised was the natural result of mass production, and has remained where mass production has remained, though men have replaced women at the machines. The fool-proof devices were a protection against the lack of experience of the dilutees, whether men or women, and they too have survived as a means of decreasing worry and improving output.

On neither of these grades, where they already existed as such, did the men make serious opposition to the coming of women. The general unions to which most of them belonged were not before the war the centralized and powerful bodies they are now; they had been able to establish few privileges, and their men were at the mercy of the recruiting officers. They therefore treated the matter as one of individual feeling rather than of labour policy, and were entitled to more gratitude than they received from their country for the unselfish way in which most of them helped the women who were to fill their places and make it possible for them to be spared for the army. It was the splitting up of the skilled work, and the consequent reduction of many of its parts to a semi-skilled rank, which produced the bitter opposition which increased rather than diminished as the war went on. This was due in some degree to mass production but more to the shortness of the training which was all the urgency of the times allowed. The strength of the women was insufficient for labouring work, but by the end of the war it became clear that they did not lack the intelligence and character necessary for the acquirement of an exacting technique. What follows is the official verdict of the Ministry of Munitions:—

"Many women might become skilled mechanics, given the necessary training and experience. But these were precluded by the conditions under which munitions were manufactured. Intensive training sufficed to meet the emergency of the moment, but it was no substitute for a thorough apprenticeship; and the (male) apprentices who were up-graded under schemes of dilution suffered like others from premature specialization. Subject to this limitation, there were few branches of skilled work which some women did not execute with success. They made tools and gauges to the finest limits, they set up complex automatics, they machined and fitted the most delicate mechanisms, they inspected the rifling of guns and mastered the use of the micrometer and vernier, they conducted scientific tests in the laboratory, they acted as charge hands and forewomen."

Had the war continued they would have been used upon this work in increasing numbers. As things were, however, it was more economical, given the large output, to train them and the male dilutees with them, to do one particular part of the complex job which a skilled man had been accustomed to carry out, and whose more difficult portions only were now left for him. Most of the work of a skilled category given to women was actually work which had been treated in this manner. For such subdivided tasks they were found perfectly suitable, and the checks to their more extensive use were, in the first place, the uneconomical rates of wages which the men's unions had imposed as the price of dilution; and secondly, the almost desperate opposition with which their employment was met by the skilled men. It was not only the employers who objected to giving a woman the full rate of a skilled man when all she could do was one among his many different jobs: the men actually working with them, however much they agreed in principle with the system of the rate for the job, could not bear with equanimity the sight of raw, unqualified women receiving wages almost equal to their own.

The obstructive policy pursued by the skilled unions was directed as much against mass production in general as against women in particular. They knew that the women must go after the war; but they feared, not unnaturally, lest the new methods and processes should stay, which meant working toward a state when the skilled man who could not find employment in the tool-room, or as a supervisor, or on experimental work, would find himself degraded to the position of a machine-minder, with his privileges gone, the interest of his life as a craftsman gone, his standard of living in danger, and the prospect before him of becoming gradually merged in the masses of the semi-skilled. Much of this had happened in America, and the utterances of certain employers gave ground for thinking that in England it was at least desired. In small sections of the metal trades they could almost see it coming to pass. On sheet-metal work, for instance, machines and processes were brought in by which women and boys could perform rapidly and cheaply work which had been slowly done by hand by skilled sheet-metal workers. The men were released for the army and left knowing that their work would be gone if ever they came back. It was no wonder that opposition was laid against the new process as acceleration of the process by which in-

dustry develops for the benefit perhaps of future generations but to the hurt of those whose whole equipment for life is their suitability to one of its changing industrial phases.

If this was the origin of the continued disputes that attended the incoming of the women, they were embittered by the fact that nothing was more vague, or varied more from district to district, than workshop practice with regard to demarcation of work. Some shops were entirely staffed by skilled men and apprentices; others did the same work with a few skilled men and a residuum of semi-skilled machinists, unskilled men and boys. Claims were put forward by the unions that work should be treated as skilled and carry the skilled man's rate—which would have covered half the work habitually done by boys; and the employers on their side seemed to consider that the slightest change in a job handed over to women dropped it at once to the minimum labouring rate. These quarrels, at first more or less local, so far from being settled were growing in intensity when the Armistice removed their cause. They did not begin until the autumn of 1915, when the introduction of women on to certain machines in Glasgow opened the troubles on the Clyde.

As will have been gathered, permission to employ women on men's work in the engineering trades had been gained at the price of a wages settlement, intended not so much to benefit the women as to protect the skilled man's rate. It maintained piece-prices and stated that the skilled man's time-rate must be paid to women undertaking a skilled man's work. These compacts, known as the Shells and Fuzes Agreement and the Treasury Agreement, were arrived at in March 1915 between the Government and the engineering unions, and it was hoped that dilution would immediately follow upon them. Unfortunately they did not produce the results expected, and in July it was found necessary to supplement them by statutory powers under the Munitions of War Act. In Sept. the new Ministry, impelled by a pledge given by Mr. Lloyd George in July that there should be no sweated labour in the munitions trades, appointed a committee to settle the wages of the women, who were by this time fast entering the metal trades. The committee, representing the Ministry, the trade and the women, recommended the time-rate of £1 a week for women on men's work other than skilled men's work. This rate, though finally nearly doubled by the awards issued from time to time by the special Arbitration Tribunals to which claims for increases were referred by the Ministry of Munitions, remained the basis of their payment throughout the war, and the standard by which wages were unavoidably fixed for other classes of women. Thus women on munitions work other than men's work came finally to a basic rate of 55d. per hour. The £1 rate was imposed on the National Factories—already among the largest employers of women—and handed on as a recommendation to private munitions firms, a method which was found inadequate to ensure payment. It was therefore embodied in a Statutory Order, binding upon all controlled establishments under Sec. 5 of the Munitions of War Act. From that moment State regulation of the wages of women on munitions work, under pressure from trade unions representing both the women entering and the men displaced, became more comprehensive every few months, until at the time of the Armistice the Ministry of Munitions' orders covered about 2,000,000 women employed in 27 trades, and a similar number were covered by arrangements made with the Admiralty and the War Office. The work of dealing with women's wages was then taken over by the Ministry of Labour in accordance with the provisions of the Wages (Temporary) Regulation Act, which lapsed only in the autumn of 1920, leaving the general level of women's rates in the trades affected at about three times the very inadequate amounts—11s. to 12s. on an average—that had been usual before the war.

This regulation was the price of dilution, and it was only natural therefore that men anxious to oppose dilution should pick endless quarrels with the interpretation placed upon the wording of the agreements and pledges by the Government departments concerned, and also with their carrying out of their own orders. Into the details of these controversies it is not possible to enter here—the whole subject is covered by the report of the War Cabinet Committee on Industry which sat to consider the question, as well as to deliberate on the theoretical problems of women's wages. On the whole it may be said that the real basis of the men's charges was their objection to dilution and not any important dereliction on the part of the Government. Until the end of 1920 the women in the industries which had been engaged on war work were adequately protected, and they themselves realized this, and showed that they did so by the steadiness and docility with which they continued to work in the face of incitements to unrest. From first to last the time lost by strikes among women on munitions work was negligible, and only one case was brought to light where they were really restricting output.

While this was going on in the munitions trades proper—which included among others shipbuilding, engineering, electrical engineering, ordnance and aircraft work, wire-rope, cables, hemp-rope, tubes, iron and steel manufacture, scientific and optical instrument making, and the manufacture of explosives, chemicals, rubber, asbestos, packing-cases, and tin boxes—the recruiting crisis which took place in the winter of 1915 forced other trades to take steps to denude themselves of men and carry on with women's labour. This was done as a rule under national agreements between the unions in

a trade and the employers, and it was generally made clear that the work handed over to women would be relinquished by them at the end of the war. They also dealt as a rule with wages, laying down rates which equalled in some cases—though not as a rule in industries where women were expected to be admitted to truly skilled work—the whole man's rate. For instance, women on men's work on the railways or on process work in the seed-crushing mills, started at the man's minimum rate, but most of the agreements provided roughly for equivalent pay for equivalent work. Allusions were also made to the conditions under which the work was to be done and to measures designed to protect the women from injury to their health. These agreements were concluded without much friction and were carried out as a rule in a generous spirit.

Agricultural Work.—The other great industry where the introduction of women caused trouble was agriculture. In spite of the efforts and the efficient organization of the Women's Land Army, and in spite of the satisfactory work acknowledged to be done by the women, the increase in their numbers during the whole war was only 33,000—less than 50% on the 1914 figures of 80,000. To these must be added some of the women entered under the head of casual labour, but it is not a good turnover for a trade employing so large a number of men. The cause was partly the obstinate refusal of the farmers to employ women—which in itself rose in part from their dislike of parting with labour often consisting of their relatives and always more closely tied to them than the town workman can be to his employer—and partly to the fact that work on the land did not prove attractive to women. The country women were not of the temperament which embraces novelties, and the town women disliked being billeted among the hostile farmers, and also the discomforts of a country winter. In the few districts where the custom survives of women working on the land, such as Eversham, a district of small-holdings, there was further discouragement from the country women, who disliked the introduction of "dressed-up" strangers into the fields where they were accustomed to work in their ordinary long clumsy skirts. It was finally found necessary for the land army to cover the country with an organization which would keep in touch with practically all its members, to provide boots and outfits for recruits, to arrange for camps where women could live together, and in short to abandon the view that women could be expected to go on the land as self-sufficing units. As an army—an alien force imported into the countryside—it was found possible to introduce them to all the lighter and much of the more skilled work of agriculture with excellent results, but it is probable that only after two generations of such employment would the industry be prepared to admit that the experiment had been made and had proved successful.

The Civil Service.—In the army, navy and the air force the prolonged resistance with which the idea of employing women was met for so long came entirely from the employing or official side. By their male colleagues they were received not only with acquiescence but with pleasure, and as they had obviously to live in segregated units they were not grudging their inevitable proportion of responsible and well-paid posts. Into the Civil Service, on the other hand, they were early welcomed; but, once there, only a very few individuals from among the 162,000 recruits, who included numbers of women with university degrees, were given any opportunity of earning any salary that any man might have envied, or of rising to any work superior to that of secretaries and clerks. Where they were found in such positions it was almost invariably either as supervisors of the women staffs or because the work of their branch related to women and the appointment had been made as a concession to public opinion, as in the case of the women in the Ministry of National Service, and the Women's Wages Section, and the Welfare Section, and the Dilution Section of the Ministry of Munitions. The most liberal department in employing women on well-paid work which might have gone to men was the Ministry of Food.

It may be said that, even in the establishment divisions, their appointment represented a victory, for so late as the autumn of 1915 one Service department, employing thousands of women and girls, was refusing to pay any of its women university graduates more than 40s. a week, or to provide the staffs with a single woman in authority to whom they could go in difficulties. Hardly at all, and only by the new type of minister, was the policy pursued of bringing in distinguished women to deal with special women's problems, although men with special experience were brought in by the dozen. Such an experiment would have been of very great value. The demobilization of these enormous bodies of women took longer than had been expected; in fact, it had hardly begun when the passing of the Sex Disqualification (Removal) Act made it necessary for the Civil Service commissioners to consider the terms on which they should be admitted to the higher grades of the permanent service. The task of framing the general principles under which they might enter was entrusted by them to the newly formed National Whitley Council for the clerical and legal departments of the Civil Service, which, as it happened, was preparing to bring forward a scheme of reorganization for the entire service. This scheme, since agreed to by Parliament, provided that, with certain exceptions, women were to be admitted to the general work of the Civil Service with the same status as men. They were not, however, for an experimental period not exceeding three years, to receive the same pay for their

work; and they were not to compete for posts with men but were to be appointed to a special proportion of posts which each department was to reserve for them; nor were they to enter by competitive examination but were to be chosen by a selection board. These conditions, especially that dealing with pay, were accepted by the women's representatives under protest, as they considered that the Civil Service together with the teaching profession were fields in which equal pay was not only eminently just but peculiarly desirable, and its opposite calculated not merely to injure the prospects of the women directly affected but to diminish their opportunities of doing valuable work. It was necessary, however, to accept such terms as part of the temporary bargain, and the Treasury proceeded to appoint a Director of Women's Establishments and to persuade, or endeavour to persuade, those branches of the service—such as the National Physical and Chemical Laboratories—where women scientists selected solely for their ability had been receiving the same salaries as men, to reduce the scales of the women on their staffs in accordance with the new arrangements for the clerical class. They took no steps, however, to admit women to the higher grades of the service, preferring to suggest that the Government should remove from the purview of the Whitley Council the question of the employment of ex-service men in the Civil Service—one of the matters definitely referred to it under its constitution—and hand it over to a committee largely composed of members of Parliament. Under shelter of the recommendations of this committee, which were at once adopted by the Treasury, even though they conflicted with the agreement signed by the same officials, the principle of admitting women to the general work of the service was abandoned, and ex-service men were appointed to all posts of which it could not definitely be said that it was impossible to employ anybody but a woman, including a number which had always been filled by women because they were concerned with the health, welfare, wages, or conditions of women. The appointments were made possible by a process of combing-out which took no account of qualifications, knowledge, or experience, and concerned itself solely with financial considerations.

On Aug. 5 1921 a debate took place in the House of Commons on the regulations framed by the Civil Service commissioners for carrying out the Whitley scheme. It was pointed out on behalf of the women that the regulations ran counter to two separate votes of the House in favour of equality of treatment, and a motion was brought forward designed to secure for women the same pay and the same conditions of service as are enjoyed by men doing the same work. Under pressure from the Chancellor of the Exchequer a compromise was finally accepted under which the regulations were confirmed for three years; a promise was given that after that time women should be admitted in the same way as men—except that the Civil Service commissioners should have power not to appoint a woman to any post for which they considered a woman unsuitable—and work under the same conditions as men, except that they might not marry; and that the question of equal pay was for further consideration. It was also promised that women establishment officers should be appointed in departments employing considerable numbers of women, but a motion to the effect that some women should be admitted to every grade was not accepted.

Industries Chiefly Affected.—The most striking transfers of work from men to women naturally took place in the aircraft and metal munitions trades, because it was they which expanded most during the war, and they also were the objects of special pressure from the dilution authorities. What that pressure amounted to may be shown by the fact that in Jan. 1918 firms working for the Admiralty, which controlled its own dilution, employed 458,000 males and 52,000 females, while firms working for the War Office, Ministry of Munitions and Air Force employed 476,000 males and 235,000 females. In Nov. of the same year the Royal Naval Torpedo Factory, Greenock, employed 2,706 males and 372 females—13.7%; while Woolwich Arsenal employed 40,000 males and 24,000 females, or 60% of females.

Next perhaps comes transport, with its uniformed women driving cars, collecting tickets and acting as conductors, guards, goods porters and signal-women. After these and the land, the change was most easily seen in the brewing industry, and in hotels and public-houses, both of which successfully employed large numbers of women on men's work during the war. Possibly 25,000 women came on to aircraft wood-work during the war.

In aircraft work, women in one Government factory by the end of the war were making the entire fuselage, including the really skilled work of propeller-shaping, and all over the country they were making, covering, and doping the wings, and doing all but the heaviest erecting. This is essentially mass-production work, as every smallest stick is cut to its size before the women touch it, and, as such, it is women's and not men's work, and peculiarly suited to them.

Women's Work Characterized.—It may be said that now for the first time the industrial capacity of women has been minutely considered by critics both hostile, impartial, and biased in their favour. The results of this scrutiny, from whatever source, are favourable, and fairly uniform. The women were more adaptable than the mass of observers had supposed them, they possessed more latent intelligence and greater physical strength, and they withstood far better the effects of monotony. On the other hand, as compared with men, they possess certain general defects which may be summed up as follows: insufficient strength; lack of initiative; lack

of interest in the technical side of their work or desire to improve their position by training or qualifying for work requiring more skill or responsibility; comparatively bad health; lack of care in dealing with machines, materials and tools supplied by the employer; lack of steadiness—shown in the frequency with which they left their situations; their bad time-keeping and irregular attendance. It was also frequently given by employers as a reason against their employment that, where they were working with men, the men's output tended to decrease until it was no more than the women's. Excluding labouring work, they were said as a rule, when on men's work, to be worth two-thirds of a man, but where details were given the discrepancy appeared to be less. On some work—light repetition work or work where skilful fingers were required—they were universally acknowledged to be better than men, turning out more work and more contented. On more skilled work demanding more individual variation they were said to produce from 40% to 60% of a man's output. These complaints were put forward as characteristic of women, but it seems possible that some at any rate were characteristic rather of the conditions under which women work in industry. The first contention—that they lack the strength of men—is of course true, though women are stronger than the pre-war employer with his underfed girls was apt to imagine. The progressive improvement that took place in the health and output of those employed under anything approaching reasonable conditions with regard to hours and lodgings showed the effect that good wages, good food and a certain amount of care will produce in even a few months. Moreover, a great deal of the work that men are now expected to do is not only too heavy for women but too heavy for men as well, and ought not to be imposed on any human being. The result of this is that men employed industrially are more and not less adversely affected by the conditions of their work than women, though their health again is greatly superior to that of married women working in their homes—the most suffering class in the community. But, obviously, women are not so suitable as men for heavy work and cannot be made so by any methods which can be foreseen. The most carefully planned schemes all ended by being prohibitive in cost. Another group of defects, their lack of discipline, their bad time-keeping and bad attendance, were really alleged against the married women hampered by household duties. Single women were as good time-keepers as men. If they changed their situations more often it was often due to preoccupations arising out of the war. They wanted to be near the hospital to which their brother or lover had been sent, or they wished to change from shells to aircraft work because their man had entered the air force. All this population of women was preoccupied: often too they had taken up work for the first time without much considering the wages paid and, as the pinch of the war made itself felt, found themselves obliged to go where they could earn enough to keep themselves.

Their lack of initiative and ambition was put down by the employers as due to their knowledge that the work was temporary, and would be brought to an end either by the end of the war or by marriage. The trade unions frequently added that employers, for the same reason, would not be willing to give women a lengthy training. It is probably true that the majority of wage-earning women are so affected by the expectation of marriage that they are unwilling to expend mental effort on their work. But it should be remembered, on the one hand, that the wages of women before the war were so low as seriously to affect their vitality, and, on the other, that the experiment of offering them training in skilled work had never been made. They are perfectly ready to learn weaving, or the skilled work in the dressmaking and millinery trades. The experience of the war would seem to show that a minority of women would welcome it and benefit by it in other occupations. Another thing shown by the war is that apprenticeship periods for the skilled trades, though convenient both for masters and men as long as the school-leaving age remains where it is, are far longer than is necessary to secure industrial efficiency. A skilled worker cannot be produced in six months, but that does not mean that his apprenticeship must last for five or seven years. If anything were to occur which modified this period the increased employment of women on skilled work would become more feasible.

Lack of initiative, lack of care and lack of attention to detail are more fundamental charges. They are possibly true, though to what extent they are true can hardly be proved by the experiment made under war conditions. Most of the women had been living in circumstances which precluded the development of initiative or a scientific thoroughness. Very few minds show initiative with regard to a totally unfamiliar technique so fenced about with terrors as engineering, so immemorially fixed as work on the loom or so trivial as most clerical occupations. Nor, to put it mildly, was women's initiative encouraged during the war, though without it there would have been no women doctors and no women in the fighting services. And as those responsible for the education of naval officers know, this quality, like others, reacts to stimulation. What is certain is that in the strength and skill of its women the war showed that Great Britain possesses a valuable industrial resource, whose wider use under suitable conditions would benefit both the women themselves and the industries they entered. Before such conditions can be established, however, a number of problems must be faced, including

the determination of the proper ratio of a woman's wage to that of a man performing similar work.
(A. B. W.)

UNITED STATES

In 1916 there were probably about 10,000,000 women wage earners in the United States, comprising about one-quarter of the total number of persons gainfully employed. In manufacturing there were about 1,500,000, three-fourths of whom were in the food, textiles, tobacco and wearing-apparel industries, but very few in those industries producing implements of war. The first demands for women were met, as in England, by drawing seasoned workers from such industries as the lighter textiles, millinery, corset-making, domestic service, laundries, stores and offices. After the supply of seasoned workers was exhausted, efforts were turned toward securing women outside the wage-earning class. Married women, many of them former industrial workers, were urged to return to industry. Part-time work was offered and occasionally a day nursery was established. In one city an organized publicity campaign for new workers resulted, after the first two weeks, in a 50% increase in employed women and after the first four weeks in a 100% increase. It was estimated that about 4,000,000 women were employed in war trades and that 2,500,000 remained in the newer fields in 1919.

English experience taught the American authorities to keep the most skilled men at home where they could continue in their usual fields of work, but in attempting to supply the increased demand for workers two main problems arose; first, to secure women to fill routine or semi-skilled positions; second, to secure in those industries which were greatly swollen by war demands not only routine workers but also skilled employees. The demand for additional women in war industries was well illustrated by conditions in the iron and steel industry, where, in 1916, less than 4% of the employees were women. During the war in every branch of this industry the number of women employed increased, between the first and second draft, from 18% to over 200%. In the industry as a whole the increase was nearly 70%, while the number of men increased only about 5% and in some branches actually decreased in numbers. In 111 plants making explosives only 73 women were reported in 1914, whereas after the second draft, 25 plants employed nearly 12,000 women. In this industry women constituted about half the total employees. In the manufacture of hand grenades, about 19 out of every 20 were women. In one gas-mask plant with 12,000 employees, 8,500 were women.

Industries showing the largest per cent of increase in the number of women after the second draft were cars, steam and electric railways, automobiles, metal and metal products, lumber and its remanufacture, chemicals and allied products. Industries showing decrease in per cent of women employed were textiles, hat and cap making, tobacco and tobacco products. Industries showing the greatest ratio of substitution were motor-cycles, bicycles and parts, cars, steam and electric railways, automobiles, airplanes, seaplanes and parts, ship and boat building, agricultural implements, lumber and its remanufacture and iron and steel; the latter industry substituted by far the largest number of women. In practically no case did all the different establishments in any industry employ women and an even smaller number substituted them for men. The practice of the employment and substitution of women was largely a matter determined by the individual establishment. In iron and steel, for example, out of 2,140 firms reporting after the second draft, only 1,011 employed women and only 430 substituted women for men.

Before the war women were employed in clerical work in connexion with the railways and as ticket sellers on a few street railways. One of the most striking war innovations was the employment of women in such positions as station agents, ticket sellers, cleaners, section hands, and elevator operators, in connexion with the railways, and as conductors on the street railways. It is estimated that by Oct. 1918 there were over 200,000 women employed on the railways, and many large

cities had installed women as conductors on the street cars. In N.Y. State alone 2,180 were substituted for men on the steam roads and 1,346 on the electric roads. In this state a law was passed limiting hours of women on street cars to nine a day and prohibiting night work between 10 P.M. and 6 A.M. In Wisconsin hours were limited to eight a day and night work was prohibited between 5 P.M. and 8 A.M., which practically prevented the employment of women on street cars during the rush periods. Other large cities employing women and limiting their hours were Chicago and Boston as ticket agents, and Kansas City, Detroit and Cleveland as conductors. In the latter city a controversy occurred over their continued employment, involving several hearings before Federal authorities. The men's union was strongly opposed to them and finally secured an agreement with the company to dismiss all the women and reinstate the men which was carried out early in 1919. A similar situation arose in Detroit with a similar result, but in Kansas City the union did not oppose the women and the War Labor Board ordered equal pay for equal work. In most cases the women were out of the service by 1921, but on railway work 81,000 were reported as still employed in Jan. 1920. The majority of these were in clerical positions, but there has been also a permanent increase in the number of women employed as station agents, ticket sellers, watchmen, and in the business offices. When the roads were under Federal control, the minimum monthly salary for clerical positions was fixed at \$87.50, while executive positions often commanded as much as \$225 a month.

Efficiency.—The new fields of work tested, as never before, the abilities of women. Although before the war women were employed in practically every kind of work, they were usually occupied on routine or standardized processes. But the war opened to them a new door. "Instead of 'tending' or 'tripping' or 'feeding work,' measured and marked for her, into a machine especially adjusted or constructed to perform a specialized or standardized process, the emergency created by the war forced the experiment of teaching the woman worker to read blue prints, to understand the characters of different metals, to grasp the purposes and capabilities of various machine tools, to adjust their mechanism, to set up, to measure and to mark her own work and be responsible for its quality as well as for its quantity." In these new fields there were of course failures, due sometimes to personal defects—but more often to ill-advised assignment of tasks, lack of proper instruction and supervision such as was so successfully carried on in English munitions work, and also because of lack of proper equipment and accommodations for women. It must also be pointed out that because of America's shorter war period there was but little time for technical training. Although a few trade schools were utilized, reports indicate that training was usually done by the "foremen," "forelady," "skilled operators," or "the gang boss." On the whole, however, testimony of manufacturers from all parts of the country, as reported by several independent investigations, agreed that the women were unquestionably successful. The output of women, according to 66 firms out of 99 in the important metal trades, "was equal to or greater than that of men in the operations in which both were employed." In another investigation from 50% to 90% of the managers in a variety of industries reported that the production, attendance, and promptness of women was equal to or greater than that of men. Employers stated: "On our 24-in. Fellows gear shapers the women turn out from 20 to 30 more pieces in a 9-hour day than men." "In our filling and burring machines . . . they have increased the production 1,200 pieces in a 9-hour day." The president of a recording and computing machine stated: "In the machine department women became expert and got out much greater production in running turret lathes, punch presses, bench lathes, milling machines, drill presses, grinding machines and engraving machines, and in addition to the operation of these machines we taught them to grind their tools, to act as job setters, and to superintend some of the departments. In the inspection department practically every inspector was a woman. In the assembly departments, as well as in the inspection departments, women were women, and they did better work and got out more production than men whom we tried on the job at various times without success. We found, too, that we could place as much, if not more, dependence on women in coming to their work and remaining on the job, which accounts for our having the lowest turnover in help in any factory ever heard of, which was less than 4% per year. We taught women to inspect tools and check them over according to the drawings after they came from the tool shop, in which department women became expert." Although much of the work done by women was repetitive and semi-skilled, requiring mainly dexterity and lightness of touch, yet testimony shows that they frequently and successfully competed with the highly skilled men.

Standards of Work.—In Oct. 1918 the Women in Industry Service (later the Women's Bureau of the Labor Department) formulated certain standards intended to govern the employment of women. These standards were indorsed by the War Labor Policies Board and after the Armistice were revised to serve as a basis for a programme for reconstruction. The recommendations included the 8-hour day, Saturday half-holiday, one day of rest in seven, and the prohibition of night work between 10 P.M. and 6 A.M. They urged equal pay for equal work and an occupational, rather than sex, determination for wage rates, with a minimum which would cover the cost of living for dependents as well as for the individual. Proper conditions of work were specified, and included the prohibition of employment where poisons which are more injurious to women than to men were used. The standards also urged that joint negotiations between employers and employees be established for enforcement purposes. The War Labor Policies Board ordered all contracts of the Federal Government to require full compliance with the labour laws of the state in which the goods were manufactured.

Hours, Wages and Conditions.—With but few exceptions pressure of work did not reach the high pitch which England experienced, and, on the whole, hours and conditions of employment in the United States did not greatly change as a result of the war; the United States profited also by England's experience in regard to the futility of excessive hours of labour, and although many attempts were made to enact state laws which would abolish or lower the existing standards, public opinion was against this movement and on the whole these attempts failed. Less than a dozen states had laws prohibiting the night work of women and the practice of the Federal Government of referring to the state labour departments for investigation any request for permission to exceed legal hours, resulted in a fairly general conformity to existing legislation. In a few cases where night work was not prohibited by law, women did take their turn in the night shift.

Rates of wages during the war fluctuated greatly and several intensive studies were made. One of the larger studies reported only wage rates and showed that in the majority of cases women's wages were admittedly lower than men's. Probably the most exhaustive study was made in N.Y. State by the Women's Bureau of the Labor Department. This study covered 117 plants and 13,643 women who replaced men. Of these women 56% received only two-thirds to three-fourths of the wages paid the men for the same work. Two-thirds of the women received less than \$15 a week, and only 190 received \$20-\$25 a week. From this study it appeared that wages had practically no relation to production or to efficiency. In 11 plants reporting that women produced more than men not one woman received as much as the men and the majority received about three-fourths of the men's wage. Several states and the Federal Government established minimum wage rates in certain occupations for the war period ranging between \$13 and \$16 per week. A Federal report indicated that in practice the time-rates of women seldom equalled those of men. Piece-rates were frequently the same for both sexes, but the guaranteed wage for the women was usually lower than for men. Another report stated that women's wages ranked about with those of boys—and often with pre-war standards for boys.

General Results.—An important test of woman's efficiency was her permanence in these newer occupations. On this point one investigation reported that "of all plants employing women in men's places over one-half are going to retain every woman so employed, second that 82% are going to retain all or part of the women so employed." In the leading war agency and implement industries the proportion of women per 1,000 wage earners in 1914 was 65; in Oct.-Nov. 1918, 139; in Aug. 1919 the proportion was 100. The reasons for retaining women were of course varied. In addition to questions of efficiency other factors entered. It has already been pointed out that women's actual wages were almost universally lower than men's. Many employers frankly gave as their reasons for retaining women: "greater production at lower wages"; "better work at lower wages"; "they produce more and demand less"; "to fight the union." One report stated that "women are staying at their new posts primarily because they permit manufacture at less cost per unit of production and with less friction between management and workers."

On the whole, and particularly in comparison with England, there was very little special machinery created during the World War to deal with problems of women in industry. Canteens were set up here and there, an occasional day-nursery was established, employment management and personnel work were stimulated, welfare work and supervision were frequently introduced, but there was no large movement to direct and supervise "dilution," no munitions tribunals with their "leaving certificates" and but few attempts on the part of the Government, either state or Federal, to regulate wages. Except in a few cases there were no serious clashes with men's trade unions, and the post-war problem of women in men's places adjusted itself without state interference.

New York, published in 1919 by the Bureau of Women in Industry of the N.Y. State Industrial Commission, N.Y. City; (3) the publications of several manufacturers' organizations, such as the National Industrial Conference Board, N.Y. City, and the chambers of commerce of various cities. (I. O. A.)

WOMEN'S WAR-WORK.—It would be impossible here to attempt to describe the special war-work done by women of all the belligerent countries in 1914-8; and this article is confined to an outline of women's war-work as organized in the United Kingdom and the United States, beginning with the former.

UNITED KINGDOM

The general dislocation which ensued in industry threw numbers of women workers in the United Kingdom out of employment. At the same time women of independent means, moved by patriotism, came forward in large numbers with offers of voluntary service. It soon became apparent that the well-meant action of the non-professional women was likely to press heavily on the position of the unemployed wage-earners; and accordingly on Aug. 20 Queen Mary inaugurated the "Queen's Work for Women Fund," technically a branch of the National Relief Fund, to provide employment for as many as possible of the women thrown out of work by the war. The Queen's collecting committee, with Lady Roxburgh as hon. sec., raised the money, but the administration of the fund was in the hands of the Central Committee on Women's Employment, a Government Committee under the chairmanship of the Marchioness of Crewe, with Mary Macarthur (d. 1921) as hon. secretary. The problem of the Committee was to help to adjust the dislocation of industry, so that unemployed firms and workers in a slack trade might ease the overpressure in other trades. Firms unused to Government work were assisted to undertake War Office contracts, and orders were placed with small establishments employing women, who would otherwise have had to relinquish their businesses. Over 70 special relief workrooms, through which about 9,000 women passed before Feb. 1915, were managed by women's employment sub-committees of the local representative committees set up by the Government Committee on the Prevention and Relief of Distress. Articles made in them were not offered for sale, and were supposed to be educative to the worker. New branches of the toy-making industry, in which there was a possibility of capturing German trade, were started in various private relief workrooms, and became paying business concerns.

The distress among the professional classes caused by the dislocation of work was very great, and the Professional Classes War Relief Council, consisting of representatives from the chief professional institutions and the principal societies organizing relief work, was formed to cope with the trouble in Oct. 1914. The Council dealt chiefly with education, maternity assistance, training, and the organization of concerts for the employment of musicians, who, as a class, were particularly hard hit. The Society for Promoting the Employment of Women opened an educated women's war emergency training fund for a year, which trained out-of-work governesses and journalists to take posts in banks; and hostels were opened by various private committees for ladies in distress owing to the war.

On Aug. 3, before the official declaration of war, the executive committee of the National Union of Women's Suffrage Societies under its president, Mrs. Fawcett, decided to suspend political action (*see WOMAN SUFFRAGE*) and devote the organizing capacity of the Union to meet the changed conditions. Within a week the London branch, with Miss Philippa Strachey as secretary, had started a free bureau under the name of "Women's Service" to direct the efforts of the thousands of non-professional women eagerly desirous of finding useful work. Over 1,300 volunteers were placed before the end of 1914. Many young women began at once to prepare themselves for nursing, joined Voluntary Aid Detachments, and worked in auxiliary hospitals. The raising of funds and making of comforts for the units of the original Expeditionary Force absorbed others, and the arrival of the Belgian refugees in England before the end of Aug. caused the formation of 2,500 local Belgian relief committees, of whom the members were mostly women. Clubs to help the wives of soldiers and

sailors were started by the Tipperary League under Mrs. Juson Kerr, the British Women's Patriotic League, and others. The Women's United Services League under Lady French and Lady Jellicoe coördinated and registered the work done by war clubs throughout the kingdom. A large number of women devoted themselves at once to the work of the Soldiers' and Sailors' Families Associations, and to the work of the Officers' Families Fund founded by the Marchioness of Lansdowne in 1914.

Already in the early months of the war it became evident that the abnormal conditions arising from the quartering of large numbers of soldiers in barracks and camps, and of convalescents in hospitals, would give rise to social dangers, and that steps should be taken to deal with the situation. A militant suffrage society, the Women's Freedom League, formed the Women's Police Volunteers, under Miss Nina Boyle, in Sept. 1914. This Corps was reorganized shortly after as the Women Police Service under Miss Damer Dawson (d. 1920), and Miss Allen. To cope with the same evil the National Union of Women Workers called an emergency meeting of their rescue and preventive sub-committee in Sept. 1914. As a result a corps of "Women Patrols" was formed to work under the official sanction of the Commissioner of Police in the metropolitan district, and of the Chief Constables in the provinces (*see WOMEN POLICE*).

I. Voluntary Organizations and Corps.—The first of the new corps of women called into existence to meet war conditions was the Women's Emergency Corps, originated by Miss Decima Moore, and launched Aug. 6 1914 in coöperation with Miss Lena Ashwell, the Hon. Evelina Haverfield, Miss Eva Moore and Mrs. Kingsley Tarpey. In addition to relief workrooms, and the registration of the innumerable voluntary offers of service characteristic of the first months of the war, schemes were started under its auspices which developed independently, after the parent corps had met the "emergency" conditions of dislocation of labour and refugee relief. The collection of surplus food from the London markets for the unemployed and for Belgian refugees developed into the National Food Fund, which raised £163,615 in gifts of food and money before the end of the war. The Women's Volunteer Reserve, founded in 1914 as a branch of the Women's Emergency Corps by the Hon. Evelina Haverfield, with the Marchioness of Londonderry as hon. colonel-in-chief, "to provide a trained and disciplined body of women ready to assist the State in any capacity," did military drill, wore khaki uniform and saluted their officers. The founders' idea that, as signalers, despatch riders, telegraphists and motorists, they might set men free for the firing line, was premature in 1914, but anticipated the need actually met later by the women of the Army Service Corps and Q.M.A.A.C. In practice the Reserve consisted of working girls who gave their leisure time to organized voluntary work in canteens, hospitals, workrooms and clubs. After Mrs. Haverfield had left the W.V.R. to work in Serbia with the Scottish Women's Hospitals, Mrs. Beatty and Mrs. Kilroy Kenyon formed the Women's Reserve Ambulance (Green Cross Corps) in June 1915, a fresh organization on somewhat similar lines to the W.V.R., but confining its activities mainly to London, whereas the most successful branches of the W.V.R. worked in the provinces till the end of the war. Other somewhat similar corps for the organization of part-time workers were the Women's Auxiliary Force, founded in 1915 by Miss Walthall and Miss Sparshatt, and the Liverpool Home Service Corps. The latter was started in May 1915 by Miss Phyllis Lovell and had branches throughout Lancashire. In Aug. 1915 it formed a Police Aid Detachment which worked in conjunction with the Lancashire police.

Public opinion with regard to the "khaki" women was reflected in a "Punch" cartoon for Dec. 15 1915, showing a gallant Highlander curtsying to take a lady officer's salute. They outlived this ridicule, and in 1918 the salute was officially adopted by the women of the Auxiliary Army Services. Nevertheless by the spring of 1915, when the country began to feel the drain of its man-power, the Marchioness of Londonderry realized that a less military corps of women would attract many of those anxious to come forward to carry on the work of the country. In July she founded the Women's Legion, which from the first was intended to be a corps of paid women replacing paid men. A khaki uniform was worn and the women were subject to regulations and discipline. Ultimately over 40,000 were

enrolled. This corps was the link between the independent voluntary associations of women, such as the Emergency Corps, formed on the outbreak of war, and the official women's services, two of which (described below) were sections of the Women's Legion.

Throughout 1915 and 1916 efforts were made by voluntary organizations such as the Women's Legion and the Women's Defence Relief Corps, under Mrs. Dawson Scott, as well as by the Government, through the War Agricultural Committees of the Board of Trade, of which 63 had been set up before July 1916, to induce women to offer their services on the land and to persuade farmers to accept them. The Women's Farm and Garden Union was the most important of the bodies which had dealt with women's work on the land before the war, and, realizing that each individual woman was an object lesson for good or ill to the farmers whose favour had to be won, the Union started a system of training farms in the autumn of 1915. Early in 1916 the Government provided a grant, and the Women's National Land Service Corps under Mrs. Roland Wilkins was launched as a war off-shoot of the Farm and Garden Union, to deal with emergency war-work on the land. By the end of the year the demand for women had become greater than could be met by a small voluntary association, and, as the result of a deputation from the Corps to the Minister of Agriculture, the Women's Land Army was instituted early in 1917 as a Women's Branch of the Board of Agriculture. The Corps continued to act as the agent of the Land Army for organizing the supply of educated women as seasonal workers. In all 9,022 workers were sent out, and in 1918 the flax harvest was saved by 3,835 holiday workers from the Corps.

By the spring of 1915 shell-work for women was beginning; in March women tram conductors started work at Glasgow, and girls were employed as telegraph operators in Liverpool. But women were impatient at the slowness of the progress of industrial substitution and at the uselessness of the Women's War Service Register compiled by the Board of Trade in March 1915. The suffrage societies urged the Government to face the need for the recognition of the claim of women to be employed on war production, and in July 1915 a procession and deputation to Mr. Lloyd George was organized by Mrs. Pankhurst to assert this claim. In connexion with the demand for skilled workers, the London Society for Women's Suffrage, which promoted the introduction of women into occupations hitherto reserved for men, started a Munitions and Aircraft Department in July 1915, and arranged the first training classes in oxy-acetylene welding. The pupils were the first women welders to enter the engineering trade, and after two years the Ministry of Munitions assumed financial responsibility for the school.

Messrs. Beardmore in Glasgow and Messrs. Vickers at Barrow-in-Furness and at Erith employed women on shell-making in the spring of 1915. In order to ease the strain due to Sunday work, a band of Women Relief Munition Workers, educated women of the leisured class, were organized by Lady Cowan and Lady Moir and trained in the rough turning and boring of 4.5 shells and 18-lb. shrapnel at Erith; they bound themselves after training to undertake week-end shifts for six months.

In 1915 and 1916 work in canteens, hostels and clubs, formed by voluntary agency in connexion with the welfare of munition workers, absorbed a large number of voluntary women workers. Lady Lawrence obtained permission to enter the almost sacred precincts of Woolwich Arsenal in May 1915 and organized the Munition Workers Canteen Committee, which provided light refreshments at many munition factories and had 1,250 workers. The movement for establishing munition and dock workers canteens, essential for the health of the worker and the consequent output of munitions, dates from this initial effort. About 500 canteens for munition and dock workers were started by 12 voluntary societies:—the Munitions Auxiliary Committee of the Y.M.C.A.; the Y.W.C.A.; the Church Army; the Salvation Army; the Church of England Temperance Society; the National Peoples' Palaces Association; the Y.M.C.A., Scotland; the British Women's Temperance Association, Scotland; the Glasgow Union of Women Workers; the Women's Volunteer Reserve; and the Women's Legion. The latter employed 2,000 paid whole-time canteen workers, but it is estimated that over 10,000 voluntary part-time workers were in attendance at less than 130 out of the 500 canteens.

The Munitions Auxiliary Committee of the Y.M.C.A. under the presidency of Princess Helena Victoria opened 183 of these 500 canteens and had over 10,000 women workers. In all, between 35,000 and 40,000 women gave their services to the Y.M.C.A. in England during the war. The canteen work was undertaken to meet an emergency and to set the canteens going more quickly than would have been possible under any other system. But it was wasteful of voluntary labour, and in 1916 the Central Control Board became the responsible authority for the organization of industrial canteens in munition works throughout the country, and encouraged the employment of paid workers.

The steady withdrawal of men from civilian to military life led in 1916 and 1917 to a remarkable expansion in the scope and volume of women's work (see WOMEN'S EMPLOYMENT). The growth of the Women's Services, and the demand for women as substitutes for men in industrial occupations and in the Civil Service, caused a consequent diminution in the number of voluntary workers and in the relative importance of the voluntary corps.

II. The Women's Services.—The Women's Services were of two types. First came those composed of "enrolled" women in the legal sense, who were in the direct employment of the War Departments, and whose contracts brought them within the regulations of the Defence of the Realm Act. The women could be enrolled as "mobile" workers for home service only, or for service at home and abroad; or as "immobile" workers, recruited for local employment, who could not be required to move away from the district. Secondly came those composed of "non-enrolled" women in the legal sense, who did not render themselves liable to penalties under the Defence of the Realm Act and might be engaged on an annual or weekly contract. Some services enrolled their women for a year only and others for the duration of the war.

(A.) ENROLLED WOMEN

The Army Nursing Services.—Before the war the only women's auxiliary army services in existence were Queen Alexandra's Imperial Military Nursing Service and Reserve, and the Territorial Force Nursing Service. The V.A.D.s, founded in 1909 under the British Red Cross Society and Order of St. John of Jerusalem, developed a section of 12,000 V.A.D. nursing members, enrolled under the War Office in 1915 for service in military hospitals, and a section of 6,000 General Service members, enrolled for general service in connexion with military hospitals in 1917.

The Q.A.I.M.N.S. expanded from a corps of 800 trained nurses to 10,304; and the T.F.N.S. from 2,738 nurses ready to serve when war broke out to 8,140 (see NURSING).

The Military Massage Service.—The Military Massage Service started its career in Aug. 1914 under the name of the Almeric Paget Massage Corps. It was maintained by Mr. Almeric Paget (afterward Lord Queenborough) and Mrs. Almeric Paget (d. 1916), and consisted of 50 fully-trained masseuses who, early in Sept. 1914, were distributed among the principal military hospitals in the United Kingdom, this number being shortly increased to 100. Lady Essex French was hon. secretary.

The next development of the work of the Corps was in Nov. 1914, when a massage and electrical out-patient clinic was opened in London for the treatment of wounded officers and men, financed till Dec. 1920 by Mr. and Mrs. Paget. During the war over 200 patients were treated in the clinic daily. It was inspected by the Director-General Army Medical Service in March 1915 and subsequently became the model for the massage and electrical departments in the convalescent hospitals and command depôts throughout the United Kingdom. Early in 1915 the War Office officially recognized the Corps by making it the body to which all masseuses and masseurs engaged for service in military hospitals must belong. An advisory committee was instituted by the War Office, which laid down the standard of training and qualifications required and formed sub-committees to select the candidates. Thus the admission of untrained or partially trained personnel was prevented, and the interests of the patients and of the massage profession were safeguarded.

In Dec. 1916 the word "Military" was added to the title of the Corps, and in Jan. 1919 it became known as the Military Massage Service by Army Council Instruction.

It was not until Jan. 1917 that military masseuses were required for service overseas, but from that date up to six months after the signing of the Armistice 56 masseuses served in France and Italy; 3,388 masseuses and masseurs had been enrolled in the service and there were over 2,000 actually at work on the day the Armistice was signed. (The Regulations for the Corps are set out in A.C.I. 779, 1,262 and 1,146 of 1917, and 65,308 and 489 of 1919.)

The Women's Legion, Cooks and Motor-drivers.—In July 1915, a scheme was originated by the Marchioness of Londonderry, founder and president of the Women's Legion, which was approved by the Q.M.G., and put into operation at Dartford Camp convalescent hospital, for taking over the whole of the kitchens and installing women cooks. The objects were to release men for the work which women could do; to improve the cooking and cleaning of the camps and to introduce economics and variety in the feeding of the troops. The experiment proved a success; other camps were taken over, and an A.C.I. of Feb. 1916 defined the position of the cooks. The first Commandant was Miss Lilian Barker who, when she became welfare superintendent at Woolwich Arsenal, was succeeded by Dame Florence Leach, Mrs. Long, who lost her life in the torpedoing of the "Warilda," was hon. secretary. Ultimately 4,000 women cooks and waitresses replaced men in camps and convalescent hospitals in Great Britain; they signed a contract for a year, but were not enrolled until the organization became part of the Women's Army Auxiliary Corps in Sept. 1917. Those who transferred retained the right to wear the Women's Legion badge.

Women motor drivers, mechanics and storekeepers were first employed as substitutes for men of the R.A.S.C. in April 1916, and of the R.F.C. in the following September. The women were recruited and put into uniform by the Women's Legion under Miss Christobel Ellis, and were paid by the army. There was no enrolment until the Section was taken over by the W.A.A.C. in 1917.

This arrangement lasted only a few months, and in Nov., at the instigation of Lady Londonderry, the army abandoned the scheme for centralizing the administration of women working in the army in one corps, and it was decided that overseas drivers should enrol in the W.A.A.C., but that drivers for home service should again belong to the Motor Transport Section of the Women's Legion. They were enrolled for a year only, instead of for the duration of the war, as in the W.A.A.C., and came under the Q.M.G.'s Department; 647 Flying Corps drivers were transferred to the W.R.A.F. in 1918. Ultimately about 2,000 women were attached to areas and battalions throughout Great Britain, and after the Armistice several hundred drivers were sent to France to replace the demobilized mechanical transport men.

Women's Forage Corps, R.A.S.C.—In July 1915, women supervisors were enrolled under the War Office for the duration of the war to arrange for the transit of hay from the farm to the station and to forward it to its ultimate destination. The urgent need for increased substitution caused a special women's branch of the Forage Department, known as the Women's Forage Corps, to be inaugurated in March 1917 under Brig.-Gen. Morgan. Mrs. Athole Stewart was appointed superintendent and 4,200 women were enrolled as 1st. and 2nd.-grade officers and industrial members, for a year or the duration of the war. They were distributed throughout Great Britain and Ireland and wore khaki uniform. The industrial members took the place of privates in the R.A.S.C. and worked as hay balers, sack makers and menders, sheet repairers, thatchers, chaffing hands, transport drivers and clerks. The substitution of women did not depreciate the quality of the work.

Queen Mary's Army Auxiliary Corps.—In Dec. 1916 the War Office ordered Gen. Lawson to enquire into the number and physical categories of men employed out of the fighting area in France. On Jan. 16 he reported that in his opinion 12,100 men might be replaced by women to begin with. He added:—"In the last year or more in England the employment of women has developed to an immense extent through lack of men, and has been attended with remarkable success. Women have taken up various forms of male employment, which, by many, had been deemed impossible for the sex. They have found their way into work in all branches of life and have proved their capacity for it. In the army at home the success has been conspicuous and women are to be found working in numerous offices and cooking in many of the home military establishments. Results have shown that the sex difficulty has not been anything like what some have predicted. The women have been hard at work and felt they were out for the job and the men have respected them, and their experience at home has been, I understand, almost unanimous in this respect."

On Jan. 24 1917 the suggestion was put forward by Sir Nevil Macready, adjutant-general, that women employed in the army should be part of the army, entirely distinct from any outside organization and established in the War Office under his Department. This scheme materialized under the name of the Women's Army Auxiliary Corps, known popularly as "W.A.A.C.'s." Mrs. Chalmers Watson took up her duties as Chief Controller at Headquarters on Feb. 18 and Dame Helen Gwynne Vaughan as Chief Controller in France. Below the Chief Controllers were a staff of controllers and administrators, all women. A special branch of the War Office, known as A.G. 11, was formed to assist in getting the Corps into working order so that it could fit into the army machinery. A Women's Auxiliary Corps of the R.A.M.C. organized the medical boards in England and France, of which Dr. Jane Turnbull was president at home, and Dr. Laura Sandeman in France. At the end of a year Mrs. Chalmers Watson resigned for urgent family reasons, having accomplished the pioneer work of the Corps and won a recognized position in the army for her women in the face of many difficulties. She was succeeded by Dame Florence Leach, then known as "Controller in Chief." When Dame Helen Gwynne Vaughan was made Commandant of the W.R.A.F. in Sept. 1918, Miss L. Davy became Chief Controller in France. The full charter for the organization of the Corps was finally completed at the end of June 1917.

The women were enrolled as mobiles for home service only, or for home or foreign service, and for the duration of the war; they received a special rate of pay, not civilian or military, and were not enlisted under the Army Act. At first substitution overseas only had been contemplated, but by March the number of women recruited by the Department of National Service was so great that Home Commands were included in the scheme. Recruiting was afterwards carried on through the Employment Department of the Ministry of Labour. In Dec. 1917, owing to the shrinkage of available woman-power, an immobile branch was formed. Women employed in the Ordnance Army Pay Department and Record offices at home were not made to join the Corps. A khaki uniform with distinguishing badges was worn. In all there were 1,200 officials and 56,000 women, of whom 9,500 were the outside number employed in France at any one time. This figure was made up of women working in the Calais, Boulogne, Etaples, St. Omer, Abbeville, Dieppe, Rouen and Havre areas and on the lines of communication, chiefly at army schools, and in certain offices at G.H.Q. A number were employed with the Expeditionary Force canteens, mostly at officers' clubs. They were drafted to every type of office and domestic employment, and to bakeries, ordnance and motor transport

depôts. In the spring of 1918, when the R.A.F. was formed, 7,000 women, including nearly the whole of the immobile branch of 1,800, transferred to the W.R.A.F.

When the American Expeditionary Force arrived in France and was prevented by shortage of transport from bringing over American women clerks, 500 members of the Corps under a Chief Controller, Miss Hornblow, who was succeeded by Miss Gordon and finally by Mrs. Vernon Lloyd as Deputy Controller, were transferred to the American camps at Bourges and Tours. Mrs. Vernon Lloyd was subsequently made Deputy Controller in Cologne, where over 100 Q.M.A.A.C. officials were employed with the army of the Rhine in the Censor's Department, under the provost marshal, and in ordnance. A small contingent was attached to the British military mission in Berlin for over a year. Queen Mary assumed the title of Commandant-in-Chief of the Corps in the spring of 1918.

A Q.M.A.A.C. unit attached to the Director-General of Graves Registration at St. Pol was in being in 1921.

Women's Royal Naval Service.—The W.R.N.S. was instituted as part of the navy at the end of Nov. 1917 when Sir Eric Geddes, the First Lord of the Admiralty, outlined what was required. The Director, Dame Katharine Furse, was asked to put up a scheme for the organization of the service, which was accepted with small amendments giving her more powers than she had set out. She had the opportunity of starting with a staff of women of considerable experience in organization and asked for Miss Edith Crowley to be appointed as her deputy. The Director was the executive head, responsible only to the Second Sea Lord. No naval officer was available to assist her, and from the first the navy encouraged the greatest possible independence in the organization of the service. The formation of another service of women under the Air Board was already in contemplation, so that the W.R.N.S. (or Wrens) was from the first organized with a view to handing over all the members working in Royal Naval Air stations; 2,033 ratings were transferred to the administration of the W.R.A.F.

For the purpose of calculating allowances the following relative ranks were agreed to:—

W.R.N.S.	R.N.
Director	Rear Admiral
Deputy Director	Commodore (2nd class)
Assistant Director	Captain
Medical Assistant Director	
Deputy Assistant Director	Commander
Divisional Director	
Deputy Divisional Director	Lt.-Commander
Principal	
Deputy Principal	Lieutenant
Assistant Principal	
Quarters Supervisor	Sub-Lieutenant
Superintending Section Leader	
Chief Section Leader	Chief Petty Officer
Section Leader	Petty Officer
Leader	Leading Hand
Woman	Seaman

There were 12 Divisions: Devonport, Portsmouth, The Nore, Harwich, London, Humber, Tyneside, Scotland, Ireland, Liverpool, Cardiff and the Mediterranean. After the Armistice, stations were set up at Ostend and Zeebrugge under the Nore Division.

The ratings were enrolled for the duration of the war and paid on a civilian basis. Coöperation with the Employment Department of the Ministry of Labour on similar lines to that already set up in connexion with the Q.M.A.A.C. was arranged for the purpose of recruitment. As it is estimated that at the time when the W.R.N.S. was being formed over a million and a half additional women had already been drawn into industrial and commercial occupations, as munition workers and substitutes for men in the Forces, the recruiting up to the high standard required was made more difficult; but in spite of this excellent results were obtained. The service consisted of women living in hostels (mobiles) and of women living in their own homes (immobiles) in almost equal proportions. The women were largely recruited from naval families, and this contributed to the keen service spirit shown.

A total of 608 officers were appointed; 6,880 women were enrolled and 785 absorbed from women already employed in naval establishments, before the formation of the Wrens. On Nov. 21 1918, the date of maximum strength, there were 6,392 ranks and ratings.

The officers, other than those engaged in the organization, welfare and discipline of the women, replaced naval officers for the following work:—coding and decoding, intelligence work, confidential books, secretaries, telephone exchange, paymasters, accountants, gas mask work, and observation station. The ratings were employed as ledger clerks, clerks, shorthand typists, victualling store assistants, telephone operators, postal sorters, stewards, cooks, general domestic workers, orderlies and messengers, porters and storewomen, bakers, tailoresses, gas mask workers, gardeners, fitters, turners, boiler cleaners, boot cleaners and painters, wiring hands, net mine workers,

depth charge workers, armourers, sailmakers, tracers and draughts-women; photographic workers, technical storekeepers, valve testers and wireless telegraph operators.

Blue uniform with distinguishing badges was worn by all ranks and ratings. The service was demobilized in Dec. 1919.

The Women's Royal Air Force.—On April 1 1918 the R.A.F. was formed by the amalgamation of the R.F.C. and the R.N.A.S. Seven thousand women in Q.M.A.A.C. and 2,033 in the W.R.N.S. had been attached to R.F.C. units and to R.M.A.S. stations before the amalgamation. These were transferred to the W.R.A.F. and formed the nucleus of the service. The chief superintendent was Lady Gertrude Crawford, who was succeeded in May 1918 by Miss Violet Douglas Pennant as Commandant. Dame Helen Gwynne Vaughan, hitherto Chief Controller Q.M.A.A.C., France, was appointed Commandant in Sept. 1918. Mrs. Pratt Barlow was Deputy Commandant, and Miss K. Curlett Assistant Commandant over-seas.

Five hundred and sixty-six officers and 31,764 other ranks passed through the Service, the strength at the time of the Armistice being rather over 25,000. (The constitution and regulations were similar in outline to those of the Q.M.A.A.C. and the W.R.N.S.) The Service consisted of mobiles and immobles in approximately equal proportions. In addition to the administrative, clerical and domestic work common to all the Services, the women were employed on meteorological work and as despatch riders, dopers, painters, acetylene welders, carpenters, magneto repairers, photographers and drivers. Fabric workers did duties of all kinds from the covering of aeroplane wings to the mending of the finest balloon silk. The uniform was first khaki, then blue, with the badges of the R.A.F.

The corresponding rank of officers and other ranks is shown below:

W.R.A.F.	R.A.F.
Commandant	Air Commodore
Deputy Commandant	Group Captain
Assistant Commandant Class 1	Wing Commander
" " " 2	Squadron Leader
Administrator	Flight Lieutenant
Deputy Administrator	Flying Officer
Assistant Administrator	(Pilot Officer)
	Observer Officer
Senior Leader	Warrant Officer 2
Chief Section Leader	Sergeant
Section Leader	Corporal
Member	Aircraft man

The medical arrangements for the W.R.A.F. were in the hands of Director of Medical Services R.A.F. under whom Dr. Lætitia Fairfield served as Woman Medical Director. A woman medical officer was on the medical staff of each of the R.A.F. Areas, and a medical woman was detailed for duty at each of the W.R.A.F. depôts and larger camps. They had hon. rank corresponding to that of the R.A.F. medical officers and by means of regular inspections and efficient care, preserved a high standard of health.

In March 1919 the first overseas draft embarked for service in France and 500 officers and other ranks formed part of the Air Force of Occupation on the Rhine. Demobilization took place March 31 1920.

In relation to the W.R.A.F. the experiment was tried of running a women's service as nearly as possible (having regard to the fact that the women were enrolled and not enlisted) as a part of the force to which it was attached. This correspondence was carried out through the usual Air Force channels; officers and other ranks of the W.R.A.F. were under the orders of senior R.A.F. officers; women officers were attached to the staff of the Air Officers commanding areas and were allowed to sign for them letters dealing with the W.R.A.F.; the officer in charge of W.R.A.F. inspection was a member of the staff of the Inspector General R.A.F. and the Commandant was stated in Air Ministry weekly orders to be on the staff of the Master General of Personnel and instructed to sign letters dealing with W.R.A.F. in the same way as directors and heads of independent branches; so that her correspondence, like theirs, carried the authority of the Air Council. The same principles were followed in the medical arrangements. By these means the need of a special section of R.A.F. officers dealing with the W.R.A.F. was obviated; economy was effected, and the administration of the W.R.A.F. was carried out on Air Force lines. The result was indicated by the terms of Air Ministry Weekly Order No. 1110 (promulgated Oct. 7 1920):

"In issuing orders for the final disbandment of the W.R.A.F. the Air Council desire at the same time to express their appreciation of the good work done by the Force both during and after the period of hostilities. In spite of much difficulty and in the face of hostile and unjust criticism, the W.R.A.F. has left a record of which it can well feel proud. During hostilities the good work it accomplished went far towards enabling the R.A.F. to reach that dominating position in the air which had such a direct influence in the achievement of the final Victory. Subsequent to the Armistice, when it was necessary to disperse a large number of airmen to civil life, it was the W.R.A.F. which made it possible for the R.A.F. to meet the demands made upon it, and maintained the services at the Aerodromes until new male personnel could be enrolled. The necessity for the demobilization of the W.R.A.F. is now imperative, but in returning

xxxii.—34

to civil life, Commandant Dame Helen Gwynne Vaughan, D.B.E., Officers and Members may feel assured that they carry with them a debt of gratitude from the Nation."

(B.) NON-ENROLLED WOMEN

Anti-Gas Department.—On April 22 1915, at the battle of Ypres, the Germans first made use of poison-gas, and within 36 hours some sort of improvised mouth pad had been issued to every man in the line. Anti-gas work was begun at once, and men worked night and day to devise a really sound method of protection. Early in June 1915 Miss Beaver was appointed superintendent of the Camden Laundry Smoke Helmet Impregnating Station, where the work of drying and packing gas helmets had been largely carried on by members of the Women's Emergency Corps. When it was decided that gas helmets could be repaired for re-issue after use at the front, Miss Beaver and Miss Carey Morgan were sent out by the War Office to organize depôts for repair work with French labour at Abbeville and Calais. They were at once given the status of officers of the Army Ordnance Department, but were not actually gassed till June 1916. They wore a nigger brown uniform with the badges and buttons of officers of the Army Ordnance Department. Six V.A.D.s were attached to the Abbeville depôt and four to Calais; they afterwards transferred to the W.A.A.C. as Administrators. The French depôts closed down when the "box respirators" had superseded the helmet types and the repair as well as the manufacture was carried out in England.

Practically the whole of the work on gas-mask manufacture was performed by women. There were 34 factories employing 12,000 under the immediate control of the Anti-Gas Department and 160 contractors employed a further 90,000 on work for the Department. In Aug. 1917 a number of educated women were trained for inspection work on the mask of the respirator and drafted out to the factories. They wore an indoor uniform of scarlet and were called "red-coats." Ultimately 800 to 1,000 of these were appointed, and 100 were promoted to the duties of check inspecting, formerly performed by sergeants of the Anti-Gas Department. They were known as sergeants also, and were interchangeable with the men. A few lady superintendents were appointed over "sergeants" and "red-coats," and Miss Carey Morgan was made officer in charge of the principal repair factory. In all about 50,000 respirators were issued.

Army Pay Corps.—The Army Pay Department was one of the earliest in the army to substitute female clerks. In July 1915, 479 were working and by Jan. 1 1916 there were 4,556 female clerks and 13 lady superintendents. The engagement was a weekly one and there was no form of contract till Aug. 1917. By that time the demands made for women by the W.A.A.C. and other organizations were so insistent that a form of agreement to serve for the duration of the war and three months afterwards was signed by the superintendents and a portion of the women doing skilled and semi-skilled work. These wore a ludge but no uniform, and by March 1918 there were 5,171 of them out of a total of 17,500. Miss Constance Holmes, lady inspector, was responsible for the welfare of the women under Sir J. T. Carter, "Accounts 2" War Office, who was "at a loss to find words to adequately express his appreciation of the valuable work performed by the Women Clerks for the Army Pay Department during the war."

Army Remount Department.—Owing to the withdrawal of male personnel from Remount Depôts, women accustomed to hunting and to the superintendence of considerable stables of horses, were employed on remount work early in 1915. The first women's establishments were organized near Pangbourne by Mr. Cecil Alden, who worked on a contract basis for the War Office, employing what labour he chose. In 1915 he had 10 depôts for the stabling of 520 convalescent horses from veterinary hospitals in the vicinity of Aldershot, and half the depôts were staffed by women. They did the entire work from beginning to end, and horses were issued fit to units direct from their stables.

The next women's depôt was organized near Chester by Mrs. Rigby, and from these beginnings the employment of women spread until nearly 200 were working as grooms in 15 depôts directly under the Remount Department. The Charger depôt at Russley Park under Lady Birkbeck was the largest staffed entirely by women, and at Dr. Rimington's depôt near Chester women schooled horses rejected by their units as incurably vicious.

Navy and Army Canteen Board.—When the Navy and Army Canteen Board (then called the "Army Canteen Committee") started operations in April 1916, only 20 women clerks were employed. During 1917 the Board's activities were enormously expanded to include catering for the Imperial Overseas Forces and for the American and Allied Troops. It was decided in March 1917 to institute a N.A.C.B. Women's Corps in mobile and immobile sections, and by the date of the Armistice the women employed in connexion with canteen organization in the mobile corps numbered 10,000 and the clerical staff in the immobile corps 2,000. After the Armistice 500 members of the Q.M.A.A.C. and 8 officers were transferred to the N.A.C.B. Women's Corps to carry on the work in France during the dispersal of British troops, and 120 went with the army of occupation to Cologne. Although the women wore uniform and were under the orders of the chief superintendent working under the Department of the Controller of the N.A.C.B., they were

not enrolled. The written agreement signed had no binding force and they could leave when they liked.

In addition to these groups of non-enrolled women in the direct employ of the War Departments, there were at the time of the Armistice 5,000 civil service clerks working on Army Records, 10,000 clerks employed by the War Office, and 17,500 miscellaneous industrial workers belonging to the Hospital Labour Staff, and the A.S.C.

Women's Land Army.—In Jan. 1917, a Women's Branch of the Food Production Department of the Board of Agriculture was set up under Dame Mariel Talbot as Director and Mrs. Alfred (Dame Edith) Lyttelton as Deputy Director. Two appeals were issued for the Branch by the Women's Section of the Department of National Service in March 1917; the first appeal to women to join a mobile Land Army on a year's enrolment ultimately secured 45,000 recruits, of whom half had to be rejected on medical and other grounds; the second appeal to village women for their part-time services, under the organization of group leaders and forewomen in the Land Army, gradually trebled the number of part-time workers already on the land.

Arrangements for recruitment were subsequently revised, and a scheme of co-operation between the three Departments concerned (viz. Board of Agriculture, Women's Branch, Ministry of Labour Service and the Employment Department, Ministry of Labour) was adopted early in 1918. Under this scheme women were given a choice of enrolling for a year or for six months, and arrangements were made with the Women's Forage Corps, R.A.S.C. and the Forestry Corps, Timber Supply Department, Board of Trade, for their recruits to be dealt with by the same machinery. With regard to Scotland a Scottish Women's Land Army was formed on somewhat parallel lines in which 1,816 women were enrolled. In addition 6,860 unenrolled women were placed in agricultural work. The employment of women as part-time workers was also stimulated and organized, and it is estimated that there were in Sept. 1918 300,000 women part-time workers and 16,000 whole-time workers actually engaged in agricultural work in England and Wales. This triumph, in the face of innumerable difficulties and at the cost of an elaborate and expensive organization, was due to the combined efforts of the Women's Branch at Headquarters, and the Women's War Agricultural Committees. These Committees set up in each county by the Board of Trade in 1915 and 1916 acted as its agents and conducted the local administration of the Land Army by means of the 13,000 women who served on them in a voluntary capacity. Between March 1917 and May 1919, 23,000 women passed through the training centres. Returns relating to 12,657 women made in Aug. 1918 show the distribution of the types of work done: 5,734 milkers, 293 tractor drivers, 3,971 field workers, 635 carters, 260 ploughmen, 84 thatchers, 21 shepherds.

The workmanlike and becoming uniform of overall, breeches and leggings contributed largely to the success of the Corps.

Special steps were taken to supply workers for seasonal work in connexion with the fruit crops, flax weeding and pulling and potato picking; co-operation was established by the Employment Department of the Ministry of Labour with the National Land Service Corps, who by arrangement with the Board of Agriculture undertook the supply of educated women for holiday work.

The work being done for food economy in the villages by the Women's Institutes (which had been founded in England in 1915 by the Agricultural Organisation Society, on the model of those in Canada) was so important that a special section of the Women's Branch of the Food Production Department was formed in 1917 to undertake their propaganda. These Institutes bid fair to become a permanent feature of country life, and owe much to the increased interest in rural matters due to the widespread employment of women on the land during the war.

Women's Forestry Service.—The Women's Forestry Service under Miss Rosamond Crowdy was instituted under the Timber Supply Department of the Board of Trade in 1917. In 1916 a considerable number of women had been employed by contractors in the cutting and measuring of timber, but it was not till early in 1917 that the first two Government camps for training women in the felling and preparation of timber for sleepers and pitprops were opened by the Women's Section of the Department of National Service, acting as agents for the Timber Supply Department of the Board of Trade. The first Government training camp for timber measurers was started in Aug. 1917 at Wendover under Mrs. Donald, through which 570 educated women passed. They learned to measure and mark off where a tree should be sawn and find the cubic contents of the logs, and were afterwards put in charge of timber gangs consisting of 20 to 30 cutters. In some cases women had the entire charge of a saw-mill with men working under them. The two camps for cutters were given up, as it was found that training was unnecessary when the women were put out to work in gangs under skilled forewomen. Private employers were supplied with 144 such gangs for felling, cross cutting, marking and measuring of timber between 1917 and 1919. About 3,000 women were engaged on the work, and wore an appropriate uniform with distinctive badges.

The King's Thanks.—On June 29 1918, an address of homage was presented to the King and Queen on the occasion of their silver wedding by the Chief Woman Inspector, Employment Department,

Ministry of Labour acting on behalf of the organizations of full-time women workers engaged on work of national importance under the control of state departments, and of whole-time women workers engaged in public utility services under local authorities. A procession of 2,540 women in uniform led by the V.A.D.s as the senior service, formed into six companies, eight abreast, facing the dais in the quadrangle of Buckingham Palace. Princess Mary stood by the King and Queen wearing her V.A.D. uniform. The King's reply to the address of homage contained the following words:—

"When the history of our Country's share in the war is written no chapter will be more remarkable than that relating to the range and extent of women's participation. This service has been rendered only at the cost of much self-sacrifice and endurance. Women have readily worked for long hours and under trying conditions in our factories and elsewhere, to produce the supplies of munitions which were urgently needed at the front and to maintain the essential services of the country. As nurses and V.A.D. workers they have laboured in hospital for the care of the sick and wounded with even more than the accustomed devotion which has characterized our Red Cross Service since the days of the Crimean War. They have often faced cheerfully and courageously great risks, both at home and overseas in carrying on their work, and the Women's Army has its own Roll of Honour of those who have lost their lives in the service of their country. Some even have fallen under the fire of the enemy. Of all these we think to-day with reverent pride."

Only the women actually belonging to the Army, Navy and Air Force took part in the Peace Procession. The W.R.N.S. marched with the Navy and Q.M.A.A.C. with the Army. The Army Nursing Services, the V.A.D.s, the F.A.N.V., and the Military Massage Service formed part of the R.A.M.C. contingent; the Women's Legion and the Forage Corps marched with the R.A.S.C.; and the W.R.A.F., incorporated with the R.A.F., brought up the rear.

III. Voluntary Organisations.—When war broke out there was an eager desire on the part of professional and non-professional women to work in France and Belgium. The passport restrictions were less stringent at first than they afterwards became, but it was never easy for women to obtain permission to work in France in connexion with the British armies. The French and Belgians, who had fewer trained women workers of their own, and were in greater need of help at the beginning of the war, accepted offers from organizations which the British authorities had rejected. Thus the privilege of undertaking the considerable amount of work actually performed by women in connexion with the British armies, even before the formation of the Q.M.A.A.C., had been won with difficulty and was highly valued.

In 1914 Rachel, Countess of Dudley (d. 1920), Lady Sarah Wilson, the Duchess of Westminster, Lady Norman and Lady Hadfield established hospitals for the British at the bases in France in which every bed was of value in the early days of stress. After a few months the army took over Lady Dudley's hospital as No. 32 Stationary; the Duchess of Westminster's became No. 1 Red Cross and Lady Hadfield's No. 5 Red Cross. In 1916, the units of Millicent Duchess of Sutherland and of Lady Murray, which had previously been open for the French, were accepted for the British as No. 9 Red Cross and No. 10 Red Cross. These voluntary units were staffed with Red Cross and St. John's nurses, who were encouraged to enrol in the Army Nursing Services when they had obtained a knowledge of active service conditions. Nursing V.A.D.s were employed from the beginning in addition to hospital orderlies. Princess Louise's convalescent home for nursing sisters was opened at Hardelet in 1914 by Sophie Lady Gifford under the British Red Cross Society, and transferred to Cannes in 1917 as a winter home for the sisters.

On Aug. 12 1914 Dr. Garrett Anderson and Dr. Flora Murray offered the services of a hospital unit staffed by women doctors and nurses to the French wounded. Within a week the offer was accepted and within a month the unit, which was the first formation to be entirely officered by medical women, had collected sufficient funds and started for Paris, under the name of the Women's Hospital Corps. Owing to the pressure of work in the north at the end of Oct. Dr. Garrett Anderson and Dr. Flora Murray decided to divide their staff and establish a branch of the unit at Wimereux. This new hospital was accepted by the British Army Medical Service. In Feb. 1915 Sir Alfred Keogh offered the Women's Hospital Corps the charge of a military hospital in London which opened at Endel Street in May.

In 1916 85 women doctors were attached as civil military practitioners to the R.A.M.C. at Malta to help care for the 27,000 wounded in the hospitals. As this experiment proved a great success, 39 others were sent with R.A.M.C. units to Salonika, and in Jan. 1918, the first medical women, of whom there were ultimately 36, went to Egypt. Four women doctors were attached to British military hospitals in France. They did not wear a distinctive uniform, and none of the 331 medical women who served under the War Office at home and abroad held military rank.

Women belonging to the Red Cross organisation worked at the British Red Cross Society headquarters in France, recruiting Red

Cross nurses and tracing the wounded and missing. On Oct. 21 1914 the first V.A.D. unit, composed of 16 members and 2 trained nurses, under Dame Katharine Furse as officer in charge, arrived at Boulogne. On Oct. 26 they founded No. 1 V.A.D. rest station, Gare Centrale, Boulogne, in three French wagons and two passenger carriages and within 24 hours had given hot drinks to a thousand wounded from the first battle of Ypres. Under the Principal Commandant, Dame Rachel Crowley, who succeeded Dame Katharine Furse in France, this work expanded in all directions until there were five rest stations for the feeding of patients on ambulance trains; two detention stations for the care of the personnel of veterinary hospitals and remount camps; six convalescent homes for nurses and W.A.A.C.s, and six motor convoys—all run and staffed by V.A.D.s. In Holland and Switzerland they were able to work for prisoners of war. In Salonika, Malta, Egypt and Italy they started kitchens attached to hospitals for the supply of invalid diets, and organized and staffed canteens for ambulance trains and convalescent homes for army nurses. In Italy they staffed motor convoys. At the beginning of the Gallipoli campaign two military hospitals went to Egypt without female personnel, on the assumption that they were destined for the peninsula, and had to depend on voluntary women helpers of all nationalities till trained nurses and V.A.D.s. could arrive.

Early in 1918 the British Section of the First Aid Nursing Yeomanry affiliated to the British Red Cross Society. This earliest women's military corps had been founded in 1909, and reorganized by Mrs. McDougall, in 1910, to assist the R.A.M.C. in time of war by providing mounted detachments with horse ambulance wagons, to take over wounded at clearing stations and convey them to base hospitals. When war broke out the services of the corps were offered to the British authorities without success, but were accepted by the Belgian army in Oct. 1914. With the ideal of working for the British always before her, Mrs. McDougall asked the War Office in July 1915 to reconsider the employment of women drivers of the F.A.N.Y. for driving motor ambulances at any British base. Although this was at first refused, renewed applications resulted in a F.A.N.Y. motor convoy starting work at Calais under Miss Franklin on Jan. 1 1916, for the transport of all British sick and wounded in the district. The F.A.N.Y. drivers were voluntary workers and supplied their own uniforms and traveling expenses; the Army gave rations; the British Red Cross Society kept up the ambulances, and in Aug. undertook complete financial responsibility in connexion with the cars. As a result of the success of this experiment, V.A.D. motor convoys were instituted in six other bases, and on Jan. 1 1918 the St. Omer convoy started work with 22 F.A.N.Y. drivers and 12 V.A.D. drivers under F.A.N.Y. officers. On May 18 1918 they worked through a particularly severe air raid and won 16 Military Medals in one night.

The great need for clubs where the army nurses and women workers could obtain rest and relaxation from hospital work was recognized by Princess Victoria early in 1915, when she formed a committee in London to finance such clubs at all hospital centres. The first was opened at Wimereux in Feb. 1915, and 10 others followed at Etaples, Camiers, Rouen, Le Tréport, Trouville, Calais, St. Omer, Abbeville and Paris. These clubs were a recognized unit under the administration of the Director-General Medical Services. In 1919 a club was also opened at Cologne. Lady Algernon Gordon-Lennox acted as Director in France and Germany.

The British army in France employed French labour for necessary industrial work such as the making of camouflage, repair of gas-masks and the salvage of clothing and war material. But in Jan. 1917 Messrs. Tarrant, who had a contract for building army huts, were allowed to send 100 trained women carpenters to Calais, where in collaboration with French female labour they made 37,000 huts. The women lived in a camp for two years under quasi-military discipline and were to a certain extent the prototype of the W.A.A.C.

On Nov. 4 1914 Lady Angela Forbes, who had a house at Etaples, started a free buffet for the wounded in the waiting-room of the Gare Maritime, Boulogne; this was the earliest of all the voluntary canteens provided for the British troops in France. In the following month Lady Mabelle Egerton opened her "Coffee Shop" at Rouen Station. From these individual efforts huts and canteens, maintained by authorized organizations, spread to every British camp in France. As time went on the authorities compelled the few privately conducted enterprises to affiliate to larger organizations. Lady Angela Forbes' original buffet became an Expeditionary Force canteen and her hut at Etaples was taken over by the Salvation Army; the Rouen Coffee Shop was affiliated to the Church Army in 1917; and in March 1918, by order of the Adjutant-General, only 10 voluntary organizations were authorized to work in the zone of the armies. These were the British Red Cross Society, the Y.M.C.A. and Y.W.C.A., the Salvation Army, the Church Army, the Scottish Churches Huts, the United Army and Navy Board, the Soldiers' Christian Association, the British Soldiers' Institute and the Wesleyan Soldiers' Institute. All these organizations had huts for men at the bases very largely staffed by women; but these were few in number compared to the huts and tents close behind the firing-line to which women could not go.

In Dec. 1914 Princess Helena Victoria formed the Ladies' Auxiliary Committee of the Y.M.C.A., to assist in providing recreation huts and reading-rooms for the troops in France and to send out

concert parties. The Committee, under the chairmanship of Princess Helena Victoria, with the Countess of Bessborough (d. 1919) as hon. sec., selected the ladies to take charge of these huts, voluntary workers living at their own expense and signing on for four months' service. The work grew rapidly, until there were Y.M.C.A. huts, largely staffed by women, in all the bases in France, providing for the spiritual, material and educational needs of the men. Women workers were sent to Italy and Malta, and huts in Egypt and in Palestine as far north as Aleppo were also partly staffed by women. In 1918 the War Office gave permission for Y.M.C.A. huts to be opened in Holland for interned officers and men, and these were entirely staffed by the female relatives of the prisoners of war, a special fund being raised by the Association to pay the expenses of those who could not afford to travel and live at their own cost. Sixteen hostels for relatives of wounded in France were also staffed by women workers, of whom more than 1,860 passed through the Committee's hands for service abroad as canteen helpers, secretaries, librarians, motor-drivers, storekeepers, lecturers and teachers. In 1918-9 a certain number had their expenses paid, and the secretaries and motor-drivers received salaries.

The provision of entertainments was under the direction of Miss Lena Ashwell, the first concert being given at Harfleur on Feb. 8 1915; at one time there were 25 parties in France, giving concerts at the rate of 14,000 a year. In addition permanent concert parties worked continuously at 12 bases, and 6 theatrical parties were stationed at Paris, Havre, Abbeville, Dieppe and Etaples. Two concert parties went to Malta and a third to Egypt. £108,000 was raised for the work.

Although the hardships of camp conditions were ameliorated as much as possible for the W.A.A.C., the unaccustomed military discipline in a foreign country was trying in many ways, and the women badly needed the friendly help of an outside organization. In May 1917 Miss Ethel Knight of the Y.W.C.A. went to France under the auspices of the Y.M.C.A. to establish huts for them on the same lines as those which had proved so great a boon to the men. By the middle of 1918 there were 23 Blue Triangle huts in all the chief Q.M.A.A.C. camps, where the women could behave as though they were at home, and forget the discipline of army and camp life. Adjoining each there was a chapel or quiet room, but in the hut itself everything possible was done for the entertainment and recreation of the girls. Central clubs were also established in seven towns, and there was a rest-house at Le Tréport, a tea-garden at Havre and the Lady Caribrooke marquee in the Q.M.A.A.C. rest camp.

Within 24 hours of the declaration of war Lady Bagot propounded her scheme that a hospital should be sent to the front manned and equipped by the Church Army. It was established at Caen under the French Red Cross. In Feb. 1915 the first of the Church Army recreation huts in France was opened at Rouen; these were staffed by voluntary workers, mostly women, who also paid their own expenses. About 500 altogether worked in Church Army huts in France and Germany.

A recreation hut for convalescent soldiers at the Colonn Camp, Boulogne, was opened by the Catholic Women's League under Mrs. Baynes in March 1915 and remained open until after the Armistice. Other huts in France followed. This was the only society which undertook concerted Catholic work on an organized plan during the war, though the Catholic Club, which had no organization or society behind it, maintained eight huts in the war zone staffed by 100 women and 18 men.

The Church of Scotland and the United Free Church of Scotland acted jointly, under the name of the Scottish Churches Huts, to carry on work similar to that of the Y.M.C.A. at the bases in France, up the line, in Malta and Egypt and in the Army of Occupation. The Salvation Army had a large organization to work among the troops, and women Salvationists laboured among Australian and American troops in huts in France, besides carrying on extensive hospital visitation and work amongst the homes of the bereaved in the United Kingdom.

The Women's Emergency Canteens, formed early in 1915 under Mrs. Wilkie with the idea of working for the French only, catered for the British also in the canteen opened at the Gare du Nord, Paris, in April 1915, which was a rendezvous for all Allied nationalities on leave. Early in 1917, when the Australians and Canadians visited Paris on leave in very large numbers, Miss Lily Butler opened a "Corner of Blighty," the pioneer leave club in Paris, to help them to spend their time as pleasantly and profitably as possible. Everything was given free of charge, and a staff of 45 voluntary women workers entertained 44,000 men in the first 10 months of the 2½ years for which the club was open.

Six months later the British Army and Navy Leave Club was opened and was the pioneer residential club in Paris for soldiers and sailors on leave. Baron D'Erlanger lent the house, and Miss Decima Moore and the Rev. A. S. V. Blunt were hon. secretaries. In the two years that it was open 59,102 men were registered and 701,546 meals were served. A body of uniformed Women Guides looked after the comfort of the men, and free entertainments on a large scale were organized.

As a result of the success of this club, the British Empire Leave Club at Cologne was originated and organized on the same lines by Miss Decima Moore, Hon. Director-General, who raised the funds

with a London Committee under Baron D'Erlanger as chairman. Each department was conducted by a voluntary woman worker drawn from one of the proved women's war organizations, who wore the uniform of her society, and did her last piece of war-work for the British in an officially recognized institution opened at the invitation of the army.

IV. Voluntary Work For Allies.—Scottish Women's Hospitals.—On Aug. 12 1914 Dr. Elsie Inglis, president of the Scottish Federation of Women's Suffrage Societies, proposed that the Federation should equip a hospital "staffed entirely by women, if not required at home to be sent abroad." Within a week the War Office had declined the offer of a unit, and on Aug. 20 overtures were made to the embassies of Belgium, France and Russia. Mrs. Fawcett agreed that the N.U.W.S.S. should join in the appeal for funds, and by the end of the war £449,000 had been collected. In all, 14 different hospitals staffed entirely by women were mobilized and worked for the Belgian, French, Serbian and Russian armies. The first opportunity of service came when typhoid broke out in the Belgian army; on Dec. 5 1914 Dr. Alice Hutchison and Dr. Phillips, with 10 trained nurses, were put in charge of the typhoid annexe of Dr. de Page's hospital at Calais, where they worked for three months, until the epidemic had been overcome. On the same day the first complete unit under Dr. Ivens, consisting of 3 surgeons, 2 physicians, a radiologist, 10 trained nurses and as many dressers and orderlies, arrived in Paris on their way to the Abbaye de Royaumont, which had been allotted them by the French Red Cross. In this ancient edifice, founded by St. Louis, French wounded were tended by the Scottish women till Feb. 1919. An offshoot of the hospital, established at Villers-Cotterêts in huts in the spring of 1917, was evacuated before the German push on May 30 1918, being the last hospital in the district to remain at work. In both hospitals 10,861 patients were treated.

The Gilton and Newnham unit worked uninterruptedly under the French War Office for four years. It went to Troyes in May 1915 with Dr. Louise McLroy as C.M.O. and with Mrs. Harley (d. 1917) as administrator. As the hospital was entirely under canvas, it was ordered to accompany the French Expeditionary Force to Salonika in Oct. 1915, and went for a short time to Ghevgeff. The unit then settled down in Salonika for three years and opened an orthopaedic department for disabled Serbian soldiers.

The remaining S.W.H. units worked for the Serbian army. The first went to Kragujevatz under Dr. Eleanor Soltau in Dec. 1914, and was the second British unit to arrive in Serbia in time for the typhus epidemic. With an equipment of 100 beds, Dr. Soltau had to take 250 patients immediately on arrival, and in March took charge of two fever hospitals as well. Three of the staff died of typhus. The next unit went out in May under Dr. Alice Hutchison to Valjevo, and was detained at Malta for a fortnight to look after British wounded from the Dardanelles, the one occasion on which a S.W.H. unit worked officially for the British army. By this time the typhus epidemic was over and a long peaceful summer intervened before the autumn invasion. The staffs of the two fever hospitals formed a camp hospital at Mladanovatz under Dr. McGregor, and Dr. Hollway with some sisters took over a Serbian hospital of 200 beds at Lazarovatz. Both these were evacuated at once when the storm of invasion broke out in Nov.; Dr. McGregor's party joined the great retreat through Albania; and Dr. Hutchison's party, with Dr. Inglis, who had come out to Serbia in May, remained working for the Serbs at Krushevatz, as prisoners of the enemy, from Nov. to Feb. 1916. The Austrians then sent them home.

In Aug. 1915 a party of Scottish women under Dr. Mary Blair had been sent to Serbia to reinforce Dr. Alice Hutchison's unit at Valjevo. As the invasion was pending they went to Salonika instead, to wait for work, and when it was decided that the Serbian civilian refugees were to accept the hospitality of the French Government at Corsica, this unit was invited to be in charge of the medical affairs of the colony. The hospital remained open at Ajaccio till April 1919 and treated 7,704 in-patients and 15,515 out-patients.

Among these were many of the Serbian soldiers who had accomplished the retreat through Albania, and after two months' rest were re-equipped to form a second Serbian army. A new S.W.H. unit, called the "America" unit, under Dr. Agnes Bennett, with a transport column under Mrs. Harley, was formed to accompany this army to Salonika. In Sept. 1916 they went to Ostrovo, to act as a casualty clearing station for the push to Monastir, and after the fall of the town a dressing station was opened at Dobrevni. The unit worked at Ostrovo till Nov. 1918, and then went to Vranja in Serbia, under Dr. Elmslie, till Oct. 1919, and coped with another typhus epidemic. Mrs. Harley, Gen. French's sister, left to do relief work in Jan. 1917, and was killed by a stray shell.

On her return from Serbia in Feb. 1916 Dr. Inglis spent six months in England trying in vain to obtain authority to take a unit to Mesopotamia for the British. Then the Serbian Government asked her to equip and maintain a field hospital, with a motor transport column attached, for service with the newly formed Serbian division, consisting of ex-Austrian subjects, who had allowed themselves to be made prisoners by the Russians and were attached to their army. The unit started in Aug. 1916 in charge of Dr. Inglis herself, with Mrs. Haverfield commanding the transport column, and went to the Dobrudja. They only had 19 days of work for the Serbs before

becoming involved in the retreat of the Russian army, and while the Serb division was resting the unit worked for the Russian Red Cross. Once again they had to retire to Galatz, and then were helped by the British Armoured-Car Corps to get to Reni, where they were able to settle down for eight months and work for the Russians. An offshoot of the hospital under Dr. Chesney went to the Rumanian front. The Russian Revolution had meanwhile broken out, and the demoralization of the Russian army was so complete that Dr. Inglis was determined to prevent the Serb division from being sacrificed on that front in order to stiffen up the Russian moral. She sent two members of the unit to England to deliver a memorized message of 2,500 words to the Foreign Office, and, after pressure from the British Government, the Russians permitted the Serb division to go to Archangel, and the Admiralty sent transports to bring them to England. Although by that time Dr. Inglis was very ill, she insisted on waiting to return home with the Serb division, and as the first Admiralty transport was filled by the Russians with refugees, she had to wait for the second. They landed at Newcastle-on-Tyne on Sunday, and on Monday Nov. 27 1917 she died. The "Elsie Inglis" unit, equipped immediately after her death, left for Serbia in Feb. 1918, under Dr. Annette Benson, and worked at the first dressing station behind the lines during the Serbian offensive that preceded the Armistice. The transport column followed on the heels of the victorious army into Serbia.

Work for French and Belgian Armies.—At the beginning of the war the regulations affecting the entry of British subjects into France and Belgium were not strict, and as the British authorities discouraged voluntary offers, British organizations, individuals and groups of friends gave lavishly of funds, stores and the service of trained nurses to the French, Belgian and Serbian allies. Millicent Duchess of Sutherland had installed an ambulance of 8 trained nurses and a surgeon at Namur by Aug. 17, and by Aug. 24 they were all prisoners of the Germans. The British Red Cross Society sent out 12 parties of nurses to Belgium before the end of Sept., and 25 parties to different voluntary units in France before the end of the year, besides two parties to Serbia and one to Montenegro.

The second hospital unit to be officered by medical women only was organized by Mrs. St. Clair Stobart as administrator, under the name of the Women's Imperial Service Hospital, and left for Antwerp to work under the Belgian Red Cross Sept. 20 1914. It consisted of 6 doctors, 10 nurses and 10 orderlies under Miss Sally McNaughtan (d. 1916), who described the 14-days' work in *An Englishwoman's Diary of the War*. The wounded were evacuated just before the entry of the Germans. Within three weeks of their return the unit was re-formed and worked at Cherbourg until March 1915 under the French Red Cross.

Miss Sally McNaughtan had stayed behind at Ostend and joined the Hector Munro Ambulance Corps, a mixed body to which Miss May Sinclair, Lady Dorothea Feilding (the first woman to win the Military Medal), Mrs. Knocker and Miss Chisholm belonged. During this time of greatest hardship for the Belgian army the corps established a hospital at Furnes, to which ambulance drivers brought in wounded under fire. Early in 1915 Mrs. Knocker and Miss Chisholm left the corps and started a dressing station of their own at Pervyse, close to the Belgian lines, where they served the soldiers till both were badly gassed in their dug-out in April 1918. Miss Sally McNaughtan ran a portable soup kitchen for the Belgians in Furnes during the winter of 1914-5 and laid the seeds of the illness to which she succumbed in 1916. During this first winter of the war the Belgian army was in deplorable need of help, and Lady Bagot, who worked at Dunkirk in Nov. and Dec. 1914, dressing wounded at the station, raised funds to establish a transportable "Hospital of Friendship" at Adinkerke, which became the surgical section of the Hôpital d'Evacuation for the Belgian army. It was too close to the front for nurses to be allowed to work there, but Lady Bagot herself remained there for two years, before handing it over to the Belgian authorities. To meet the dearth of hospital requisites and clothing, Mrs. Bernard Allen started the Belgian Hospital Fund in Jan. 1915, which collected £25,000 in money and £25,000 in kind and aided 137 Belgian military hospitals and convalescent depôts in France and Belgium, and 30 colonies for refugee children, besides providing a club for soldiers, a recreation hut for the front, a hospice for refugees and 450 surgical outfits for regimental doctors.

During the battle of the Yser in Oct. 1914 the Belgian wounded poured into Calais, and Mrs. McDougall, of the First Aid Nursing Yeomanry, who had offered the services of the corps to the Belgian army, was asked to take over two old schools full of wounded as a hospital. There was no equipment, and the unit worked incredibly hard to produce a good military hospital out of nothing. The workers, with the exception of the trained nurses, paid all their expenses and subscribed to the hospital as well. From Nov. to Jan. 1915 they established a regimental aid post for the Belgians at Oostkerke, and during the height of the typhoid epidemic ran a convalescent home as an offshoot of the Lamarck hospital. The convalescent soldiers were drafted off in large numbers to the Camp de Richard near Tours, and there the F.A.N.Y. maintained a hut for them, with a canteen and cinema, and paid a trained nurse to look after the consumptives.

The motor-drivers originally belonging to the Lamarck hospital, who also conveyed the Belgian wounded from the clearing hospital

to all the other hospitals in Calais, were officially attached to the Belgian Corps de Transport when the Lamarck hospital closed in Oct., 1916. This unit continued to drive for the Belgian army till after the Armistice and went with it to Bruges and Brussels. Belgian civilians who remained in the little strip of land not occupied by the enemy were in desperate plight too. King Albert's Civilian Hospital Fund was founded, by Mrs. Oliphant Murray and the Duchess of Buckingham and Chandos, to help Belgian state civilian hospitals abroad; the Belgian Canal Boat Fund, with Mrs. Agar Adamson as founder and Mrs. Innes Taylor as organizer in Belgium, fed and clothed 300 families in and about Furnes till June 1919; and the Belgian Frost Relief Fund, under Miss Georgie Fyfe, evacuated 1,341 Belgian children from the war area into France and Switzerland, and repatriated them all at the end of the war, besides maintaining a maternity hospital at Vinckem for four years.

The work for the French was more extensive still. There were three Red Cross societies in France; the Société de Secours aux Blessés Militaires, the Association des Dames Françaises, and the Union des Femmes de France. As only the last named had a committee in London, a British Committee of the French Red Cross was called into being by the French ambassador towards the end of 1914, in order to allocate the services offered by British volunteers to the best advantage of all three societies. At the end of 1917 the Anglo-French Committee of the Joint War Committee, which had been formed in Jan. 1915 to sift the credentials of British applicants for Red Cross work with the French, united with the British Committee. By this date 8,537 certificates had been granted to British volunteers for work in France. As the French army bore the brunt of the fighting for the first two years of the war their hospital problem was acute, especially as the nuns had left France before a sufficient number of nurses had been trained to replace them. To help fill the need, Miss Grace Ellison founded the French Flag Nursing Corps, which organized the supply of 250 British trained nurses, paid by the French Government, to help in the improvisation of the enormous number of French hospitals needed to cope with the rush of wounded. The Urgency Cases Hospital, a unit of first-class surgeons and 20 fully trained nurses, raised on the initiative of Miss Eden, hon. sec. of the National Union of Trained Nurses, went to Revigny in March 1915 to receive the worst cases on that section of the front. In July 1917 it was taken over by the British Committee of the French Red Cross. About 30 other units for the French were equipped by voluntary effort and staffed by British nurses and V.A.D.s, including Miss Bromley Martin's hospital at Arc-en-Barrois, the Johnston-Reckett unit at Ris-Orangis, Lady Sykes' hospital at Malo-les-Bains, the Michelham Foundation in Paris, the Ulster unit supported for two years by the Ulster Women's Unionist Council, the Martouret hospital and Ceret convalescent home of Mrs. Allhusen, the Sanatorium Beausoleil of Miss Lind-af-Illageby, Lady Eva Wemyss' hospital at Compiègne, Lady Guernsey's at Fécamp, Mrs. Symons' at Remberliu, Lady Tangye's at Paris Plage and others. In addition a large number of V.A.D.s worked in French hospitals and held positions of considerable responsibility.

The French Wounded Emergency Fund, which had branches throughout Great Britain for the making of comforts, was founded in Nov. 1914, with Miss Evelyn Wild as hon. sec., in order to give assistance to the French military and *bénévole* hospitals, as distinguished from the auxiliary hospitals run under the three French Red Cross societies. In May 1916, 2,755 French hospitals were classed as military, 1,532 as *bénévole* and 1,225 as auxiliary. By March 1918 the Fund had helped military hospitals in 1,200 different French towns, and £163,000 had been raised in money, and £75,000 in kind. Canteens were also established in many of the military hospitals. The French authorities placed a devastated sector on the Somme under the care of the Fund, and after the Armistice much work was done in the devastated areas.

On the closing of the Lamarck hospital at Calais the F.A.N.Y. transferred their personnel to staff a hospital for the French at Port à Binson, Marne, which opened in Jan. 1917. In the summer of 1917 the Corps began supplying ambulance units for the French army. There were finally three: S.S.Y.2, S.S.Y.4, and S.S.Y.5. The F.A.N.Y. officer commanding each unit held official rank in the French army as an officer. After the Armistice the S.S.Y.2 drivers were the first women to go into Germany with their ambulances to bring back prisoners of war. The Hackett-Lowther ambulance unit of women drivers under Miss Toupie-Lowther was attached to the second Army Corps of the 3rd French army in 1918 as S.S.Y.3. This was the only women's unit allowed to do front-line work; the cars were sent to the advanced "postes de secours," and the entire section was mentioned in despatches, which carried with it the right to have the Croix de Guerre painted on their ambulances. During 1919 the women's convoys did civilian relief work in the devastated areas.

The Women's Emergency Canteens, an independent Society under Mrs. Wilkie, and an offshoot of the Women's Emergency Corps, started a canteen at Compiègne in Feb. 1915 with a recreation room, which was the first of its kind. Another canteen was opened for four years at the Gare du Nord, Paris, with 60 beds attached, which was used by British and Allied soldiers, and all Belgians were fed free there for two years. Other smaller canteens were run for a time as offshoots of the one at Compiègne.

Canteen work under the "Oeuvre de la Goutte de Café" started

by M. Duquesnoy early in the war, absorbed a very large number of British women workers, who were selected and sent out to France by the British Committee of the French Red Cross. The canteens were of four types, those at railway stations; those at *foyers de cantonnement* or recreation rooms attached to rest camps; those for the provision of invalid diets at *dépôts d'éclappés*, and those at *dépôts d'isolés* for men rejoining their regiments. The earliest railway canteen was opened at Hazebrouck in Feb. 1915, and moved to Doullens, where the work was very heavy during the Somme offensive; thousands of wounded from Gommecourt came through in a few days, and the helpers were sometimes working for 19 hours at a stretch. Many of the canteen workers had narrow escapes during the German push of 1918, when they had to evacuate suddenly with the Germans on their heels. A large number of the helpers were elderly women who worked extraordinarily hard, paid all their own expenses and faced all the hazards of war.

Work for the Serbian Army.—The first British women who worked for Serbia during the war left London with Madame Grouitch, the American wife of the Serbian minister at Nish, on Aug. 12 1914, and went to the Serbian 1st reserve hospital at Krngujevatz; the hospital material was exhausted in a few months, and it was as a result of the pitiful stories that reached home from this band of women that the Serbian Relief Fund was formed. Miss Flora Sandes and Miss Emily Simmonds, who belonged to the original party, raised a private fund, took out 108 tons of hospital material to Valjevo in Jan. 1915, and nursed typhus in a Serbian hospital, doing operations and dressings for 12 hours a day, till both caught the disease.

The plight of Serbia during the first winter of the war, harried first by the Austrian invasion and then by the typhus epidemic, was so terrible that hospital after hospital was sent out from Great Britain by the Serbian Relief Fund, the British Red Cross Society, the Wounded Allies Relief Committee and the Scottish Women's Hospitals. All these took out trained nurses and many had women doctors, but, with the exception of the Scottish Women's Hospitals, the only two units under women administrators were financed by the Serbian Relief Fund. The first Serbian Relief Fund surgical unit under Lady Paget, the wife of Sir Ralph Paget, who became the British Commissioner for Serbia in 1925, reached the country in Nov. 1914 before any of the others, and did heroic service at Skopje under appalling conditions. From Nov. to Jan. there was an unending stream of Austrian and Serbian wounded and in the second half of the month the typhus epidemic assumed serious proportions. Lady Paget, who had previously worked in Serbian hospitals in Belgrade during the Balkan wars of 1911 and 1912-3, organized a typhus colony in collaboration with the British Red Cross Society unit, for the isolation of the cases, which opened on March 1. Very few nurses could be spared from the surgical hospital, as over 90% of the staff were off duty for sickness between Nov. and February. Lady Paget herself, two sisters, two doctors, some Serbian voluntary assistants and Austrian prisoner orderlies coped with beds at the colony for 300 typhus patients. Between March 6 and 24 sixteen workers went down with the disease, including Lady Paget, and for a week one sister remained in charge of 300 patients. Then she was relieved by four nurses from the second Serbian Relief Fund unit (Lady Wimborne's). By May the epidemic was overcome and not a case left in the town.

Plenty of hospitals had arrived in the country by this time and, as there had been no fighting since Dec., the surgical units found themselves with little to do. Mrs. St. Clair Stobart, who commanded the 3rd Serbian Relief Fund unit, which was entirely staffed by women, landed in Serbia in April 1915, and at once began to utilize her medical personnel for the far greater needs of the civil population. She put up a wayside dispensary by the hospital camp, where 12,000 people were treated in a few weeks, and established six others in country districts during the summer. At the end of Sept. the Austrians, Germans and Bulgarians began massing on the frontiers and Mrs. Stobart was invited to accompany the Serbian army to the front with a part of her unit as a flying field hospital. They moved forward for a few days, but on Oct. 17 the great retreat of the Serbian nation began, and thousands of people trekked for three months over the Albanian mountains down to the sea at Scutari. Mrs. Stobart rode at the head of her column all the way for 800 m., and brought it through intact.

Lady Paget with all her staff decided to remain with the hospital at Skopje and allow themselves to be taken prisoners by the Bulgarians, in order to continue to care for the Serbian wounded of their own hospital and of the other hospitals abandoned by their staffs. She was allowed by the Bulgarians to distribute the hospital stores of food and clothing to all destitute refugees irrespective of nationality. Early in Dec. the Germans arrived, and in Feb. permission was given for the unit to leave the country. Lady Paget had accomplished the purpose for which she had stayed, having been able to superintend the distribution of all the stores and money.

Miss Flora Sandes, who was in England when the Bulgarians declared war, went back at once, and was officially attached to the ambulance of the 2nd Infantry Regiment. When the retreat began, the Commandant of the Division told her that her presence would encourage the soldiers; so, as the ambulance could not travel, she enlisted in the 2nd Infantry Regiment as a private and retreated through Albania with the Serbian army. When the army was

re-formed she was promoted corporal, sergeant, and lieutenant, and went through every engagement with her regiment till she was wounded; she returned again to the front and was not demobilized till 1919. Whilst on active service, in co-operation with Mrs. Haverfield, she organized a Comforts Fund for the Serbian soldiers in the trenches, and raised money for the Sandes-Haverfield canteens, which worked directly under the Serbian army.

Work for the Russian Army.—In Sept. 1915 a British Committee, with Lady Muriel Paget as hon. sec., raised funds to equip an Anglo-Russian hospital for work under the Russian Red Cross Society. The hospital of 200 beds was formally opened in the palace of the Grand Duke Dmitri at Petrograd in Feb. 1916 in the presence of the Empress and a brilliant company. At the beginning of May, during the offensive of Gen. Brussilov a field hospital of 100 beds was attached to the Russian Guards, with a motor ambulance column of 22 ambulances; the Anglo-Russian hospital also took charge of 120 beds in a Russian hospital at Lutsk, providing the nurses and doctors. Over £100,000 was raised. Mrs. Wynne, an original member of the Hector Munro Ambulance Corps in Belgium, took a unit of motor ambulances to Russia in 1915, and was attached to the First Caucasian ambulance unit on the Persian front. The conditions proving too rough for her 50 H.P. cars, she transferred them to the column of the Anglo-Russian hospital. The Revolution put an end to the work, and Lady Muriel Paget and her staff had to travel home via Siberia and Japan, taking a month to cross Siberia in a third-class carriage.

The N.U.W.S.S. raised the Millicent Garrett Fawcett Maternity unit for work among the Russian refugees at a cost of over £12,000, and the Great Britain to Poland Fund, and the Polish War Victims Relief Committee worked as long as political circumstances permitted for the Polish refugees.

Work for the Italian Army.—Soon after Italy joined the Allies in May 1915, the British Committee in aid of the Italian wounded raised funds to finance the first unit of the British Red Cross Society in Italy, which arrived on the Isonzo front in Sept. 1915. A field hospital at Villa Trento, staffed by British sisters and V.A.D.s under the Joint War Committee, broke down the Italian rule against employing women nurses at the front.

In Dec. 1915 Lady Helena Gleichen and Mrs. Hollings, who had been trained as X-ray operators and had raised private funds to purchase motor-cars fitted with X-ray apparatus, were attached as a radiographic unit to the 6th Army Corps of the 3rd Army. The British Red Cross Society provided additional staff and cars. After six months they were attached to the headquarters staff of the 2nd Army and were present at both battles of Gorizia. Between Dec. 1915 and Oct. 1917, 12,600 X-ray examinations were made.

Mrs. Watkins, who raised her own funds for two years, and was helped by the British Red Cross Society, went to Italy in Sept. 1915 with a staff to set up station canteens for the hospital trains at Cervignano and San Giovanni Manzano, the railroads on the Isonzo front. In July 1917 she undertook the feeding of the wounded in the clearing station of Dolegna, and during Aug. an average of 1,600 wounded were dealt with in 24 hours. It was due to her initiative that the first recreation hut for soldiers of the 2nd and 3rd armies was opened by the Italian army in the spring of 1916. Mrs. Watkins and her helpers undertook the organization of 14 others, which proved so successful that the Supreme Command took up the idea and were building 100 huts just before the retreat of Oct. 1917. Mrs. Wynne, on her return from Russia, worked with her motor ambulances for the Italian Red Cross.

V. Voluntary Effort in Supplies, Etc.—The outbreak of war found voluntary effort for the fighting forces entirely unorganized, apart from the Regimental Associations in connexion with the regular battalions of the regiments comprising the pre-war army. The British Red Cross Society and Order of St. John were the only organizations that supplied hospital requisites for the sick and wounded. These could obviously not expand sufficiently fast to meet the new needs, and Queen Mary's Needlework Guild, with Lady Lawley as hon. sec., came into being on Aug. 10 1914, with the more general object of "organizing a collection of garments for those who will suffer on account of the war." The King and Queen and Princess Mary gave the lead in promoting funds to send a present for Christmas 1914 to every person wearing the King's uniform and to every nurse at the front, and Queen Alexandra presented each nurse in the regular army nursing services in France with a fur-lined cape, hood and muff.

It is estimated that the value of goods in kind presented to soldiers and sailors by voluntary effort in the first year of the war was £5,000,000, and funds were formed to collect in bulk such articles as air pillows, Christmas puddings, gloves, handkerchiefs, hot-water bottles, Boveril, letter cases, razors, respirators, "tubs for Tommies," periscopes, field glasses, wire cutters, sandbags, matches, cigarettes, tobacco, mouth organs, hospital bags, walking sticks and eggs. Some of these funds continued till the end of the war. The National Society provided over 44,000,000 eggs for hospitals in four years.

Lady Smith-Dorrien's Hospital Bag Fund distributed over 2,500,000 bags before Jan. 1 1918; Lady Roberts' Field Glass Fund produced on an average 300 field glasses a month; Miss Gladys Storey's Boveril Fund sent Boveril to all the fronts throughout the war; the Glove Waistcoat Society made 55,000 windproof waistcoats out of old gloves, and John Penoyre collected over 100,000 sweaters. By the sale of worn-out silver thimbles and oddments of silver and gold, the Silver Thimble Fund under Miss Hope Clarke raised over £60,000 and provided 15 motor ambulances, 5 motor hospital launches 2 motor dental surgery cars, besides large donations to the Red Cross and other funds for soldiers and sailors. The Vegetable Products Committee for naval supply under E. Jerome Dyer despatched 50,000,000 lb. of vegetables to the fleet, estimated in cash value at £1,250,000. Every town had its own fund to send parcels to prisoners of war, and the packing was done by voluntary women workers.

Outstanding private comforts funds were those started by Lady French and Lady Jellicoe, which closed down at the end of the first winter campaign, when the needs of the army and navy were for the moment satisfied. The one comforts fund inherited from the Boer war was Queen Alexandra's Field Force Fund, which opened in Oct. 1914, with Mrs. William Selater, who had organized it in S. Africa, as hon. secretary. Gifts were sent out in response to definite requests from commanding officers, and by the Armistice over £80,000 had been raised.

The universal desire to make something for the man on active service caused a multitude of uncorrelated work parties to spring up all over the country, and it was clear that before the second winter campaign some general scheme of co-ordination was essential if the best use was to be made of the energy and enthusiasm of a vast band of voluntary needle workers. In Sept. 1915 the department of the Director-General of Voluntary Organizations, with Sir Edward Ward as Director General, was formed as a branch of the War Office, without funds, to establish county, city, borough, and district associations throughout Great Britain under which it was proposed to affiliate existing voluntary bodies. The organization dealt with supplies to combatants and to men in military hospitals. Regimental organizations were recommended to continue and extend their work, and the Joint War Committee and Queen Mary's Needlework Guild were recognized as separate and independent organizations.

From Aug. 10 1914 till Feb. 1919 St. James' Palace was the collecting centre for the 15,500,000 articles that were sent in by the members of Queen Mary's Needlework Guild all over the world. Six hundred and thirty branches with a membership of 1,078,839 persons were formed in Great Britain alone. The need for hospital dressings had been realized early and the first Surgical Branch Depot was started by Miss McCaul in 1914, with Mrs. Gibson as general manager; this became the Central Surgical Depot of the Guild, which sent 11,000,000 articles direct to Allied hospitals and hospital ships. The first orthopaedic branch was the Surgical Requisites Association started at Mulberry Walk, Chelsea, which became the central orthopaedic branch of Q.M.N.G. with 1,000 members and 44 branches. This depot was a centre of instruction for all the institutions engaged in orthopaedic work, owing to the inventions made by the workers. Elinor Hallé first utilized papier-mâché as a material for arm cradles, and then devised a light boot, with a papier-mâché back, for drop foot, which was in such great demand that centres were opened for making them throughout France and Italy as well as in Great Britain and India. A Papier-Mâché Surgical Appliances Department at Simla had 11 branches.

A process of making the papier-mâché waterproof for baths by using a cuprammonium solution of cotton wool instead of paste for the final layers of the papier-mâché, was invented by Miss Acheson. This medium was adapted for splints, and permission was obtained for voluntary workers to visit the military hospitals and take plaster casts from the limbs of the patients, on to which the splints were moulded, so that the utmost amount of pressure could be brought to bear without causing pain. This method of making splints for special cases became generally adopted by other depôts. Many elaborations of the splints were invented by Mrs. Sanyer Adkin; in the words of Sir Robert Jones, the department was an "inspiration."

The Red Cross and St. John's working parties were recognized as a distinct body under the Joint War Committee. They continued as before primarily to supply the auxiliary and voluntary hospitals, and sent their surplus to the military hospitals when asked to do so by the D.G.V.O. During the war 2,823 workparties were registered at the Central Workrooms at Burlington House, which were established in Oct. 1915 to co-ordinate the work. Over 30,000,000 articles were produced by the branches; 540,000 gifts were contributed by the 1,617 registered home workers, and 800,000 things were made by the 1,202 members of the Central Workrooms. The independent bodies of workers not belonging to Queen Mary's Needlework Guild or to the Joint War Committee were dealt with by the D.G.V.O., who invited the workparties to assemble their workers into groups covering certain areas under the Army Council's scheme. The comforts were issued to combatants through a "Comforts Pool" in each theatre of war, and to military hospitals according to the demands of the officers commanding hospital units. A total of 88,000,000 articles of clothing and surgical comforts estimated at a

value of £5,000,000 were supplied to combatants, patients in military hospitals, allies and prisoners of war, by the 267 recognized head associations, composed of approximately 400,000 workers, grouped into 2,983 branches, all financially independent. These ranged from bodies of village women and shop girls to factories like the Belgavia War Hospital Supply Depot and the Kensington War Hospital Supply Depot; the latter, with an average daily attendance of 1,200 workers turned out 6,000,000 articles, making a speciality of elaborate orthopaedic appliances. A number of men did valuable work in the woodwork annexes of the depôts.

In addition to comforts made by hand the D.G.V.O. sent out 232,599,191 cigarettes, 256,487 lb. of tobacco and 62,193 games. The supply of books to the troops was in the hands of Dame Eva Anstruther, who had established the Camps Library in Oct. 1914 (afterwards affiliated to the D.G.V.O.) and despatched 16,000,000 books and magazines to fighting men. The War Library, run by Mrs. Gaskell and Dr. Hagbert Wright under the British Red Cross Society, furnished 6,000,000 books to the hospitals.

The provision of artificial teeth and dental treatment for soldiers and sailors was undertaken by the Soldiers and Sailors Dental Aid Fund under Miss Banister Fletcher. When it was founded in Dec. 1914 there was no arrangement for the supply of dentures to soldiers; but from March 1915 onwards the War Office gave a grant to meet the cost of treatment for their own men, and in Nov. took over the work. The Fund was reconstituted later under the name of the Ivory Cross, to provide treatment for discharged service men, for Home Army men and for the mercantile marine.

Ten thousand people, mostly women, worked in 1918 for the welfare of soldiers on leave in the London area alone, under the control of the General Officer Commanding the London District. In that year 3,068,135 men, 232,495 officers and 28,450 cadets were accommodated in rest houses in London. The Maple Leaf Club, the Victoria League Club and Peel House (started by Mrs. Moncreiffa and Mrs. Graham Murray) had been opened as residential clubs for the Overseas forces in the autumn of 1915, on the same lines as the Union Jack Club, founded as a memorial to the men who had lost their lives in the Boer War. Motor volunteer corps, such as the Motor Transport Volunteers, the Y.M.C.A. Baltic Night Transport, and the Women's Reserve Ambulance (Green Cross Corps) drove nearly a million men from station to station in 1918, and 8,000,000 men were fed at the free buffets at Victoria, Paddington, London Bridge, Liverpool Street, Euston, Waterloo and Charing Cross the same year. These buffets were maintained and staffed in night and day shifts entirely by women voluntary workers, and 12,000,000 men were fed during the war at Victoria station at a cost of £60,000. Similar buffets were organized at the big junctions in the provinces, such as Preston. It is impossible to estimate the additional number of women who worked throughout the country in canteens for soldiers in training and on home service.

Parallel with the supply of tangible comforts such as food and clothing went the provision of entertainment for men in camp and patients in hospital. The "Music in War Time" committees, subsidized in part as relief work for musicians by the Professional Classes War Relief Council, gave 15,000 concerts in hospitals and camps at home, 2,000,000 wounded soldiers being entertained in the Manchester area alone. Individuals and organizations such as the Y.M.C.A. at home, the Lena Ashwell concert parties at the front, the Three Arts Club and the Soldiers Entertainment Fund, did the same work.

The labour of the nursing staff in hospitals was lessened by the organizations which provided drives for the wounded, free bus rides and river trips, and arranged for the visitation of patients and the teaching of handicrafts. The friendships formed in hospital led to voluntary after-care work for the disabled. (For a list of funds, associations and societies for the assistance of service and ex-service officers, men, women, and their dependents, see 114/Gen. No. 6198, compiled by the secretary C.3 department, War Office.)

The Auctioneers and Estate Agents Institute of the United Kingdom bought the Star and Garter Hotel, Richmond Hill, as a home for the totally disabled in 1915 and presented it to Queen Mary; a sum of £224,000 for the building was raised by the British Women's Hospital Committee under the chairmanship of Dame May Whitty as a tribute from the women of the Empire.

VI. *Work for Belgian Refugees in Great Britain.*—In Aug. 1914 the gaze of the Allies was focussed upon Belgium, where one of the greatest tragedies of history was being enacted. After the first accounts of the German atrocities perpetrated at Visé and Liège, but before the extent of the German invasion of Belgium was foreseen, it occurred to Lady Lugard that a large number of Belgian women and children might be brought to the protection of English hospitality, by means of the organization recently improvised in Ulster for the removal of Irish women and children from the area which in July 1914 threatened to become a theatre of war. Preparations on these lines proceeded, with the co-operation of Ulster, the Catholic Church, the Foreign Office, the Local Government Board and the Belgian Government. Meanwhile the situation in Belgium was becoming more acute, and on Aug. 22 an official of the Exhibitions Branch of the Board of Trade, who was in Belgium on business, announced to Lady Lugard that he hoped to arrive from Ostend on the 24th with a transport carrying from 100 to 1,000 Belgians.

Within two days the War Refugees Committee was formed to provide for them, mainly by the exertions of Lady Lugard and Mrs. Alfred Lyttelton. Lord Hugh Cecil became chairman and Viscount Gladstone treasurer. The response of the first appeal in the press brought offers of private hospitality for 100,000 persons, and not one of the refugees who poured into the country in an increasing stream was left without food, lodging and a warm welcome from the 500 volunteers who at first did the work. But the Committee was not rich in funds. A large proportion of the money, subscribed in England for the Belgians, went to the Belgian minister's fund for Belgian relief, which was earmarked to be spent upon the Continent. £106,500 was subscribed to the War Refugees Committee, and this had to be conserved for the expenses of organization, and for emergency relief. It was soon obvious that a national exodus could not be dealt with by private effort alone. In the House of Commons, on Sept. 9, Mr. (afterwards Sir) Herbert Samuel, then President of the Local Government Board, offered the hospitality of the British nation to Belgium, and from that day a department of the Local Government Board, under Sir Frederick Willis, worked in close relation with the War Refugees Committee. At first the Belgians had been received in refuges improvised by the War Refugees Committee; but it was then arranged that the Local Government Board should provide accommodation for the refugees in London and should superintend their reception at the ports and bear the cost of their transport. The War Refugees Committee was to allocate the refugees to private hospitality and organize the transport.

The Women's Emergency Corps had provided a body of interpreters to meet trains early in Aug. and did valuable work for the Belgians of the middle and upper classes who were able to pay their way temporarily. The greatest rush occurred during the week after the fall of Antwerp, when 26,000 refugees arrived at Folkestone and were welcomed by the local committee; 2,000 a day were dealt with in London by the allocation department of the War Refugees Committee under Dame Victoria Samuel (Mrs. Gilbert Samuel), and 6,000 a day by the transport department under Mr. H. Campbell. The occupation of Ostend by the Germans on Oct. 17 closed the Belgian coast, and all refugees arriving in England after that date came by way of Holland, and in far smaller numbers.

The early refugees had borne the first onslaught of German fury, and families arrived separated from each other and with no material possessions whatsoever. British women, protected from the same fate by the sea, and with few opportunities at that time of helping actively with other war work, poured out money and sympathy lavishly on the Belgians. By Jan. 1915, it was estimated that private hosts had spent £2,000,000 on hospitality. The central register of refugees compiled under the Registrar General's Department showed that 265,000 refugees arrived in England; they cost the Government approximately £3,500,000; but the total spent on them by private hosts and local committees was estimated in 1917 as at least £6,000,000. Over 6,000 Jews were cared for at the cost of the Jewish community in London. 2,500 local Belgian relief committees, of which about 1,500 were really effective, were formed in Great Britain, to which the refugees, after spending a few days at the Government refuges, were allocated by the 100 voluntary allocators of the War Refugees Committee; by the allocators at the office of the Belgian consulate, working in the same building; as well as by the Catholic Women's League and the Women's Emergency Corps. Four large refuges holding 8,000 persons, at Alexandra Palace, Earl's Court, Edmonton and Millfield House, were managed for the Local Government Board by the Metropolitan Asylums Board, and during the period of the greatest rush several boards of guardians lent other buildings. Edmonton and Earl's Court through which 100,000 refugees passed, remained open till the end of the war.

When the local relief committees, originally organized by the Earl of Lytton, had received their refugees from headquarters, they worked in complete independence. The Glasgow Corporation Belgian Refugee Committee under Mr. Alexander Walker acted as a central authority for receiving and distributing refugees all over Scotland. The Scotch committees raised £360,000. Liverpool, Manchester, Birmingham and Exeter, to mention only a few, looked after many thousands of refugees each. The university of Cambridge invited professors and students from the four Belgian universities to come into residence and organized lectures for them and hospitality for their families. The Chelsea Committee, with Mrs. Erskine Childers as hon. sec., started industries for the refugees on a large scale, and spent £72,000 of English and American money. The National Food Fund and the Belgian Refugee Food Fund, with the substantial assistance of the Smithfield Markets Belgian Relief Fund (which divided gifts of meat between the two funds), supplied an allowance of free food to hostels and Belgian households in London; this made it possible for a large number to do without other financial assistance.

In Jan. 1915, owing to the natural drying up of the sources of private hospitality, the Government undertook to make grants in aid to refugees when private offers were not available, and in this way wholly or partially maintained an average of 6,500 persons till May 1919. In Nov. 1915 it took over the cost of the staff of the War Refugees Committee. When this organization took definite shape, it consisted of a staff of 400 paid workers, who by degrees assumed the places of the original volunteers, though some of these

continued to give their services till the end of the war. Lord Gladstone was chairman of the managing committee and Mr. Algernon Maudslayi, who had assisted the committee from the earliest days of the war, hon. secretary. The health department, which made provision for chronic, maternity, convalescent and dental cases all over the country, was organized by the Countess of Sandwich in Oct. 1914 and afterwards by Dame Victoria Samuel. Viscountess Gladstone was at first in charge of the education department, and Mrs. Alfred Lyttelton of hostels and flats for the use of refugees passing through London. Mrs. Henn Collins and Mrs. A. S. Webbe looked after undesirables and organized rescue work.

In the first months of the war, owing to unemployment at home and to the feeling that the Belgians might soon be able to return to their own country, the refugees were discouraged from seeking paid work. But when this policy was reversed, it became the chief duty of the relief committees to help their guests to find employment. During 1915 factories for the manufacture of war material, established by the initiative of the Belgians themselves, were staffed with Belgian labour, and 65,000 refugees obtained work through the labour exchanges. Ultimately, nearly all the refugees, except those of the professional classes, were absorbed into the economic life of the country. This did not mean that they were all entirely self-supporting, owing to the high rent of furnished rooms and to the difficulties besetting exiles in a foreign country. Lady Lugard's hospitality committee and the Duchess of Somerset's housing committee established hostels for the propertied and professional classes, where the Government allowance was supplemented by a private fund. A scheme for assistance with the rent of furnished flats in London on a large scale, devised by Mrs. Alfred Lyttelton, proved an immense boon to all classes of refugees.

In the first week of Oct. 1914, the Wounded Allies Relief Committee organized the transportation of the first wounded soldiers from Belgian hospitals to England. Auxiliary V.A.D. hospitals, mobilized, but not at the time needed for the British, opened with enthusiasm to receive the Belgians. 40,000 wounded soldiers came to England, many to return shortly to the front. The first of the five King Albert military hospitals, established in England by the Belgian Government, opened at Highgate in Dec. 1914. By degrees the seriously wounded were concentrated in this hospital, which remained open till 1919, and the discharged drafted to a Belgian reeducation camp in France.

Owing to the large number of refugees in England, the Belgian soldier at the front had to be helped to spend his leave with his relatives. The Local Government Board, from Jan. 1916 onwards, bore the expenses of his journey; a special channel service transporting 300 men a day was organized; the transport department of the War Refugees Committee under Mr. H. Campbell arranged the distribution of 185,000 men to their families, and the British Club for Belgian Soldiers was opened from voluntary sources as a residential club for men without friends or relatives.

Gradually much help was organized for their compatriots by the refugees themselves. A "Union de Comité" under M. Emile Vandervelde, Ministre de l'Intendance de l'Armée Belge, which had its headquarters in London, coördinated the work of approximately 20 Belgian funds chiefly for Belgian soldiers. Mme. Edmond Carton de Wiart, Mme. Maton, wife of the Belgian military attaché in London, and Mme. Pollat, wife of the consul-general for Belgium, took a prominent part in the charitable activities of the Belgian community.

During four and a half years of exile the Belgians grew to feel at home in a strange land, and when the time for repatriation came, many were loth to go. The expenses of repatriation were borne by the British Government at a cost of £243,000 and in Oct. 1920 a monument was erected on the Thames Embankment from a fund raised by the ex-refugees themselves, in memory of their exile in Great Britain during the war. (A. E. C.)

UNITED STATES

When the United States entered the World War in April 1917, but one organization depending mainly on the efforts of women was officially recognized by the Government: the Red Cross. On May 6 1917 the Red Cross had 562 chapters with a membership of 486,194. At the signing of the Armistice, it had more than 3,500 chapters and upwards of 8,000,000 regular volunteer women workers. These women produced in 20 months over 371,000,000 relief articles, including surgical dressings, garments for the wounded and the refugees, and a variety of comforts and conveniences for soldiers and sailors. The value of their output was about \$94,000,000. The Red Cross enrolled during the war 23,822 women as nurses. They served in the military and naval hospitals in the United States, Europe, and the Near East, as well as in convalescent homes for soldiers and sailors and in relief work for adults and children both in the United States and overseas. They worked in 700 Red Cross canteens in the United States and 135 in France, serving refreshments to moving troops,

giving them medical care, transferring them when sick, and in other ways aiding and cheering them.

When war was declared many large national organizations of women applied to the Government for instructions. The Council of National Defense appointed at the end of April 1917 a committee of nine women (afterwards increased to eleven) with Dr. Anna Howard Shaw as chairman, to form a plan by which the women of the country could be utilized. This committee selected a woman in each state as a temporary chairman, requesting her to call together the heads of all national organizations of women in her territory to elect permanent officers for a state division. This state division was in turn to organize county committees and each county was to form a division in each city and town. This work of organization was carried on so rapidly that by Dec. 1917 the county organization was complete in 23 states, and a year later there were county chairmen in more than 80% of all the counties in the country. Seventy-three different national organizations of women coöperated. Through these divisions it was possible to convey at once to practically all of the women of the nation the requests of the Government.

The plan of work which the women's committee laid out included the following departments: (1) registration for service, (2) food production and home economics, (3) food administration, (4) women in industry, (5) child welfare, (6) maintenance of existing social service agencies, (7) health and recreation, (8) educational propaganda, (9) Liberty Loan work, (10) home and foreign relief. The specific tasks for these departments originated either in requests or suggestions of the Government or in plans made by the committee itself and approved by the Government. Two months after the women's committee was created it was requested by the Government to enrol the women of the country in a league to support such plans for food conservation as the food administration might present. In a few weeks 5,223,850 pledge cards were signed. The signers were the nucleus of a women's food army which, throughout the war, responded to every request for the conservation, substitution or production of foods made by the food administration. Throughout the war, the women's committee continued to serve the Government in similar drives. For some months the committee gave active assistance to the national women's Liberty Loan Committee created by the Secretary of the Treasury, and in 1918, at the request of the agencies responsible for furnishing nurses to the army, including the Red Cross, and the surgeon-general's office undertook a campaign to enrol students for the U.S. student nurses' reserve. While 5,000 student nurses had been asked for, 13,880 were enrolled, and by the end of Dec. of that year 7,730 of these had been placed for training.

The National League for Women's Service, an organization formed after a study of the activities of English women, some weeks before the United States went into the war, developed an extensive motor corps, carried on a variety of services to soldiers and sailors, and effectively supported all drives. The Y.W.C.A. organized in June 1917 a war council, under which it developed a variety of service clubs, both in the United States and overseas, particularly France. The hostess houses of the association at the home camps of both white and coloured soldiers looked after women visitors, a service which proved of such value that the War Department at the close of the war took the work under its educational and recreational branch. Some 50 buildings were turned over to the Government by the war works council of the Y.W.C.A. Overseas the association conducted service clubs which served Red Cross nurses and other women workers. Both in France and in the United States this organization carried on industrial service clubs near large manufacturing centres.

The employment of women in war industries began in the United States in the winter of 1914-5 with the manufacture of supplies for the Allies. The percentage of women to men in the 19 leading war industries increased from 6.5% in 1914 to 7.7% in the latter part of 1916. In the next two years, to the close of 1918, the proportion rose in these industries to 13.9 per cent. A conservative estimate places the number of women employed in factories (food, textile and war supplies) by the end of 1918 at 2,139,700—an increase of between five and six hundred thousand over the number employed in

these industries in 1914, the date of the last official census. These women were trained to perform a variety of skilled and semi-skilled tasks in the metal trades, in electrical and chemical occupations, in the making of fine instruments, in wood, rubber and leather work, all trades which had been considered beyond their capacity. The substitution of women for men on street railways and subways, in railway yards, banks, offices, shops and hotels and in agricultural pursuits, increased steadily until the signing of the Armistice.

This invasion of industry and commerce by women was accompanied by an effort to preserve existing legal safeguards and to ensure suitable living and working conditions. In 1918 Congress established a women's bureau in the Department of Labor, the aim of which was to develop the most effective use of women's service in production for the war, and at the same time to prevent their employment under injurious conditions. The bureau adopted a set of standards governing women's employment. Although created for the war emergency, the women's bureau in June 1920 was made a permanent section of the Department of Labor.

No official nation-wide registration of women for war service was ever made; plans for such registration were completed by the women's committee of the Council of National Defense and approved by the Government, and it was left to each state to decide whether or not there was a need for registration in its territory. But it is a fact that practically all the women of the United States were doing volunteer war service at the time of the Armistice. They served in the food army, in the farm army, in the chapters of the Red Cross, in the many drives for funds, and in many other less conspicuous but essential activities backed by the Government.

(I. M. T.)

WOOD, SIR HENRY EVELYN (1838-1919), British field-marshal (see 28,789). The field-marshal, who retained his mental and bodily vigour almost to the end, died at his Essex home Dec. 2 1919 and was buried at Aldershot. His record in Zululand indicated unmistakable capacity for command in presence of the enemy, and he was perhaps unfortunate in that his presence during the hostilities with the Boers in 1881 and at Alexandria in 1882 afforded him no further opportunities of a similar kind. From the period when he was chief at Aldershot dates the introduction of military training on practical lines into the British army, and during a prolonged and distinguished career as a soldier he proved himself a keen reformer and an untiring worker, wrapped up in the profession which he adorned.

WOOD, SIR HENRY JOSEPH (1860-), English conductor and musician, was born in London March 3 1860. His musical education was largely received at the Royal Academy of Music and when only ten years old he became deputy organist at St. Mary's, Aldermanbury. As a conductor, he first appeared in 1889, when he joined the Roushey opera company, and for some years he toured with various companies, including the Carl Rosa (1893). In 1895 the Queen's Hall concerts were started under a system of guarantees, with Henry Wood as conductor and Robert Newman as manager. Under his conductorship the standard of English orchestral playing was notably raised, and his work for music in London was deservedly honoured by a knighthood in 1911. He married, first, in 1898, a Russian lady, Princess Olga Ourousoff (d. 1909); second, in 1911, Muriel, daughter of Major Greatrex.

WOOD, MRS. JOHN [Matilda Charlotte] (1833-1915), English actress, was born at Liverpool Nov. 6 1833, the daughter of Henry Vining, and first appeared on the stage at Brighton at the age of eight. As a young girl she played leading parts in comedy at the Theatre Royal, Manchester, and in 1852 appeared there as Ophelia. After her marriage she acted for some years in America, beginning in 1854 with *The Loan of a Lover*, followed by many other parts. She opened a theatre of her own in New York in 1863 but returned to England in 1866. From that time until her retirement from the stage in 1905, she was in the first rank of robust comedy actresses. Her management of the Court theatre, between 1883 and 1891 saw the production of many of Pinero's best comedies. Later she appeared in elderly rôles in most of the Drury Lane melodramas, her last appearance being in Hall Caine's *The Red Rover* in 1905. She died at Birchington-on-Sea Jan. 11 1915.

WOOD, LEONARD (1860-), American soldier, was born at Winchester, N.H., Oct. 9 1860. He graduated from the Harvard Medical School in 1884, was appointed assistant surgeon with the rank of first-lieutenant in the U.S. army in

1886, and at once joined Capt. Lawton's expedition against the Apaches in the southwest, resulting in the capture of Geronimo. For distinguished services he was awarded the Congressional Medal of Honor. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., was President McKinley's personal physician. Here he became the close friend of Theodore Roosevelt, then Assistant-Secretary of the Navy. On the outbreak of the Spanish American War in 1898 Wood was commissioned colonel of volunteers, and together with Roosevelt, as lieutenant-colonel, raised the famous regiment of "Rough Riders," composed of western ranchmen and cowboys as well as members of prominent eastern families eager to serve under these two strenuous leaders. For conduct at Las Guasimas and San Juan Hill, Wood was promoted brigadier-general July 1898 and in Dec. major-general of volunteers. He was military governor of Cuba from 1899 to 1902 when the Cuban Republic was established. Under his guidance great improvements were made in schools and sanitation. Meanwhile he had been honourably discharged from voluntary service and appointed brigadier-general in the regular army Feb. 1901. In March 1903 he was sent to the Philippines and in Aug. promoted major-general. For three years he was governor of the Moro Province and during 1906-8 was commander of the Philippines Division. In 1908 he returned to America as commander of the Eastern Department for a year. In 1910 he was special American ambassador to the centenary celebration of Argentine independence. On his return he was appointed chief of staff, serving until 1914, when he was again given command of the Eastern Department. General Wood often had disapproved the policies of the War Department, and as early as 1908 had urged preparedness. To him was largely due the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after America's entrance into the World War. In 1915, when he gave unofficial indorsement to the proposed formation of the American Legion whose purpose was to establish a body of some 300,000 men ready for immediate service, he was rebuked by the Secretary of War. Just before America's entrance into the World War in 1917 it was announced that the Eastern Division, then under Gen. Wood's command, had been divided into three divisions, and Gen. Wood was assigned to the South-eastern Division, with the alternative of choosing either Hawaii or the Philippines. As a soldier desiring active service he naturally chose the American post; but the apparent motive of the War Department to humiliate him, aroused criticism. He was later transferred to Camp Funston, where he trained the 80th Div., N.A. In Jan. 1918, while in France, presumably preparatory to bringing his troops there, he was painfully wounded by the explosion of a French mortar. After his return to America he was on the point of embarking with the 80th Div., when he was suddenly assigned to the Western Department, no reason being given. It was generally understood that his name was not on the list of officers submitted by Gen. Pershing as acceptable for duty overseas. By change of orders he was returned to Camp Funston, where he trained the 10th Div. of the regular army and other troops. In 1919 he was put in command of the Central Department, with headquarters at Chicago. In 1920 he was a prominent candidate for the presidential nomination at the Republican National Convention. He led on the first four ballots and never fell below second place. When the supporters of Governor Lowden, his chief competitor, were released after the eighth ballot, they swung to Senator Harding, a "dark horse," who was nominated on the tenth ballot, with 692 votes to 156 for Gen. Wood. In 1921 Gen. Wood was sent on a special Federal mission to the Philippine Is. to report on conditions there. During his absence he was appointed head of the university of Pennsylvania. In Oct. 1921 he retired from active service in the army and was appointed governor-general of the Philippines. He was granted a year's leave of absence from the university of Pennsylvania, but it was thought that he might be able to assume his academic duties in Oct. 1922. He was the author of *The Military Obligation of Citizenship* (1915), lectures at Prince-

ton and elsewhere); *Our Military History, Its Facts and Fallacies* (1916); and *Universal Military Training* (1917).

See I. F. Marcosson, *Leonard Wood, Prophet of Preparedness* (1917); Joseph H. Sears, *The Career of Leonard Wood* (1919); and *Leonard Wood on National Issues* (1920), compiled by Evan J. David.

WOODGATE, WALTER BRADFORD (1841-1920), British oarsman and barrister, was born at Belbroughton, Worc., Sept. 20 1841. He was the eldest son of Canon Henry Arthur Woodgate, who was a fellow of St. John's College, Oxford, and Bampton lecturer in 1838. He was educated at Radley College, and Brasenose College, Oxford, and during his undergraduate course he founded Vincents' Club. In 1872 he was called to the bar; but it is as a first-class oarsman and journalistic critic of rowing that he is remembered. He rowed for his own college, and in 1862 and 1863 in the winning eight for Oxford. In 1864 he won the Diamond sculls after a dead heat two years previously (see 23,784), and in 1865 he was in the winning eight for the Grand Challenge Cup at Henley. He contributed the volume on *Boating* to the Badminton Library, and also wrote *Oars and Sculls, and how to use them* (1886) and the *Reminiscences of an Old Sportsman* (1906). He was also the author of *A Modern Layman's Faith* (1893) and of one or two novels. He died at Southampton Nov. 1 1920.

WOODS, HENRY GEORGE (1842-1915), English divine, was born at Woodend, Northants., June 16 1842. He was educated at Lancing and at Corpus Christi College, Oxford, where he had a distinguished career. In 1865 he became a fellow of Trinity, and in 1866 was ordained. He was a tutor at Trinity from 1866 to 1880, and bursar from 1867 to 1887, in which year he was elected president of Trinity. He resigned the presidency of Trinity in 1897, and from 1900 to 1904 was rector of Little Gaddesden, Herts, and chaplain and librarian to Lord Brownlow at Ashridge Park. In 1905 he succeeded Ainger as Master of the Temple. He died at the Master's House, Temple, July 19 1915.

His wife, MARGARET LOUISA WOODS (b. Nov. 20 1856), poet and novelist, was married to him in 1879. Her first novel, *A Village Tragedy*, appeared in 1887, and her first volume of verse, *Lyrics and Ballads*, in 1889. Later novels included *Esther Van-hornigh* (1891); *The Vagabonds* (1894); *Sons of the Sword* (1901), and *The Invader* (1907). In *The Princess of Hanover* (1902) she essayed historical drama. In 1913 her *Collected Poems* were published.

WOODWARD, HENRY (1832-1921), English geologist (see 28,804), died at Bushey, Herts, Sept. 6 1921.

WOODWARD, HORACE BOLINGBROKE (1848-1914), English geologist (see 28,804), died Feb. 5 1914.

WOOL (see 28,805).—The functions of "supply" and "demand," of "free-trade" and "controlled trade" in the wool industry, during the decade 1910-20, form a very interesting study for the economist. The situations before, during, and after the war are best shown separately:—

I. BEFORE THE WAR (1911 to 1914)

(a) *Wool Production*.—The best available statement of the world's sheep and wool production is given in Table 1; it includes figures of the pre-war and post-war periods.

TABLE 1. *The World's Sheep and Wool.*

	Sheep		Wool in lb.	
	Pre-war	Post-war	Pre-war	Post-war
Europe	177,981,207	171,026,261	803,400,043	751,104,667
Australasia	96,189,727	107,467,005	645,138,880	852,122,484
S. America	118,638,046	72,342,762	482,640,707	487,180,000
N. America	54,053,409	49,549,458	303,473,000	327,829,531
Asia	92,378,419	96,735,546	273,146,000	326,505,000
Africa	63,432,738	69,114,685	219,919,000	219,919,000
Central America and W. Indies	770,380		750,000	750,000
Total	603,323,941	566,235,717	2,728,461,630	2,965,419,682

Chiefly from the *Wool Review* of the National Association of Wool Manufacturers, United States.

From these statistics the following interesting deductions are to be drawn. It is somewhat surprising to find Europe heading the list of wool-growing continents. This is largely due to the flocks of European Russia: 320,000,000 lb. of wool (pre-war) are credited under this head, and this probably explains the source of German wool clothing during the latter days of the war. What had become of this huge quantity latterly was not on record in 1921. Incidentally it would certainly appear that the continent of Europe as a wool-growing continent had not claimed the attention merited. In most respects Europe compared more than favourably with other continents, and it was only owing to the diversity of interests, languages, etc., that this was not more in evidence. If the nations of Europe would all pull together, that continent would probably have more to give to the world than to receive.

Europe and North America, being by far the greatest manufacturing centres in the world, have practically consumed the whole of the very large surplus stocks from the other wool-growing countries, apparently in the proportions of 80% for Europe and 20% for North America. The marked difference in the weights of the fleeces produced as indirectly shown by this table is obviously worthy of careful consideration.

(b) *Wool Distribution*.—The detailed figures respecting local supplies, importations and re-exportations are very confusing. The figures in Table 2 may be taken—with exceptions to be presently noted—as an indication of the wool each important manufacturing country received. One or two questions

TABLE 2. *Wool-manufacturing Countries.*

Country	Imported for Manufacturing	Local Supplies	Total
1. France (1909)	623,000,000	75,000,000	698,000,000
2. United Kingdom (1911)	490,307,000	90,000,000	580,307,000
3. United States	251,000,000	804,000,000	555,000,000
4. Germany	517,000,000	25,600,000	542,600,000
5. Russia	94,000,000	320,000,000	414,000,000
6. Belgium	355,000,000	1,000,000	356,000,000

Austria, Hungary, Italy and the Netherlands follow in the order named.

These figures require careful consideration. Probably a large proportion of this wool is usually manufactured in other countries—notably Germany and Britain.

here arise. The United Kingdom is credited with manufacturing 90,000,000 lb. approximately of a 120,000,000 lb. clip. It must not be forgotten, however, that a very considerable amount of the world's wool supply passes through the London or Liverpool wool sales, as is shown by Table 3.

TABLE 3. *United Kingdom Imports and Exports (1911).*

	Imports	Exports	Retained
Colonial	659,511,000		
Foreign	135,004,000		
Totals	794,515,000	304,265,000	490,250,000

The colonial (and foreign) wool not accounted for by Table 3 is no doubt sold direct to the manufacturing countries. This is indicated by the sales of South African wools for the year 1913 (Table 4).

TABLE 4. *Distribution of South African Wools.*

	1913	1919
United Kingdom	96,028,737	96,464,203
Germany	61,123,713	
Belgium	20,695,225	12,662,059
France	4,898,212	9,588,452
Italy	924,852	43,002
United States	221,522	71,502,522
Japan		39,800,648

An analysis of S. American exports would, no doubt, show by far the larger porportion of S. American wools passing directly to Belgium, France, Germany and the United States, a large quantity, of course, passing through the Antwerp sale-rooms.

(c) *Tendencies in Production and Distribution*.—In wool production from 1920 to 1921 there is little to note. S. Africa

made a valiant attempt to improve both the quality and quantity of her wool, and succeeded in both objects to a certain extent. In Australia certain developments of sheep-growing districts are to be noted, but these, with the increase in the weights of the individual fleeces, probably only just served to balance losses through drought and in other directions. Falkland Island wool (fine crossbred) made a name for itself as a good hosiery wool, but unfortunately the increase up to 1914 was not great. S. America generally proved disappointing, in view of the demand for its wools, not only from the European continent but also from Great Britain, following the decline in the prejudice against them.

Undoubtedly the greatest wool problem prior to the war was the provision of a sufficient quantity of fine merino wool. This

TABLE 5. *New Zealand Wool.*

	Total Sheep	Merinos
1910	23,480,707	1,868,805
1917	25,270,386	1,063,491
1920	23,914,506	803,589

is illustrated in Table 5. S. Africa partly met this deficiency, but Australia pinned her faith on mutton rather than on wool, so that the tendency to eliminate the pure-bred merino is still in evidence.

So far as the distribution of the wool manufacturing industry was concerned there was an undoubted tendency in Britain to relinquish wool manufacture owing to severe competition. The continental European competition took the form of efficiency in manipulation and excellence in the goods produced. How Yorkshire was going to face the importation of certain continental goods was a problem—and one that had still to be faced after the war. The competition with the United States was apparently controlled by the tariff charges, but it is more than probable that the excellence of American manufactured goods was already beginning to tell against European importations; although America still had to start her export trade. Yorkshire, however, appeared to be falling between two stools—she was not producing goods of the excellence of the continental styles and thereby forcing a way into neutral markets; nor was she organized on such a scale that she could face the United States' markets—indeed the American manufacturers were surpassing her in scale of organization. It would not be over-stating the case to say that the year 1914 opened with many misgivings so far as the British wool manufacturing industry was concerned. The war came, and temporarily dominated everything. But the conditions of 1914 were likely to reappear afterwards, and would have to be faced sooner or later.

II. THE WAR PERIOD (1914 to 1918)

The Slump in Trade.—Fear of the unknown naturally created the trade slump observable during the early months of the World War. Britain, a country whose very life depended upon the importation of the raw material and exportation of the semi-manufactured, or fully manufactured article, naturally had most to fear. This fear was further aggravated by the fact that British manufacturers had huge financial interests involved with Germany; and, conversely, Germany had financial interests with Britain. With trade universally in a state of suspended animation, and the sequence of delivery of goods and payment of accounts seriously interfered with, many British firms—and especially those in the wool, top and yarn trade—were at once in serious financial difficulties. The Government, however, tidied over the difficulty by the "moratorium," which, by the "time easement" given, enabled the greater proportion of firms eventually to meet their liabilities.

A period of suspense followed, during which the exact trend of many matters was being worked out. By the middle of 1915, however, the idea that, when the British and French armies got going, they would sweep the Germans back into the Fatherland, had practically gone. In the meantime Germany had been swept from the seas. It was now evident that Germany, from the wool point of view, would have to be self-contained,

neither importing raw wool¹ nor exporting manufactured goods; that France was seriously incapacitated as a manufacturing country owing to the invasion of much of her manufacturing territory; that Russia would seriously have to draw upon British stocks of manufactured goods; in fact, that Britain must be the mainstay of the Allies—and of the world, with the exception of the United States and Japan—so far as wool manufactured goods were concerned. The extent to which Germany deliberately crippled France both during the war period and subsequently will be realized from the following quotation from the *Yorkshire Observer* in March 1921:—

"The Fournies District remained practically the whole time away from actual fighting range and did not suffer from gunfire, but, this notwithstanding, the destruction by hammer, pick, dynamite and fire was complete, the Fournies woollen plants having always proved most serious competitors of those of Germany. The enemy reached the district on Aug. 26 1914, and left it on Nov. 9 1918. When they arrived there were 75 textile works in full activity; they destroyed all except five worsted spinning plants, one woollen spinning plant and one combing plant. The steam engines were broken or otherwise damaged; the boilers removed and rendered unserviceable, the safes were broken into and all records of manufacture, samples, reference data, representing 30 years of activity, removed to Germany. . . . Immediately the Germans occupied the northern departments of France, not a single wool-combing machine was left throughout the country; there remained in activity throughout the land only 160,000 worsted spindles out of 2,400,000; only half the total of 700,000 woollen spindles; only about 11,000 weaving looms out of 56,000."

By 1916, two other factors had come into play. The drain on the man-power of Great Britain was becoming serious. But it was now fully revealed that in the wool industry there was a vast surplus of labour ready to maintain output, at least at a very high rate. By April, scarcity of shipping was threatened. Thus early in 1916, if the serious limitation of the supply of raw materials was not actually felt, it was in sight.

The Difficulties Leading to Wool Control.—The British War Office, having in the very early days of the war experienced the difficulty of clothing in khaki the large army in course of formation, organized itself to overcome this difficulty, and by the inevitable restrictions indirectly placed on the manufacture of civilian clothing had so far succeeded fairly well in its direct object. But by the early days of 1916 the War Office was seriously alarmed at the future prospects of supplies of raw materials and sought outside advice. As illustrating the method of working the following may be taken as typical. On Feb. 2 1916 a War Office official (who, incidentally, knew nothing of wool) visited the university of Leeds and asked for certain estimates respecting British combs and spindles, to be supplied to him four days later when the Army Council would meet to discuss supplies. In Table 6 the figures then supplied are given, and alongside the estimates are given also the actual figures, kindly supplied some years later by the same official. The estimate for 1916 was 337,500,000 lb., as against an actual production of 309,443,185 lb., based on the first half of 1917.

The following figures were also supplied on the same date:—

Wool available for use in the United Kingdom	800,000,000 lb.
Less clothing wools used in the woollen trade	200,000,000 lb.
Available for combing	600,000,000 lb.
Less shrinkage and tearage in scouring and combing (40%)	240,000,000 lb.
Wool available for "tops"	360,000,000 lb.

The estimated shrinkage and tearage of 40% would have been much too low—as average Australian merino gives a shrinkage of about 50% and a tearage of from 5 to 1 to 8 to 1—but for the endeavour made to save shipping space by shipping in the scoured state only, and by reason of the large quantities of washed home-grown wools and low-yielding colonial crossbreds included. The effect of this is clearly shown (Table 7) in Mr. Norman Rae's figures published in the *Yorkshire Observer* of Friday, Aug. 10 1917. From these figures it is evident—

¹ With the exception noted with reference to Russian wools.

TABLE 6. *Estimates (Feb. 1916) and Figures*
(Output of combs per annum)

Combs			1,500 combs long wool and crossbred each combing 600 lb. per 10 hours	1,500 combs Botany each combing 300 lb. per 10 hours
Actual 1914	Est'd. 1916	Actual 1915	Estimated 1916	Actual (1917) ¹
2,823	3,000	2,956	225,000,000	206,635,428
				Estimated 1916
				112,500,000
				Actual (1917) ¹
				92,869,516

(Output of worsted spinning spindles per annum.)

Spindles			2 lb. per week per spindle estimated
Actual 1904	Est'd. 1916	Actual 1916	1916
3,000,000	3,000,000	3,241,714	300,000,000 lb.
			Actual (1916) ¹
			300,241,712 lb.
			(The 1915 actual was 253,879,664 lb.)

¹ Large quantities of scoured colonial wools were being imported. Certain worsted wools were also being drawn and spun without being combed, thus eliminating "less tearage."

TABLE 7. *Stock Dec. 31.*

Schwartz %	Type	%	Greasy lb.	Clean lb.
72	N.Z. greasy crossbred.	70	50,656,000	35,439,000
45	Aust. greasy merino	45	49,438,000	21,258,000
85	" scoured crossbred	85	33,704,000	28,648,000
"	mtg. gay. crossbred	72	17,901,000	12,888,000
"	mtg. gay. merino	43	4,638,000	1,994,000
73	" low wools	75	40,223,000	30,167,000
60	" mohair, etc.	80	17,807,000	14,245,000
		68.69 %	237,213,000	162,935,000
	Private British	78	21,701,000	16,920,000
	Government British	78	51,053,000	39,821,000
	Total	70.87 %	309,967,000	219,682,000

Yield as above
Leaving out skins, yield at 50% (instead of 70.87%)

219,682,000 lb. (clean)

154,983,000 lb. (clean)

Increase (wool under-estimated)
Skins, 7,238,000 lb., not included.

64,698,500 lb. (clean)

keep the Allies' wool industries supplied with wool, and much under-estimated the yields—although they had the Leeds University suggestion of 40% for yield and tearage before them; (b) that the industry was feeling the shortage of wool and was regarding the future with misgivings; (c) that leading wool men thought it actually expedient to question the Government figures, and, if possible, to obtain at once a greater wool distribution; (d) that as subsequent figures seem to show, the University figures of 40% average loss between raw wool and finished top and the other figures supplied were most nearly correct, and would have served well as a basis to work upon. All these figures, however, are chiefly useful as illustrating the difficulties involved not only in estimating the workable supplies of wool during the war period but in estimating the yields and in averaging up the quantities of clean wool which the actual deliveries might be expected to give.

How serious was the problem of supplying wool to the home trade, and to such of the Allies as could manufacture it, is shown in Tables 8 and 9. To the quantities shown in these tables should be added something over 300,000,000 lb. of remanufactured materials, probably derived as follows (in 1914 figures):—Of the wool manufactured in Great Britain, 500,000,000 lb., about $\frac{1}{4}$ (166,000,000 lb.) is retained at home, and about half this (84,000,000 lb.) is torn up each year; rags imported amount to 100,000,000 lb.; so that the total remanufactured materials (excluding wool) amount to 184,000,000 lb. But this is probably an under-statement, as the figures collected by the Board of Trade during the war period show an average approximating to 200,000,000 lb. Thus it would appear that the woollen industry of Great Britain roughly consumes per annum:—200,000,000 lb. greasy wool¹, 200,000,000 lb. remanufactured materials, and 60,000,000 lb. of oil, or a total of 460,000,000 lb.

These figures reveal—(1) the continuous reduction in the quantity of British wool grown and, excepting during the war period, manufactured in Britain; (2) an increase in supplies

¹ This figure is questionable as large quantities of so-called clothing wools may be employed for combing purposes.

of colonial and foreign wools, if we take into account the fact that there is possibly still some of the 1910 period wool to be accounted for; (3) the increase in the quantity of colonial and foreign wool manufactured in Britain; (4) the large increase in the foreign and colonial importation in 1915; (5) the effects of the German submarine campaign on the 1918 importation, and the making up of lost ground in 1919; (6) the fact that the average importation of colonial and foreign wool for the five years ending 1919 is much below the five years ending 1914. Had wool gone elsewhere, or had it not been grown? It may be noted (7) that Turkey mohair (sent to Britain by parcel post during the first year of the war) would disappear until 1919, the large increase shown on 1919 being no doubt partly Turkey mohair and partly Cape mohair; and (8) that alpaca, being free, was largely employed to take the place of merino wool during 1917 and 1918, the clipping of immature fibre led to the marked increase in 1918 and the consequent reduction in 1919.

TABLE 8. *Pre-war Supplies of Raw Materials.*
(In millions of lb.)

Average for five years finishing	1899	1904	1909	1914	1919

Camels' hair			2.7	2.3	4.8

¹ Average for five years = 724 (see Table 8).

These facts and figures, although somewhat prematurely placed here, may be usefully borne in mind in studying all phases of the subject.

In April 1916 the Army Contracts Department of the War Office began to commandeering hosiery yarns on the financial basis of a fixed margin to cover the processes of manufacture. A little later restrictions were imposed upon the export of raw wool—possibly owing to rumours of it reaching enemy countries and certainly because wool supplies for home purposes were becoming very restricted. By June 1916 the War Office knew that further control was almost certainly inevitable, and circulated compulsory requests for particulars of stocks of wool, tops and yarn, which requests, of course, were very disquieting to the trade. Later in the same month, so serious was the position judged to be that the War Office prohibited the opening of the British wool fair of Kettering, and, eventually, after some debate,

purchased the whole of the British clip at 35% above July 1914 prices. The British clips of 1917 and 1918 were also bought.

Anxiety with reference to the possibility of supplying the army with the wool goods it really needed continually increased. In April 1917 the open market for wool was closed and the sales by auction abolished. In May, in anticipation of the lack of wool to keep the factories going and of labour disturbances, an army council order was issued which resulted in the reduction of working hours in the factories from 55½ per week to 45 per week, unless permission was obtained from the director of army contracts to work full time. This order was not withdrawn until May 18 1918, following the enormous demand for flannel goods.

Following the revolt, already referred to, of Yorkshire manufacturers in Aug. 1917, due to War Office restrictions of supplies and of estimates of future supplies, and following the failure of the trade itself to supply reliable data, came the formation of a "Board of Control."

Wool Control.—The Board of Control was organized with Sir Arthur Goldfinch as director of raw material supplies, Col. F. V. Willey as controller of wool supplies, and Sir Charles Sykes as director of wool textile production. The department was housed in the Great Northern Hotel, Bradford, and was given complete control of both supplies of raw material and output of finished clothing. The activities of the department followed briefly the following lines:—(1) A reasonably exact basis of "yields" was ascertained and all wools dealt with on the "clean wool" basis. (2) Reliable statistics were obtained and made the basis of the distribution of supplies of raw materials. (3) A method of "rationing" the margin of wool supplies (about 20% of the available supplies) available for the civilian trade was worked out. (4) Difficulties of a minor nature, such as the supply of oils for oiling wool, soaps for scouring, etc., were faced and usually satisfactorily surmounted. (5) A standard clothing scheme was introduced, the intention of which was, no doubt, good, and its failure only to be attributed to the failure to employ the technical skill actually available in the industry in the designing and displaying of the goods manufactured. Exhibitions were held up and down the country and attracted much attention, but little demand for the fabrics was exhibited. Last, but perhaps not least, the department had to face the problem of relinquishing control on the termination of the war. Those who know the anxiety caused, years before the war was over, by the clearly foreseen difficulties of disbanding an enormous army, will know something of the anxieties of the Wool Control Board to close down with credit to itself and no less to either the wool grower or the wool manufacturer.

Provision for After the War.—The Armistice brought with it the determination of those whose trade had been taken from them by the Wool Control Board to oust the Board and regain their own back again. The Board's function, on realizing the inevitable, was to dissolve (1) with credit to itself, and (2) with due regard to the interests of the wool growers and wool merchants, of the wool manufacturers, and of the consuming public. With the huge demand for goods following the Armistice prices soared up and up, and it was only human that the Board should tend to retain command to its own financial advantage, and also to attempt to prevent undue inflation of values to the detriment of the consuming public. So far as British wools were concerned the removal of control was so simple that no preliminary action was considered necessary, and the restrictions were actually removed in time for the wool fairs in 1919.

To meet the difficulty with reference to Australian wools the Imperial Government had decided to purchase the Australian clip for one year after the war. To further facilitate matters, a Wool Council, which included imperial representatives, was formed by the War Office.

With reference to the interests of the manufacturers and consumers the Government again asked for advice from the university of Leeds through one of its representatives. In a personal interview with the official in question the probable trend of trade after the war was outlined and the suggestion given that, in view of the almost certain shortage of immediately

available supplies and the huge demand for fine merino wools, certain manufacturing restrictions—such as spinning only to fine counts of yarn—should be imposed. Unfortunately this suggestion was not sufficiently acted upon, with the result that the army's revolt from rough khaki to fine blue serge sent merino wools soaring up to unthought of heights, all other qualities following suit. The intention of the Wool Council was undoubtedly good, but again the direction of the matter was primarily in the hands of those who knew little or nothing about the wool industry, who could not even judge who were giving them sound advice and who were giving them questionable advice. It may be conceded that to control speculation under the conditions prevailing from 1918 to 1921 was apparently impossible. Apparently the only thing to be done was to unload stocks as rapidly as possible—although one authority did suggest that the way to reduce prices was to keep large stocks of wool and not to sell.

During this period there was much unrest in the labour world and a great deal of talk about "profiteering." As an indirect result of this the Whitley Act was passed by Parliament, and note should here be made of the endeavours made by the British woollen and worsted industries to take advantage of this Act and form "Industrial Councils" composed of employers and employees, also of the formation of the "National Wool Textile Industrial Council," the final draft-constitution of which—prepared by Mr. Ernest Marsh (chairman) and Mr. G. H. Wood (secretary)—as adopted on Dec. 10 1918, was as follows (*Yorkshire Observer*, Nov. 27 1918):—

"The title selected is the National Wool (and Allied) Textile Industrial Council, and its objects are defined as follows:—

To promote the development of the industry and to secure that wages, methods of production, and conditions of employment shall be systematically reviewed and decisions agreed upon which shall have as their object the improvement of the relations between employers and employees.

In furtherance of these objects the Council shall:—

(a) Consider wages, hours, and working conditions in the industry as a whole, and the fixing of standard rates of wages for similar occupations in the industry. It shall also consider the employment of scientific and agreed methods of fixing wages, and of adjusting wages to new conditions, and the securing to the employees of a share in any increased prosperity of the industry;

(b) Consider the best means of securing the highest efficiency of the industry, including any improvement in machinery, invention, or method by which the prosperity of the industry is to be increased; secure that such invention or improvement in method shall give to each party a fair distribution of the benefits derived from the increased efficiency; utilize to the fullest extent the practical knowledge and experience of the workpeople, and secure that such knowledge may receive consideration;

(c) Consider the existing machinery for the settlement of differences between different parts and sections in the industry, and the establishment of regular methods of negotiation on anticipated issues between employers and employees, and upon differences which may be reported with a view to the prevention of differences and their equitable adjustment;

(d) Consider the supervision of the entry into and training of employees for the industry, and co-operation with the educational authorities in arranging educational facilities for the industry in all its branches;

(e) Make comparative studies of the workings and methods of the industry in this and other countries, and when desirable publish reports;

(f) Secure to the workman a greater share in and responsibility for the determination and observance of the conditions under which he works, in so far as it relates to his material comfort and well-being; make efforts for the decasualisation and permanent security of employment, having regard to the conditions surrounding changes of occupation between one employer and another; consider means toward the improvement of conditions with a view to removing the danger to health in the industry, and toward providing special treatment where necessary for employees in the industry;

(g) Make reports to Government departments and local authorities of the needs and opinions of the industry; consider any questions bearing on such matters which may be referred to the Industrial Council by the Government or by a Government department; consider jointly all proposed legislation affecting the industry and take joint action where such legislation is likely to interfere with its prosperity;

(h) Consider the best means of insuring the observance of the decisions of the Council and of agreements made between organizations of employers and employees;

(i) Consider means whereby the employers and employees shall be brought within their respective associations."

This Council steadily extended its activities, and may ultimately be the deciding factor in helping Great Britain to maintain and possibly to extend her manufacturing position.

Another indirect result of the war was the development of industrial and scientific research. The university of Leeds (so far as the wool industry was concerned) here took the lead, and, in conjunction with the West Riding County Council and with the help of many prominent manufacturers in the various manufacturing districts, raised approximately £5,000 per annum for a period of five years. With the development of the Government Department of Scientific and Industrial Research, however, came the question of overlapping, and the university, while naturally retaining its own research status, not only gave way to the new department but strenuously helped in the development of "The Research Association for the Woollen and Worsted Industries" now housed in Leeds. This Research Department is designed to cover the requirements of Great Britain and Ireland.

III. AFTER THE WAR (1918 to 1921)

Withdrawal of Control from British Wools.—Under political pressure the Government freed the wool fairs of 1919 from State control. But a curious tendency now made itself felt. Owing to the limitation of supplies of colonial crossbreds and other

CHART 1

Values of British Wools and Tops (1912 to 1921).

crossbred wools, woollen manufacturers had been constrained to use British Down wools and Down crosses. These were discovered to possess just the characteristics sought for in certain woollen goods. They were also the wools sought for by the hosiery manufacturer; and as hosiery now took a wonderful development the Down wools went soaring away in price, at last almost rivaling colonial merinos. When the slump came, Down wools stood out against it even longer than merinos, and it seemed probable that when trade should revive Down wools would again come into their own. In view of the great future before Down wools it was regrettable that more British farmers did not follow the suggestion to grow Down crosses, as strenuously advocated by qualified representatives of the universities of Edinburgh and Leeds.

The changes in values of British wools and tops are shown for the decade in Chart 1.

Of course the high values shown in this chart are fictitious in more senses than one, but it would seem that if the 1921 prices of these wools had been brought to the 1914 basis they must be so cheap that demand for goods manufactured from them would have been immediate. Probably the large stocks of manufactured goods still held in 1921 by the middleman kept the prices of these goods at an artificial height and thus lamentably interfered with trade.

Withdrawal of Control from Colonial Wools.—The Wool Council of the War Office on the cessation of hostilities found itself in great difficulties with reference to colonial wools. Just as on the outbreak of war no one knew what would happen, so in this case it was impossible to foresee whether the enhanced values of the war period would be maintained or prices rapidly fall. If prices had rapidly fallen it is possible that the wool grower would have held the Wool Council to its bargain, and

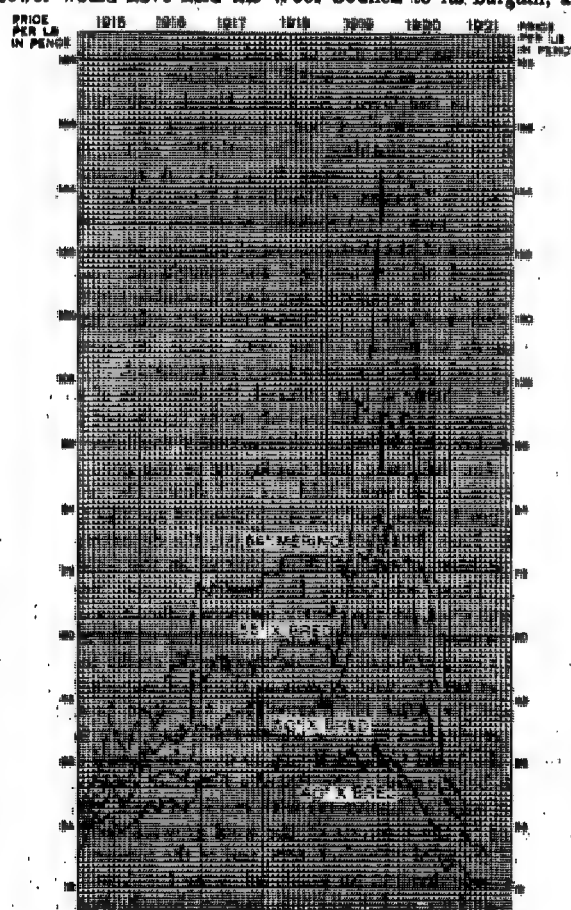

CHART 2

Values of Colonial Wools and Tops.

no one could well have found fault with their attitude. But prices rapidly rose, and so it came about that the colonial wool grower felt aggrieved that he was not going to profit by the enhanced wool values like the home wool grower. Thus it came about that the Imperial War Council agreed to share the very substantial prospective profits with the colonial wool grower. Unfortunately much of the 1919 wool had not been brought under the hammer before the slump started (May 1920), but it was stated that, after the British Treasury had been reimbursed for the expenditure it had incurred, there was at the end of 1920 a clear profit of £14,000,000, half of which belonged to the growers, bringing their total receipts up to £180,896,059. In addition to this there remained unsold (Dec. 1920) 1,800,000 bales, half of which belonged to the growers.

The change in the values of colonial wools and tops during the decade are shown in Chart 2.

Up to May 1920 the endeavour of the Wool Council was rather to maintain than to inflate values, and much fault was found with the Council for not making greater progress with the disposal of the wool to hand—the manufacturers were crying out for it. To meet this demand the Antwerp sales were reopened on Oct. 25 1919 and extensive sales in the United States of America were also promoted, one of the first being held in Philadelphia in Sept. 1919. Apparently the fall in the prices of wool was almost coincident with the release of ships for transport. Unfortunately few realized the large stocks of wool on hand—or rather they estimated their consumption at the 1919 rate and consequently minimized their stocks. Thus it came about that, following a period when every conceivable bale of wool was called for and (from the sellers' point of view) ought to have been placed on the market, came a period when with bated breath one heard the word "unloading," and all too soon new wool and old wool were on the market together.

CHART 3

Wool Values Adjusted to 1914 Values.

Adjustment of Sale of Old and New Wool.—In the early days of 1920 those starting new works in the colonies, India and elsewhere, were asking—can we obtain sufficient wool to run out

factories? And there was every inducement to wool growers—particularly growers of the finer sorts—to extend operations. Toward the end of 1920 almost all factory building the world over was suspended or carried on very leisurely; and with the fall in wool values many sheep breeders were already looking on wool as an almost valueless by-product. Probably both extremes were wrong. Table 10 gives a fair idea of the world's wool stocks about the end of 1920 or early in 1921.

TABLE 10. *World's Wool Stocks (Approximate)*¹

Wool in England (held by the B.A.W.R.A.)	1,600,000 bales
Australia	800,000 bales
Cape wool (held by B.A.W.R.A.)	100,000 bales
U.S.A. surplus stock (Oct. 1 1920) ²	1,000,000 bales
S. American wool	5,000 bales
Total	3,505,000 bales

¹ No doubt small stocks were held elsewhere.

² Two years' stocks said to be accumulated.

Prior to the war the world's yield of wool was about 2,728,461,630 lb., and it might be taken that about this amount was yearly absorbed. It would thus appear that the surplus wool on hand was equivalent to about 14 or 15 months' normal world's consumption.¹ Now if there were serious depletion of stocks of manufactured goods, and if there were likely to be a greater demand from the better paid workers of the world, and from countries likely to demand wool goods which previously had not consumed such goods in great quantities (India for example), then the stock of wool would appear hardly sufficient to meet the probable demand. Possibly these brighter conditions might have been realized, but for over speculation in the wool industry and the general slump in prices. Actually, however, what did happen was that the countries which could purchase were inundated with the goods which, under normal conditions, would have been spread over a broader field and the slump followed storage of goods and lack of sales. The reaction probably went much too far—for the home market in Britain was good in the middle of 1921. But the Wool Council had not only to face this surplus of wool but the new wool (1920 clip and in prospect the 1921 clip) coming on to the market at the reopened sales in Australia. The adjustment of this prospective difficulty was exemplified as shown in table 11 in the quantities of old and new wools—offered, sold and withdrawn—in both London and Australia in June 1921. Of these quantities, about 79,500 bales,

TABLE 11. *London Colonial Wool Sales (Feb. 22 to March 5 1921).*

	On Government Account	On Importers' Account
	Bales	Bales
Sydney	24,567	9,889
Queensland	4,991	6,435
Port Philip	12,862	3,274
Adelaide	5,286	1,542
Tasmania	2,648	279
Western Australia	3,599	40,507

Cape	..	81,734
Punta Arenas	..	34,871
Falkland Islands	..	577
River Plate	..	165
Sundries	..	724
Total	74,217	80,226

of which approximately 76,000 bales were colonial, were sold; 44,000 bales were taken for export, including 2,000 bales Punta Arenas and Falkland Islands; 8,000 bales went to America. At the April 1921 London sales the reserve prices of the old wool were so high that no bids were forthcoming and all of this wool was withdrawn. Owing to the formation of the British Australian Wool Realization Association not being completed, or rather its policy not being decided upon, all the Australian old wool sales for April 1921 were also cancelled.

The difficulties of adjustment, actually realized later, were foreseen and deemed so great that when Mr. Hughes (Prime Minister of the Commonwealth and a stalwart fighter for the

¹ The U.S.A. normally holds 400,000,000 lb. of wool in stock.

development of Australian wool industries) proposed to form an association of Australian wool growers and British Government representatives, with the object of realizing at reasonable values the large stocks of wool held in Australia and England, the Wool Council accepted the proposed control. Indirectly the Wool Council was apparently sacrificing the possibility of cheap wool for the manufacturers of this country: but it regarded the pocket of the whole country as coming first and the manufacturers' demand for cheap wool as coming second. The Australian Board was thinking chiefly of the interest of the Australian grower. The association was registered in April 1921, as follows:—

"British Australian Wool Realization Association, Ltd., Caxton House, West Tothill Street, Westminster, London, S.W.1. Incorporated in the State of Victoria, Australia. Registered April 14, to acquire and take over (a) one-half share of, or interest in, all Australian wool bought by the British Government through the Government of the Commonwealth of Australia and still undisposed of, and in all real and personal property acquired in connexion therewith and still undisposed of; (b) one-half share of, or interest in, any surplus profit on resale of Australian wool so bought still undistributed. Also to take over and assume one-half of all or any liabilities and obligations connected with and chargeable to such wool, property and surplus profits not yet liquidated. Nominal capital £25,000,000 in 25,000,000 shares of £1 each. Names of persons authorized to accept service: Sir Arthur Horne Goldfinch, K.B.E., 8 Rosecroft Avenue, Hampstead, London, N.W. (Governing Director British Australian Wool Realization Association, Ltd., Delegate General Chilean Nitrate Producers Association); James Alexander Cooper, C.B.E., F.S.A.A., Mentmore House, Uxbridge Road, Kingston on Thames, Surrey (Assistant Governing Director, British Australian Wool Realization Association)."

With the lack of demand for goods and consequent lack of consumption of wool the world over, even the best merino continued to fall in value up to May 1921, and the poorer sorts in some cases were below 1914 values (see Chart 3). Whether the enhanced values realized in May by both merinos and crossbreds would be maintained was questionable. Table 11, from the *Yorkshire Observer* of May 16, showed a turn of the tide—if there were no set-backs. Demand from the United States in anticipation of the new tariff might be, at least in part, the explanation. Germany had already commenced to buy wool.

IV. PROSPECTS IN 1921

Wool Manufacturing.—Australian combed tops were on the Bradford market, on the American market, and were also being worked up in Japan in 1921. Did this presage a re-distribution of the world's wool manufacturing industry, and if so what was the line of distribution likely to be followed?

The astounding prosperity of the British wool-manufacturing industry following the Armistice attracted world-wide attention, and it was but natural that every one with any connexion with the industry the world over should wish to share in the prosperity.

There were two types of country in which the development of manufacturing would undoubtedly be attempted, and in which the attempt is undoubtedly justified, (1) the wool-producing continents or countries, Australasia, S. Africa, and S. America, and (2) new wool-consuming countries such as India, Japan, Brazil. In Australia some few mills were developing before the war, and after the war, under private enterprise, stimulated by the energy of Mr. Hughes and others, and, in some cases, further encouraged by the mother-country financiers. Australia made strenuous endeavours to develop a huge wool-manufacturing industry. Her ideal was to manufacture one-tenth of her wool production per annum—say, 50 to 60,000,000 lb., and in 1921 nearly 40 wool manufacturing mills were already in existence. Similarly South Africa, stimulated by Gen. Enslin, was also making a bid for wool manufacturing.

In the case of Australia no forethought or skill was being spared. The mills were being equipped with the finest machinery—French-made combs, for example, had so far been given preference over the speedier but less exact British (Noble) combs—and the best skilled workers were engaged in many of the mills. Excellently combed Australian tops were already on the Bradford market.

So long as profits remained high and high rates of wages were maintained, the appeal to the financial instincts of the worker, even in the case of Australia, might be expected to hold him in the mill. But if the conditions of 1914 came round again and the skill and temperament of the newly developed Australian industry were pitted against the skill and temperament of the older industrial countries, which would win out? Broadly speaking, in anything beyond combing it would be the older countries' fault if they did not dominate. Again, with the need for harder conditions in the factories which must almost inevitably follow severe competition, it was a question which operatives would best stand the strain. Australia, and possibly S. Africa and S. America, might develop quite considerable wool manufacturing industries, but it would seem inevitable that the old manufacturing countries would almost entirely retain their hold on the bulk of the world trade in manufactured wool goods.

In the case of India, Brazil and more particularly Japan, it was probable that the growing demand for wool goods would be only partly met by local production, and for some years to come the outside demand of these countries for manufactured goods seemed more likely to develop than to contract.

So far as the British wool-manufacturing industry is concerned everything depended upon (1) the introduction of scientific method into the works; (2) efficiency in manipulative skill, and (3) efficiency in organization. With reference to the first and second points the introduction of automatic machinery was day by day placing an enhanced value on careful, thoughtful workmanship. The Englishman likes to get a job done, he prefers "driving force" to thoughtfulness. The continental controllers and workers are too often years ahead of the British managers and workers; in thoughtful outlook the American managers and workers are up to the British in bulk production and threaten to pass them even in excellence of output.

With reference to the third point, organization depends upon both directors and workers. An unsympathetic attitude on the part of either will lead to trouble and disaster. The scale of organization had probably been set by the United States. There the Arlington mills each day treat the fleeces of about 35,000 sheep—say, 100,000 lb. of wool; and this is said by no means to be the largest wool manufacturing company in the United States. Along with this enormous organization goes an efficiency in organization and cleanliness in installation which puts most European mills to shame. The American manufacturer has no time to develop that "secrecy" which is far too much in evidence in European concerns; he relies upon progressive efficiency.

To sum up, it would seem that while wool-growing countries may develop quite considerable wool-manufacturing industries, these will not be to the exclusion of the older manufacturing countries. On the other hand, American enterprise (and possi-

bly Japanese enterprise) will severely test the resources of the older industrial countries, and success will rest in the future with the country developing the most thoughtful captains and rank and file of industry.

(b) *Wool Production*.—During the high prices period of 1918 to 1921 the demand for wool was so great, and future prospects for the wool-grower seemed so rosy, that likely and unlikely fields for the development of sheep-breeding were considered.

With the slump in prices the future prospects of the wool-grower suffered an apparent eclipse. No doubt in 1920 prospects were considered too rosy, but equally in 1921 prospects were regarded in altogether too sombre a light. A few broad glances at the situation will clear the way.

If we take the United States as practically a self-contained country, and allow the approximately ten million negro population (wearing little or no wool) to balance the extra wool required for garments in the northern states, where cold winters have to be faced, we get this interesting result:—Wool consumed, 600,000,000 lb.; population, 100,000,000; or 6 lb. of wool per head per annum. Even if we allow for a considerable quantity of re-manufactured material and also for the negro population, this can only be regarded as a "miserable statement," for the 6 lb. is greasy wool yielding about 3 lb. of clean wool, or half a suit or half a dress length per annum for each male and female in the United States. In this allowance are included the imports of wool materials (other than raw wool) amounting to an average of over 30,000,000 lb. per annum. Neither Great Britain, France nor Germany shows any advance on this.

The world's wool statistics and population only serve to emphasize the lack of supplies; for taking the pre-war figure (given in Table 1) of 2,728,461,630 lb., and allowing an average yield of 60% clean wool, this leaves about 1,400,000,000 lb. of clean wool to serve for a world's population of 1,606,542,000 or 10 lb. of wool per male or female. To make this discrepancy even clearer, however, take only the population of Britain, Canada, Australia, the United States, France, Germany, Austria, European Russia and the Netherlands—these total up to approximately 282,000,000 souls, consuming hardly 6 lb. per head per annum. The problem of the future would seem to be:—How to develop such conditions of livelihood the world over that the greatest possible number become substantial purchasing (or exchanging) units?

What possibilities of increased supplies are there? These may be grouped under two heads: (1) an increased yield from the present flocks; and (2) the opening up of new tracts of sheep-rearing land. The first point is admirably illustrated by particulars taken from Table 1, the weights of fleeces for the several continents working out as follows:—

Europe	8034	5 lb. per fleece.
Oceania	1780	7 " " "
S. America	645	4 " " "
N. and Central America	4826	6 " " "
Asia	1186	3 " " "
Africa	2731	3 " " "
	923	
	2199	
	634	

In some cases the sheep-lands are too poor to be expected to do better, but it will probably be found that this is very rarely the case. It is stated, for example, that Herdwick sheep, living on Cumberland hills which will hardly support rabbits, will produce fleeces from 5 lb. to 10 lb. weight. But what may be effected through careful selection is best illustrated by the following record of New South Wales flocks:—

Period	Sheep	Average Weight of Fleece	Total Weight
1890-3	60,000,000	3 lb. 9 oz.	213,700,000
1900-3	36,000,000	6 lb. 3 oz.	222,750,000
1916-9	35,000,000	8 lb. 7 oz.	295,310,000

Thus with 25 million fewer sheep in 1916 as against 1890 some 80,000,000 lb. more wool was produced. Great Britain has seriously taken these figures to heart, and under the auspices of the Research Association for the Woollen and Worsted Industries, strenuous endeavours are being made, (a) to increase the quality and yield of the well-established breeds of sheep, and (b) to improve the quality of the wool in certain mountain types by crossing with better quality sheep, especially Down sheep.

With reference to the second point, although nothing like the development of a second Australia is to be expected, it is already obvious that marked developments of sheep-growing tracts of land may be expected. In the spring of 1921, for example, Col. Robert Sturdy, on behalf of the Peruvian Government, sailed from Britain with cargoes of Southdown, Suffolk Down, Shropshire, Rambouillet (merino) and Soay rams, with the object of developing wool growing in Peru. Wool analysis of the Peruvian wools grown in 1921 on the degenerate sheep of the country, as analyzed by the university of Leeds, revealed remarkable qualities specially acceptable to the hosiery manufacturer. The development of Peru as a wool-growing country is one of the most fascinating possibilities.

The Duke of Devonshire, Governor-General of Canada until 1921, was specially interested and concerned in the development of the prairie lands of the Dominion on the four years' rotation basis, and one of the years will mean sheep. Thus it is quite possible that in the near future Canada will produce more wool of the Down type and possibly of the merino type: for if Russia can raise merinos amid the snows of winter, why not Canada? The Indians and Japanese are both making inquiries with the idea not only of improving the breed of such sheep as they have, but also of developing large tracts of land which probably could well carry sheep.

(c) *Wool Distribution*.—The question as to where the wool of the world will be distributed for manufacture and re-distributed for wear, is largely a matter of surmise, and, after the extraordinary change from the conditions prevailing in the early months of 1920 to the conditions prevailing in the early months of 1921, even the most reliable authorities hesitated to commit themselves. If the world becomes more stabilized, and the suppressive effects of vested interests on the one hand and of "ca'canny" on the other are brought within reasonable limits, then it may be that conditions as rosy as 1918 to 1921 will return with accompanying similar conditions in other industries. To meet such conditions, should they arise, will necessitate the employment of every possible type of automatic machine, and a developed skill depending on the quality of "thoughtfulness," on the part of the individual worker in using such automatic machinery. It will thus be evident that forethought, efficiency and skill will play a greater part than ever in deciding the peoples to whom the bulk of the world's wool shall pass to be manufactured. Australia will undoubtedly manufacture an increasing quantity of wool—but she may possibly grow an even greater quantity than that demanded to balance for the manufacturing in her own mills. S. Africa, S. America, India and Japan will no doubt all claim their quota for manufacturing purposes. But the great bulk of the wool will be manufactured elsewhere: and it is safe to say that will be where scientific method and scientific management and a broad, humane outlook dominate. And the manufactured material of course will go to those peoples who have something to offer in exchange.

It is true that the immediate outlook in 1921 was dark. But the reason why was becoming apparent. And when this was fully realized the world would be well on the way to adjust its economic condition to facilitate production and exchange to the advantage of all its peoples. (A. F. B.)

WOOLDRIDGE, HARRY ELLIS (1845-1917), English musical antiquary, was born in 1845. He studied art, and became a student of the Royal Academy in 1865, about the same time commencing his researches into early music. He received various commissions for artistic works, the most important being a reredos for St. Martin's church, Brighton, and the frescoes in St. John's church, Hampstead. At the same time his reputation as

an authority on music was steadily rising, and in 1895 he was elected Slade professor of Fine Arts at Oxford, a post which he held until 1904. His chief works on music are a new edition of Chappell's *Popular Music of the Olden Time*, which appeared under the title *Old English Popular Music* (1893) and *The Polyphonic Period*, parts I. and II. (vols. i. and ii. of the *Oxford History of Music*, 1901-5). He died in London on Feb. 13 1917.

WOOLWORTH, FRANK WINFIELD (1852-1910), American merchant, was born near Rodman, N.Y., April 13 1852. He was reared on a farm, studied in the public schools, and graduated from a business college at Watertown, N.Y., in 1872. He began his career as a clerk in Watertown, and it is said that a bargain counter in his employer's store first suggested to him the idea that resulted in the establishment of the long chain of "five and ten cent" stores that bear his name. Early in 1879 he opened at Utica, N.Y., his first "five cent" store which, however, was a failure. Later in the same year he established a similar store at Lancaster, Pa., followed by another at Harrisburg. The chain in 1920 was composed of about 987 "five and ten cent" stores in the United States, 94 in Canada, and 81 in England. When the F. W. Woolworth Co. was incorporated in New York in Dec. 1911 he became president. In 1912 the Woolworth building in New York City, costing \$13,000,000, was completed from the designs of Cass Gilbert. It is 760 ft. high, has 57 storeys, and, excepting the Eiffel Tower in Paris, is the tallest building in the world. The gross sales of the company in 1920 amounted to \$140,918,981 and the net profits \$9,775,251, as compared with \$119,496,107 and \$10,361,557 respectively in 1919. Woolworth died at Glen Cove, L.I., April 8 1910, leaving an estate appraised at \$27,000,000.

WORDSWORTH, ELIZABETH (1840-), English educationist, was born at Harrow June 22 1840, the eldest daughter of Christopher Wordsworth, afterwards Bishop of Lincoln, and hence a great-niece of the poet. She was educated at home and lived a home life until in 1879 Lady Margaret Hall was founded at Oxford, largely owing to Miss Wordsworth's energy and organizing capacity, and she became its first principal. Her social gifts and powers of clever conversation made her a prominent figure in Oxford life. She retired from her post at Lady Margaret Hall in 1909, but continued to live in Oxford and to be an active member of its council. In Oct. 1921 the university of Oxford conferred upon her an hon. M.A. degree. Miss Wordsworth contributed many charming tales to *Aunt Judy's Magazine*, edited by Mrs. Gatty (see 11.530), and also published various devotional books and volumes of verse and essays. In collaboration with J. Overton, she published in 1888 the *Life of Christopher Wordsworth*.

WORDSWORTH, JOHN (1843-1911), English divine and scholar, was born at Harrow Sept. 21 1843, the son of Christopher Wordsworth, afterwards Bishop of Lincoln, and grand-nephew of the poet. He was educated at Winchester and New College, Oxford, where he had a distinguished career, and after a short period as a master at Wellington College was elected a fellow of Brasenose and took orders (1867). He became widely known both as a Latin scholar and as a theologian, being elected Bampton lecturer in 1881 and Ireland professor of exegesis in 1883. In 1883 he became a canon of Rochester and in 1885 Bishop of Salisbury. His works include *Fragments and Specimens of Early Latin* (1874); *Old Latin Biblical Texts* (1883 and 1886), vol. II., in conjunction with Dr. Sanday and Rev. H. J. White; *The Episcopate of Charles Wordsworth* (1898); *Teaching of the Church of England for Information of Eastern Christians* (1900); *The Invocation of Saints and the 22nd Article* (2nd ed. 1910). He died at Salisbury Aug. 16 1911.

WORLD WAR, THE.—The military history of the World War is told in these New Volumes in separate articles dealing with campaigns and battles, and a general account of the war at sea is given in the article **NAVAL OPERATIONS** (supplemented by separate articles on the battles of JUTLAND, DOGGER BANK, CORONEL, HELIGOLAND BIGHT, FALKLAND ISLANDS, ZEEBRUGGE, and on the GOEBEN AND BRESLAU affair, together with those under the headings of **SUBMARINE CAMPAIGNS**, **BLOCKADE**, **MINESWEEPING**

AND **MINELAYING** and **CORVOY**). As regards the land operations, reference to the separate headings under which the military history is narrated may best be made here by a brief résumé of the course of the war.

The war opened simultaneously on three fronts in Aug. 1914. These fronts were the western, the eastern and the Serbian, and the continuous story of the major operations on these fronts will be found under the respective headings: **WESTERN EUROPEAN FRONT CAMPAIGNS**, **EASTERN EUROPEAN FRONT CAMPAIGNS** and **SERBIAN CAMPAIGNS**, together with **SALONIKA CAMPAIGNS**. In the west the German invasion of Belgium and France was marked by the five-fold battle of the **FRONTIERS** (q.v.)—in Alsace, Lorraine, Ardennes, at Charleroi and at Mons—by the sieges of **LIÈGE**, **NAMUR** and **MAUBEUGE** (q.v.), and by the battle of **GUISSE** (q.v.). Its culmination in the battles of Sept. 4-20 is told in detail under the heading **MARNE**; and the development of the northern flanks of the opposed armies towards the sea, at the same time as **ANTWERP** (q.v.) fell to the Germans, is dealt with under the headings **ARTOIS** (part I.), and **YPRES AND THE YSER** (part I.).

On the eastern front the Russian invasion of East Prussia, with its battles of Tannenberg and the Masurian Lakes, is dealt with in detail under the heading **MASURIA, BATTLES IN** (parts I., II.), while the main conflict between the Russian and Austrian offensive efforts in Galicia and Poland during August and early September is described under **LEMBERG** (part I.). The subsequent united efforts of the Austrian and German armies in Poland and Galicia to stem the onset of the "steam-roller" may be divided into periods characterized by the battle names **VISTULA-SAN** (q.v.), and **LODZ-CRACOW** (q.v.). The first siege of **PRZEMYSL** will be found under that heading. The three Austrian invasions of Serbia are described in the general article for that front, mentioned above.

The year 1915, a year of stabilization on the western front, was one of open warfare on the eastern. Beginning with the battle of the **CARPATHIANS** (q.v.) and the second siege of **PRZEMYSL** (q.v.) on the one flank, and the "Winter Battle" of Masuria (see **MASURIA, BATTLES IN**, part III.) on the other, the operations, after a pause, took shape as a general Austro-German offensive from May 1. The right half of this offensive preceded the left by two months, and its successive episodes are marked by the battles of Gorlice-Tarnov and the San (see **DUNAJEC-SAN** and **PRZEMYSL**), the battles of Grodek, Lemberg and Stryi (see **LEMBERG**, part II.), and by the later episode of **ROVNO** (q.v.). At a certain stage in the development of these operations, their left wing becomes one branch of a double-envelopment aimed at the rear of the Russian centre in West Poland; this branch is the campaign from the Tanev river against **BAZAR-LITOVSK** (q.v.), while the other is the offensive of the "Gallwitz army" from Przasnysz, across the Narew into the interior of the corridor followed by the Russians in their retreat (see **NAREW, BATTLES OF THE**). The final efforts of the Germans to isolate the retreating Russians, which ended in ill-success and in the formation of a stable trench-line, as in the W., are dealt with in the general military narrative of operations on the eastern front, named above.

In the E. the entry of Turkey into the war led to the expedition against the **DARDANELLES** (q.v.), and to the renewal of the offensive of the Central Powers against Serbia in the autumn of 1915 (see **SERBIAN CAMPAIGNS**), which closed with the conquest of Serbia on the one side, and the creation of a new minor front at Salonika on the other (see **SALONIKA CAMPAIGNS**). The campaigns in Asia Minor are dealt with under the general heading **TURKISH CAMPAIGNS**, of which the several sections describe the operations which took place in the Caucasus, in Mesopotamia and in Sinai and Syria.

In the W. the years 1915, 1916, 1917 are essentially the "trench-warfare" period. The battles of Ypres in 1915 (see **YPRES AND THE YSER**, part II.), of Neuve Chapelle, Carency, Souchez and Loos (see **ARTOIS, BATTLES IN**, part II.) respectively, the minor offensive of Crony, the winter battle in Champagne (see **CHAMPAGNE**, parts I., II.), and the trench-warfare fighting in **ARGONNE** (q.v.) and **WOLVRE** (q.v.), culminated in the great French

offensive of Sept. 25 1915 in Champagne (see CHAMPAGNE, part III.), but without materially affecting the stability of the trench-warfare conditions. The year 1916 opened with the great German blow at VERDUN (q.v.), which forestalled the Allied offensive of the SOMME (q.v. part I.): these two great names fill the history of the 1916 campaign in the west. In 1917 a first essay in operating under a united command was made by the Allies in the spring campaign, and produced the Arras battles described under ARTOIS (part III.), and the Aisne offensive of April (see CHAMPAGNE, part IV.); the results were disappointing, and the parts of the inter-allied machine fell asunder, the British taking up the weight of the task in the battles around Messines, Ypres, Passchendaele, etc. (see YPRES and THE YSER, part III.), and in the "tank-battle" of CAMBRAI (see ARTOIS, section I.), while the French carried through two battles of limited objective, described under CHAMPAGNE (part IV.) and VERDUN.

Meantime, the entry of Italy into the war in 1915 had created new military relations in the Mediterranean basin. Austria had established a new defensive front on the Isonzo, and, shortly after the Verdun offensive of her ally, had struck a similar blow on the Tirol front at Asiago. The unity of operations in the Italian theatre of war makes it possible to refer the reader to a single heading, ITALIAN FRONT CAMPAIGNS, with the subordinate articles therein referred to, for the story of the war in this region from first to last.

On the Russian front, the year 1916 saw a final effort of Russia, in spite of losses, to regain lost ground and to help her Allies. The battles, after an isolated winter battle known as the "New Year's fight," described under the heading STRYPA-CZERNOVITZ, fall into two main groups, those of the spring and those of the summer and autumn, in which the battles of NAMOCH LAKE (q.v.) and LUCK (q.v.) are the central episodes.

The spring of the final year, 1918, finds the focus of military events in Europe placed on that section of the front in France which lies north of the Oise. Here, on March 21, the great German offensive broke through the lines of the British V. Army (see SOMME, part III.); here also, on April 9, a second effort was made at the LYS (q.v.). In summer, the German attacks of May 27 on the Chemin des Dames (see CHAMPAGNE, part V.), of June 9 on NOYON (q.v.), and of July 15 on both sides of Reims (see CHAMPAGNE, part VI.), culminate, and the period of Allied counter-attacks under united command begins with July 18 (see CHAMPAGNE, part VII.), Aug. 8 (see SOMME, part IV.), Aug. 21 (see SOMME, part V.) and St. Mihiel (see WOËVRE), to assume at last a coherent and decisive form in the three simultaneous offensives of the Americans in the MEUSE-ARGONNE (q.v.) battle, of the British in the battle of CAMBRAI-ST. QUENTIN (q.v.) and the Belgians, British and French in the last battle of YPRES (q.v.).

As regards the origin of the World War, its history is told in the article EUROPE, in the final section of which its results on the national reshaping of Europe after the war are analyzed. Reference on both these aspects may also be made to the historical and geographical sections of the articles dealing with each country involved in the war. But during the war itself the political aspects ceased to be merely European: it became a World War. The general international politics throughout its course are therefore dealt with under the present heading, in the article below, as distinctively world-history, by way of continuation of the historical article under EUROPE which deals with the international politics of Europe up to August 1914. (H. CH.)

POLITICAL HISTORY OF THE WAR¹

From the moment hostilities began in 1914, it became the absorbing aim of all the combatant countries to win the war;

¹For side-lights on conflicting national viewpoints in connexion with particular episodes, and for greater detail in regard to them—the accounts being still sometimes irreconcilable as between representatives of the different countries concerned,—see the separate historical articles under country headings: especially ENGLISH HISTORY, UNITED STATES (History), AUSTRIAN EMPIRE (Foreign History), ITALY (History), ITALY (History), GERMANY (History), FRANCE (History), ITALY (History), JAPAN (Foreign Relations), SERBIA (History), YUGOSLAVIA (History), CZECHOSLOVAKIA (History), GREECE (History).

but each of them placed a different interpretation upon the meaning of victory, and that meaning also varied with their fortunes, the eclipse of this or that belligerent, and the entrance of fresh forces into the arena. The war aims of Great Britain were tersely stated in general terms by Mr. Asquith at the Guildhall on Nov. 9 1914, when he declared: "We shall never sheathe the sword, which we have not lightly drawn, until Belgium recovers in full measure all and more than all that she has sacrificed, until France is adequately secured against the menace of aggression, until the rights of the smaller nationalities of Europe are placed upon an unassailable foundation, and until the military domination of Prussia is wholly and finally destroyed." France and Russia, while agreeing with these objects, mentally put a more concrete interpretation on victory: to France the symbol of victory was the restoration of Alsace-Lorraine with further guarantees against a repetition of 1870-1; while Russia desired to exorcise Prussian apparitions "in shining armour" at Petrograd and to secure control of Constantinople and the Straits.

The Original Combatants.—Germany was less single-minded in her ideas. The mass of her people had been persuaded that the war was one of defence against a Pan-Slav peril and hostile encirclement by other Powers; but the bourgeois classes looked for *Weltmacht* in the shape of commercial and colonial expansion, while Bernhardt expressed the mind of Prussian militarists when he demanded three years before the war that "France must be so completely crushed that she can never cross our path again." Behind such ebullitions was a growing conviction in the Prussian mind that the Prussian system of government could not long maintain itself against social democracy without fresh tributes to the efficacy of the sword. "This danger," wrote Prince von Bülow, "must be faced and met with a great and comprehensive national policy under the strong guidance of clear-sighted and courageous governments, which whether amicably or by fighting can make the parties bow to the might of the national idea." "Nor," concluded Bernhardt, "must we think merely of external foes who compel us to fight. A war may seem to be forced upon a statesman by the condition of home affairs." To Austria the compulsion came from the attitude of Yugoslavs within her borders; and her original war aims probably did not extend beyond the reduction of Serbia to dependence and the consequent eclipse of Russian prestige in the Balkans. For Belgium and for Serbia the object of the war was primarily self-defence, although in Serbia's case successful self-defence would inevitably bring with it the prospect of increased influence in the domestic affairs of the Habsburg Empire. Japan was bound to intervene by her alliance with Great Britain, but a positive inducement to fulfil its terms was held out by the opportunity of conquering Kiaochow and excluding Germany from Far Eastern waters.

Not much choice had in fact been left to these original combatants by the circumstance of past policy which had driven them into the war. Other Powers had freer hands and a market in which they could sell their alliance to buyers who would bid high. They could intervene or hold aloof, and the nature and extent of the price they set on their services would modify the war aims of those whose cause they espoused. The course, the objects, and the end of the war were profoundly affected by the gradual expansion of the hostile groups.

The leading part played by Germany in the movements which precipitated the outbreak is emphasized by the fact that Austria, having declared war on Serbia on July 28, remained at peace with all other States for several days after Germany had drawn the sword. It was not until Aug. 6 that Austria declared war on Russia, nor until the 10th and 12th that France and Great Britain declared war upon her, nor until the 27th that she declared war on Belgium, the German invasion of which had dragged in Great Britain three weeks before. So far as Austria was concerned, the Triple Alliance had been purely defensive, and it had not even bound her to defend Germany against France, unless Russia also intervened. Italy, on the other hand, had been bound to assist Germany against a French attack; and the legends about French aggression, which Germany

propagated in the early days of Aug., were meant for Italian as much as for British consumption. Italy had, however, under wise guidance, refused to believe in French aggressiveness, and had declared her neutrality on Aug. 7 on the ground that her intervention was not required by the terms of the Triple Alliance. Her abstention on this occasion was probably the greatest service she rendered to the Entente during the war, for it released from the Franco-Italian frontier some hundreds of thousands of troops without whose assistance the battle of the Marne could hardly have been won. Her example may also have been the last straw in the balance which determined Rumania, despite its Hohenzollern King and its Austrian alliance, to stand aloof from the struggle.

The Neutral States.—Neutrality was expected from the other European States, whatever their sympathies might be. Holland's traditions were more friendly to Germany than to Belgium, but they were obliterated by the wanton invasion of Belgium's neutrality, and Bethmann-Hollweg's argument that a German annexation of Belgium would be useless without the acquisition of Dutch territory was not calculated to assuage alarm. But more immediate perils dictated Dutch neutrality. There was no reason to suppose that Entente forces, which protected only a tiny corner of Belgium, could have saved a single acre of Dutch territory. Holland, with its wealth of capital and agricultural produce and its harbours, would have fallen an easy prey to Germany, while the remnants of its colonial empire might have gone the way the Cape of Good Hope and Ceylon had gone during the last occupation of Holland by an enemy of Great Britain. Holland was wise in its neutrality, and even the Entente probably benefited more by it than it would have done by Dutch intervention. It was certainly well for Great Britain that in 1917-8 German submarines had no Dutch ports for bases which could not be blocked as the exits from Bruges were in April 1918.

Denmark was in the like case, albeit with an ancient grievance against Germany in the wrongful detention of Danish Slesvig. But again, Denmark could not have been defended against German invasion, and Danish coasts and ports would have been invaluable to German submarines. Denmark, too, was wise to eschew belligerency and seek to develop its influence in conjunction with its Scandinavian colleagues. Of these, Norway sympathized with the Entente, and might, but for the fear of Sweden, have been driven by German piracy into war. Sweden's affections were more divided. The Labour party, led by Branting, was, if not pro-Entente, at least averse from intervention on Germany's side. But the upper and bourgeois classes were strongly German in sympathy and inclined to *activism* in that direction. This affection was partly due to cultural development, but more to a greater fear of Russia which had been aggravated by the fate of Finland and Russian designs in the Åland Islands. The Baltic was, like the Adriatic, the scene of a triangular duel; but the Russian menace in the Baltic was greater than the Teutonic menace in the Adriatic. Sweden's fears of Russia counterbalanced Danish and Norwegian grievances against Germany, and the Scandinavian States found a basis for neutrality in an equilibrium of antipathies.

Spanish neutrality was the resultant of similarly antagonistic domestic feelings. The King, with his English wife, was pro-Entente, but the Catholic and conservative upper classes were pro-German, while the democratic factions, hankering after revolution, took the opposite side. Portugal was, as it had been since its war of liberation and the marriage of Catherine of Braganza, an ally if not a pawn of England; and the prospective agreements which England and Germany had just made for the division of its colonies had not sufficed to transfer its allegiance from the one to the other beneficiary. No one expected Switzerland to abandon its neutrality; and the Balkans were left to the principal sphere of diplomatic competition. Greece had a Russian Queen and a King who was a Prussian field-marshal, but a prime minister whose sympathies and confidence were whole-heartedly with the Entente. Bulgaria, as a result of the Treaty of Berlin in 1878, had no sympathies at all, but a comprehensive grievance against all her neighbours who

had robbed her of the fruits of victory over Turkey, and against the Great Powers which had acquiesced in that spoliation. Her object was simply to discover the probable winner, and back it with all her resources in the hope of getting back all she could from the losers. For the moment she would wait and see.

Turkey was nearer to a decision. She had long been wooed by the Kaiser. In 1898 he had declared himself the friend of all Mahomedans, whose-soever subjects they might be; and the circumstance that, outside Turkey, they were mostly the subjects of Great Britain, Russia, or France gave point to his policy. The Turkish revolution of 1908 and the machinations of a so-called party of progress, led by Enver and Tal'at, made no difference to the growth of Turco-Teutonic affection. England had afforded but a half-hearted support against the Russian advance toward Constantinople; she had assisted in the liberation of Greece and the Balkans, and had helped herself to Cyprus and Egypt and other fragments of the dismembered Turkish Empire; and her friendship seemed but the nether millstone to the upper millstone of Russian aggression. Moreover, by August 1914 the antagonism between England and Russia, on which 'Abdul Hamid relied; had disappeared in an alliance in which, so far as the Near East was concerned, Russia would be the predominant partner; and the interpretation which Russia put on that entente was illustrated by a crown council held in St. Petersburg on Feb. 6 1914 to discuss the means for securing the Straits and Constantinople. The appointment of the German Gen. Liman von Sanders to reorganize Turkish forces was the retort which naturally commended itself both to the Turk and the Teuton.

The Turkish mind was, however, slow to move; it was no light matter to reverse the traditional policy of centuries and embark on war with a Power which had long regarded the maintenance of the Turkish Empire as one of the first of British interests. The Kaiser believed that he had Turkey in his pocket, but no one knew what her attitude would be. When the German admiral made for the Dardanelles with the "Goeben" and the "Breslau" on Aug. 8-9 his course was dictated by necessity and not by plan, and he was even prepared to force his way up the Straits if peaceful admission were refused. As late as the 5th the German embassy at Constantinople had reported that it was undesirable for him to arrive there yet. He was, however, received with open arms. Turkish opinion had been profoundly irritated by the commandeering of two Turkish dreadnoughts which had been built in British dockyards out of the proceeds of a patriotic Turkish loan; officers of the British Naval Mission in Turkey were superseded, and, in spite of the Grand Vizier's opposition, Enver, the Minister of War, was mobilizing Turkish forces for an attack on the Suez Canal. Plans for Anglo-French naval co-operation in the Mediterranean had to be abandoned and British ships detached to blockade the Dardanelles and safeguard the Red Sea, while troops were hurried from India to Egypt. Twice before the end of Aug. Sir Louis Mallet, H.M.'s ambassador at Constantinople, mooted the possibility of forcing the Dardanelles; but expressed the opinion that success was doubtful without military co-operation and that failure would be disastrous. He succeeded, however, in prolonging the resistance of the Grand Vizier to Enver's designs and in delaying the breach until toward the end of Oct.

Turkey's Entry.—By that time the German Government had determined to cut the Gordian knot of Turkish indecision. The western campaign was coming to a deadlock before Ypres, the first German attack on Warsaw had failed, and a great Austrian effort was being planned to punish Serbia for her success in resisting attacks in the Balkans. On Oct. 28 Souchon sallied out of the Bosphorus into the Black Sea with the combined German and Turkish squadrons, and on the 29-30th he mined Sevastopol harbour, sank a transport, and bombarded Odessa, Theodosia, and Novorossisk. Souchon alleged that the transport was a minelayer laying mines in Turkish territorial waters; and while the rival parties were still discussing the rival versions, Russia, having in Sept. secured a neutrality engagement from Rumania which was not communicated to her allies, declared

war on the 31st without their connivance. The British and French ambassadors had already been instructed to follow their Russian colleague; on Nov. 2 they left Constantinople, and on the 3rd Adm. Carden bombarded the forts of the Dardanelles. Russian precipitation had, however, only hastened the end. Enver's troops had long been on the march toward the Suez Canal, and on Oct. 27 British outposts at El 'Arish and Nekhl had been withdrawn.

The entrance of Turkey into the war as Germany's ally was the first great diplomatic success achieved by either of the belligerent groups, and it did more than anything else to extend the sphere of the war and to increase in particular Great Britain's anxieties and obligations. Britain had little contact with Austria, and not much more with Bulgaria. Even Germany, apart from her naval ambitions, presented few points of direct conflict; they arose indirectly, either through the menace to Britain's allies in France and Belgium, or through the doors which Turkey now opened to German penetration. These led so far and in so many directions threatening British interests that, as they were gradually revealed in 1914-5, it seemed to many that they represented the original motive of Germany's aggression. Through Turkish dominions lay the overland route not merely to India but to Egypt and E. Africa; and both paths were strewn with inflammable material. Britain ruled over something like half the Mahomedans of the world, and for many of them the Sultan of Turkey was their head. Even more dangerous might Germany's propaganda, backed by German military success, become in the midst of other discontented elements in India and in Egypt. With these under German and Turkish influence, the ferment might spread throughout the greater part of Asia and of Africa. Even the sea routes, on which the life of the Empire depended, would become unsafe when threatened on their flanks; for the problem has not yet been solved of how to command the sea in distant waters against an enemy holding the neighbouring lands and using the submarine. More immediately the entrance of Turkey into the war imposed upon Great Britain the task of defending the naval position in the eastern Mediterranean, the route through the Suez Canal, Egyptian territory, the Persian Gulf and the overland route to India against Turkish and Arab attacks. Incidentally it cut off Russia from her least indirect and irregular communication with her allies. Fortunately, the action of Japan limited these anxieties and relieved the Entente of the greater part of the burden of eradicating German power in the Far East. A Japanese ultimatum, which had been expected a little earlier, was delivered to Germany on Aug. 15 demanding the unconditional surrender of Kiaochow; it expired on the 22nd, and next day Japan entered the war.

Turkey's intervention had an immediate effect upon the status of her former provinces held by Great Britain. Cyprus was annexed at once; a British protectorate was proclaimed over Egypt on Dec. 17 with the connivance of France, whose protectorate over Morocco was recognized by Great Britain on the 24th, and on the 18th the Khedive 'Abbas II., who had thrown in his lot with his Turkish suzerain, was deposed in favour of his uncle Hussein, who further received the title of Sultan. Egyptian opinion accepted the change, and Turkey's efforts to reconquer her lost dominions were frustrated by the necessities of self-defence in the Dardanelles and on all her Asiatic frontiers. Before the Russians could move across the Caucasus, divisions of the Indian army had sailed up the Shatt al 'Arab and begun that chequered advance which led them from Basra to Mosul. Not the least of the political effects of Turkey's action was to bring India into the war to a far greater extent than would have been possible had British participation been restricted to European fronts. Over a million native Indian troops were eventually engaged, and they assisted materially in the conquest of Mesopotamia, Palestine, and Syria. Before long Arabia, too, turned against the Turks, and found in Turkey's participation in the war the opportunity to emancipate itself from Turkish rule.

Russia's Claims.—For the moment, however, these were unforeseen developments, and the more immediate effect of Turkey's intervention was to bring within the sphere of apparently

practical politics ambitions which belonged to an older world. The breach which Russia had helped to precipitate opened up the prospect of giving effect to the deliberations of the Russian crown council of Feb. 6 1914. The subject was not apparently broached by Russia to her allies until they, for reasons of their own, had committed themselves to an enterprise which would render it possible for Russia to reap its fruits—unless, indeed, it was really with an eye to securing Constantinople and the Straits by means of allied efforts that Russia despatched on Jan. 2 1915 an urgent request for some diversion to relieve Turkish pressure in the Caucasus. This is not the place to trace the growth of the Dardanelles expedition, which after the premature bombardment of Nov. 3, was keenly taken up by Mr. Churchill. The political and strategical motives for it seemed adequate. There remained no flank to turn on the western front; an unbroken line of trenches stretched from the North Sea to the Alps; and neither side could break the deadlock. On the other hand, the flank might be turned by sea power operating in the Dardanelles, an enemy knocked out by the capture of Constantinople, communications restored with Russia, the Teutonic path barred to the East and to Egypt, and two if not three new allies found in Greece, Rumania, and Bulgaria, who uniting with Serbia and linking up Russia with a fourth potential recruit in Italy, might sweep upon Austria-Hungary and threaten an attack on Germany's southern frontiers which would destroy the bastions she had made on her eastern and western fronts.

Such was the prospect which Allied vision discerned and Russia proposed to convert into territorial substance. On March 4, when England and France had been committed to the enterprise, Russia handed in a memorandum to the British and French ambassadors at Petrograd, in which she explained her ideas. Most of what was left of Turkey in Europe, including Constantinople, the western shores of the Bosphorus, of the Sea of Marmora, and of the Dardanelles, and Thrace as far as the Enos-Midia line, was to become Russian territory. 'So, too, were the islands in the Sea of Marmora, Imbros and Tenedos outside the Dardanelles, and the coast of Asia Minor from the Bosphorus to the mouth of the Sakaria and across to the gulf of Ismid. On the other hand, the middle zone of Persia, declared neutral by the agreement of 1907, was to be assigned to the British sphere of influence, while Arabia was to become independent. By March 20 both the British and French governments had signified their assent to these proposals. Russia was still the predominant partner in the military alliance; her armies were overrunning the Carpathians and the Bukovina, and the anticipated collapse of Austria discounted the need to respect Balkan susceptibilities.

The agreement was secret, but Russian secrets had a habit of leaking out to her enemies during the war. Nor, indeed, did British or French politicians conceal their conversion to the justice of Russia's demands, while they ignored in their comments the impression it would produce upon wavering minds in the Balkans. The effect was to give Turkey the unaccustomed part of champion of Balkan independence; for with Russian ambitions fulfilled, no other Balkan power could have been more than a client State. Greece saw her aspirations—more legitimate at least than those of Russia—thwarted forever by Allied complaisance; Bulgaria seemed to have struggled in vain under Stambolov to free herself from Russian tutelage, and to be doomed to perpetual servitude; Rumania lost hope of righting the wrong of 1878 and redeeming the Rumanians of Bessarabia; and only Serbia, which looked to the Adriatic, was content with this prospective Russian monopoly of the Black Sea and the Straits and dominance of the Aegean. The intervention of Turkey had given a predatory turn to the thoughts of the Entente; and, so far, the diplomacy of the war had tended to show an increasing disrespect for the liberties of little nations.

The war was not, however, making much progress on those lines. In the Near East Russia's difficulty lay not in securing her Allies' assent to her aspirations but in providing for their realization. This she was totally unable to do, and her contribution to the Dardanelles campaign, which was to have taken

propagated in the early days of Aug., were meant for Italian as much as for British consumption. Italy had, however, under wise guidance, refused to believe in French aggressiveness, and had declared her neutrality on Aug. 7 on the ground that her intervention was not required by the terms of the Triple Alliance. Her abstention on this occasion was probably the greatest service she rendered to the Entente during the war, for it released from the Franco-Italian frontier some hundreds of thousands of troops without whose assistance the battle of the Marne could hardly have been won. Her example may also have been the last straw in the balance which determined Rumania, despite its Hohenzollern King and its Austrian alliance, to stand aloof from the struggle.

The Neutral States.—Neutrality was expected from the other European States, whatever their sympathies might be. Holland's traditions were more friendly to Germany than to Belgium, but they were obliterated by the wanton invasion of Belgium's neutrality, and Bethmann-Hollweg's argument that a German annexation of Belgium would be useless without the acquisition of Dutch territory was not calculated to assuage alarm. But more immediate perils dictated Dutch neutrality. There was no reason to suppose that Entente forces, which protected only a tiny corner of Belgium, could have saved a single acre of Dutch territory. Holland, with its wealth of capital and agricultural produce and its harbours, would have fallen an easy prey to Germany, while the remnants of its colonial empire might have gone the way the Cape of Good Hope and Ceylon had gone during the last occupation of Holland by an enemy of Great Britain. Holland was wise in its neutrality, and even the Entente probably benefited more by it than it would have done by Dutch intervention. It was certainly well for Great Britain that in 1917-8 German submarines had no Dutch ports for bases which could not be blocked as the exits from Bruges were in April 1918.

Denmark was in the like case, albeit with an ancient grievance against Germany in the wrongful detention of Danish Slesvig. But again, Denmark could not have been defended against German invasion, and Danish coasts and ports would have been invaluable to German submarines. Denmark, too, was wise to eschew belligerency and seek to develop its influence in conjunction with its Scandinavian colleagues. Of these, Norway sympathized with the Entente, and might, but for the fear of Sweden, have been driven by German piracy into war. Sweden's affections were more divided. The Labour party, led by Branting, was, if not pro-Entente, at least averse from intervention on Germany's side. But the upper and bourgeois classes were strongly German in sympathy and inclined to *activism* in that direction. This affection was partly due to cultural development, but more to a greater fear of Russia which had been aggravated by the fate of Finland and Russian designs in the Åland Islands. The Baltic was, like the Adriatic, the scene of a triangular duel; but the Russian menace in the Baltic was greater than the Teutonic menace in the Adriatic. Sweden's fears of Russia counterbalanced Danish and Norwegian grievances against Germany, and the Scandinavian States found a basis for neutrality in an equilibrium of antipathies.

Spanish neutrality was the resultant of similarly antagonistic domestic feelings. The King, with his English wife, was pro-Entente, but the Catholic and conservative upper classes were pro-German, while the democratic factions, hankering after revolution, took the opposite side. Portugal was, as it had been since its war of liberation and the marriage of Catherine of Braganza, an ally if not a pawn of England; and the prospective agreements which England and Germany had just made for the division of its colonies had not sufficed to transfer its allegiance from the one to the other beneficiary. No one expected Switzerland to abandon its neutrality; and the Balkans were left to the principal sphere of diplomatic competition. Greece had a Russian Queen and a King who was a Prussian field-marshal, but a prime minister whose sympathies and confidence were whole-heartedly with the Entente. Bulgaria, as a result of the Treaty of Berlin in 1878, had no sympathies at all, but a comprehensive grievance against all her neighbours who

had robbed her of the fruits of victory over Turkey, and against the Great Powers which had acquiesced in that spoliation. Her object was simply to discover the probable winner, and back it with all her resources in the hope of getting back all she could from the losers. For the moment she would wait and see.

Turkey was nearer to a decision. She had long been wooed by the Kaiser. In 1898 he had declared himself the friend of all Mahomedans, whose-soever subjects they might be; and the circumstance that, outside Turkey, they were mostly the subjects of Great Britain, Russia, or France gave point to his policy. The Turkish revolution of 1908 and the machinations of a so-called party of progress, led by Enver and Tal'at, made no difference to the growth of Turco-Teutonic affection. England had afforded but a half-hearted support against the Russian advance toward Constantinople; she had assisted in the liberation of Greece and the Balkans, and had helped herself to Cyprus and Egypt and other fragments of the dismembered Turkish Empire; and her friendship seemed but the nether millstone to the upper millstone of Russian aggression. Moreover, by August 1914 the antagonism between England and Russia, on which 'Abdul Hamid relied; had disappeared in an alliance in which, so far as the Near East was concerned, Russia would be the predominant partner; and the interpretation which Russia put on that entente was illustrated by a crown council held in St. Petersburg on Feb. 6 1914 to discuss the means for securing the Straits and Constantinople. The appointment of the German Gen. Liman von Sanders to reorganize Turkish forces was the retort which naturally commended itself both to the Turk and the Teuton.

The Turkish mind was, however, slow to move; it was no light matter to reverse the traditional policy of centuries and embark on war with a Power which had long regarded the maintenance of the Turkish Empire as one of the first of British interests. The Kaiser believed that he had Turkey in his pocket, but no one knew what her attitude would be. When the German admiral made for the Dardanelles with the "Goeben" and the "Breslau" on Aug. 8-9 his course was dictated by necessity and not by plan, and he was even prepared to force his way up the Straits if peaceful admission were refused. As late as the 5th the German embassy at Constantinople had reported that it was undesirable for him to arrive there yet. He was, however, received with open arms. Turkish opinion had been profoundly irritated by the commandeering of two Turkish dreadnoughts which had been built in British dockyards out of the proceeds of a patriotic Turkish loan; officers of the British Naval Mission in Turkey were superseded, and, in spite of the Grand Vizier's opposition, Enver, the Minister of War, was mobilizing Turkish forces for an attack on the Suez Canal. Plans for Anglo-French naval co-operation in the Mediterranean had to be abandoned and British ships detached to blockade the Dardanelles and safeguard the Red Sea, while troops were hurried from India to Egypt. Twice before the end of Aug. Sir Louis Mallet, H.M.'s ambassador at Constantinople, mooted the possibility of forcing the Dardanelles; but expressed the opinion that success was doubtful without military co-operation and that failure would be disastrous. He succeeded, however, in prolonging the resistance of the Grand Vizier to Enver's designs and in delaying the breach until toward the end of Oct.

Turkey's Entry.—By that time the German Government had determined to cut the Gordian knot of Turkish indecision. The western campaign was coming to a deadlock before Ypres, the first German attack on Warsaw had failed, and a great Austrian effort was being planned to punish Serbia for her success in resisting attacks in the Balkans. On Oct. 28 Souchon sallied out of the Bosphorus into the Black Sea with the combined German and Turkish squadrons, and on the 29-30th he mined Sevastopol harbour, sank a transport, and bombarded Odessa, Theodosia, and Novorossisk. Souchon alleged that the transport was a minelayer laying mines in Turkish territorial waters; and while the rival parties were still discussing the rival versions, Russia, having in Sept. secured a neutrality engagement from Rumania which was not communicated to her allies, declared

the intervention of Rumania; to whom an Entente loan had been guaranteed three months before; nor was it the ineffectiveness of Italy's attacks across the Isonzo. It was the military defeat of Russia in Galicia and Poland, and Great Britain's failure in the Dardanelles, that provoked the next accession of strength to the enemies' cause.

Bulgaria's Entry.—Bulgarian neutrality had always been precarious, and the Government itself had difficulty in restraining its irregulars and *komitajis* from raiding the Serbian frontier. A serious affray of this sort occurred on April 1 at Valandova while King Ferdinand was still waiting upon events, but by July the Russian *débâcle* in Galicia and the British failure to make much advance in the Dardanelles convinced him that Germany would win, and on the 17th a treaty was concluded which offered Bulgaria, in return for her intervention, the whole of Serbian Macedonia and Albanian Epirus; she was also allowed to extort from Turkey a strip of territory along the Maritsa controlling that river and Adrianople. Belated efforts had been made to buy off this new enemy, but it was not until Aug. 23 that the Serbian *skupshina* was brought to recognize "the sacrifices indispensable for the preservation of the vital interests of her people." They would have preferred more heroic measures, and in vain begged the Entente to authorize a Serbian attack on Bulgaria before the latter got her blow in first. The normal correctness of the Entente was reinforced by the fact that Serbian aggression would release Greece from her treaty obligations to assist Serbia if attacked by Bulgaria. It did not foresee the autocratic dismissal of Venizelos by Constantine on Oct. 6, the acquiescence of the Greek parliamentary majority, and Constantine's repudiation of his treaty obligations when Bulgaria took the offensive. It was carefully synchronized with Mackensen's invasion from the N.; and, taken on two fronts, Serbia was in a desperate position. The British and French troops hastily transferred from Gallipoli to Salonika were too late even to assure the Serbs a retreat down the Vardar; and they had to make their perilous way across the trackless and snow-clad mountains of Albania to the inhospitable shores of the Adriatic. The outposts followed the centre of the Entente position in the Balkans; Montenegro was overrun by Austria; and the British evacuated Gallipoli, keeping Salonika as a thorn in the enemy's side and a bridle on Greek vagaries.

Christmas, 1915, marked the climax of German success in the war. She had easily held her western front with inferior forces against wasteful and premature Allied attacks, while she conquered Galicia and Poland, and with Bulgarian help overran Serbia and made a corridor to Turkey and the East. Von der Goltz was already in Mesopotamia organizing the Turkish forces which evacuated Bagdad from Townshend in Nov. 1915 and then captured his army in Kut in the following April; while Egypt had to withstand Arab attacks on the W. and Turkish attempts in the Suez Canal. But it needed a longer and stronger arm than even Germany possessed to strike with much effect across the torpid body of the Turkish Empire and the sands of Syrian and Arab deserts. Russia more than atoned for the British failure before Bagdad by the rapid and brilliant seizure of Erzerum in Feb. 1916, and then pushed on S. to Mush, Bitlis, and Van, and W. to Trebizond. On June 7 the Grand Sherif of Mecca threw off his allegiance to Turkey, occupied Jidda and Yambo', laid siege to Medina, cut the Hejaz railway and was joined by tribes farther S. who captured Aunfuda; on Dec. 16 he was recognized as King of the Hejaz by Great Britain. Between March and Sept. Smuts conquered nine-tenths of German E. Africa, while Portugal threw in her lot with Great Britain to assist in the campaign; and, although the week after the fall of Kut did not seem a happy moment for the conclusion of the Sykes-Picot Agreement of May 9 1916, its arrangements for British, French, and neutral zones in Mesopotamia, Syria, and Palestine were intelligent anticipations of the future. Germany's oriental visions were unsubstantial, and her Balkan allies would not be much help toward a decision on the western front. She had merely secured immunity for her eastern frontiers and relief from fear lest Austria should collapse, while she

turned her forces once more to the W. for a blow at the heart of France before the first serious Allied offensive matured. The Marne had taught her the risks of the far-flung line, and she now selected the shortest route to a vital spot at Verdun.

Rumania's Entry.—France saved herself in the titanic conflict which followed; but Germany, too, was hardly less successful in her resistance to the Franco-British attack on the Somme, while with her left hand, so to speak, she bolstered up Austria's stand against the unexpected and vigorous assaults which Brusilov launched in July, and then crushed Rumania when on Aug. 27 the fifth Balkan state ventured into the turmoil of war. Rumania, long shivering on the brink, chose an unfortunate moment to plunge. Her case was a replica of Italy's; there was a *Romania iridentia* (as the Rumanians spell it) across the Carpathians, subject to worse treatment from Magyars than unredeemed Italy suffered at Austria's hands. There were also strategic frontiers to be rectified, and a semi-circular state to be rounded off. By the secret treaty with Rumania which was signed by Italy, France, Great Britain, and Russia, Rumania was to receive the Banat, the whole of Transylvania, a large slice of Hungary up to a line from Szeged on the Theiss through Debreczen to half-way between Csap and Szatmar-Negeti, as well as the Bukovina up to the Pruth, "the most ethnically unjust of all the secret agreements made during the war;" which only the subsequent and separate peace of Bucharest in May 1918 released the Allies from their obligations to enforce. Nothing was naturally said about the Rumanes under Russian rule in Bessarabia or Bulgarians under Rumanian sway in the Dobruja. The treaty had been drafted on Aug. 8, but Stuermer objected that the Great Powers must not be bound to continue the war until all Rumania's territorial aims had been achieved, and Briand agreed to waive the point. Bratiano, however, threatened to resign, and on Aug. 12 the Tsar apparently yielded. The Allies were to advance from Salonika on the 20th and Rumania to declare war on the 27th.

Sarrail's plans had, however, been betrayed by two of his officers, and it was not until Sept. 7 that he could move. Rumania kept to her bond, and attacked Transylvania on Aug. 28. Her subsequent disasters were attributed to her neglect of Entente counsels and wishes in attacking Transylvania instead of Bulgaria; but the criticism was unjust. There was apparently no stipulation about the direction of Rumania's action, and she had hopes that Bulgaria might not intervene. Justification for aggressive war must always be found in a political and not a strategic motive. Rumania had a legitimate grievance against Austria-Hungary in the treatment of *Romania iridentia*; she had none against Bulgaria whom she had robbed in 1913. Even on strategic grounds her conduct might be defended; for her ruin was wrought, not by Bulgaria, but by Falkenhayn's Austro-German attack through the passes, and their progress would have been even more rapid had Rumania launched her armies against Bulgaria. She might have withstood Falkenhayn, had Russia done her duty and sent adequate forces into the Dobruja to oppose Mackensen and carry out the threats she had uttered against Bulgaria in 1915, while Rumanian neutrality barred their execution. The Entente Powers had, in fact, simply looked to Rumania to pull their chestnuts out of the Balkan fire; they had no idea that the battle of the Somme had left Germany in a condition to make an effort elsewhere like Falkenhayn's; while the creeping paralysis which had overcome Russia suggested the tale of a secret understanding between her ambiguous Premier Stuermer and the Habsburgs to partition Rumania, Wallachia to go to the Habsburgs and Moldavia to Russia. Before the end of the year Bucharest had been captured and the Rumanian armies driven behind the Sereth, while Sarrail's offensive in the S.W. barely reached Monastir. From the Aegean to the Carpathians, and from the Adriatic to the Black Sea, the Balkans had become a solid Teutonic block.

Peace Moves, 1916-7.—The moment appeared favourable for Germany to make overtures of peace. The Kaiser had discussed the idea in a letter to his Chancellor, Bethmann Hollweg, at the

¹ *History of the Peace Conference*, I. 184.

end of Oct.; on Dec. 12 a note was addressed to President Wilson and the Pope, and the matter was made public in the Reichstag. The note was based on Germany's success; she and her allies, it declared, "have given proof of their indestructible strength. . . Their unshakable lines resist ceaseless attacks. . . The latest events have demonstrated that a continuation of the war cannot break their resisting power. The general situation much rather justifies their hope of fresh successes." These they would forego for the sake of peace. "They do not seek to crush or annihilate their adversaries" and "they feel sure that the propositions which they would bring forward . . . would be such as to serve as a basis for the restoration of a lasting peace." These they did not specify; nor, indeed, had they made up their minds on the point. Eighteen months earlier the "Six Associations" representing German industry and commerce had demanded as conditions of peace "a colonial empire adequate to satisfy Germany's manifold economic interests," the military and economic control of Belgium, the annexation of the French coast and its hinterland from the Belgian frontier to the Somme, of Briey, Longwy, Verdun and Belfort, of "at least parts of the Baltic provinces," and had declared that the surrender of any occupied territory "in which so much German blood has been spilt and so many of our best and noblest have found a grave, would do violence to the sentiments of our people and to their conception of an honourable peace." Bethmann Hollweg would not have countenanced such preposterous demands; but Ludendorff was more influential, and in vaguely describing the terms which alone reached the enemy with his approval, he uses phrases which might be made to cover them all except the annexation of the Channel ports and their hinterland.

Whatever their official conceptions of peace, the Teutonic allies dared not avow them in public; and the absence of substantial proposals convinced their opponents that the note about peace was a mere manoeuvre of war; a continuation of the German offensive designed to complete the disintegrating work of German arms and to break up the Entente by playing off one Power against another. Consciousness of the real perils of such a conference gave an angry tone to the note in which the Entente replied on Dec. 29, and it consisted of a comprehensive indictment of Germany's conduct during the war, with particular reference to Belgium; and of a categorical refusal "to entertain a proposal which was devoid alike of sincerity and of substance."

Almost simultaneously but quite independently President Wilson addressed an inquiry to both belligerent groups on Dec. 28. He admitted that he was embarrassed by the coincidence because his note "may now seem to have been prompted by the recent overtures of the Central Powers," and the popular voice in Entente countries was convinced that he was "playing Germany's game." Clearer sighted observers discerned in it the President's first step toward intervention on the Entente side. It was, in effect, a request for information about the intentions of the belligerents; and resembled the inquiry which Great Britain addressed to France and to Germany with respect to Belgium's neutrality. The answers then determined British intervention, and the answers to Wilson's note helped him to make up his mind, or rather that of his people. "What," he asked, "did the two sides mean by the general terms they used of the war? The concrete objects for which it is being waged have never been definitely stated. The leaders of the several belligerents have . . . stated these objects in general terms. . . But, stated in general terms, they seem the same on both sides. Never yet . . . authoritative spokesmen of either side avowed the objects which would, if attained, satisfy them and their people; that the war had been fought out. The world has been . . . conjecture what definitive results, what actual exchange of guarantees, what political or territorial changes or readjustments, what stage of military success even would bring the war to an end." Germany brushed aside the request on Dec. 26 by reaffirming her contention that a direct exchange of views between the belligerents was "the most suitable way of arriving at the desired result." She proposed the speedy assembly, on neutral ground, of delegates of the warring States.

The Entente reply was more considered and was not completed until Jan. 20 1917. Demurring to the President's "assimilation" of the two belligerent groups, the Allies expressed their disbelief in the possibility at the moment of attaining "a peace which will assure them reparation, restitution, and the guarantees to which they are entitled by the aggression for which the responsibility rests with the Central Powers." They proceeded to indicate as their objects the restoration of Belgium, Serbia, and Montenegro with indemnities; the evacuation of the invaded territories of France, of Russia, and of Rumania with just reparation; the "reorganization of Europe"; the "restitution of provinces and territories wrested in the past from the Allies by force or against the will of their populations; the liberation of Italians, of Slavs, of Rumanians, and of Czechoslavs from foreign domination; the enfranchisement of populations subject to the bloody tyranny of the Turks; the expulsion from Europe of the Ottoman Empire." In a covering despatch dated Jan. 13, which was one of the most important and effective State papers of the war, Mr. Balfour demonstrated that "a durable peace can hardly be expected unless three conditions are fulfilled. The first is that existing causes of international unrest should be, as far as possible, removed or weakened. The second is that the aggressive aims and the unscrupulous methods of the Central Powers should fall into disrepute among their own peoples. The third is that behind international law and behind all treaty arrangements for preventing or limiting hostilities some form of international sanction should be devised which would give pause to the hardest aggressor." It would, perhaps, be hyperbole to call Mr. Balfour the author of Mr. Wilson's policy, but its future outlines could hardly have been more accurately indicated.

Germany's first "peace offensive" had failed, to the deep disappointment of her people and her Government. Her situation was, indeed, imposing rather than substantial. Apart from a corner of German E. Africa, her colonies had all been lost; the battle of Jutland had terrified her high seas fleet into ignominious inaction; and on the western front Hindenburg had prepared a comprehensive retreat. In Oct. the *Vorwärts* had been suppressed as a minority Socialist organ and subjected to official inspiration. Ominous creaking began to be heard in the joints of her Austrian ally. Francis Joseph had died on Nov. 21, giving place to the more pacific Charles, and the murder of Count Stürgkh on Oct. 27 was followed by a rapid succession of three prime ministers in Dec. and by the substitution of Czernin for Tisza's henchman Burian as Foreign Minister. Peace had become a popular aspiration, and when the Allies rejected the offer, astonishment mingled with consternation. "*Jetzt ist alles verloren*," exclaimed a German officer interned in the Hagadah. Nor did the opening months of 1917 belie this gloomy German forecast. The German retreat to the Hindenburg lines, sound enough in itself, depressed a public accustomed to judge by the map. Sir Stanley Maude's spectacular conquest of Bagdad gave a sinister turn to the Berlin-Bagdad vision. Sir Archibald Murray was at the gates of Gaza, and if Maude's campaign were a precedent, would soon be in Damascus. Above all there loomed the threatened breach with the United States, which would make the ultimate defeat of Germany inevitable save by a miracle. Corresponding elation appeared on the Entente side; even sober critics thought that the war would soon be won with the substitution of Mr. Lloyd George for Mr. Asquith in Dec., and in Jan. 1917 a highly successful "Victory" loan was launched in England on the basis of triumph within eight months.

Allied War Aims.—Prospective victors made haste to divide the contingent spoil. France demanded, and Russia agreed, on Feb. 14 1917, to the Rhine as "a permanent strategical frontier against a Germanic invasion." Besides the restoration of Alsace-Lorraine, the new boundaries were "to be drawn up at the discretion of the French Government so as to provide for . . . the inclusion in French territory of the entire iron district of Lorraine and of the entire coal district of the Saar valley." The rest of the territories on the left bank of the Rhine were to be separated from Germany, constituted an autonomous and neutral state, and garrisoned by French troops until all the condi-

tions of peace had been completely satisfied. Mr. Balfour on Dec. 19 1917 affirmed that the British Government had never desired, encouraged, or approved of this idea; but it was publicly advocated by one of his colleagues in the Cabinet. In return Russia insisted upon, and France recognized, Russia's "complete liberty in establishing her western frontiers." The meaning of this had been specifically explained by Sazonov a year earlier, on March 9 1916: "It is particularly necessary to insist on the exclusion of the Polish question from the subjects of international discussion and on the elimination of all attempts to place the future of Poland under the guarantee and the control of the Powers." Since that date, the Central Powers had, on Nov. 5 1916, proclaimed the independence of Russian Poland, and on the 15th the Tsar issued an ambiguous statement to which Mr. Asquith and M. Briand endeavoured to give a precise interpretation. In his general order for Christmas Day, the Tsar did, indeed, refer to a "free Poland," and the Allied note of Jan. 10 1917 averred that his intentions had thereby "been clearly indicated." But an imperial commission, appointed to determine what was meant by the phrase, narrowed it down in Feb. 1917, as Gourko relates, on the ground that "a free Poland would fall under Germany's influence." Others of Russia's imperialistic aims had been recognized in the spring of 1916, at the time of the Sykes-Picot Agreement about Syria and Mesopotamia, and she had secured Erzerum, Trebizond, and Turkish territory as far as a line running through Mush, Sert, Ibn 'Omar, and Amajia to the Persian frontier. On July 3 1916 by a treaty which was to be "kept in complete secrecy from everybody except the two high contracting parties," Russia and Japan had bound themselves to safeguard China "against the political domination of any third Power entertaining hostile designs toward Russia or Japan"; and in Jan.-Feb. 1917 the Entente Powers, by another secret treaty, recognized the concessions which Japan had extorted from China on May 7 1915 by means of an ultimatum. Japan thus became the territorial if not the spiritual heir of Germany in the Shantung peninsula and acquired a lien on China's economic development.

The opening of the campaign of 1917 proved, however, delusive, and its later stages postponed to an indefinite future the realization of these secret agreements. The Hindenburg lines justified the hopes the Germans had placed upon them; and while the British won a considerable success at Vimy, the French effort in Champagne and along the Chemin des Dames was a costly and disastrous failure. The German submarine campaign was hardly less disastrous to the shipping upon which Great Britain and her Allies relied for their ability to continue the war; the British offensive in Flanders was a depressing disappointment, and Murray failed to force the gates of Palestine. The doubtful success of Entente arms corresponded to the dubious methods and aims of its diplomacy; and a candid survey of the secret agreements, to which the Entente Powers had committed themselves, suggests a serious doubt whether, if victory had been won early in 1917, it would have been worth the winning or would have resulted in a happier world than that which had existed before the war broke out. Not all of the Powers were, indeed, committed to all of the agreements; but each of them had staked out claims for new conquests and fresh subject-peoples, and not one had proposed to sacrifice a single acre on the altar of self-determination. Nor, in the hour of imperialistic victory, would it have been British or American statesmanship which would have interpreted the "freedom" of Poland, the "autonomy" of Germans on the Rhine, the rights to self-government claimed by Czechoslovaks, Dalmatians, or Armenians, or the liberties of the little nations in the Balkans or the Baltic. There would, in the event of victory early in 1917, have been no League of Nations, no "minorities clauses," no mandates, no guarantees for better domestic rule by states or better regulation of their external affairs. Russia might even have remained an autocracy fortified by success, and the Tsar have supported the cause of autocracy in Germany and in Austria. Cruel as were the sacrifices exacted from the western Powers by the deferment of hope and by Russia's collapse, criminal as were the means by which the

Bolsheviks imposed their new tyranny upon the Russian people, the destruction of Tsardom may seem to have been in the long run the greatest service Russia rendered in the war. No one would claim perfection for the work of the Peace Conference of 1919, but what sanity it showed was mainly due to the fact that the one autocracy in the Entente had disappeared and its place in council had been more than filled by the great republic of the West. The diplomatic atmosphere was purified by the change, and power shifted towards an idealistic left. Great Britain, instead of representing as hitherto the extreme of moderation, presently found herself holding the balance between France, which, with the elimination of Russia, came to represent the right of annexation, and the United States, which ultimately put two million men in the field and did not ask for an acre in return. Gradually a programme was evolved which did not require the veil of secret diplomacy; a reformed band of Allied and Associated Powers gathered behind its banner of freedom most of the democracies of the world; and the war entered on a course which made a fight to a finish a rational policy.

The Russian Revolution.—The Russian revolution and American intervention together form the turning point of the war even more from the diplomatic than from the military point of view. But the one was needed to complete the other: without the revolution American intervention would still have left the Entente with a dubious face and a divided mind; without American intervention the Russian revolution would have robbed the Entente of its victory. Nevertheless, the coincidence of the two events appears to have been accidental. The revolution came first by some three weeks, and the Ides of March were fatal to the Russian Caesar. Its effects upon the war developed step by step with the progress of internal change, but from March 1917 fighting almost ceased upon the Russian fronts. The Cadet party, which was led by Miliukov and controlled the Provisional Government, would have continued the war for the sake of the Straits and Constantinople; it was straightforward on Poland, and on March 30 frankly recognized its independence. But power passed more and more into the hands of the Soviets, who wanted a general peace which would give each nation what it possessed before the war and each proletariat a good deal more. There were to be "no annexations and no indemnities," save such as each proletariat was entitled to levy upon its own capitalists and bourgeoisie. For this purpose the Soviets on May 12 proposed an International Labour Congress at Stockholm and on the 30th invited the Allies to restate their war aims. But even the Soviets did not yet demand a separate peace, and while on April 10 Russia renounced her imperialistic aims, on the 15th Czernin's offer to that effect was declined.

On May 13, however, the Russian Provisional Government fell, and Kerensky became the leading spirit in a new and more socialistic administration. He believed that only the success of Russian arms could guarantee the orderly progress of the revolution, and did his best to withstand the propaganda of the Bolsheviks, who were destroying discipline, urging peasant soldiers to go home and garner the fruits of the revolution in the shape of the land, and denouncing the wickedness of Russians killing their brother German socialists. Lenin's Bolshevik insurrection on July 16 was suppressed, but the miasma of his doctrine proved fatal to Kornilov's spirited offensive in Galicia; and as soon as the Germans counter-attacked, Russian troops threw down their arms and fled, massacring the officers who sought to stop them. By the end of July Russia had lost all her gains in Galicia; in Aug. a similar riot in the Russian contingent in Rumania nearly ruined the latter's gallant resistance which defeated the Germans at Marasheshiti; in Sept. the Germans forced the Dvina and captured Riga, and in Oct. occupied Oesel, getting into touch with Finland. Kerensky now became a convert to the necessity of a dictatorship, but repudiated Kornilov when on Sept. 7 he moved troops on Petrograd to effect it; and on Nov. 7 another Bolshevik insurrection transferred the dictatorship to Lenin and Trotsky, who began *pourparlers* for peace.

Russia had gone effectively out of the war faster than the United States came in; but she left a blazing trail behind her, and

sparks from the conflagration started a smouldering fire on German soil which was never extinguished. Bolshevik pacifism seemed a ridiculous gesture in face of Prussian arms, but its moral effect was by no means contemptible. "Looking back," writes the archmilitarist Ludendorff, "I can see that our decline obviously began with the outbreak of the Revolution in Russia." After all, the original ground or pretence upon which the war had enlisted democratic support in Germany was its appearance as a war of defence against autocratic Pan-Slavism. When Russia had destroyed the Tsardom, repudiated its aims, and laid down its arms, Germans who were not militarists or capitalists might well ask for what they were fighting; and on June 27 Hindenburg pointed out to the Kaiser the decline in German *moral*. So, while the elimination of Tsarism gave greater reality to the moral claims of the Entente, it deprived those of the Central Powers of their substance; and the war became more nakedly a struggle between militarist imperialism and democratic idealism. A practical illustration was afforded by the formation of a Polish army in Russia and a Polish legion in France at the moment when the Polish legion in Austria had to be disbanded.

Czernin seems to have been the first among Teutonic statesmen to realize the change in the position and to seek to capitalize a situation in which the Habsburg Empire had nothing more to gain and everything to lose. Her soil was now rid of the Russian invader; Italy had made no serious impression, and Trieste was in no danger; Serbia only existed in exile, and Rumania trembled on its brink. On the other hand, the prolongation of war and Russian contagion might stir a series of domestic revolutions. Hence his conference with Bethmann Hollweg on March 27, his offer of peace to Russia in April, and his suggestion that Germany should cede Alsace-Lorraine to France while Austria handed over Galicia to Poland with a view to the subjection of both to German control; hence, too, the meeting of the Austrian Reichsrat on May 30 for the first time since the war began.

Ludendorff placed his heel on these proposals, and Czernin then turned his attention to the German Reichstag, where a complicated struggle was waged between Ludendorff's militarists and Bethmann Hollweg's politicians, who were beginning to react to popular discontent and the effect of Russian developments. "Bethmann Hollweg and Czernin," writes Ludendorff, "were both completely obsessed by the Russian Revolution. Both feared similar events in their own countries." On July 6 Erzberger, who was perhaps in Czernin's confidence, opened the attack with revelations about the non-fulfilment of official hopes from the submarine campaign and demanded a "peace of understanding." On the 11th the Kaiser was constrained to sign a rescript promising universal, direct, and secret suffrage for Prussia after the war; as a set-off to this Bethmann Hollweg was forced to resign on the 13th, being succeeded by Michaelis, a mere official who said what he was told and contradicted himself when occasion or his superiors required it. Then on the 19th the Reichstag passed by 224 to 116 votes a resolution in favour of peace "without indemnities or annexations," which Michaelis accepted only "as he understood it." It was timed and tuned for the Stockholm conference, which German and Russian Socialists were allowed to attend, while British and French were not, and probably also for the Peace Note which the Pope launched on Aug. 1, and which France and England, being estopped by their secret agreement with Italy, left President Wilson to answer.

President Wilson's Policy.—From that time onward for two years President Wilson became the principal spokesman of the Allied and Associated Powers; but it appears that the Russian revolution had exercised so far a more potent influence on the Central Empires than the intervention of the United States. Russia was their immediate neighbour on a frontier of a thousand miles. America was four thousand miles away, and it was long a German delusion that American troops would be kept but of the same submarines on which Germany relied to Great Britain to terms; and arguments not backed by fists Germany was indifferently. She had made up her mind to take what she could. In Feb. 1917 she resumed her unrestricted submarine campaign; and that approaching

resolve had helped to determine her simultaneous refusal to state her war aims in response to the President's invitation.

The coincidence seems to have been largely a matter of accident. Originally elected President in 1912 by a minority vote owing to the split in the Republican party between Roosevelt and Taft, Mr. Wilson was re-elected in 1916 after a close contest in which neither of the opposing American parties had made war with Germany a plank in its platform; and without the prospect of an unprecedented third presidential term, Mr. Wilson enjoyed in his second a freer hand than any other democratic statesman. But he was obviously tied by the traditions and public opinion of a community diverse in origin, in interests, and in outlook, spread over vast areas, separated by thousands of miles from the European conflict, and inured to the idea of splendid isolation. "We are," said President Wilson on March 3 1917, "a composite and cosmopolitan people. We are of the blood of all the nations that are at war." Action was impossible until there was some common measure of agreement in a heterogeneous people, and it was not easy to unite on a basis of intervention a Federal democracy whose one common principle in foreign policy was abstention from European quarrels. The Monroe Doctrine, as understood by modern interpreters, implied that the United States would resent and resist European intervention in a S. American war, however gross might have been the aggression, and however much it might have shocked the European conscience. So far as the Western Hemisphere was concerned, the United States claimed to be the keeper of the conscience of the world, and it thought that claim was only tenable so long as it washed its hands of conscience so far as Europe was concerned. Intervention on behalf of Belgian neutrality or even protest against its violation might open the door to rebuffs in kind and break down the quarantine which the democratic republic had sought to impose upon Old World infection.

But the war put the finishing touch to the obsolescence of the schismatic doctrine of two worlds and two human consciences. It was only a practicable dogma provided either that the United States kept not merely its conscience but its people, its capital, its commerce, and its shipping on its side of the Atlantic; or that the Old World observed those rules of international law and conscience which had commended themselves to the American people. In other words, so far from there being two worlds, the Old must accommodate itself to the New; and the most hardened believers in the Monroe Doctrine rebelled against the idea that Germany could indefinitely sink American ships and kill American citizens without provoking a war, which America could not wage without giving its conscience a passport to Europe. "As far as the United States is concerned," writes Dr. J. B. Scott, "the cause of its war with the Imperial German Government is the submarine . . . for the law could not be changed to suit the submarine." Nor was the Monroe Doctrine compatible with the enforcement of the American conception of the freedom of the seas or with the maintenance of neutral rights; and a long series of incidents convinced the American public that its cause could not be isolated. "The challenge," said President Wilson, "is to all mankind"; and when he intervened, it was not merely in defence of American rights but of a common humanity.

The outstanding episode in the slow and painful process by which the American people were brought to realize the dilemma between war and the surrender of their principles must be briefly indicated. A series of events, which, in the despatch of Secretary Bryan, the Government of the United States had observed "with growing concern, distress, and amazement," culminated on May 7 1915 when the "Lusitania" was torpedoed without warning, and 114 American and nearly a thousand other lives were lost; and on the 13th he intimated that his Government would not "omit any word or act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment." But he resigned when acts seemed likely to follow words, and the President's second "Lusitania" note was signed on June 9 by Mr. Lansing. Bryan's resignation was not, however, without its effects; and the words continued

while more American lives were lost in each succeeding month.¹ The most definite action was taken in Sept. against Germany's less powerful and less pernicious ally, when Dr. Dumba, the Austrian ambassador, was required to leave on account of his complicity in the intrigues of J. F. Archibald and other Teutonic agents. A graver crisis was reached with the torpedoing of the Channel steamer "Sussex" on March 24 1916. "The Government of the United States," wrote Mr. Lansing on April 18, "has been very patient. . . . Unless the Imperial Government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight carrying vessels, the Government of the United States can have no choice but to sever diplomatic relations with the German Empire altogether." On May 4 the German Government made some concessions, and as President Wilson expressed it on April 2 1917, "somewhat restrained the commanders of its undersea craft." The reason for its complaisance, given later on by Bethmann Hollweg, was that it had not yet sufficient submarines to carry out unrestricted submarine warfare effectively.

That time came with the beginning of 1917. The decision was taken on Jan. 9, and it was Germany's real answer to the President's note of Dec. 18. But it was based on a serious miscalculation. The German naval authorities thought it would compel Great Britain to sue for peace within six months, and Bethmann Hollweg has cast the responsibility for its effects upon them. Hindenburg's plea that the Chancellor failed to inform him of the impression it would produce in America is less convincing, for Ludendorff says that "we reckoned that the adoption of the submarine campaign would effect a favourable decision for us, at latest before America's new troops could participate in the war." So American intervention was anticipated and discounted. But eighteen months were yet to pass before American intervention took a form which was materially to disconcert Ludendorff's military calculations. For more than a year diplomatic relations had practically been severed between the United States and Austria-Hungary, and it did not at once appear that the resumption of unrestricted submarine warfare would be followed by more drastic American action with regard to Germany.

On Jan. 22, ignorant of Germany's decision, Mr. Wilson addressed Congress on the results of his note of Dec. 18, and sketched the conditions which would justify the United States in guaranteeing peace with a view to making it permanent.

"In every discussion of the peace that must end this war it is taken for granted that that peace must be followed by some definite concert of power, which will make it virtually impossible that any such catastrophe should ever overwhelm us again. . . . Such a settlement cannot now be long postponed. It is right that before it comes this Government should frankly formulate the conditions upon which it would be justified in asking our people to approve its formal and solemn adherence to a League of Peace. . . . No covenant of cooperative peace that does not include the peoples of this New World can suffice to keep the future safe against war. . . . It will be absolutely necessary that a force be created as a guarantee of the permanency of the settlement. . . . There must be, not a balance of power, but a community of power. . . . But the implications of these assurances. . . . imply, first of all, that it must be a peace without victory. . . . Only a peace between equals can last. . . . And there is a deeper thing involved than even equality of right among organized nations. No peace can last, or ought to last, which does not recognize and accept the principle that governments derive all their just powers from the consent of the governed, and that no right anywhere exists to hand peoples about from sovereignty to sovereignty as if they were property. . . . Statesmen everywhere are agreed that there should be a united, independent, and autonomous Poland. . . . And the paths of the sea must alike in law and in fact be free. The freedom of the seas is the *sine qua non* of peace, equality, and cooperation. . . . The question of armaments, whether on land or sea, is the most immediately and intensely practical question connected with the future fortunes of nations and of mankind. . . . I am proposing, as it were, that all nations should with one accord adopt the doctrine of President Monroe as the doctrine of the world; that no nation should seek to extend its polity over any other nation or people. . . . that all nations should avoid entangling alliances. . . . There is no entangling alliance in a concert of power. . . . These are American principles, American policies. We could stand for no others."

¹ See a provisional list of these and other crimes in J. B. Scott, *Diplomatic Correspondence*, pp. ix.-xv.

But while it was "inconceivable that the people of the United States should play no part in that great enterprise" of laying "afresh and upon a new plan the foundations of peace among the nations," the present war must first be ended, and the United States would "have no voice in determining . . . the treaties and agreements which would bring it to an end," only "in determining whether they shall be made lasting or not by the guarantees of a universal covenant."

American Intervention.—Such was the President's frame of mind when, nine days later, on Jan. 31, Bernstorff communicated Germany's revocation of its pledge of May 4 1916 and its decision to recommence unrestricted submarine warfare on Feb. 1. On Feb. 3 he simply and literally fulfilled his threat of April 18 and "severed diplomatic relations with the German Empire altogether." "I take it for granted," he said to Congress, "that all neutral governments will take the same course," but "we do not desire any hostile conflict with the Imperial German Government." On the 26th he pointed out that the caution of ship-owners and consequent congestion of commerce "might presently accomplish, in effect, what the new German submarine orders were meant to accomplish, so far as we are concerned," and proceeded to arm American merchant ships; but he was "not now contemplating war or any steps that need lead to it. . . . War can come only by the wilful acts and aggressions of others."

It came with speedy steps. Germany denied the right of neutrals to use arms at all, and intimated that the armed guards placed on American merchant ships would be treated as pirates. "Armed neutrality," confessed the President, "it now appears, is impracticable." There had, too, been intercepted a note dated Jan. 19 from Berlin to Mexico, proposing in the event of war an offensive and defensive alliance between Germany, Mexico, and Japan, and the reconquest of Mexico's "lost territory in New Mexico, Texas, and Arizona"; and on April 2 Mr. Wilson advised a special session of Congress "to declare the recent course of the Imperial Government to be in fact nothing less than war against the Government and people of the United States." "We are," he had declared in his second inaugural address on March 5, "provincials no longer. The tragical events of the thirty months of vital turmoil through which we have just passed have made us citizens of the world. There can be no turning back." And now "the world must be made safe for democracy." "The great, generous Russian people have been added in all their native majesty and might to the forces that are fighting for freedom in the world, for justice, and for peace. Here is a fit partner for a League of Honour. . . . We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make. We are but one of the champions of the rights of mankind." The resolution was passed in the Senate on April 4 by 82 votes to 6, and in the House of Representatives on the 5th by 373 to 50, and on the 6th the President declared war. Austria was not included, but Tarnowski, Dumba's successor, had been refused recognition, and relations were suspended; on April 13 they were severed with Turkey.

The President's somewhat naïve assumption that all neutral governments would follow his lead into armed neutrality had been promptly belied; and all European neutrals excused themselves. They were even less likely to follow him into war; but New World States, which were more immune from the consequences, were more amenable to his example. Cuba declared war on April 7, and on the 8th Panama associated itself with the United States. Brazil broke off diplomatic relations on April 11, Bolivia on the 13th, and Guatemala on the 27th, Honduras on May 17 and Nicaragua on the 19th, Haiti on June 15, Costa Rica on Sept. 23, Peru on Oct. 6 and Uruguay on the 7th, and Ecuador on Dec. 9. Brazil declared war on Oct. 26, while the Argentine declared her benevolent neutrality on April 11; but Chile and Venezuela remained neutral without benevolence. The contagion, however, spread into the Eastern Hemisphere: Liberia severed diplomatic relations on May 8 and declared war on Aug. 7; Siam declared war on July 23, and China on Aug. 14. *Securus judicat orbis terrarum*: but the world of little States needed

some security before it would pronounce judgment. Nevertheless, more than half the States of the world had now declared war on, or broken off diplomatic relations with, Germany and her three allies; the Entente had become a War League of Nations; and the peace that would be made in case of victory would represent the judgment of the world and be very different from that contemplated in the secret agreements.

But there was a yawning gulf between judgment and execution, and a painful interval between the President's declaration and the time when, in Ludendorff's words, "America became the decisive power in the War." Financial coöperation began to relieve the strain at once, and naval coöperation to ease the submarine situation in May; and at the end of June the so-called "sentimental Division" arrived as an earnest of what was to follow on the field of battle. But as late as March 1918 there were only five American divisions in France, of which two were untrained; and meanwhile the endurance of the European Allies was sorely tried. The French army was seriously demoralized by the failure of Nivelle's offensive, and Cailaux began to undermine its political fortitude. The sinking of 25% of British merchantmen at sea in April was an almost more fearful menace; Russia had become a broken reed; the British campaign in Flanders proved a disappointment; Stockholm was holding out the lure of a "peace by negotiation" to Labour; Mr. Henderson resigned from the British Cabinet on Aug. 11; the Pope had appealed on the 1st for a peace on the basis of the *status quo*, disarmament, and arbitration; and tentative discussions were proceeding by more or less authorized agents in Switzerland. Michaelis secured an equivocal answer to the Pope's note in his effort to please both his militarist and his parliamentary masters. But the situation in Germany was as equivocal as its Chancellor: for while at the end of Oct. he was replaced by Hertling, a *persona grata* to the Pope as the first Roman Catholic Chancellor of Protestant Germany, for receding from the July resolutions, Germany was receding quite as fast with the apparent improvement in her military situation. "The future will show," declared Czernin after the Armistice, "what superhuman efforts we made to induce Germany to give way. That all proved fruitless was not the fault of the German people . . . but that of the leaders of the German military party, which had attained such enormous power in the country."

Greece in the War.—The only set-back had been the constrained entry of Greece into the Entente fold. Since the dismissal of Venizelos in Oct. 1915, Constantine had governed by means of phantom ministers; and in May 1916, acting under his orders, the Greek commanders admitted Bulgarian forces into Forts Rupel and Dragotin, the keys of the Struma valley, while in Aug. Greek garrisons surrendered Seres, Kavalla, and Demirhisar to the same racial enemies. This was too much for the better part of Greece. A revolution broke out at Salonika, which swept over Crete, Mytilene, Samos, Chios, and the other Greek islands in Sept.; and a provisional government of insurgent Greece was formed under Venizelos, Condouriotis, and Danglis, which was tardily—owing to Russian and Italian influence—recognized by the Entente and declared war on Bulgaria. But Constantine controlled the mainland of Old Greece, and constantly intrigued against the Entente. At length, in June 1917, Tsarist protection having been removed by the Russian revolution, the Entente intervened by force of arms, and Constantine was deposed on the 11th and removed to Switzerland. Venizelos returned to Athens on the 21st, and on the 30th diplomatic relations were severed with Germany and Austria. The high-banded proceedings of the Entente were, no doubt, necessary measures of war; but Venizelos had to pay the penalty later for the violent patronage he had enjoyed, and the Entente needed the moral support which President Wilson gave it in the drastic reply he returned to the Pope's peace note on Aug. 27. To deal with Germany by way of peace upon the plans proposed by His Holiness would, the President declared, "involve a recupescence of its strength and a renewal of its policy." The recupescence of its strength was exemplified in Oct. in the further advance into Russia and the

Italian disaster at Caporetto; and the renewal of its policy was seen at Brest Litovsk. On Nov. 20, a fortnight after the successful Bolshevik revolution, Lenin proposed to all the belligerents a general armistice and discussion of peace; and on the 20th Germany accepted the invitation. The armistice was concluded at Brest Litovsk on Dec. 15. The Bolsheviks inserted a clause to the effect that German troops were not to be transferred from the eastern to the western front; but the Germans simply ignored it. It was mainly for that purpose that they signed the armistice; the idea of a great offensive on the W. had already occurred to them; and in Nov. and Dec. 24 divisions were transferred. Austria's main idea was much the same: "peace at the earliest moment," said Czernin, "is necessary for our own salvation, and we cannot obtain peace unless the Germans get to Paris, and they cannot get to Paris unless the eastern front is free." Czernin, and possibly even Kühlmann, the German Foreign Secretary, were prepared for such terms as might have secured this freedom and given Ludendorff a reasonable prospect of getting to Paris; but the grasping nature of the militarists stood in their own way. A preliminary conference at German Headquarters on Dec. 18 agreed to demand the acquisition of a protective belt of territory along the Russian-Polish frontier, and a personal union of Courland and Lithuania with Germany or Prussia, and to suggest the evacuation of Esthonia and Livonia by the Russians in the interests of self-determination.

At the Conference of Brest Litovsk, which opened on the 22nd, Kühlmann and Gen. Hoffmann represented Germany, Trotsky and Joffe the Bolsheviks, and Czernin Austria-Hungary. The Bolsheviks insisted on open diplomacy, and the arguments of the diplomatists were published throughout Europe from day to day by wireless telegraphy. This was essential for their schemes, for they relied upon propaganda to rouse the proletariats in all the belligerent countries to demand a cessation of the national wars which divided their forces, in order to combine them in a universal revolutionary movement. Their proposals were the evacuation of all conquests, restoration of independence to all nations subjected during the war, self-determination for those which had not previously secured independence, and no indemnities. Czernin replied for the Central Powers on the 25th, accepting the principles of no forcible annexations and no indemnities, but making the whole bargain conditional upon the acceptance of a general peace by the Allied and Associated Powers, who were given until Jan. 4 to signify their assent. No formal reply was made by them to the invitation; but one of the most important results of the Brest Litovsk negotiations was to clinch the case for a restatement of the Entente aims in the war.

Peace Moves, 1917-8.—Russia had asked for that restatement as far back as May 30, and in a communication addressed to the Provisional Government on June 9 President Wilson had replied that "no people must be forced under sovereignty under which it does not wish to live. No territory must change hands except for the purpose of securing those who inhabit it a fair chance of life and liberty. No indemnities must be insisted on except those that constitute payment for manifest wrongs done. No readjustments of power must be made except such as will tend to secure the future peace of the world and the future happiness of its peoples. And then the free peoples of the world must draw together in some common covenant . . . that will in effect combine their force to secure peace and justice in the dealings of nations with one another." On Nov. 18 M. Clémenceau, the new French premier, spoke slightly of a League of Nations, remarking that he was only out to win the war; and the Bolshevik publication of the Secret Agreements which began on the 22nd revealed the gulf which separated the Old World ambitions of the Entente Powers from the objects for which Mr. Wilson had told revolutionary Russia "we can afford to pour out blood and treasure." On the 29th Lord Lansdowne published a letter in the *Daily Telegraph* (The Times having declined to give it publicity) coupling a demand for a restatement of war aims with a more dubious proposal for peace negotiations. To the latter suggestion Wilson made an

effective reply by declaring war on Austria on Dec. 4, and fulminating against German power as "a thing without conscience or honour or capacity for covenanted peace" and refusing to negotiate until the "German people have spokesmen whose word we can believe" and "those spokesmen are ready in the name of their people to accept the common judgment of the nations as to what shall henceforth be the bases of law and of covenant for the life of the world. . . . Our immediate task is to win the war." But even he had not grasped all the implications: "We do not wish in any way to impair or to rearrange the Austro-Hungarian Empire," and it was left to France to recognize on Dec. 19 the Czechoslovak forces as "an autonomous army."

The Fourteen Points.—The initiative in a comprehensive and radical restatement of war aims was taken in a British Labour Memorandum, which was adopted without amendment by a special Labour conference on Dec. 28 and was then, with changes due to President Wilson's address of Jan. 8 1918, accepted by the Inter-Allied Labour and Socialist Conference in London on Feb. 22. Basing itself on Wilson's principle that "the world must be made safe for democracy," it emphasized the necessity, and sketched a plan, for a League of Nations, declared that the problem of Alsace-Lorraine was one of right and not of territorial readjustment, demanded restoration and reparation for Belgium and the Balkan States (with a Customs and Postal Union for the latter), the independence of Poland with access to the sea, the liberation of subject peoples from Turkish rule with the neutralization of the Dardanelles, condemned German annexation in Livonia, Courland, or Lithuania, and "the aims of conquest of Italian imperialism," and while "not proposing as a war aim the dismemberment of Austria-Hungary" protested against regarding "the claims to independence made by the Czechoslovaks and the Yugoslavs merely as questions for internal decision." Most of these aims were accepted in principle by Mr. Lloyd George on Jan. 5 after consultation with Dominion statesmen, Labour leaders, and Lord Grey and Mr. Asquith; but he made some notable concessions to what seemed to be the realities of the situation, and disclaimed any idea of fighting to "alter or destroy the imperial constitution of Germany," "to destroy Austria-Hungary," or even "to deprive Turkey of its capital or of the rich and renowned lands of Thrace, which are predominantly Turkish in race"; and he seemed lukewarm about the League of Nations. Then on Jan. 8, in an address to Congress, President Wilson laid down his famous "Fourteen Points," demanding:—

I. Open covenants of peace, openly arrived at, after which there shall be no private international understanding of any kind, but diplomacy shall proceed always frankly and in the public view.

II. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

III. The removal, as far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

IV. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

V. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the Governments whose title is determined.

VI. The evacuation of all Russian territory and such a settlement of all questions affecting Russia as will secure the best and freest cooperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy and assure her of a sincere welcome into the society of free nations under institutions of her own choosing; and, more than a welcome assistance also of every kind that she may need and may herself desire. The treatment accorded to Russia by her sister nations in the months to come will be the acid test of their goodwill, of their comprehension of her needs as distinguished from their own interests and of their intelligent and unselfish sympathy.

VII. Belgium, the whole world will agree, must be evacuated and restored, without any attempt to limit the sovereignty which she

enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

VIII. All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which had unsettled the peace of the world for nearly fifty years, should be righted, in order that peace may once more be made secure in the interest of all.

IX. A readjustment of the frontiers of Italy should be effected along clearly recognized lines of nationality.

X. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

XI. Rumania, Serbia, and Montenegro should be evacuated; occupied territories restored; Serbia accorded free and secure access to the sea; and the relations of the several Balkan States to one another determined by friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan States should be entered into.

XII. The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

XIII. An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

XIV. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

The Humiliation of Russia.—In introducing these points President Wilson referred to the Brest Litovsk negotiations as having been broken off, and described "the whole incident" as "full of significance." There had, indeed, during the interval allowed for the Entente to reply, been a violent disagreement between Ludendorff and Kühlmann, who was supported by Czernin and Hertling. On Dec. 28 the militarists secured a German declaration to the effect that the representative bodies existing in the occupied territories under German protection expressed their "self-determination" and that plebiscites were superfluous. On Jan. 2 Trotsky denounced these claims as hypocritical, and proposed to change the seat of the conference from Brest to Stockholm. He reappeared at Brest, however, on Jan. 7, asseverating that the Bolsheviks would make no peace that was not "just and democratic"; and there followed weeks of discussion on the meaning of "self-determination" and its methods of expression. Trotsky's flank was turned by the appearance of delegates from the Ukraine asserting their independence of Russia. They represented only the middle-class Rada, while Ukraine revolutionaries sided with the Bolsheviks, seized Kiev, and overran most of the Ukraine. The Rada thereupon signed a peace with the Central Powers on Feb. 9, which gave Polish Kholm to the Ukraine and sowed the seeds of discord between the two nationalities, and invited the Germans and Austrians to drive the Bolsheviks out of the Ukraine. They were willing enough; food was their real quest, and alarming strikes had already broken out in Vienna, Berlin, and elsewhere.

These seemed to give Trotsky the leverage he had been seeking, and on the day the Ukraine treaty was signed he issued a wireless call to the German army to refuse obedience to the Kaiser. Next day he declared war to be at an end, but refused to sign a German peace. On Feb. 13 Germany denounced the armistice, and on the 18th recommenced the march toward Petrograd and the occupation of the Ukraine. There was no organized resistance; the peace of Brest Litovsk was signed on March 3 and ratified by a congress of Soviets at Moscow, after a three days' debate, on the 16th. The Baltic nationalities were surrendered by Russia for their fate to be determined between themselves and Germany; the Ukraine treaty of Feb. 9 was accepted by the Bolsheviks; Russia was also required to cede the districts

of Kars, Ardahan, and Batum to Turkey; commercially she was made a preserve for the Central Powers; and the two million German colonists in Russia were exempted from the legislation of, and allegiance to, the Bolshevik Government. Trotsky had given up foreign affairs on March 8 and devoted himself to the more promising task of organizing a Red army; it was left for Lenin to persuade the Soviets of the necessity of temporarily bowing to the inevitable. Consequential and similar treaties were signed between the Central Powers and Finland on March 7 and with Rumania, provisionally, on March 5 and finally on May 7. German control over their commerce, industry, and finance was established in both, and Rumania further ceded the Carpathian crests and the Dobruja.

Germany and the Fourteen Points.—These deeds were a more convincing reply to President Wilson's "Fourteen Points" than the disingenuous speeches made in concert by Kühlmann and Czernin at Berlin and Vienna on Jan. 24. The Central Powers had been given the opportunity of demonstrating the interpretation which they put on victory; and there could not remain the slightest doubt that they would impose similar, if not severer, conditions upon the rest of the world if they got the chance. Nothing could have been more sinister or more impressive than the complete contradiction between their words to Powers which they did not yet control and their deeds to those which they did; and whatever criticisms might be made of the ultimate settlement, they would have to be based not on the ground that the Central Powers suffered more than they deserved, but that the penalties were impolitic and fell on the wrong shoulders. The treaties were approved of by all parties in the Reichstag except the Minority Socialists and the Poles; and early in March the Minority Socialists lost a seat at Nieder Barnim.

There was little more for diplomacy to say. It was obvious, although the fact was not universally recognized, that the speeches of Teutonic ministers afforded no basis for negotiation, since from Brest Litovsk onward the German G.H.Q. superseded the Government; but it was a blunder on the part of the supreme war council at Versailles to issue on Feb. 4 a statement that it would not accept Hertling's and Czernin's professions and had decided on a vigorous prosecution of the war, thereby creating the impression that the same supersession of the civil by military power was also taking place in the Entente. Nevertheless, President Wilson did, indeed, on Feb. 11 give a useful definition of Four Principles on which the settlement must be based; and he used what his Secretary of State, Lansing, subsequently denounced as an explosive expression when he declared that "Self-determination" is not a mere phrase. It is an imperative principle of action which statesmen will henceforth ignore at their peril." But he was in closer touch with the realities of the situation when on April 6, commenting on the contrast between Hertling's professed acceptance of those four principles and the militarist terms dictated at Brest Litovsk, he declared: "Germany has once more said that force, and force alone, shall decide whether justice and peace shall reign in the affairs of men, whether Right as America conceives it or Dominion as she conceives it shall determine the destinies of mankind. There is, therefore, but one response possible from us: force, force to the utmost, force without stint or limit, the righteous and triumphant force which shall make Right the law of the world, and cast every selfish Dominion down in the dust."

It needed, however, a crisis to elicit an adequate display of American force on fields where the issue would be decided. In the previous Nov. the Kaiser had declared that the only means to secure peace was for Germans to hew their way through those who would not make it; and the terms of the Treaty of Brest Litovsk are intelligible only on the assumption that he relied upon a German offensive on the western front to constrain the Entente to recognize those terms if not to accept similar ones for themselves. From the beginning of the German offensive on March 21 until the first Austrian peace-note on Sept. 15 the pen gave way to the sword. Czernin resigned on April 15 after his controversy with Clemenceau over the Sixte of Parma *pourparlers* in the summer of 1917, but the fact that he was suc-

ceeded by Burián indicated a stiffening rather than a relaxation of the Austrian attitude. Nor had the growing discontent and the declining *moral* of the German people any effect upon the diplomatic situation, although in Jan. strikers had demanded peace on the basis of self-determination without annexations or indemnities, and crowds in Berlin had vociferated against a fresh offensive on the western front.

War Weariness.—More potent than social ferment in Germany was imperial disintegration in Austria. The disaster at Caporetto had a wholesome effect upon the Italian attitude toward the Yugoslavs, and the revelation of the secret Treaty of London by the Bolsheviks gave more progressive opinion in Italy an opportunity of expressing itself. In Feb. 1918 a committee was formed to promote an understanding with the Yugoslavs, and on March 7 Signor Torre on a visit to London arranged with Dr. Trumbitch the holding of a congress of oppressed nationalities at Rome. It met early in April, and on the 10th produced the "Pact of Rome," by which the "unity and independence" of the Yugoslav nation, "known also as the nation of Serbs, Croats, and Slovenes," were recognized as a vital interest for Italy, and the completion of Italian unity as a vital interest for the Yugoslavs. It was also mutually agreed to defend the freedom of the Adriatic against every enemy present or future, and to decide amicably the territorial questions between them on the basis of nationality and self-determination. This entente was of the utmost value in promoting the successful Italian resistance on the Piave in June and victory in Oct. President Wilson hastened to bless the practical application of his own principles; on June 28 he asserted that all branches of the Slav race must be completely freed from German and Austrian rule; on Sept. 3 he formally recognized the Czechoslovak National Council as a belligerent Government; and on Oct. 18 in reply to the Austrian peace-note declared that he was no longer at liberty to accept the "autonomy" of these peoples—as indicated in the tenth of his Fourteen Points—as a basis of peace, but "is obliged to insist that they, and not he, shall be the judges of what action on the part of the Austro-Hungarian Government will satisfy their aspirations and their conceptions of their rights and destiny as members of the family of nations."

For the time, the success of the German offensive made all talk about terms of peace irrelevant except on the German side, where it generally took the form of repudiating the peace resolution of July 1917. But before the end of April confidence began to wane, first at G.H.Q. and then in the public mind in Germany itself. The difference was that the worse the situation became, the more determined Ludendorff grew in his persistence, and the more sceptical the public showed itself of his success; the reason was that the militarism of the German Government became more and more involved in the fortunes of the war. On June 24 Kühlmann in a long speech let fall the phrase, "an absolute end can hardly be expected through purely military decisions alone"; and a fortnight's disputation over his meaning ended in his resignation at Ludendorff's behest on July 9. It had become heresy, in the waning prestige of militarist orthodoxy, to dispute what the German G.H.Q. could do; and Kühlmann's successor was von Hintze, its nominee without any pretence of that "parliamentarization" which both the Reichstag and President Wilson had demanded as a preliminary to peace. On July 4 President Wilson laid down four great ends of the war, which he said "can be put into a single sentence. What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind." Next day Mr. Lloyd George said the Kaiser could have peace to-morrow if he would accept the President's terms. But Ludendorff's conception of the reign of law was the will of G.H.Q. sustained by German arms, and he was desperately bent on giving it effect.

He refused to admit in words that his increasing lack of success and resources, or even Foch's counter-offensive on July 18, had made his position hopeless. But he confessed that Aug. 8 was Germany's "black day," and on the 14th at a crown council at Spa the Kaiser decided that negotiations must begin on the

first, suitable occasion. The Austrian Emperor and Burian emphasised the need on the 15th, and wanted to begin at once. A fortnight was spent in arguing, and on the 30th Austria threatened an independent overture. But both parties assumed that defensive war could still be successfully carried on in France, while the offensive submarine inclined the enemy to a peace which would leave the Central Empires their ill-gotten gains in the east; and they were at the moment engaged on the supplementary treaties of Brest Litovsk, which, as signed on the 27th, compelled the Bolsheviks to oppose the Entente forces in N. Russia, to renounce sovereignty over Estonia, Livonia, and Georgia and to pay heavy gold indemnities, and riveted the German economic yoke more firmly than ever. The German public and even the civil government looked helplessly on while G.H.Q. wasted their opportunities for peace. There was no foresight, and no discussion of any terms that might have satisfied enemies whom Germany found it increasingly difficult to resist. Civil intelligence had abandoned its functions for so long to the soldier that it was simply atrophied for lack of use; and it was not until late in Oct. that ministers screwed up their courage to action independent of General Headquarters.

Concluding Stages.—By that time the Hindenburg defences on which the army and public relied had broken down. On Sept. 2 the Wotan line was pierced, on the 12th the Americans wiped out the St. Mihiel salient, and on the 15th, the day on which the Bulgarian line in the Balkans was broken, Austria addressed a peace-note to belligerents, neutrals, and the Pope proposing a confidential and non-committal discussion in some neutral country. President Wilson replied on the following day that the United States "can and will entertain no proposal for conference upon a matter concerning which it has made its position and purpose so plain"; and Austria retired from the diplomatic struggle. German G.H.Q. were not reduced to a suppliant attitude until the 29th, the day on which Bulgaria signed her armistice and went out of the war, abandoning the whole of the Balkans to the Entente. Meanwhile Allenby had destroyed the Turkish armies in Palestine, the Hindenburg lines in front of Cambrai had been broken, and a combined offensive in Belgium had undermined Germany's hold on the coast. On the 27th President Wilson added "Five Particulars" to his "Fourteen Points," "Four Principles," and "Four Ends." Some details, he said, were needed to make his general terms "sound less like a thesis and more like a practical programme." But even these particulars were less terms of peace than principles which must govern those terms, and they were as follows:—

First. The impartial justice meted out must involve no discrimination between those to whom we wished to be just and those to whom we did not wish to be just.

Second. No special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all.

Third. There can be no leagues or alliances or special covenants and understandings within the general and common family of the League of Nations.

Fourth. And, more specifically, there can be no special selfish economic combinations within the League, and no employment of any form of economic boycott or exclusion, except as the power of economic penalty, by exclusion from the markets of the world, may be vested in the League of Nations itself as a means of discipline and control.

Fifth. All international agreements and treaties of every kind must be made known in their entirety to the rest of the world.

Two days later Hertling and all his ministers resigned in order that the Kaiser might be provided with an administration supported by the Reichstag to meet the President's objection to negotiating with an autocratic government; but the Kaiser in accepting this principle would only say that it was his "will that men who are supported by the confidence of the people should, to a large extent, participate in the rights and duties of the Government." Prince Maximilian of Baden was appointed German Chancellor, and he had to deal with a veritable panic at G.H.Q. Ludendorff was in despair. "To-day," he declared, "the soldiers hold their ground; it is impossible to foresee what may happen tomorrow . . . the peace offer must be made

to-day." Hindenburg was hardly less emphatic: "Every day of delay will cost thousands of brave soldiers their lives." So on Oct. 4 a first peace-note was despatched by Germany. The appeal was to President Wilson alone, asking him to take steps for the restoration of peace. The German note accepted the Fourteen Points as a programme; the Austro-Hungarian note, which followed on Oct. 7, accepted also the Four Principles of Feb. 11 and agreed that the Five Particulars should "also be taken into account."

The President's replies to these, and to the succeeding notes constituted a process of depriving the German Government one by one of possible loopholes of escape, and of the means, such as defensive warfare on French soil, delay for recuperation, and the submarine campaign, by which Ludendorff still hoped that the situation might be improved. On Oct. 8 he pressed for more specific acceptance of his principles, declined to propose an armistice unless the Central Powers consented "immediately to withdraw their forces everywhere from invaded territory," and pointedly asked whether the German Chancellor was merely speaking for the imperial authorities who had so far conducted the war. Satisfactory assurances were given by Germany on the 12th with regard to the first; but as to the second she proposed a mixed commission, and as to the third was not conclusive. Her acceptance of the first justified the President, as he said on the 14th, in being frank with regard to the other two points; the process of evacuation and terms of the armistice must be left to the advice of the military authorities, but no arrangement could be accepted which did not guarantee the present military supremacy of his Government and its Allies. Nor would he or they consent to consider an armistice so long as German submarines continued their sinking of passenger ships, and German troops the pillage and destruction which marked their withdrawal. With regard to the democratic character of the German Government, he referred to his "Four Ends" speech of July 4, in which he had plainly intimated that if the Germans wanted peace they must change their constitution. To the Austro-Hungarian note he returned a separate reply on the 18th, explaining his change of attitude toward Czechoslovak and Yugoslav "autonomy."

Both Governments made in reply concessions, in view of which the President said on the 23rd he could not decline to take up the question of an armistice with his Allies. He had therefore transmitted the correspondence to them; but he pointed out that extraordinary safeguards would have to be demanded in view of the fact that "the power of the King of Prussia to control the policy of the Empire is unimpaired . . . that the nations of the world do not and cannot trust the word of those who have hitherto been the masters of German policy." If the Government of the United States "must deal with the military masters and the monarchical autocrats of Germany . . . it must demand not peace negotiations but surrender. Nothing can be gained by leaving this essential thing unsaid."

The German reply was dated the 27th. Incidentally that was the date of the Austrian débâcle on the Piave; but Germany's action was dictated by events nearer home. Almost the last vestige of the Hindenburg defences had disappeared. But Ludendorff had recovered his obstinacy, if not his nerves, and urged the rejection of Wilson's terms. At last the civilian ministers acted on their own responsibility, and Ludendorff had to resign on the 27th. Next day, when the High Seas Fleet, the submarine having been barred, was ordered out, it mutinied; and the German note merely intimated that the German Government awaited the proposals for an armistice. But the President's Allies had still to be heard; and on Nov. 5 he informed Germany that they reserved complete freedom of action at the Peace Conference with regard to the freedom of the seas, and understood by "restoration" "compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air." No reference was apparently made to the Secret Agreements, which therefore would not be binding on the Conference.¹

¹ See PEACE CONFERENCE for the actual proceedings.

Germany raised no further objections, and on Nov. 7 the Armistice Commission met. It continued its deliberations, to the accompaniment of popular insurrections and monarchical abdications, until on the 11th an Armistice was signed on the day that Americans fought their way into Sedan and Canadians into Mons. Verily a New World had been called in to redress the balance of the Old. For subsequent events see especially articles on GREECE, RUSSIA, OTTOMAN EMPIRE, and other countries of Eastern Europe. (A. F. P.)

WRANGEL, PETER NICHOLAIEVICH, BARON (1879-), Russian general, was born in Petrograd in 1879, the eldest son of an impoverished Baltic nobleman of Swedish descent. His father, Baron Nicholas Igorevich, held an important post in the International Bank, at Petrograd. At the age of 20 Wrangel entered the Mining Institute at Petrograd and finished its course brilliantly. He served as private in the Horse Guards for one year. Leaving the regiment with the rank of N.C.O. he went to Siberia and worked there as a mining engineer until the Russo-Japanese War. At the beginning of that war he joined the Trans-Baikal Cossack Regt., which he left at the end of hostilities with the rank of captain. He retained his rank in the Horse Guards, which he rejoined after the war, thus devoting his life to the military profession. At the beginning of the World War he was in command of a squadron, but was soon promoted colonel, received the St. George Cross and was made A.D.C. to the Tsar. In 1915 he was appointed commander of a Cossack regiment at the Galician front. Later he rose to the command of a Cossack division. Wrangel was among the first officers who joined Gen. Kaledin in his fight against the Bolsheviks, and after Kaledin's suicide he took part in the organization and struggle of the volunteer army under Alexeyev and Denikin, and distinguished himself especially by the defence of Tsaritsyn. After the disastrous retreat of Gen. Denikin, from Orel to the Black Sea, Wrangel was appointed on April 4 1920 commander of the volunteer army. Men and officers of the army were demoralized, and the lack of munitions and food supplies made the situation almost desperate. Fortunately for Wrangel, the Bolsheviks considered the volunteer army to be out of action, and they had to send a large part of their forces against the Poles who were approaching Kiev. This made it possible for Wrangel to attempt the reconstruction of the southern army; and for some time his attempt was successful. His nomination to the post of commander-in-chief corresponded with the attempt of Mr. Lloyd George to induce the volunteer army to begin peace negotiations with Soviet Russia. In a note to this effect the volunteers were warned that, in case of refusal, they would be deprived of all British support; this note was handed to Gen. Denikin on April 4, and seems to have been one of the chief causes of his resignation. Replying to this proposition Wrangel refused to enter into direct negotiations with the Bolsheviks, and asked the Allies to guarantee the life and safety of his troops and of the refugees under his protection. These negotiations proved eventually a failure. In the meantime Wrangel did his best for the reorganization of the army and the administration. A Council was formed which continued the work of Denikin's Government. Krivochin was nominated president of the council; Peter Struve received the portfolio of Foreign Affairs, Bernatsky that of Finance. The Government was modelled on the basis of personal dictatorship. In the "Statute" published on April 14 it was proclaimed that the "Ruler and Commander-in-Chief of the armed forces of South Russia holds full military and civil power without any limitation whatever." It was intended that this temporary dictatorship should lead in the future to the reconstruction of Russia. The main points of Wrangel's programme were outlined by Struve in an interview to the representative of an English paper in the following way:—

"The seizure by the peasants of large properties should be recognized wherever it has actually taken place. It constitutes the starting point for wide agricultural reform destined to assure the peasants the full ownership of the land which they cultivate. The agrarian revolution which has taken place in favour of peasants would thus be legalized, and, to the profit of the new owners of the soil, would result in an agrarian organization based on the principle of private

property, which corresponds beyond doubt to the aspirations of the peasants." (These principles served as a foundation to the "Rules for the transfer of agricultural land to the tillers of the soil" of March 25 1920.) "The future organization of Russia should be based on an agreement between the existing political formations. The union of the different parts of Russia, at present divided, in a large federation would be founded on voluntary agreement between them, resulting from the community of interests, and, above all, from economic needs. This policy in no way seeks to enforce union by violence. Whatever may be the future relations of the different parts of Russia now separated from one another, the political organization of these territories and the constitution of their federal union should be founded on the free expression of popular will by means of representative assemblies elected on democratic basis. The underlying motive of Wrangel and those who supported him in attempting to establish themselves in Southern Russia was the conviction that while, sooner or later, the Bolshevik system must come to an end, it is nevertheless essential that its disintegration should be assisted by outside action."

The reorganization of the army by conscription proceeded successfully, and the events of the Polish front as well as the shortage of food in Crimea obliged Wrangel to try a new offensive. On May 25 he began an advance on the whole front, combined with landings on the coast to the east and west, which resulted in a series of defeats for the Bolsheviks. The whole of the fertile corn lands of the Taurida Province were occupied, and the position of the army was greatly strengthened. At the end of June the new line of the front passed approximately through Berdyansk (Sea of Azov), Tokmak (Sevastopol-Kharkov railway), Alioshki (on the Dnieper, near Kherson). The front of 30 km. had been extended to one of 250 kilometres.

With the defeat of Poland Mr. Lloyd George renewed his proposals as to settlement with the Bolsheviks at the conference of Spa. On the contrary, on Aug. 11 the French Government issued a statement which declared, "that taking into consideration the military successes and the growing strength of the Soviet Republican Government" it was recognized by France as the *de facto* Government of Russia under the obligation of recognition of Russian debts, and the promise to follow a democratic policy with regard to domestic affairs.

Wrangel and his Government tried to follow these advices in spite of the opposition of a section of the Russian society. But the heavy hand of the military dictatorship made itself often felt in spite of the democratic programme. For example, in his order of Oct. 3 Wrangel prohibited all "public speeches, sermons, lectures and conferences tending to arouse political or national disorder." His relations with the Caucasus, Ukraine, Poland and other territories, which had been parts of the Russian Empire before the revolution, were of vital importance for the success of the undertaking. The principle of federation was proclaimed and resulted in the agreement of July 22 (Aug. 4) between Wrangel on the one side and the Atamans of Don, Kuban, Terek and Astrakhan on the other. Complete self-government was granted to the Cossacks in their internal organization and administration, but the direction of foreign relations and of military affairs was reserved for the Commander-in-Chief. A delegation of the Paris Ukrainian National Committee was received by Wrangel at Sevastopol on Sept. 23, and established coöperation of the non-separatist Ukrainians with Wrangel. In order to facilitate the organization of a special Ukrainian administration and the formation of Ukrainian military units, a Commissioner for Ukrainian affairs was appointed in Wrangel's Government with the rank of Minister. Wrangel was also recognized as the supreme chief of the anti-Bolshevik movement by the leader of the Siberian Cossacks, Ataman Semenov, and the chiefs of different independent guerilla units acting in the south of Russia, the best known of whom is Makhno. Wrangel successfully repulsed all Bolshevik attacks until the end of Oct., and even found it possible to extend the area of his occupation. An official *communiqué* at the end of Oct. reports "that between May 25th and October 25th the Russian army had captured 70,500 prisoners, 250 guns, 17 armoured trains, 21 armoured cars, hundreds of horses, and considerable amount of other booty." But these successes were only of a short duration. Peace with Poland had freed considerable Bolshevik forces, which were transferred to the southern front against Wrangel. The small

ay numbering 45,000 trained soldiers was unable to defend a nt of 400 km. against the overwhelming number of Bolsheviks, well provided with heavy artillery and unlimited munitions. The isthmus of Perikop had to be abandoned in consequence of a turning movement by the Reds across the "Putrid 1." On Nov. 15 Sevastopol was occupied by the Bolsheviks. The evacuation of the army and of thousands of refugees was tried out in good order under the personal supervision of Wrangel, who was the last to leave on board the "Korniloff." total of 130,000 people were evacuated, of whom 70,000 were diers (30,000 fighting men, and 40,000 from the rear), about 100 wounded, the rest being civilians. One hundred and fifty million fr. were advanced by the French Government for the relief of the army and refugees, who were in the most awful condition. The refugees were sent to Lemnos, to Egypt and to Yugoslavia.

Wrangel hoped that the evacuation would enable him to keep his army together as a fighting unit to be used at the first opportunity against the Bolsheviks. The excellent discipline and loyalty of the troops and their devotion to their chief favoured such a plan; but it could not be effected without the support of the Allies, and this resource proved to be exhausted.

The French Government, which had done most for the forces in the Crimea, was unwilling to continue a policy which it considered hopeless. M. Leygues, the successor of M. Millerand as prime minister, demanded categorically the disbandment of Wrangel's army, and the General was directed to announce to the troops that he was not their chief any more and that they were free to disband. About 10,000 were "repatriated" to Soviet Russia, about 12,000 accommodated in Serbia and Brazil. The rest part of the army kept together in the camp of Gallipoli in their regimental formations, maintaining—according to the testimony of foreign officers—excellent discipline and sturdy spirit. The problem as to what was to be done with these picked troops was still unsolved in the winter of 1921. France had withdrawn her support; Serbia had taken over 5,000 cavalry to serve as frontier guards; the rest were expecting assistance from Russian institutions abroad, such as the Russian embassies in Washington and Tokio, and from the intervention of the League of Nations. (P. VI.)

WRENBURY, HENRY BURTON BUCKLEY, 1st BARON WRENBURY (1845–), English judge, was born in London Sept. 15 1845. His father was for many years vicar of St. Mary's, Paddington, and Arabella Buckley, the author of *The Fairy Land of Science* (1878), was his sister. He was educated at Merchant Taylors' school and Christ's College, Cambridge, being ninth wrangler in 1868. In 1869 he was called to the bar, and rose to a position of eminence as an authority on company law. He became a Q.C. in 1886 and a bencher of Lincoln's Inn in 1891, while from 1883 to 1898 he was a member of the Bar Committee and the Bar Council. In 1900 he was made a judge of the Chancery division, and in 1906 became a lord justice of appeal and a privy councillor. He retired in 1915, and was raised to the peerage, his high legal authority adding strength to the House of Lords. Lord Wrenbury founded in 1904 the Buckley scholarship in political economy at Cambridge, later styled the Wrenbury scholarship, to be held by scholars from Merchant Taylors' school. His *Law under the Companies Acts* (1873; 9th ed. 1909) is a standard work.

WRIGHT, SIR ALMROTH EDWARD (1861–), British bacteriologist, was born at Middleton Tyas, Yorks, Aug. 10 1861. He was educated at Dublin University, and afterwards studied law, subsequently obtaining his medical and scientific education at the universities of Leipzig, Strassburg and Marburg. In 1887 he became a demonstrator of pathology at Cambridge, in 1889 went to Sydney as lecturer in physiology, and from 1892 to 1902 was professor at the army medical school at Netley, being then appointed professor of experimental pathology in the university of London. He was knighted in 1906. Sir Almroth Wright came into prominence primarily by his remarkable researches into the problems of parasitic diseases. He introduced the system of anti-typhoid inoculation (see 20.775, 783), and also did much valuable work on the preparation of other vaccines and

toxins, while he carried out many important experiments in bacterial infection and in measuring the protective matter of human blood. He acted as a consulting physician to the army in France from 1914–9, and was in 1918 created K.B.E. He has published *System of Anti-Typhoid Inoculation* (1904); *Principles of Microscopy* (1906) and *Studies in Immunisation* (1909), besides many papers in medical and scientific periodicals. In 1913 appeared *The Unexpurgated Case against Woman Suffrage*, which provoked much discussion.

WRIGHT, WILBUR (1867–1912), American inventor, was born near Millville, Ind., April 16 1867. He was the son of Milton Wright, a bishop of the United Brethren in Christ. He secured a high-school education in Richmond, Ind., and Dayton, O. Together with his brother Orville he opened a shop for repairing bicycles at Dayton in the early 'nineties. The Wright brothers early became interested in the problem of flying, and from about 1900 made many experiments with gliding machines at Kittyhawk, N.C. On Dec. 17 1903 such a machine with a petrol motor attached flew 260 yd., the first successful flight of an aeroplane; and on Oct. 5 1905, near Dayton, they accomplished their first successful long flight, more than 24 m., at the speed of 38 m. an hour. In spite of this proof of the practicability of flight in heavier-than-air machines, they were unsuccessful in enlisting financial support in America. In 1908 Wilbur Wright went to France, and on Sept. 21 won the Michelin prize by a flight of 56 miles. This brought him international fame. In Dec. of the same year he made from Le Mans, France, a flight of 77 m. in 2 hours and 20 minutes. In 1909, during the Hudson-Fulton Exposition in New York City, he flew from Governor's Island up the Hudson river to Grant's tomb and back, travelling 21 m. in 33 minutes and 33 seconds. On March 3 1909 Congress awarded the Wright brothers a special medal. Later the U.S. Government purchased a machine for \$30,000, and afterwards the invention was officially adopted by the U.S. army. The French patents were sold for \$100,000. After 1910 Wilbur Wright gave up public flying and devoted his time to mechanical improvement of the Wright machine. He received many medals and honours from European countries. He died at Dayton, May 30 1912.

His brother, **ORVILLE WRIGHT** (1871–), was born at Dayton, O., Aug. 18 1871. He was educated in the Dayton schools, worked with his brother Wilbur in the bicycle repairing business, and was closely associated with him in all his experiments in developing a practicable aeroplane. He shared in the many honours awarded by foreign countries, and after the death of his brother became director of the Wright Aeronautical Laboratory at Dayton. In 1913 he received the Collier trophy for developing the automatic stabilizer. In 1915 he was appointed a member of the U.S. Naval Consulting Board. The same year the Wright Aeroplane Co. sold its patents to a New York syndicate, Orville Wright remaining chief engineer.

WRIGHT, WILLIAM ALDIS (1836–1914), English man of letters (see 28.847), died at Cambridge May 19 1914. His last publication was *The Hexaplar Psalter* (1911). In 1912 he resigned the vice-mastership of Trinity College, Cambridge, and lived in retirement till his death.

WUNDT, WILHELM MAX (1832–1920), German philosopher (see 28.855), died at Leipzig Sept. 1 1920. His principal work was done before 1907. At the outset of the World War he published an address justifying Germany, and his *Die Nationen und ihre Philosophen* (1915) eulogizes German thought and culture whilst belittling those of England and France.

WÜRTTEMBERG (see 28.856). Pop. according to 1919 census, 2,518,773. During 1910–1921 the constitutional question in Württemberg passed through decisive developments. The constitution dating from Sept. 20 1819 was one of the oldest in Germany. Created by a contract between the King and the Assembly of Estates, it was based upon the people's will and could, for that very reason, be maintained almost without alteration for close upon a century.

The first alteration of any importance was made in 1906, when Württemberg introduced, before any other German state, the proportional system of election for the Second Chamber of

the Diet. The result of the elections of 1906 was such that the two Liberal parties on the one side and the Catholic Centre and the Conservatives on the other were equally strong, so that the Social Democrats held the balance. The elections of 1912 brought about a fresh grouping of parties. The Conservatives and the Catholic Centre (forming together the so-called "Black-and-Blue bloc") returned as many deputies as all the other parties together, with the consequence that very keen opposition developed between the Right and the Left. The composition of the Ministry, it is true, was not affected by the constellation of parties, as the government of Württemberg was not on the parliamentary system. The Weizsäcker Ministry remained in office and continued to conduct its policy on the liberal lines which had always been followed in Württemberg. The demand for the appointment of parliamentary ministers, which had been vigorously prosecuted by the Democratic (non-Socialist) party during the World War, was rejected by the Weizsäcker Ministry, notwithstanding its liberal tendencies, until the change in the constitution of the Empire under Prince Max of Baden's chancellorship in Oct. 1918 compelled the Württemberg Government to give way. The Weizsäcker Ministry resigned. A new Ministry was formed, containing a member of each of the four parties, the Catholic Centre, the National Liberal, the Democrats and the Social Democrats. The Democrat Liesching was made president of the Ministry. This new Ministry was going to meet on Nov. 8, but on Nov. 9 the revolution broke out in Stuttgart and on Nov. 10 the Liesching Cabinet resigned. A provisional Government was formed, consisting at first entirely of Social Democrats. The most extreme members of this Government, however, were ejected on Nov. 11, and a member of each of the three parties, the Centre, the Democrats and the National Liberals, entered the Cabinet. After the disturbances which broke out in Jan. 1919 the Independent Socialists left the Ministry, and its composition then remained unaltered until the general election of the year 1920.

The King, William II. (born 1848), had abdicated on Nov. 30 1918 and retained only the title of Duke of Württemberg. He subsequently lived mostly at Bebenhausen Castle in the Black Forest, where he died on Oct. 2 1921. The headship of the family passed to Duke Albrecht of Württemberg. The abolition of the monarchy in Württemberg was solely a consequence of the fall of the Hohenzollern monarchy in the empire. The King of Württemberg himself had enjoyed great popularity, which extended into the ranks of the Social Democrats. The democratic tendencies which had always prevailed in Württemberg had, after the revolution, the favourable effect of enabling the Territory (*Land*) to settle down with comparative rapidity, and the coöperation of the so-called "bourgeois" (i.e. non-Socialist) parties with the Social Democrats took place without any serious friction.

After Nov. 9 1918 Württemberg experienced no further political convulsion of a serious character. The disturbances of Jan. 1919 were quickly suppressed. The attempt of the extremists among the working classes to cause disturbances by a general strike was frustrated by the action of the railway officials in paralysing the communications with Stuttgart. The Bavarian Communist insurrection produced no effect in Württemberg; it was, on the contrary, suppressed with the aid of Württemberg troops before it could spread across the border. During the so-called Kapp "Putch" (March 1920) the Government of the Reich and the National Assembly removed for a short time from Berlin to Stuttgart because they felt that they would be safest in the capital of Württemberg.

The provisional Government of Württemberg issued on Nov. 2 1918 regulations for the election of a Representative Assembly which should meet and vote the new constitution. The elections of Jan. 12 1919 resulted in the return of 51 Social Democrats, 38 Democrats, 31 members of the Catholic Centre, 25 Conservatives and 4 Independent Socialists. The Assembly first confirmed the Government in office and then proceeded to deal with the new constitution. It was voted on April 16 against a minority of 11, and the whole of the rest of the House. Most of the Con-

servatives were amongst the majority; the minority consisted of a few Conservatives and the Independent Socialists. Württemberg was the second state of the Reich which deduced the consequence of the revolution by setting up a new constitution; Baden alone preceded it. The constitution of Württemberg naturally resembles that of Baden in many respects, but also differs from it in several important particulars. Moreover, the constitution which came into force on May 23 1919 was not definitive. As the constitution of the Reich had considerably restricted the rights of the separate states which composed it, a reconsideration of the constitution of Württemberg became necessary and large sections of it were eliminated. On Sept. 25 1919, exactly 100 years after the adoption of the first Württemberg constitution, the new constitution was finally voted.

The constitution of Württemberg could not fail to resemble that of the other German states, since the constitution of the Reich prescribes for all the states that they must be republics and have a parliamentary government. The powers of the state in Württemberg proceed from the people and are transferred by the people to the Diet; the people can, however, resume the powers of the state by dissolving the Diet or by giving a popular vote (*Volksabstimmung*) on a law. Such a vote may be passed either upon a referendum or upon a popular initiative. In contrast to Baden, there is no compulsory referendum.

The Diet transfers the executive power to the Government. At the head of the Government there is the Minister-President, who has the title of President of the State (*Staatspräsident*); but in Württemberg, as in Baden, there is no head of the state independent of the Diet. The Ministry is formed by the Diet's electing the President of the State, who selects the Ministry in accord with the Diet. (The same procedure is followed in Bavaria and Baden.) The administration, however, is not conducted by the Ministry as a whole, but by individual ministers. A peculiarity of the Württemberg constitution is that councils (*Beiräte*), formed from the different classes according to occupations (*Berufsstände*), are attached to the ministries. Elections for the Diet take place every four years. No provision is made for a dissolution of the Diet except that, as already mentioned, the Diet can be dismissed by a vote of the people.

The constitution of Württemberg was framed by those parties which restored order in the country after the revolution—the Social Democrats, the Democrats and the Catholic Centre. At the elections of June 1920 these parties, particularly the Social Democrats and the Democrats, were considerably weakened, while the parties to the Right and the Left of them gained. As in the Reich the result of the general elections compelled the Government to resign; the Württemberg Government took this course, although there was no absolute necessity. The new Government of Herr Hieber was composed of members of the Democratic and the Catholic Centre parties, but was nevertheless supported by the German People's Party (former National Liberals) and the Social Democrats. The change of government did not entail any essential alteration in the policy of Württemberg. (W. v. B.)

WYNDHAM, SIR CHARLES (1837–1919), English actor (see 28.872), died in London Jan. 12 1919. In 1916 he married, as his second wife, Miss Mary Moore, who had been for many years his leading actress and his partner in management. His last appearance on the stage was made in a revival of *Mrs. Dane's Defence* at the New theatre, London, in 1912.

WYNDHAM, GEORGE (1863–1913), English politician and man of letters, was born Aug. 29 1863, the eldest son of the Hon. Percy Scawen Wyndham, and grandson of the 1st Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, 1st baronet; and through her he was great grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Boer campaign of 1885. But his military career was a very short one. Interested as he was in soldiering, his eager temperament impelled him still more to adventure in politics and letters. He left the army in 1887, married Sibell Mary, daughter of the

9th Earl of Scarbrough, widow of Earl Grosvenor, mother of the 2nd Duke of Westminster, and became private secretary to Mr. Balfour, at the time Irish Secretary, a position which he held till 1892. In 1889 at the age of 26 he entered Parliament as Conservative member for Dover, and retained the seat till his death. In 1898 he was appointed financial secretary to the War Office, a post in which he distinguished himself during the Boer War, in particular by a brilliant defence, in the debate on the Address in 1900, of the conduct of his office in regard to intelligence and reinforcements. But his chief claim to political remembrance is based on his tenure, from 1900 to 1905 (after 1902 as a Cabinet minister), of the office of Chief Secretary for Ireland. Having been private secretary for several years to the most successful chief secretary of modern times, he started with a large store of experience, and his appointment was regarded with benignity even by the Nationalists on account of his descent from Lord Edward Fitzgerald. His early work in Ireland met with general approval. He developed enormously the policy of land purchase, which the Unionists had found to exercise such a calming and beneficial effect; and the Land Purchase Act which he successfully carried in 1903 was the most comprehensive measure of the kind ever submitted to Parliament. He entertained hopes of arranging some form of local government which should sufficiently meet Nationalist hopes; and with this in view appointed an eminent Anglo-Indian, Sir Antony (afterwards Lord) Macdonnell, who was known to be a decided Home Ruler, to the permanent secretaryship in 1902, giving him at the same time greater authority and wider scope than is usually conferred on a civil servant. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven to resignation. He never held office again, but he was very active in support of the causes which he had at heart, such as tariff reform, and woman suffrage; he was a keen critic of Lord Haldane's army reforms, and threw himself vigorously into the "die-hard" campaign of 1911.

This varied political activity was however but a portion of his life. He was also a man of letters, possessed of fine taste and a graceful style. Here his genius was stimulated by his friendship with W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of *Shakespeare's Poems* (1898); but he wrote also on North's *Plutarch* and Ronsard. The Admirable Crichton of his day, he was keen alike on field sports and the arts, the friend and admirer equally of Cecil Rhodes and of Rodin, a railway director and a yeomanry colonel. Oxford, Edinburgh and Glasgow gave him honorary degrees; the two Scottish universities made him lord rector.

By his father's death in 1911, Mr. Wyndham came into possession of his beautiful house, Clouds, in Wiltshire. Two years later, at the early age of 50, he died in Paris, of congestion of the lungs, after only a few hours' illness. Lady Grosvenor survived her husband. They had one son, Lt. Percy Lyulph Wyndham, who followed his father in the Coldstream Guards, was married in 1913, a few weeks before his father's death, and was killed in action in France on Sept. 15 1914, leaving no child.

WYOMING (see 28.873).—The pop. of the state in 1920 was 194,402 as compared with 145,965 in 1910, an increase of 48,437 or 33.2%, as against an increase of 57.7% in the preceding decade. The density of pop. was two per sq. m. in 1920. The urban pop. (in places having 2,500 inhabitants or more) in 1910 was 43,221, or 29.6% of the whole; in 1920, 57,348, or 29.5%. The rural pop. was 102,744 in 1910, 137,054 in 1920. The cities in Wyoming having a pop. in 1920 of over 5,000 and their percentage of increase were:—

	1920	1910	Percentage Increase
Casper	11,447	2,639	333.8
Cheyenne	13,829	11,320	22.2
Laramie	6,301	8,273	23.5
Rock Springs	6,456	5,778	11.7
Sheridan	9,175	8,408	9.1

The increase of pop. has been chiefly elsewhere than in the southern parts of the state, which had been the first to be settled.

Agriculture.—The number of farms was 6,095 in 1900, 10,987 in 1910, 15,748 in 1920. The acreage of all crops was estimated for 1920 as 1,826,000. The number of sheep in 1919 was 4,000,000 valued at \$49,200,000. In 1920 the number was 3,200,000 valued at \$32,640,000, being one-fifteenth in numbers and value of the total sheep in the United States. The estimated product of wool in 1919 was 33,415,000 lb., the average weight per fleece 8.5 lb. The total number of neat cattle in 1919 was 1,180,000 valued at \$75,580,000; in 1920 there were 869,000 valued at \$47,370,000. Other figures are correspondingly higher for 1919. In 1920 there were 258,000 horses valued at \$11,925,000; mules 4,000, valued at \$360,000; and swine 63,000, valued at \$1,159,000. Other agricultural products of Wyoming and their value in 1920 were as follows:—

Crop	Ac. sown	Production	Value
Hay, cultivated	740,000	1,850,000 tons	\$22,200,000
Hay, wild, salt and prairie	360,000	360,000 tons	5,148,000
Oats	300,000	11,400,000 bus.	7,068,000
Wheat	254,000	5,080,000 bus.	6,858,000
Corn	65,000	1,560,000 bus.	874,000
Barley	28,000	1,008,000 bus.	1,109,000
Potatoes	27,000	3,375,000 bus.	4,050,000

The irrigated area was 1,133,302 ac. in 1909, 1,209,527 in 1919. In 1920 the acreage capable of irrigation was 1,799,361. There were, in 1918, 978,681 ac. of land used for dry farming.

Mining.—The annual gross value of Wyoming's mineral products at the places of production was estimated at \$68,250,000 for 1920. In 1917 the state ranked ninth in the output of bituminous coal with 8,575,000 tons valued at \$16,593,619; in 1918 it was 9,300,000 tons; in 1919 7,145,000 tons (the decrease being attributed to labour shortage). The largest product comes from Sweetwater, Lincoln and Sheridan counties. The total production of coal to the end of 1917 was 148,000,000 short tons. Copper mining has decreased, the annual production averaging in value about \$200,000. The gypsum production in 1917 was 55,804 short tons valued at \$197,867. The average output of iron ore was about 500,000 tons, worth \$1,500,000 at the mines. A deposit of carnotite (uranium, radium), accidentally discovered near Lusk in Niobrara county, produced in 1919 71.86 tons valued at \$382 per ton. Most important in the state's mining development is the petroleum industry. In 1918 the output was 12,596,287 bar., in 1919 13,580,000 bar., and the estimate for 1920 16,000,000 bar. of crude oil, valued at over \$45,000,000 at the wells. There were 17 fields in the state where oil was produced for market. About one-half the state's output was from Salt Creek field in Natrona county. Converse county came next in 1919 with 3,267,302 bar., Hot Springs followed with 2,151,867 bar., and Park with 773,893 bar.

Manufactures and Railways.—Wyoming's manufactures continue to be of little relative importance, aside from the petroleum refining industry to which this great increase of 1919 is due. The following figures are from the census report:—

	1919	1909
Number of establishments	576	268
Persons engaged	8,095	3,393
Value of products	\$81,445,394	\$6,249,078
Value added by manufacture	39,194,866	3,640,889

Of the 8,095 persons engaged 3,057 were wage-earners in the steam railway construction and repair shops. Railway mileage in 1917 was 1,924 m. as compared with 1,623 in 1909.

Education.—The educational system was reorganized in 1919 by Act of the Legislature providing for an elective state superintendent of public instruction, a state Board of Education appointed by the state superintendent with the approval of the governor, and a commissioner of education appointed by the state Board with the approval of the governor.

History.—Wyoming in 1921 was still governed under its first constitution. The six amendments which had been adopted gave additional powers to the Legislature—notably for workmen's compensation measures, highway construction and protection of live stock from disease. An eight-hour day for underground work in mines was established in 1909. A direct primary law was passed in 1911, and a Mother's Pension Act in 1915, the latter to be administered by the county commissioners. A Public Service Commission was established in 1915, composed of members of the state Board of Equalization, with power to supervise and regulate any public utility doing business in the state. In 1919 a "blue sky" law was passed. In the same year the Executive Budget system was adopted. In 1921 a system of rural credits, to be managed by a Farm Loan Board, was pro-

vided for, and an Act passed allowing towns of 1,000 inhabitants or more to adopt the commission-manager form of government. By an Act of 1919 the commissioner of taxation was replaced by a state Board of Equalization with power to increase or decrease the assessed value of any class of property in any county. The law of 1909 limiting county taxes was replaced by the Act of 1911 grading the tax limit according to the assessed valuation of the county. A beginning was made in 1921 in the revision of the taxation system by provision for an effective inheritance tax. The bonded debt was reduced from \$140,000 in 1910 to \$99,000 in 1918, but in 1920 it was increased to \$1,935,000, due to the issue of bonds for the construction of roads.

Wyoming has been normally a Republican state in politics, but Republican control was seriously threatened for some years, beginning with the Insurgent Republican movement of 1910. Joseph M. Carey headed that movement, and a combination of Insurgent Republicans and Democrats resulted in the election in 1910 of Carey as governor, and of a majority of Democratic state officials. But the Republicans retained their control of the state Legislature throughout the decade 1910-20, and controlled the judiciary until the Act of 1918 providing for election of judges on a non-partisan ticket. Frank W. Mondell (Rep.)

was reelected as the state's one representative in Congress in 1910 and in every succeeding election of the decade. Clarence D. Clark (Rep.) was reelected to the U.S. Senate in 1910 and Francis E. Warren (Rep.) in 1912 and again in 1918. In 1914 John B. Kendrick (Dem.) was elected governor by a vote of 22,387 to 19,174 for his Republican competitor; in 1916 he was elected to the U.S. Senate over Clark (Rep.) by a vote of 26,324 to 23,258. In 1918, however, the Republicans won the elections by substantial majorities, and in 1920 they swept the state for both state and national tickets. The presidential vote in 1912 was 15,310 for Wilson, 14,560 for Taft, and 9,232 for Roosevelt; in 1916 it was 28,316 for Wilson and 21,698 for Hughes; in 1920 it was 35,091 for Harding and 17,429 for Cox.

During the World War Wyoming supplied to the U.S. army 11,393 men, to the navy 638, and to the marine corps 111. The subscriptions to the war loans, in each case exceeding the state's quota, were as follows: First Liberty Loan, \$1,568,900; Second, \$5,132,650; Third, \$6,737,000; Fourth, \$10,183,150; Victory Loan, \$6,862,250.

The recent governors have been: Joseph M. Carey (Prog.), 1911-5; John B. Kendrick (Dem.), 1915-7; F. L. Houx (acting, Dem.), 1917-9; Robert D. Carey (Rep.), 1919- . (L. A. W.*)
